

# BQ25730 具有电源路径控制功能和 USB-C PD 3.0 OTG 输出的 I<sup>2</sup>C 1 至 5 节电池 降压/升压窄 VDC 电池充电控制器

## 1 特性

- 通过电池 MOSFET 实现电源路径控制，无需电池或电池电量耗尽即可实现独立的系统电压瞬时启动
- 400kHz/800kHz 可编程开关频率，可实现高效率/高功率密度
- 适用于 USB-C 电力输送 (PD) 接口平台的降压/升压窄电压直流 (NVDC) 充电器
  - 输入范围为 3.5V 至 26V，可为 1 至 5 节电池充电
  - 充电电流高达 16.2A/8.1A，分辨率为 128mA/64mA，基于 5mΩ/10mΩ 检测电阻
  - 输入电流限制高达 10A/6.35A，分辨率为 100mA/50mA，基于 5mΩ/10mΩ 检测电阻
  - 支持 USB 2.0、USB 3.0、USB 3.1 和 USB 电力传输 (PD)
  - 输入电流优化器 (ICO)，无需过载适配器即可获得最大输入功率
  - 可在降压、降压/升压和升压操作之间无缝转换
  - 提供输入电流和电压调节 (IINDPM 和 VINDPM) 以防电源过载
- TI 获得专利的开关频率抖动模式，可降低 EMI 噪声
- TI 获得专利的直通模式 (PTM)，可提高系统功效并实现 99% 的电池快速充电。
- 通过专用引脚监测输入和电池电流
- 集成型 8 位 ADC，可监控电压、电流和功率
- 在补充模式下实现电池 MOSFET 理想二极管运行，可在适配器满载时支持系统
- 通过电池给 USB 端口加电 (USB OTG)
  - 3V 至 24V OTG，分辨率为 8mV
  - 输出电流限制高达 12.7A/6.35A，分辨率为 100mA/50mA，基于 5mΩ/10mΩ 检测电阻
- 可通过 I<sup>2</sup>C 主机控制接口实现灵活系统配置
- 高精度调节和监控
  - ±0.5% 充电电压调节
  - ±3% 充电电流调节
  - ±2.5% 输入电流调节
  - ±2% 输入/充电电流监测
- 安全
  - 热关断
  - 输入、系统和电池过压保护
  - 输入、MOSFET 和电感器过流保护
- 安全相关认证
  - 经 IEC 62368-1 CB 认证
- 封装：32 引脚，4.0mm × 4.0mm WQFN

## 2 应用

- 制氧机、呼吸机、扫地机器人
- 平板电脑 (多媒体)、无线扬声器

## 3 说明

BQ25730 是一款同步 NVDC 降压/升压电池充电控制器，可通过 USB 适配器、高电压 USB-C 电力输送 (PD) 源和传统适配器等各种输入源为 1 至 5 节电池充电。它为空间受限的 1 至 5 节电池充电应用提供了一个元件数很少的高效解决方案。窄 VDC 降压/升压架构避免了从输入源到系统电压的直接电源路径，从而同时实现宽输入电压范围和窄系统电压范围。窄系统电压范围对于加快电池充电速度和降低下一级转换器的 MOSFET 额定值很重要。

### 器件信息

器件型号	封装 <sup>(1)</sup>	封装尺寸 (标称值)
BQ25730	RSN (WQFN 32)	4.00mm x 4.00mm

(1) 有关所有可选封装，请参阅节 14。

## 4 说明 (续)

通过 NVDC 配置，可将系统电压稳定在电池电压水平，但无法将其降至低于系统最低电压。即使在电池完全放电或被取出时，系统也仍会继续工作。当负载功率超过输入源额定值时，电池会进入补电模式并防止系统崩溃。

在上电期间，充电器基于输入源和电池状况，将转换器设置为降压、升压或降压/升压配置。充电器可在降压、升压、降压/升压工作模式间无缝转换，无需主机控制。

在无输入源的情况下，BQ25730 可支持适用于 1 到 5 芯电池的 USB On-the-Go (OTG) 功能，从而在 VBUS 上生成具有 8mV 分辨率的 3V 至 24V 可调输出电压。可以配置 OTG 输出电压转换率，以符合 USB-PD 3.0 PPS 规范。

最新版本的 USB-C PD 规范包括快速角色交换 (FRS)，以确保及时进行电源角色交换，以便连接到扩展坞的器件可以避免瞬时断电或瞬时故障。此器件集成了 FRS，符合 PD 规范。

TI 获得专利的开关频率抖动模式可以在整个 EMI 传导频率范围 (150kHz 至 30MHz) 内显著降低 EMI 噪声。有多个抖动扩展选项可为不同的应用提供灵活性，从而简化 EMI 噪声滤波器设计。

该充电器可以在 TI 获得专利的直通模式 (PTM) 下运行，从而在整个负载范围内提高效率。在 PTM 中，输入功率直接通过充电器传递到系统。为了实现高效运行，可以节省 MOSFET 的开关损耗和电感器磁芯损耗。

