TEXAS INSTRUMENTS

BQ2057、BQ2057x 用于单节和两节锂离子和锂聚合物电池的高级线性充电管理 IC

## 1 特性

- 非常适合单节电池（4.1V 或 4.2V）和双节电池（8.2V 或 8.4V）锂离子或锂聚合物电池包
- 要求少量的外部元件
- 0.3V 压降电压，可更大限度地降低热耗散
- 在预设电压下具有优于 ±1% 的电压调节精度
- AutoCompM 动态补偿电池包的内部阻抗，可缩短充电时间
- 充电前和充电期间可选芯温度监测
- 具有可编程充电电流和高侧或低侧电流检测功能的集成式电压和电流调节
- 集成式电芯调节功能可恢复深度放电的电芯，并在充电的初始阶段更大限度地减少热耗散
- 用于一个或两个 LED 或主机处理器接口的充电状态输出
- 自动电池充电功能
- 以最小电流终止充电
- 移除 V_{CC} 时自动进入低功耗睡眠模式
- 可提供用于快速评估的 EVM
- 封装：8 引脚 SOIC、8 引脚 TSSOP、8 引脚 MSOP

2 应用

- 紧急呼叫系统，远程信息处理控制单元
- 售后市场远程信息处理
- 游戏和计算机配件
- 便携式医疗设备
- EPOS 读卡器

3 说明

BQ2057 系列高级锂离子 (Li-ion) 和锂聚合物 (Li-pol) 线性充电管理 IC 专为成本敏感型、紧凑型便携式电子

产品而设计。它们将高精度电流和电压调节、电池调节、温度监控、充电终止、充电状态指示和 AutoComp ™ 充电速率补偿功能集成在一个 8 引脚 IC 中。提供 MSOP、TSSOP 和 SOIC 封装选项，以适应广泛的终端应用。
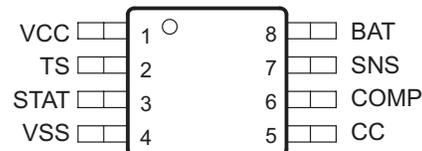

BQ2057 使用外部热敏电阻持续测量电池温度。为安全起见，BQ2057 会在电池温度处于用户定义的阈值内之前禁止充电。然后，BQ2057 分三个阶段对电池进行充电：调节、恒定电流和恒定电压。如果电池电压低于低电压阈值 $V_{(min)}$，BQ2057 将使用低电流进行预充电，以调节电池。调节充电速率大概为调节电流的 10%。调节电流还可在充电的初始阶段更大限度地减少外部通道元件中的热耗散。调节后，BQ2057 向电池施加恒定电流。外部检测电阻器设置电流。检测电阻器可以位于电池的高侧或低侧，无需额外的元件。恒定电流阶段一直持续到电池达到充电调节电压。

器件信息

器件型号	封装[1]	封装尺寸（标称值）
BQ2057C，BQ2057W	SOIC (8)	4.90mm × 3.91mm
BQ2057，BQ2057C，BQ2057T，BQ2057W	TSSOP (8)	3.00mm × 4.40mm
BQ2057，BQ2057C	MSOP (8)[2]	3.00mm × 3.00mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

(2) 请注意该器件的引脚分配差异。

Table of Contents

4 Revision History

注：以前版本的页码可能与当前版本的页码不同

5 说明（续）

然后，BQ2057 开始恒压阶段。在整个工作温度和电源电压范围内，电压调节的精度优于 ±1%。对于单节和双节电池，BQ2057 提供四种固定电压版本：4.1V、4.2V、8.2V 和 8.4V。当电流逐渐达到充电终止阈值 $I_{(TERM)}$ 时，充电停止。如果电池电压低于 $V_{(RCH)}$ 阈值，BQ2057 会自动重新开始充电。

设计人员还可以使用 AutoComp 功能来缩短充电时间。这种专有技术允许在充电期间对电池包的内部阻抗进行安全、动态补偿。

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
	Supply voltage (V_{CC} with respect to GND)	−0.3	18	V
	Input voltage, SNS, BAT, TS, COMP (all with respect to GND)	−0.3	V_{CC}+0.3	V
	Sink current (STAT pin) not to exceed P_D		20	mA
	Source current (STAT pin) not to exceed P_D		10	mA
	Output current (CC pin) not to exceed P_D		40	mA
P_D	Total power dissipation (at 25°C)		300	mW
T_A	Operating free-air temperature range	−20	70	°C
T_{stg}	Storage temperature	−40	125	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

8.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	4.5		15	V
T_A	Operating free-air temperature range	−20		70	°C

8.4 Thermal Information

9 Detailed Description

9.1 Overview

Descriptions of the devices are presented in the following sections.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Current-Sense Input

Battery current is sensed via the voltage developed on this pin by an external sense resistor. The external resistor can be placed on either the high or low side of the battery. (See schematics for details.)

9.3.2 Battery-Voltage Input

Voltage sense-input tied directly to the positive side of the battery.

Product Folder Links: *BQ2057 BQ2057C BQ2057T BQ2057W*

9.3.3 Temperature Sense Input

Input for an external battery-temperature monitoring circuit. Connecting this input to VCC/2 disables this feature.