BQ25730 采用 32 引脚 4mm × 4mm WQFN 封装。

## 5 Device Comparison Table

## 6 Pin Configuration and Functions

图 6-1. RSN Package 32-Pin WQFN Top View

表 6-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NUMBER		
ACN	2	PWR	Input current sense amplifier negative input. The leakage on ACP and ACN are matched. A RC low-pass filter is required to be placed between the sense resistor and the ACN pin to suppress the high frequency noise in the input current signal. Refer to 节 9.2.2.2 for ACP/ACN filter design.
ACP	3	PWR	Input current sense amplifier positive input. The leakage on ACP and ACN are matched. A RC low-pass filter is required to be placed between the sense resistor and the ACP pin to suppress the high frequency noise in the input current signal. Refer to 节 9.2.2.2 for ACP/ACN filter design.
BATDRV	21	O	P-channel battery FET (BATFET) gate driver output. It is shorted to VSYS to turn off the BATFET. It goes 10 V below VSYS to fully turn on BATFET. BATFET is in linear mode to regulate VSYS at minimum system voltage when battery is depleted. BATFET is fully on during fast charge and works as an ideal-diode in supplement mode.
BTST1	30	PWR	Buck mode high-side power MOSFET driver power supply. Connect a 0.047- $\mu$ F capacitor between SW1 and BTST1. The bootstrap diode between REGN and BTST1 is integrated.
BTST2	25	PWR	Boost mode high-side power MOSFET driver power supply. Connect a 0.047- $\mu$ F capacitor between SW2 and BTST2. The bootstrap diode between REGN and BTST2 is integrated.
CELL_BATPRESZ	18	I	Battery cell selection pin for 1- to 5- cell battery setting. CELL_BATPRESZ pin is biased from VDDA through a resistor divider. CELL_BATPRESZ pin also sets SYSOVP thresholds to 5 V for 1-cell, 12 V for 2-cell and 19.5 V for 3-cell/4-cell. CELL_BATPRESZ pin is pulled below $V_{CELL\_BATPRESZ\_FALL}$ to indicate battery removal. After battery is removed the charge voltage register REG0x05/04h() goes back to default. No external cap is allowed at CELL_BATPRESZ pin. The device exits LEARN mode and disables charge when CELL_BATPRESZ pin is pulled low (upon battery removal).

表 6-1. Pin Functions (续)

PIN		I/O	DESCRIPTION
NAME	NUMBER		
CHRG_OK	4	O	Open drain active high indicator to inform the system good power source is connected to the charger input. Connect to the pullup rail via 10-k $\Omega$ resistor. When VBUS rises above 3.5 V and falls below 25.8 V, CHRG_OK is HIGH after 50-ms deglitch time. When VBUS falls below 3.2 V or rises above 26.8 V, CHRG_OK is LOW. When one of SYSOVP, SYSUVP, ACOC, TSHUT, BATOV, BATOC or force converter off faults occurs, CHRG_OK is asserted LOW.
CMPIN	14	I	Input of independent comparator. The independent comparator compares the voltage sensed on CMPIN pin with internal reference, and its output is on CMPOUT pin. Internal reference, output polarity and deglitch time is selectable by the I <sup>2</sup> C host. With polarity HIGH (CMP_POL = 1b), place a resistor between CMPIN and CMPOUT to program hysteresis. With polarity LOW (CMP_POL = 0b), the internal hysteresis is 100 mV. If the independent comparator is not in use, tie CMPIN to ground.
CMPOUT	15	O	Open-drain output of independent comparator. Place a pullup resistor from CMPOUT to pullup supply rail. Internal reference, output polarity and deglitch time are selectable by the I <sup>2</sup> C host. If the independent comparator is not in use, float CMPOUT pin.
COMP2	17	I	Buck boost converter compensation pin 2. Refer to 节 8.3.12 for COMP2 pin RC network.
COMP1	16	I	Buck boost converter compensation pin 1. Refer to 节 8.3.12 for COMP1 pin RC network.
OTG/VAP/FRS	5	I	Active HIGH to enable OTG or FRS modes. 1) When OTG_VAP_MODE=1b and EN_OTG=1b, pulling high this pin can enable OTG mode. 2) When OTG_VAP_MODE=1b and EN_FRS=1b, pulling high this pin can enable FRS mode in forward operation.
HIDRV1	31	O	Buck mode high-side power MOSFET (Q1) driver. Connect to high-side n-channel MOSFET gate.
HIDRV2	24	O	Boost mode high-side power MOSFET(Q4) driver. Connect to high-side n-channel MOSFET gate.
IADPT	8	O	The adapter current monitoring output pin. $V_{IADPT} = 20$ or $40 \times (V_{ACP} - V_{ACN})$ with ratio selectable through IADPT_GAIN bit. This pin is also used to program the inductance used in the application. Refer to 节 8.3.11 for selecting resistor from the IADPT pin to ground. For a 4.7- $\mu$ H inductance, the resistor is 191-k $\Omega$ or 187-k $\Omega$ standard value. Place a 100-pF or less ceramic decoupling capacitor from IADPT pin to ground. IADPT output voltage is clamped below 3.3 V.
IBAT	9	O	The battery current monitoring output pin. $V_{IBAT} = 8$ or $16 \times (V_{SRP} - V_{SRN})$ for charge current, or $V_{IBAT} = 8$ or $16 \times (V_{SRN} - V_{SRP})$ for discharge current, with ratio selectable through IBAT_GAIN bit. Place a 100-pF or less ceramic decoupling capacitor from IBAT pin to ground. This pin can be floating if not in use. Its output voltage is clamped below 3.3 V.
ILIM_HIZ	6	I	Input current limit setting pin. Program ILIM_HIZ voltage by connecting a resistor divider from VDDA rail to ground. The pin voltage is calculated as: $V_{(ILIM\_HIZ)} = 1\text{ V} + 40 \times IDPM \times R_{ac}$ , in which IDPM is the target input current limit. When EN_EXTILIM = 1b the input current limit used by the charger is the lower setting of ILIM_HIZ pin and IIN_HOST register. When EN_EXTILIM = 0b input current limit is only determined by IIN_HOST register. When the pin voltage is below 0.4 V, the device enters high impedance (HIZ) mode with low quiescent current. When the pin voltage is above 0.8 V, the device is out of HIZ mode. The ILIM_HIZ pin voltage is continuous read and used for updating current limit setting (If EN_EXTILIM=1b), this allows dynamic change input current limit setting by adjusting this pin voltage.
LODRV1	29	O	Buck mode low side power MOSFET (Q2) driver. Connect to low side n-channel MOSFET gate.
LODRV2	26	O	Boost mode low side power MOSFET (Q3) driver. Connect to low side n-channel MOSFET gate.
PGND	27	GND	Device power ground.
PROCHOT	11	O	Active low open drain output indicator. It monitors adapter input current, battery discharge current, and system voltage. After any event in the PROCHOT profile is triggered, a pulse is asserted. The minimum pulse width is adjustable through PROCHOT_WIDTH bits.

表 6-1. Pin Functions (续)

PIN		I/O	DESCRIPTION
NAME	NUMBER		
PSYS	10	O	Current mode system power monitor. The output current is proportional to the total power from the adapter and the battery. The gain is selectable through I <sup>2</sup> C. Place a resistor from PSYS to ground to generate output voltage. This pin can be floating if not in use. Its output voltage is clamped at 3.3 V. Place a capacitor in parallel with the resistor for filtering.
REGN	28	PWR	6-V linear regulator output supplied from VBUS or VSYS. The LDO is active when VBUS above V <sub>VBUS_CONVEN</sub> . Connect a 2.2- or 3.3- μ F ceramic capacitor from REGN to power ground. REGN pin output is for power stage gate drive.
SCL	13	I	I <sup>2</sup> C clock input. Connect to clock line from the host controller or smart battery. Connect a 10-k Ω pullup resistor according to specifications.
SDA	12	I/O	I <sup>2</sup> C open-drain data I/O. Connect to data line from the host controller or smart battery. Connect a 10-k Ω pullup resistor according to I <sup>2</sup> C specifications.
SRN	19	PWR	Charge current sense amplifier negative input. SRN pin is for battery voltage sensing as well. Connect a 0.1- μ F filter cap cross battery charging sensing resistor and use 10- Ω contact resistor between SRN pin and battery charging sensing resistor. The leakage current on SRP and SRN are matched.
SRP	20	PWR	Charge current sense amplifier positive input. Connect a 0.1- μ F filter cap cross battery charging sensing resistor and use 10- Ω contact resistor between SRP pin and battery charging sensing resistor. The leakage current on SRP and SRN are matched.
SW1	32	PWR	Buck mode switching node. Connect to the source of the buck half bridge high side n-channel MOSFET.
SW2	23	PWR	Boost mode switching node. Connect to the source of the boost half bridge high side n-channel MOSFET.
VBUS	1	PWR	Charger input voltage. An input low pass filter of 1 Ω and 0.47 μ F (minimum) is recommended.
VDDA	7	PWR	Internal reference bias pin. Connect a 10- Ω resistor from REGN to VDDA and a 1- μ F ceramic capacitor from VDDA to power ground.
VSYS	22	PWR	Charger system voltage sensing. The system voltage regulation maximum limit is programmed in ChargeVoltage register plus 150 mV and regulation minimum limit is programmed in VSYS_MIN register.
Thermal pad	-	-	Exposed pad beneath the IC. Always solder thermal pad to the board, and have vias on the thermal pad plane connecting to power ground planes. It serves as a thermal pad to dissipate the heat.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	SRN, SRP, ACN, ACP, VBUS, VSYS	- 0.3	32	V
	SW1, SW2	- 2	32	
	BTST1, BTST2, HIDRV1, HIDRV2, BATDRV	- 0.3	38	
	LODRV1, LODRV2 (25nS)	- 4	7	
	HIDRV1, HIDRV2 (25nS)	- 4	38	
	SW1, SW2 (25nS)	- 4	32	
	SDA, SCL, REGN, PSYS, CHRG_OK, CELL_BATPRESZ, ILIM_HIZ, LODRV1, LODRV2, VDDA, COMP2, CMPIN, CMPOUT, OTG/VAP/FRS,	- 0.3	7	
	PROCHOT	- 0.3	5.5	
	IADPT, IBAT, COMP1	- 0.3	3.6	
Differential Voltage	BTST1-SW1, BTST2-SW2, HIDRV1-SW1, HIDRV2-SW2	- 0.3	7	V
	SRP-SRN, ACP-ACN	- 0.5	0.5	
Temperature	Junction temperature range, T <sub>J</sub>	- 40	150	°C
Temperature	Storage temperature, T <sub>stg</sub>	- 55	150	

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Voltage	ACN, ACP, VBUS	0		26	V
	SRN, SRP, VSYS	0		23.15	
	SW1, SW2	- 2		26	
	BTST1, BTST2, HIDRV1, HIDRV2, BATDRV	0		32	
	SDA, SCL, REGN, PSYS, CHRG_OK, CELL_BATPRESZ, ILIM_HIZ, LODRV1, LODRV2, VDDA, COMP2, CMPIN, CMPOUT, OTG/VAP/FRS	0		6.5	
	PROCHOT	0		5.3	
	IADPT, IBAT, COMP1	0		3.3	
Differential Voltage	BTST1-SW1, BTST2-SW2, HIDRV1-SW1, HIDRV2-SW2	0		6.5	V
	SRP-SRN, ACP-ACN	- 0.5		0.5	
	BATDRV-VSYS	0		10.8	

### 7.3 Recommended Operating Conditions (续)

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Temperature	Junction temperature range, $T_J$	-20		125	°C
	Storage temperature, $T_{stg}$	-20		85	

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		BQ25730		UNIT
		RSN (WQFN)		
		32 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance (JEDEC <sup>(1)</sup> )	37.2		°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	26.1		°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	7.8		°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	0.3		°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	7.8		°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.3		°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

### 7.5 Electrical Characteristics(BQ25730)

$V_{VBUS\_UVLOZ} < V_{VBUS} < V_{VBUSOV\_FALL}$ ,  $T_J = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ , and  $T_J = 25^\circ\text{C}$  for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

## 8 Detailed Description

### 8.1 Overview

The BQ25730 is a narrow VDC buck-boost charger controller for oxygen concentrator, ventilator, and portable electronics such as tablet and other mobile devices with rechargeable batteries. It provides seamless transition between different converter operation modes (buck, boost, or buck-boost), fast transient response, and high light load efficiency.