9.3.4 Charge-status Output

Three-state indication of charge in progress, charge complete, and temperature fault or sleep mode.

9.3.5 Charge-Control Output

Source-follower output that drives an external pass-transistor (PNP or P-channel MOSFET) for current and voltage regulation.

9.3.6 Charge-Rate Compensation Input

Sets the charge-rate compensation level. The voltage-regulation output may be programmed to vary as a function of the charge current delivered to the battery.

9.3.7 Supply Voltage Input

Power supply input and current reference for high-side sensing configuration.

10 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

10.1.1 Functional Description

The BQ2057 is an advanced linear charge controller for single or two-cell Li-Ion or Li-Pol applications. 图 10-1 shows the schematic of charger using a PNP pass transistor. 图 10-2 is an operational state diagram, and 图 10-3 is a typical charge profile. 图 10-4 shows the schematic of a charger using P-channel MOSFET.

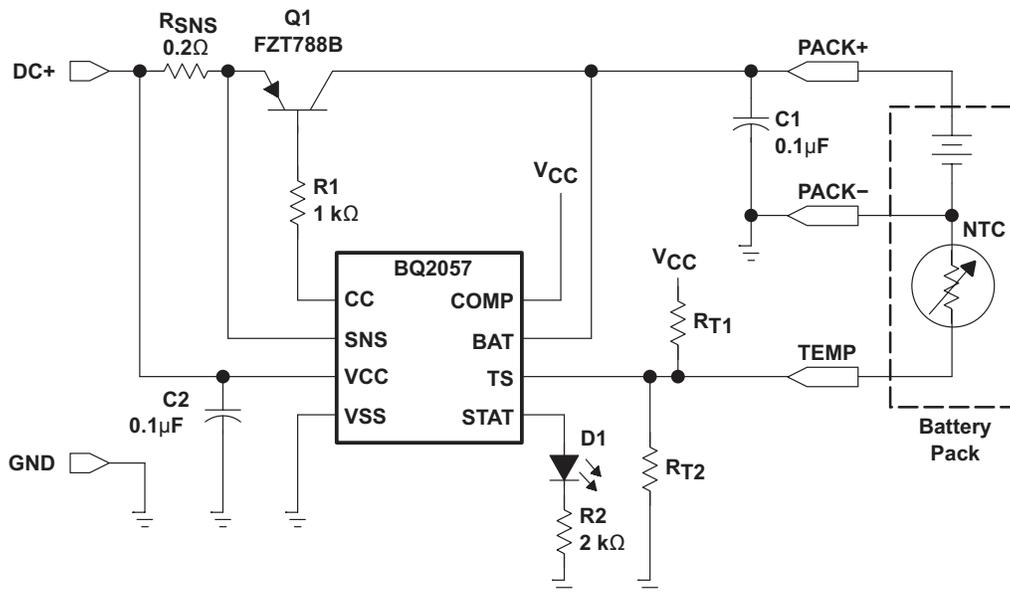

**图 10-1. Low Dropout Single- or Two-Cell Li-Ion/Li-Pol Charger**

Product Folder Links: *BQ2057 BQ2057C BQ2057T BQ2057W*
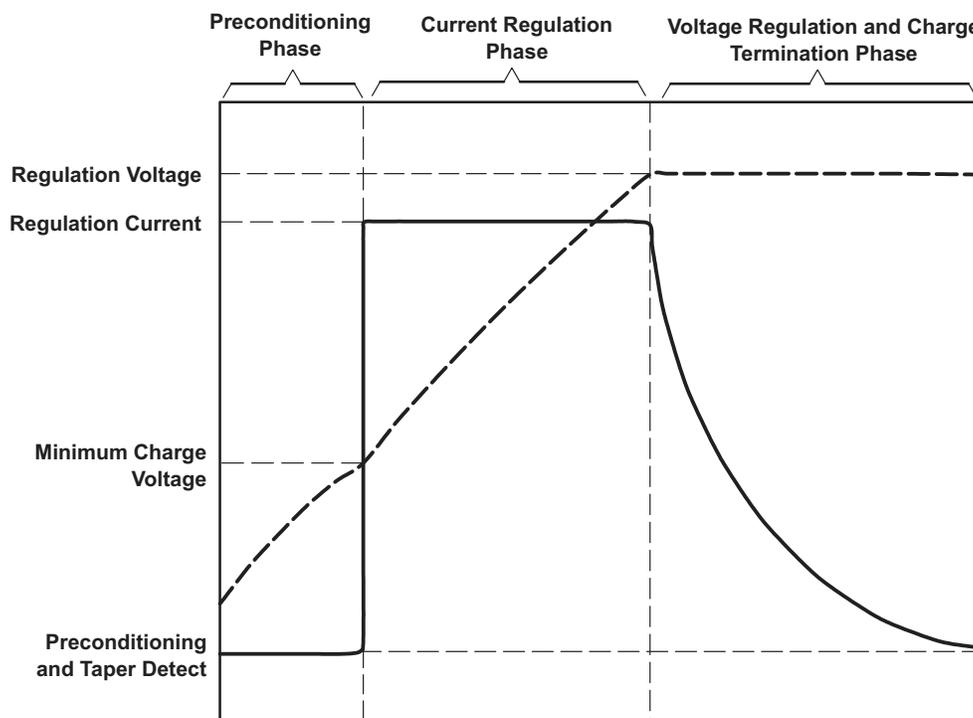