The BQ25730 supports a wide range of power sources, including USB-C PD ports, legacy USB ports, traditional AC-DC adapters, and so forth. It takes input voltage from 3.5 V to 26 V and charges a battery of 1 to 5 cells in series. In the absence of an input source, the BQ25730 supports the USB On-the-Go (OTG) function from a 1- to 5-cell battery to generate an adjustable 3 V to 24 V at the USB port with 8-mV resolution.

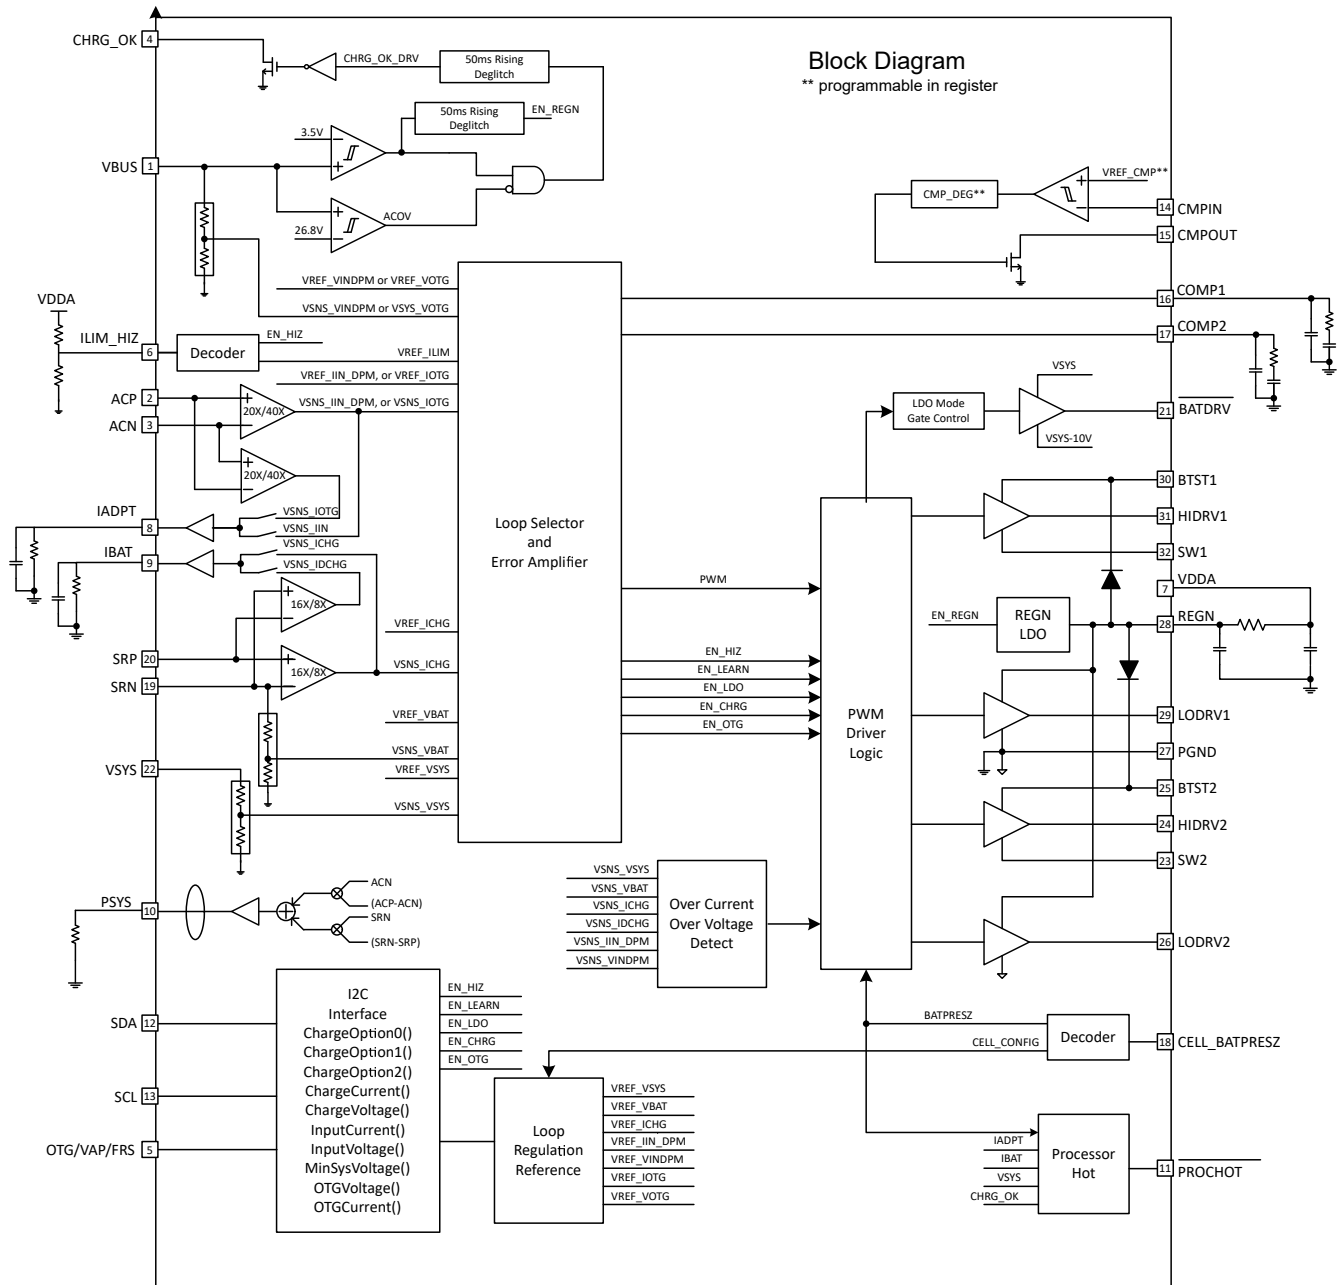

The BQ25730 features Dynamic Power Management (DPM) to limit input power and avoid AC adapter overloading. During battery charging, as system power increases, charging current is reduced to maintain total input current below adapter rating. If system power demand temporarily exceeds adapter rating, the BQ25730 supports the NVDC architecture to allow battery discharge energy to supplement system power.

The latest version of the USB-C PD specification includes Fast Role Swap (FRS) to ensure power role swapping occurs in a timely fashion so that the device(s) connected to the dock never experience momentary power loss or glitching. The device integrates FRS with compliance to the USB-C PD specification.

The TI patented switching frequency dithering pattern can significantly reduce EMI noise over the entire conductive EMI frequency range (150 kHz to 30 MHz). Multiple dithering scale options are available to provide flexibility for different applications to simplify EMI noise filter design.

The I<sup>2</sup>C host controls input current, charge current, and charge voltage registers with high resolution, high accuracy regulation limits.

## 8.2 Functional Block Diagram

## 8.3 Feature Description

### 8.3.1 Power-Up Sequence

The device powers up from the higher voltage of VBUS or VBAT through integrated power selector. The charger starts POR (power on reset) when VBUS exceeds  $V_{VBUS\_UVLOZ}$  or VBAT exceeds  $V_{VBAT\_UVLOZ}$ . 5 ms after either VBUS or VBAT becomes valid, the charger resets all the registers to the default state. Another 5 ms later, the user registers become accessible to the host.

Power up sequence when the charger is powered up from VBUS:

- After VBUS above  $V_{VBUS\_UVLOZ}$ , enable 6-V LDO REGN pin and VDDA pin voltage increase accordingly. CHRГ\_OK pin goes HIGH and the AC\_STAT is configured to 1.
- After passing VBUS qualification, the REGN voltage is setup. VINDPM is detected in VBUS steady state voltage and IIN\_DPM is detected at ILIM\_HIZ pin steady state voltage.
- Battery CELL configuration is read at CELL\_BATPRESZ pin voltage and compared to VDDA to determine cell configuration. Corresponding the default value of ChargeVoltage register (REG0x05/04()), ChargeCurrent register (Reg0x03/02), VSYS\_MIN register (Reg0x0D/0C) and SYSOVP threshold are loaded.
- Converter powers up.

Power up sequence when the charger is powered up from VBAT:

- If only battery is present and the voltage is above  $V_{VBAT\_UVLOZ}$ , charger wakes up and the BATFET is turned on and connecting the battery to system.
- By default, the charger is in low power mode (EN\_LWPWR = 1b) with lowest quiescent current. The REGN LDO stays off. The Quiescent current is minimized.  $\overline{PROCHOT}$  is available through the independent comparator by setting EN\_PROCHOT\_LPWR=1b.
- The adapter present comparator is activated, to monitor the VBUS voltage.
- SDA and SDL lines stand by waiting for host commands.
- Device can move to performance mode by configuring EN\_LWPWR = 0b. The host can enable IBAT buffer through setting EN\_IBAT=1b to monitor discharge current. The PSYS,  $\overline{PROCHOT}$  or the independent comparator also can be enabled by the host.
- In performance mode, the REGN LDO is always available to provide an accurate reference and gate drive voltage for the converter.

### 8.3.2 Two-Level Battery Discharge Current Limit

To prevent the triggering of battery overcurrent protection and avoid battery wear-out, two battery current limit levels (IDCHG\_TH1 and IDCHG\_TH2)  $\overline{PROCHOT}$  profiles are recommended to be enabled. Define IDCHG\_TH1 through REG0x39h[7:2], IDCHG\_TH2 is set through REG0x3Ch[5:3] for fixed percentage of IDCHG\_TH1. There are dedicated de-glitch time setting registers (IDCHG\_DEG1 and IDCHG\_DEG2) for both IDCHG\_TH1 and IDCHG\_TH2.

- When battery discharge current is continuously higher than IDCHG\_TH1 for more than IDCHG\_DEG1 de-glitch time,  $\overline{PROCHOT}$  is asserted immediately. If the discharge current reduces to lower than IDCHG\_TH1, then the time counter resets automatically. STAT\_IDCHG1 bit will be set to 1 after  $\overline{PROCHOT}$  is triggered.

Set PP\_IDCHG1=1b to enable IDCHG\_TH1 for triggering  $\overline{PROCHOT}$ .