图 **10-2. Operation Flowchart**

图 **10-3. Typical Charge Profile**

10.1.2 Qualification and Precharge

When power is applied, the BQ2057 starts a charge-cycle if a battery is already present or when a battery is inserted. Charge qualification is based on battery temperature and voltage. The BQ2057 suspends charge if the battery temperature is outside the $V_{(TS1)}$ to $V_{(TS2)}$ range and suspends charge until the battery temperature is within the allowed range. The BQ2057 also checks the battery voltage. If the battery voltage is below the precharge threshold $V_{(min)}$, the BQ2057 uses precharge to condition the battery. The conditioning charge rate $I_{(PRECHG)}$ is set at approximately 10% of the regulation current. The conditioning current also minimizes heat dissipation in the external pass-element during the initial stage of charge. See 图 10-3 for a typical charge-profile.
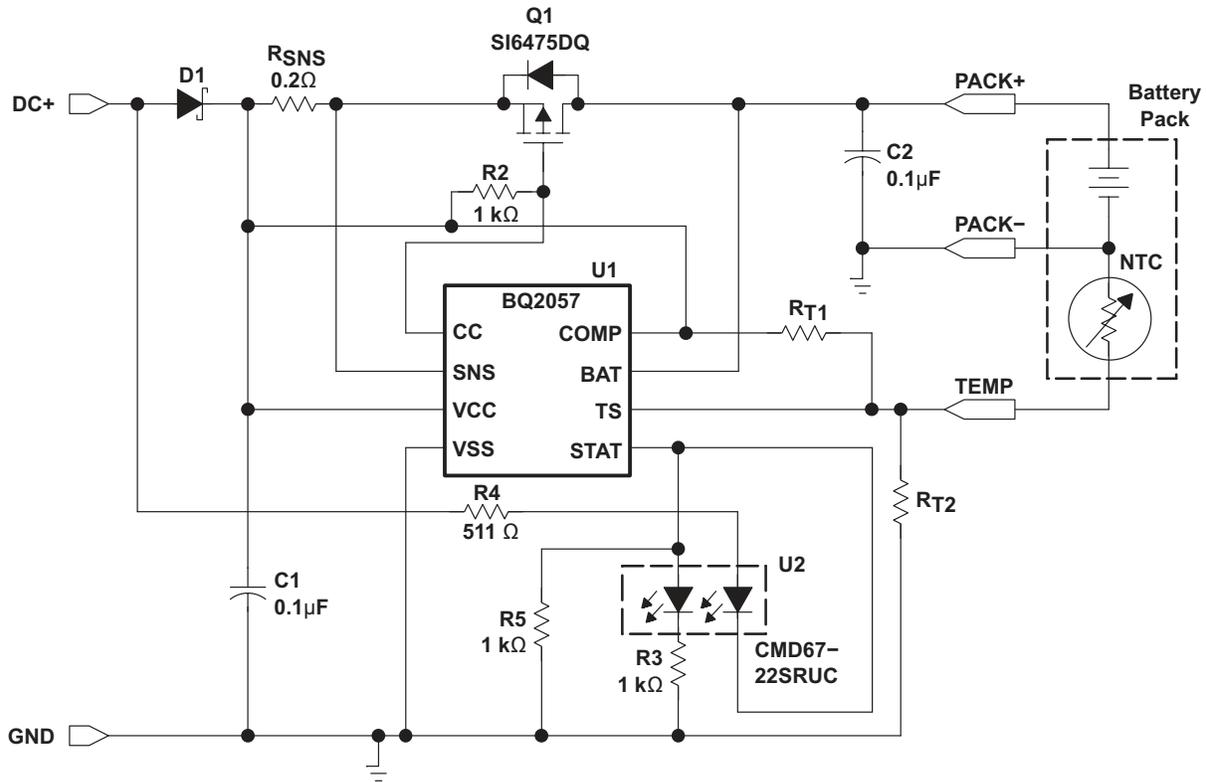

图 10-4. 0.5-A Charger Using P-Channel MOSFET

10.1.3 Current Regulation Phase

The BQ2057 regulates current while the battery-pack voltage is less than the regulation voltage, $V_{O(REG)}$. The BQ2057 monitors charge current at the SNS input by the voltage drop across a sense-resistor, R_{SNS}, in series with the battery pack. In high-side current sensing configuration (see 图 10-5), R_{SNS} is between the VCC and SNS pins, and in low-side sensing (see 图 10-6) the R_{SNS} is between VSS (battery negative) and SNS (charger ground) pins. Charge-current feedback, applied through pin SNS, maintains a voltage of $V_{(SNS)}$ across the current sense resistor. Equation 1 calculates the value of the sense resistor:

$$R_{SNS} = \frac{V_{(SNS)}}{I_{O(REG)}}$$
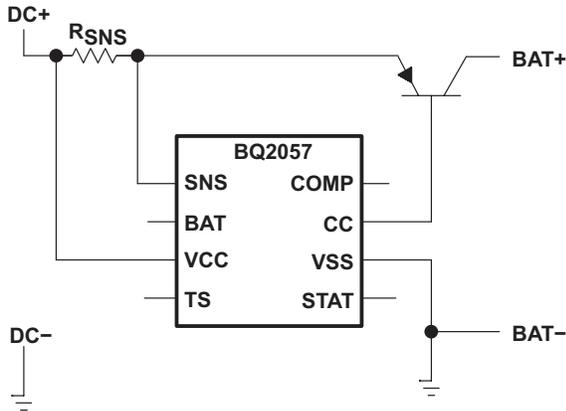

(1)

Where $I_{O(REG)}$ is the desired charging current.