- When battery discharge current is continuously higher than IDCHG\_TH2 for more than IDCHG\_DEG2 de-glitch time,  $\overline{PROCHOT}$  is asserted immediately. If the discharge current reduces to lower than IDCHG\_TH2, then the time counter resets automatically. STAT\_IDCHG2 bit will be set to 1 after  $\overline{PROCHOT}$  is triggered.

Set PP\_IDCHG2=1b to enable IDCHG\_TH2 for triggering  $\overline{PROCHOT}$ .

图 8-1. Two-Level Battery Discharging Current Trigger PROCHOT Diagram

### 8.3.3 Fast Role Swap Feature

Fast Role Swap (FRS) means charger quickly swaps from power sink role to power source role to provide an OTG output voltage to accessories when the original power source is disconnected. This feature is defined to transfer the charger from forward mode to OTG mode quickly without dropping VBUS voltage per USB-C PD specification requirement. Please contact factory for more detail information about FRS mode.

### 8.3.4 CHRG\_OK Indicator

CHRG\_OK is an active HIGH open drain indicator. It indicates the charger is in normal operation when the following conditions are valid:

- VBUS is above  $V_{VBUS\_CONVEN}$
- VBUS is below  $V_{ACOV\_FALL}$
- No faults triggered such as: SYSOVP/SYSUVP/ACOC/TSHUT/BATOV/P/BATOC/force converter off.

### 8.3.5 Input and Charge Current Sensing

The charger supports  $10\text{ m}\Omega$  and  $5\text{ m}\Omega$  for both input current sensing and charge current sensing. By default,  $5\text{ m}\Omega$  is enabled by POR setting RSNS\_RAC=1b and RSNS\_RSR=1b, if  $10\text{-m}\Omega$  sensing is used please configure RSNS\_RAC=0b and RSNS\_RSR=0b. Lower current sensing resistor can help improve overall charge efficiency especially under heavy load. At same time PSYS, IADPT, IBAT pin accuracy and IINDPM/ICHG/IOTG regulation accuracy get worse due to effective signal reduction in comparison to error signal components.

When RSNS\_RAC=RSNS\_RSR=0b and  $10\text{ m}\Omega$  is used for both input and charge current sensing, the pre-charge current clamp is  $384\text{ mA}$  ( $2\text{ A}$  for  $1\text{ S}$  if  $V_{SYS\_MIN} > V_{BAT} > 3\text{ V}$ ), the maximum IIN\_HOST setting is clamped at  $6.35\text{ A}$ , and the maximum charge current is clamped at  $8.128\text{ A}$ .

When RSNS\_RAC=RSNS\_RSR=1b and  $5\text{ m}\Omega$  is used for both input and charge current sensing, the charger will internally compensate pre-charge current clamp to be  $384\text{ mA}$  ( $2\text{ A}$  for  $1\text{ S}$  if  $V_{SYS\_MIN} > V_{BAT} > 3\text{ V}$ ) under  $5\text{-m}\Omega$  current sensing which keeps consistent between  $10\text{ m}\Omega$  and  $5\text{ m}\Omega$ . Under  $5\text{-m}\Omega$  current sensing application charge current range is doubled to  $16.256\text{ A}$ . Based on EN\_FAST\_5MOHM register bit status and IADPT pin resistor the maximum input current can be configured referring to 表 8-1:

For defined current sense resistors ( $10\text{ m}\Omega/5\text{ m}\Omega$ ), PSYS function is still valid when unsymmetrical input current sense and charge current sense resistors are used. But RSNS\_RAC and RSNS\_RSR bit status have to be consistent with practical resistors used in the system.

**表 8-1. Maximum Input Current Limit Configuration Table**

INDUCTANCE (IADPT Pin Resistance)	EN_FAST_5MOHM	RSR_RAC BIT	MAXIMUM INPUT CURRENT LIMIT (IINDPM)
1.0 uH(90.9 kΩ)	Xb	RSNS_RAC=0b	6.35 A
1.5 uH(121 kΩ)	1b	RSNS_RAC=1b	6.35 A
2.2 uH(137 kΩ)	0b	RSNS_RAC=1b	10 A
3.3 uH(169 kΩ)	Xb	RSNS_RAC=0b	6.35 A
	Xb	RSNS_RAC=1b	10 A

### 8.3.6 Input Voltage and Current Limit Setup

The actual input current limit being adopted by the device is the lower setting of IIN\_DPM and ILIM\_HIZ pin. Register IIN\_DPM input current limit setting will reset for below scenarios:

- When adapter is removed (CHRG\_OK is not valid). Note when adapter is removed IIN\_HOST will be reset one time to 3.25 A, under battery only host is still able to overwrite IIN\_HOST register with a new value. If the adapter plug back in and CHRG\_OK is pulled up, IIN\_HOST will not be reset again.
- When input current optimization (ICO) is executed (EN\_ICO\_MODE=1b), the charger will automatically detect the optimized input current limit based on adapter output characteristic. The final IIN\_DPM register setting could be different from IIN\_HOST after ICO.

The voltage regulation loop of the charger regulates the input voltage to prevent the input adapter collapsing. The VINDPM threshold should be configured based on no load input voltage level. Charger initiates a VBUS voltage measurement without any load (VBUS at no load) right before the converter is enabled. The default VINDPM threshold is VBUS at no load - 1.28 V. Host can adjust VINDPM threshold after device POR through InputVoltage register(0x0B/0Ah[]), range from 3.2V to 19.52V with LSB 64mV.

After input current and voltage limits are set, the charger device is ready to power up. The host can always program the input current and voltage limit after the charger being powered up based on the input source type.