Product Folder Links: *BQ2057 BQ2057C BQ2057T BQ2057W*
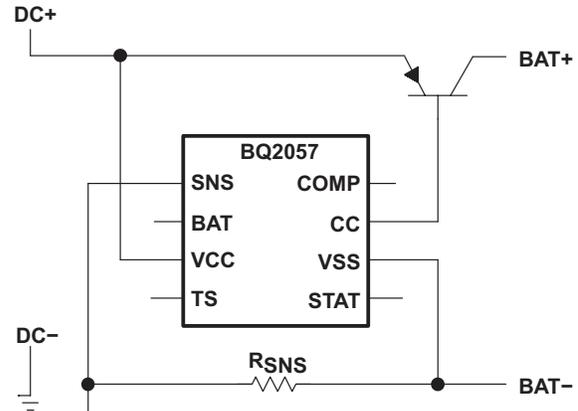

图 **10-5. High-Side Current Sensing**

图 **10-6. Low-Side Current Sensing**

10.1.4 Voltage Regulation Phase

The voltage regulation feedback is through the BAT pin. This input is tied directly to the positive side of the battery pack. The BQ2057 monitors the battery-pack voltage between the BAT and VSS pins. The BQ2057 is offered in four fixed-voltage versions: 4.1 V, 4.2 V, 8.2 V, and 8.4 V.

Other regulation voltages can be achieved by adding a voltage divider between the positive and negative terminals of the battery pack and using BQ2057T or BQ2057W. The voltage divider presents scaled battery-pack voltage to BAT input. (See 图 10-7 and 图 10-8.) The resistor values RB1 and RB2 for the voltage divider are calculated by the following equation:

$$\frac{R_{B1}}{R_{B2}} = \left(N \times \frac{V_{(CELL)}}{V_{O(REG)}} \right) - 1$$

(2)

Where:

N = Number of cells in series
$V_{(CELL)}$ = Desired regulation voltage per cell

图 **10-7. Optional Voltage Divider for Nonstandard Regulation Voltage, (High-Side Current Sensing)**

图 **10-8. Optional Voltage Divider for Nonstandard Regulation Voltage, (Low-Side Current Sensing)**

Product Folder Links: *BQ2057 BQ2057C BQ2057T BQ2057W*

10.1.5 Charge Termination and Recharge

The BQ2057 monitors the charging current during the voltage-regulation phase. The BQ2057 declares a done condition and terminates charge when the current tapers off to the charge termination threshold, $I_{(TERM)}$. A new charge cycle begins when the battery voltage falls below the $V_{(RCH)}$ threshold.

10.1.6 Battery Temperature Monitoring

The BQ2057 continuously monitors temperature by measuring the voltage between the TS and VSS pins. A negative- or a positive-temperature coefficient thermistor (NTC, PTC) and an external voltage divider typically develop this voltage. (See 图 10-9.) The BQ2057 compares this voltage against its internal V(TS1) and V(TS2) thresholds to determine if charging is allowed. (See 图 10-10.) The temperature sensing circuit is immune to any fluctuation in V_{CC}, since both the external voltage divider and the internal thresholds ($V_{(TS1)}$ and $V_{(TS2)}$) are referenced to VCC.

The resistor values of $R_{(T1)}$ and $R_{(T2)}$ are calculated by the following equations:

For NTC Thermistors

$$R_{T1} = \frac{5 \times R_{TH} \times R_{TC}}{3 \times (R_{TC} - R_{TH})}$$

(3)

$$R_{T1} = \frac{5 \times R_{TH} \times R_{TC}}{3 \times (R_{TC} - R_{TH})}$$

(4)

For PTC Thermistors

$$R_{T1} = \frac{5 \times R_{TH} \times R_{TC}}{3 \times (R_{TH} - R_{TC})}$$

(5)

$$R_{T2} = \frac{5 \times R_{TH} \times R_{TC}}{\left[(2 \times R_{TH}) - (7 \times R_{TC}) \right]}$$

(6)

Where $R_{(TC)}$ is the cold temperature resistance and $R_{(TH)}$ is the hot temperature resistance of thermistor, as specified by the thermistor manufacturer.

R_{T1} or R_{T2} can be omitted If only one temperature (hot or cold) setting is required. Applying a voltage between the $V_{(TS1)}$ and $V_{(TS2)}$ thresholds to pin TS disables the temperature-sensing feature.
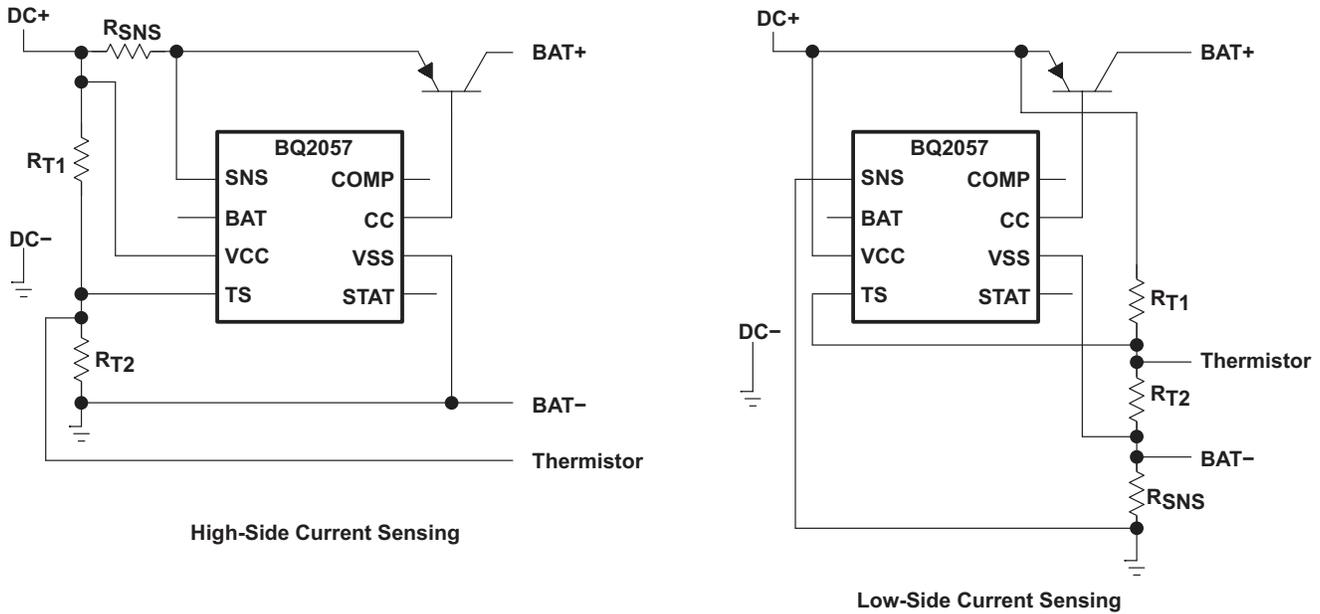

Product Folder Links: *BQ2057 BQ2057C BQ2057T BQ2057W*
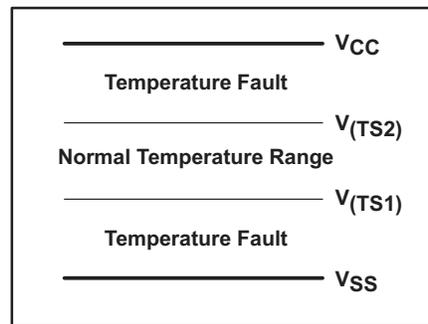

图 **10-9. Temperature Sensing Circuits**

图 **10-10. BQ2057 TS Input Thresholds**

10.1.7 Charge Inhibit Function

The TS pin can be used as charge-inhibit input. The user can inhibit charge by connecting the TS pin to VCC or VSS (or any level outside the V(TS1) to V(TS2) thresholds). Applying a voltage between the $V_{(TS1)}$ and $V_{(TS2)}$ thresholds to pin TS returns the charger to normal operation.

10.1.8 Charge Status Indication

The BQ2057 reports the status of the charger on the 3-state STAT pin. The following table summarized the operation of the STAT pin.

CONDITION	STAT PIN
Battery conditioning and charging	High
Charge complete (Done)	Low
Temperature fault or sleep mode	Hi-Z

The STAT pin can be used to drive a single LED (图 10-1), dual-chip LEDs (Figure 4) or for interface to a host or system processor (图 10-11). When interfacing the BQ2057 to a processor, the user can use an output port, as shown in 图 10-11, to recognize the Hi-Z state of the STAT pin. In this configuration, the user needs to read the input pin, toggle the output port and read the STAT pin again. In a Hi-Z condition, the input port always matches the signal level on the output port.
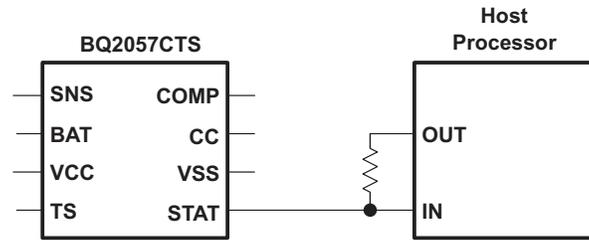

Product Folder Links: *BQ2057 BQ2057C BQ2057T BQ2057W*

图 10-11. Interfacing the BQ2057 to a Host Processor

10.1.9 Low-power Sleep Mode

The BQ2057 enters the sleep mode if the VCC falls below the voltage at the BAT input. This feature prevents draining the battery pack during the absence of VCC.