### 8.3.7 Battery Cell Configuration

CELL\_BATPRESZ pin is biased with a resistor divider from VDDA to GND. After REGN LDO is activated (VDDA rise up), the device detects the battery configuration through CELL\_BATPRESZ pin bias voltage. No external cap is allowed at CELL\_BATPRESZ pin. When CELL\_BATPRESZ pin is pulled down to GND (because of battery removal) at the beginning of startup process, VSYS\_MIN = 3.6 V and SYS\_OVP = 25 V and Maximum charge voltage (REG0x05/04) follow 1 cell default setting 4.2 V. VSYS and VBAT ADC offset is also determined by CELL\_BATPRESZ pin setting, under 1S-4S VSYS/VBAT ADC holds 2.88-V offset, however under 5S detection VSYS/VBAT ADC only holds 8.16-V offset to cover higher voltage range. Refer to 表 8-2 for CELL\_BATPRESZ pin configuration typical voltage for swept cell count.

**表 8-2. Battery Cell Configuration**

CELL COUNT	PIN VOLTAGE w.r.t. VDDA	CHARGEVOLTAGE (REG0x05/04h)	SYSOVP	VSYS_MIN	VSYS/VBAT ADC OFFSET
5S	100%(Directly connect to VDDA)	21.000 V	25 V	15.4 V	8.16 V
4S	75%	16.800 V	19.5 V	12.3 V	2.88 V
3S	55%	12.600 V	19.5 V	9.2 V	2.88 V
2S	40%	8.400 V	12 V	6.6 V	2.88 V
1S	25%	4.200 V	6 V	3.6 V	2.88 V
Battery removal	0%	4.200 V	25 V	3.6 V	2.88 V

### 8.3.8 Device HIZ State

When input source is present, the charger can enter HIZ mode (converter shuts off) when ILIM\_HIZ pin voltage is below 0.4 V or EN\_HIZ is set to 1b. The charger is in the low quiescent current mode with REGN LDO enabled, ADC circuits are deactivated to reduce quiescent current. In order to exit HIZ mode, ILIM\_HIZ pin voltage has to be higher than 0.8 V and EN\_HIZ bit has to be set to 0b.

### 8.3.9 USB On-The-Go (OTG)

The device supports USB OTG operation to deliver power from the battery to other portable devices through USB port. The OTG mode output voltage is set in OTGVoltage register REG0x07/06() with 8-mV LSB range from 3.0 V to 24 V. The OTG mode output current is set in OTGCurrent register REG0x09() with 100-mA LSB range from 0 A to 12.7 A under 5-m $\Omega$  input current sensing. Both OTG voltage and OTG current are qualified for USB-C™ programed power supply (PPS) specification in terms of resolution and accuracy. The OTG mode can be enabled following below steps:

- Set target OTG current limit in OTGCurrent register, VBUS is below  $V_{VBUS\_CONVENZ}$ .
- Set OTG\_VAP\_MODE = 1b and EN\_OTG = 1b.
- OTG/VAP/FRS pin is pulled high.
- 15 ms after the above conditions are valid, converter starts and VBUS ramps up to target voltage. CHRГ\_OK pin goes HIGH if OTG\_ON\_CHRGOK= 1b.

OTG/VAP/FRS pin is used as multi-function to enable OTG and FRS mode.

### 8.3.10 Converter Operation

The charger operates in buck, buck-boost and boost mode under different VBUS and VSYS combination. The buck-boost can operate seamlessly across the three operation modes. The 4 main switches operating status under continuous conduction mode (CCM) are listed below for reference.

表 8-3. MOSFET Operation

MODE	BUCK	BUCK-BOOST	BOOST
Q1	Switching	Switching	ON
Q2	Switching	Switching	OFF
Q3	OFF	Switching	Switching
Q4	ON	Switching	Switching

### 8.3.11 Inductance Detection Through IADPT Pin

The charger reads both converter operation frequency and the inductance value through the resistance tied to IADPT pin before the converter starts up. The resistances recommended for 2.2- $\mu$ H (800 kHz), 3.3- $\mu$ H (800 kHz) and 4.7- $\mu$ H (400 kHz) inductance refers to 表 8-4. A surface mount chip resistor with  $\pm 3\%$  or better tolerance must to be used for an accurate inductance detection.

表 8-4. Inductor Detection through IADPT Resistance

INDUCTOR IN USE	RESISTOR ON IADPT PIN
2.2 $\mu$ H (recommended for 800 kHz)	137 k $\Omega$ or 140 k $\Omega$
3.3 $\mu$ H (recommended for 800 kHz)	169 k $\Omega$
4.7 $\mu$ H (recommended for 400 kHz)	191 k $\Omega$ or 187 k $\Omega$

### 8.3.12 Converter Compensation

The charger employs two compensation pins COMP1 and COMP2 for converter compensation purpose, appropriate RC network is needed to guarantee converter steady state and transient operation. Under different operation frequency corresponding RC network value needs to be configured respectively as shown in below table. The definition of these RC components can be referred to 图 8-2. It is not recommended to change the compensation network value due to the complexity of various operation modes.

表 8-5. Compensation Configuration

COMPONENT VALUE	INDUCTOR	COMP1 R1	COMP1 C11	COMP1 C12	COMP2 R2	COMP2 C21	COMP2 C22
400 kHz	4.7 $\mu$ H	40.2 k $\Omega$	4.7 nF	33 pF	15 k $\Omega$	680 pF	15 pF
800 kHz	3.3 $\mu$ H	16.9 k $\Omega$	3.3 nF	33 pF	15 k $\Omega$	1200 pF	15 pF
800 kHz	2.2 $\mu$ H	16.9 k $\Omega$	3.3 nF	33 pF	10 k $\Omega$	1200 pF	15 pF

图 8-2. Compensation RC Network

### 8.3.13 Continuous Conduction Mode (CCM)

With sufficient charge or system current, the inductor current does not cross 0 A, which is defined as CCM. The controller starts a new cycle with ramp coming up from 200 mV. As long as the error amplifier output voltage is above the ramp voltage, the high-side MOSFET (HSFET) stays on. When the ramp voltage exceeds error amplifier output voltage, HSFET turns off and low-side MOSFET (LSFET) turns on. At the end of the cycle, ramp gets reset and LSFET turns off, ready for the next cycle. There is always break-before-make logic during transition to prevent cross-conduction and shoot-through. During the dead time when both MOSFETs are off, the body-diode of the low-side power MOSFET conducts the inductor current.