10.1.10 Selecting an External Pass-Transistor

The BQ2057 is designed to work with both PNP transistor and P-channel MOSFET. The device should be chosen to handle the required power dissipation, given the circuit parameters, PCB layout and heat sink configuration. The following examples illustrate the design process for either device:

PNP transistor: Selection steps for a PNP bipolar transistor: Example: V_I = 4.5 V, $I_{(REG)}$ = 1 A, 4.2-V single-cell Li-Ion (bq2057C). V_I is the input voltage to the charger and $I_{(REG)}$ is the desired charge current (see 图 10-1).

1. Determine the maximum power dissipation, P_D, in the transistor. The worst case power dissipation happens when the cell voltage, $V_{(BAT)}$, is at its lowest (typically 3 V at the beginning of current regulation phase) and VI is at its maximum.
    Where V_{CS} is the voltage drop across the current sense resistor.

$$P_D = \left(V_I - V_{CS} - V_{(BAT)}\right) \times IREG$$
$$P_D = \left(4.5 - 0.1 - 3\right) \times 1\,A$$
$$P_D = 1.4\,W \tag{7}$$

2. Determine the package size needed in order to keep the junction temperature below the manufacturer's recommended value, $T_{(J)max}$. Calculate the total theta, θ (°C/W), needed.

$$\theta_{JC} = \frac{\left(T_{(J)max} - T_{A(max)}\right)}{P_D}$$
$$\theta_{JC} = \frac{\left(150 - 40\right)}{1.4}$$
$$\theta_{JC} = 78°C\,/\,W \tag{8}$$

Now choose a device package with a theta at least 10% below this value to account for additional thetas other than the device. A SOT223 package, for instance, has typically a theta of 60°C/W.

3. Select a collector-emitter voltage, $V_{(CE)}$, rating greater than the maximum input voltage. A 15-V device will be adequate in this example.
4. Select a device that has at least 50% higher drain current I_C rating than the desired charge current $I_{(REG)}$.
5. Using Equation 9, calculate the minimum beta (β or h_{FE}) needed:

$$\beta_{min} = \frac{I_{CMAX}}{1_B}$$
$$\beta_{min} = \frac{1}{0.035}$$
$$\beta_{min} = 28 \tag{9}$$

Product Folder Links: *BQ2057 BQ2057C BQ2057T BQ2057W*

where $I_{max(C)}$ is the maximum collector current (in this case same as $I_{(REG)}$), and I_B is the base current (chosen to be 35 mA in this example).

<div align="center">备注</div>

The beta of a transistor drops off by a factor of 3 over temperature and also drops off with load. Therefore, note the beta of device at $I_{(REG)}$ and the minimum ambient temperature when choosing the device. This beta should be larger than the minimum required beta.

Now choose a PNP transistor that is rated for $V_{(CE)} \geqslant 15$ V, $\theta_{JC} \leqslant 78$°C/W, $I_C \geqslant 1.5$ A, $\beta_{min} \geqslant 28$ and that is in a SOT223 package.

P-channel MOSFET: Selection steps for a P-channel MOSFET: Example: $V_I = 5.5$ V, $I_{(REG)} = 500$ mA, 4.2-V single-cell Li-Ion (BQ2057C). V_I is the input voltage to the charger and $I_{(REG)}$ is the desired charge current. (See 图 10-4.)

1. Determine the maximum power dissipation, P_D, in the transistor.
   The worst case power dissipation happens when the cell voltage, $V_{(BAT)}$, is at its lowest (typically 3 V at the beginning of current regulation phase) and V_I is at its maximum.
   Where V_D is the forward voltage drop across the reverse-blocking diode (if one is used), and V_{CS} is the voltage drop across the current sense resistor.

$$P_D = \left(V_I - V_D - V_{(CS)} - V_{(BAT)}\right) \times I_{(REG)}$$
$$P_D = \left(5.5 - 0.4 - 0.1 - 3\right) \times 0.5 \text{ A}$$
$$P_D = 1 \text{ W}$$

<div align="right">(10)</div>

2. Determine the package size needed in order to keep the junction temperature below the manufacturer's recommended value, T_{JMAX}. Calculate the total theta, θ (°C/W), needed.

$$\theta_{JC} = \frac{\left(T_{max(J)} - T_{A(max)}\right)}{P_D}$$
$$\theta_{JC} = \frac{\left(150 - 40\right)}{1}$$
$$\theta_{JC} = 110°C / W$$

<div align="right">(11)</div>

Now choose a device package with a theta at least 10% below this value to account for additional thetas other than the device. A TSSOP-8 package, for instance, has typically a theta of 70°C/W.
3. Select a drain-source voltage, $V_{(DS)}$, rating greater than the maximum input voltage. A 12-V device will be adequate in this example.
4. Select a device that has at least 50% higher drain current (I_D) rating than the desired charge current $I_{(REG)}$.
5. Verify that the available drive is large enough to supply the desired charge current.

$$V_{(GS)} = \left(V_D + V_{(CS)} + V_{OL(CC)}\right) - V_I$$
$$V_{(GS)} = \left(0.4 + 0.1 + 1.5\right) - 5.5$$
$$V_{(GS)} = -3.5$$

<div align="right">(12)</div>

Where $V_{(GS)}$ is the gate-to-source voltage, V_D is the forward voltage drop across the reverse-blocking diode (if one is used), and V_{CS} is the voltage drop across the current sense resistor, and $V_{OL(CC)}$ is the CC pin output low voltage specification for the BQ2057.

Select a MOSFET with gate threshold voltage, $V_{(GSth)}$, rating less than the calculated $V_{(GS)}$.

Now choose a P-channel MOSFET transistor that is rated for $V_{DS} \leqslant -15$ V, $\theta_{JC} \leqslant 110°C/W$, $I_D \geqslant 1$ A, $V_{(GSth)} \geqslant -3.5$ V and in a TSSOP package.

10.1.11 Selecting Input Capacitor

In most applications, all that is needed is a high-frequency decoupling capacitor. A 0.1-µF ceramic, placed in proximity to VCC and VSS pins, works well. The BQ2057 works with both regulated and unregulated external dc supplies. If a nonregulated supply is chosen, the supply unit should have enough capacitance to hold up the supply voltage to the minimum required input voltage at maximum load. If not, more capacitance must be added to the input of the charger.

10.1.12 Selecting Output Capacitor

The BQ2057 does not require any output capacitor for loop stability. The user can add output capacitance in order to control the output voltage when a battery is not present. The charger quickly charges the output capacitor to the regulation voltage, but the output voltage decays slowly, because of the low leakage current on the BAT pin, down to the recharge threshold. Addition of a 0.1-µF ceramic capacitor, for instance, results in a 100-mV(pp) ripple waveform, with an approximate frequency of 25 Hz. Higher capacitor values can be used if a lower frequency is desired.

10.1.13 Automatic Charge-rate Compensation

To reduce charging time, the BQ2057 uses the proprietary AutoComp technique to compensate safely for internal impedance of the battery pack. The AutoComp feature is disabled by connecting the COMP pin to VCC in high-side current-sensing configuration, and to VSS in low-side current-sensing configuration. The COMP pin must not be left floating.

图 10-12 outlines the major components of a single-cell Li-Ion battery pack. The Li-Ion battery pack consists of a cell, protection circuit, fuse, connector, current sense-resistors, and some wiring. Each of these components contains some resistance. Total impedance of the battery pack is the sum of the minimum resistances of all battery-pack components. Using the minimum resistance values reduces the odds for overcompensating. Overcompensating may activate the safety circuit of the battery pack.

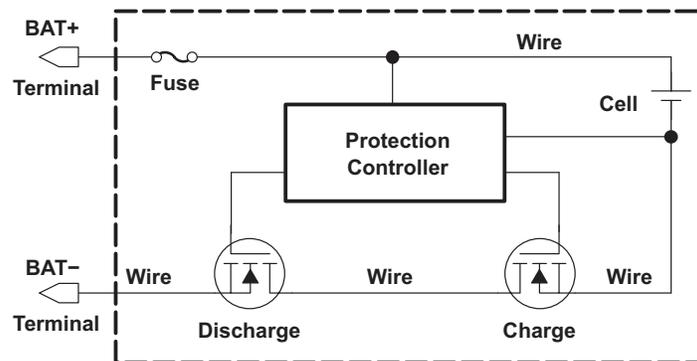

图 **10-12. Typical Components of a Single-Cell Li-Ion Pack**

Compensation is achieved through input pin COMP (图 10-13). A portion of the current-sense voltage, presented through this pin, is scaled by a factor of G(COMP) and summed with the regulation threshold, VO(REG). This process increases the output voltage to compensate for the battery pack's internal impedance and for undesired voltage drops in the circuit.

AutoComp setup requires the following information:

- Total impedance of battery pack ($Z_{(PACK)}$)
- Maximum charging current ($I_{(REG)}$)

The voltage drop across the internal impedance of battery pack, $V_{(Z)}$, can then be calculated using Equation 13:

$$V_{(Z)} = Z_{(PACK)} \times I_{(REG)}$$

(13)

The required compensation is then calculated using Equation 14:

$$V_{(COMP)} = \frac{V_{(Z)}}{G_{(COMP)}}$$

$$V_{(PACK)} = V_{O(REG)} + \left(G_{(COMP)} \times V_{(COMP)}\right)$$

(14)

Where $V_{(COMP)}$ is the voltage on COMP pin. This voltage is referenced to VCC in high-side current sensing configuration and to VSS for low-side sensing. $V_{(PACK)}$ is the voltage across the battery pack.

The values of $R_{(COMP1)}$ and $R_{(COMP2)}$ can be calculated using Equation 15:

$$\frac{V_{(COMP)}}{V_{(SNS)}} = \frac{R_{COMP2}}{R_{COMP1} + R_{COMP2}}$$

(15)

High-Side Current Sensing Low-Side Current Sensing

图 **10-13. AutoComp Circuits**

The following example illustrates these calculations:

Assume $Z_{(PACK)}$ = 100 mΩ, $I_{(REG)}$ = 500 mA, high-side current sensing BQ2057C

$$V_{(Z)} = Z_{(PACK)} \times I_{(REG)}$$
$$V_{(Z)} = 0.1 \times 0.5$$
$$V_{(Z)} = 50 \text{ mV}$$

(16)

$$V_{(COMP)} = \frac{V_{(Z)}}{G_{(COMP)}}$$

$$V_{(COMP)} = \frac{0.05}{2.2}$$

$$V_{(COMP)} = 22.7 \text{ mV}$$

Let $R_{COMP2} = 10 \text{ k}\Omega$

(17)

Product Folder Links: *BQ2057 BQ2057C BQ2057T BQ2057W*

$$R_{COMP1} = \frac{R_{COMP2} \times \left(V_{(SNS)} - V_{(COMP)}\right)}{V_{(COMP)}}$$

$$R_{COMP1} = 10k \times \frac{\left(105\ mV - 22.7\ mV\right)}{22.7\ mV}$$

$$R_{COMP1} = 36.25\ k\Omega \tag{18}$$

Use the closest standard value (36.0 kΩ) for R_{COMP1}.
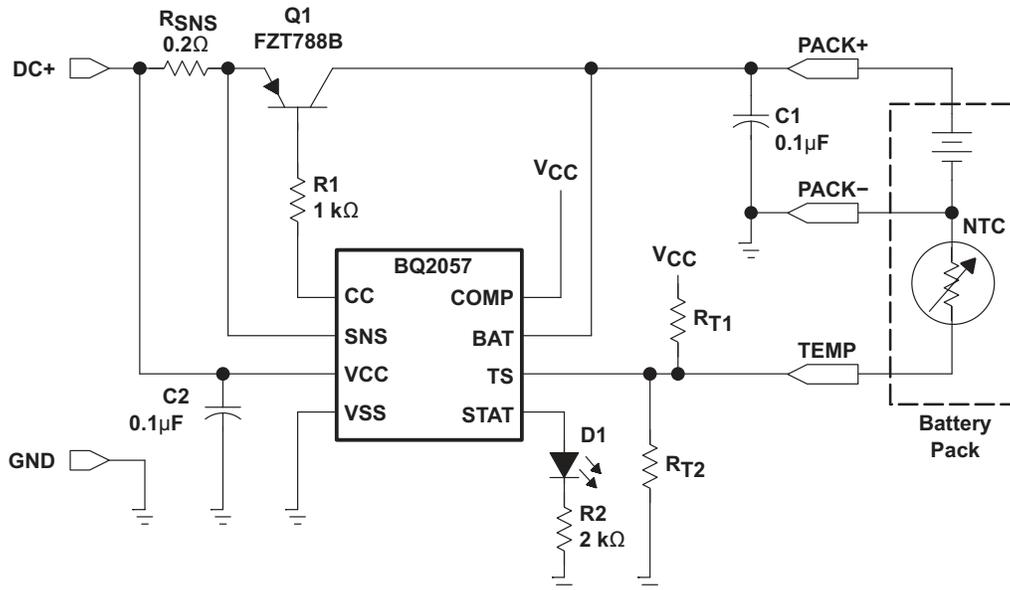

10.2 Typical Application

图 10-14. Low Dropout Single- or Two-Cell Li-Ion/Li-Pol Charger

10.2.1 Design Requirements

The design requirements include the following:

- Supply voltage = 12 V
- Dual cell Li-ion 8.2 V
- Fast charge current = 600 mA
  - High-side current sense
- Termination current = 10% (default)
- Precharge current = 10% (default)
- TS – Battery temperature sense = 10 kΩ (103AT, NTC)
  - 0°C cold and 60°C hot

10.2.2 Detailed Design Procedure

The detailed design procedure is listed below:

- Single cell Li-ion, 8.2 V - BQ2057T
- Pass transistor
  - For PNP BJT, see section 10.1.10 PNP transistor
  - For P-Type MOSFET, see section 10.1.10 P-channel MOSFET
- Fast charge current, see equation 1
  - Rsns = Vsns / Iout - 125 mV/600mA = 0.2 Ω

Product Folder Links: *BQ2057 BQ2057C BQ2057T BQ2057W*

- Termination Current default to 10% of fast charge current
- Pre-Charge Current default to 10% of fast charge current.
- TS – apply Equations 3 and 4 to calculate RT1 and RT2
  - RT1 = 5600 Ω (5.62 kΩ), RT2 = 12326 Ω (12.4 kΩ)

10.2.3 Application Curves

11 Power Supply Recommendations

The devices are designed to operate from an input voltage supply range between 4.5 V and 15 V and current capability of at least the maximum designed charge current. This input supply should be well regulated. If located more than a few inches from the device, VCC and GND terminals, a larger capacitor is recommended.

12 Layout

12.1 Layout Guidelines

12.1.1 Power FET

The external pass PNP transistor or P-channel MOSFET will have high thermal rise, good heat sinking will be required.

12.1.2 Current Sense

The BQ2057 regulates current by sensing, on the SNS pin, the voltage drop developed across an external sense resistor. The sense resistor must be placed between the supply voltage (Vcc) and the input of the IC (IN pins).

12.1.3 Voltage Sense

To achieve maximum voltage regulation accuracy, the BQ2057 uses the feedback on the BAT pin. Externally, this pin should be connected as close to the battery cell terminals as possible. For additional safety, a 10-kΩ internal pullup resistor is connected between the VSENSE and OUT pins.

12.1.4 Enable (TS)

The TS pin can be used as charge-inhibit. Pulling up to VCC or pulling down to VSS places the device in a low-power standby mode.

13.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

BQ2057CTSTR.A	Active	Production	TSSOP (PW) | 8	2000 | LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-20 to 70	2057C

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