During CCM, the inductor current always flows. Having the LSFET turn-on when the HSFET is off keeps the power dissipation low and allows safe charging at high currents.

### 8.3.14 Pulse Frequency Modulation (PFM)

In order to improve converter light-load efficiency, BQ25730 switches to PFM operation at light load. The effective switching frequency will decrease accordingly when system load decreases. The minimum frequency can be limited to 25 kHz when the OOA feature is enabled (EN\_OOA=1b) to avoid audible noise.

### 8.3.15 Switching Frequency and Dithering Feature

Normally, the IC switches in fixed frequency which can be adjusted through PWM\_FREQ register bit. The Charger also support frequency dithering function to improve EMI performance. This function is disabled by default with setting EN\_DITHER=00b. It can be enabled by setting EN\_DITHER=01/10/11b, the switching frequency is not fixed when dithering is enabled. It varies within determined range by EN\_DITHER setting, 01/10/11b is corresponding to  $\pm 2\%/4\%/6\%$  switching frequency. Please contact factory for more detail information.

### 8.3.16 Current and Power Monitor

#### 8.3.16.1 High-Accuracy Current Sense Amplifier (IADPT and IBAT)

A high-accuracy current sense amplifier (CSA) is used to monitor the input current during forward charging, or output current during OTG (IADPT) and the charge/discharge current (IBAT). IADPT voltage is 20 $\times$  or 40 $\times$  the differential voltage across ACP and ACN. IBAT voltage is 8 $\times$ /16 $\times$  of the differential across SRP and SRN. After

input voltage or battery voltage is above UVLO, IADPT output becomes valid. To lower the voltage on current monitoring, a resistor divider from CSA output to GND can be used and accuracy over temperature can still be achieved.

- $V_{IADPT} = 20$  or  $40 \times (V_{ACP} - V_{ACN})$  during forward mode, or  $20$  or  $40 \times (V_{ACN} - V_{ACP})$  during reverse OTG mode.
- $V_{IBAT} = 8$  or  $16 \times (V_{SRP} - V_{SRN})$  during forward charging mode.
- $V_{IBAT} = 8$  or  $16 \times (V_{SRN} - V_{SRP})$  during forward supplement mode, reverse OTG mode and battery only discharge scenario.

A maximum 100-pF capacitor is recommended to connect on the output for decoupling high-frequency noise. An additional RC filter is optional. Note that RC filtering has additional response delay. The CSA output voltage is clamped at 3.3 V.

### 8.3.16.2 High-Accuracy Power Sense Amplifier (PSYS)

The charger monitors total system power. During forward mode, the input adapter powers the system. During reverse OTG mode and battery only discharge scenario, the battery powers the system and VBUS output. The ratio of PSYS pin output current and total system power,  $K_{PSYS}$ , can be programmed in PSYS\_RATIO register bit with default  $1 \mu A/W$ . The input and charge sense resistors ( $R_{AC}$  and  $R_{SR}$ ) are selected in RSNS\_RAC bit and RSNS\_RSR bit. By default, PSYS\_CONFIG=00b and PSYS voltage can be calculated with [方程式 1](#), where  $I_{IN}>0$  when the charger is in forward charging and  $I_{IN}<0$  when charger is in OTG operation; where  $I_{BAT}<0$  when the battery is in charging and  $I_{BAT}>0$  when battery is discharging.

$$V_{PSYS} = R_{PSYS} \cdot K_{PSYS} (V_{ACP} \cdot I_{IN} + V_{SYS} \cdot I_{BAT}) \quad (1)$$

$R_{AC}$  and  $R_{SR}$  values are not limited to symmetrical both 5 m $\Omega$  or both 10 m $\Omega$ . For defined current sense resistors (10 m $\Omega$ /5 m $\Omega$ ), PSYS function is still valid when  $R_{AC}=5$  m $\Omega$  (RSNS\_RAC=1b) and  $R_{SR}=10$  m $\Omega$  (RSNS\_RAC=0b), vice versa. As long as RSNS\_RAC and RSNS\_RSR bit status are consistent with practical resistors used in the system.

Charger can block IBAT contribution to above equation by setting PSYS\_CONFIG =01b in forward mode and block IBUS contribution to above equation by setting PSYS\_OTG\_IDCHG=1b in OTG mode.

To minimize the quiescent current, the PSYS function is disabled by default PSYS\_CONFIG = 11b.

表 8-6. PSYS Configuration Table

CASE #	PSYS_CONFIG BITS	PSYS_OTG_IDCHG BITS	FORWARD MODE PSYS CONFIGURATION	OTG MODE PSYS CONFIGURATION
1	00b	0b	PSYS = PBUS+PBAT	PSYS = PBUS + PBAT
2	00b	1b	PSYS = PBUS+PBAT	PSYS =PBAT
3	01b	Xb	PSYS = PBUS	PSYS = 0
4	11b	Xb	PSYS = 0 (Disabled)	PSYS = 0 (Disabled)
5 (Reserved)	10b	Xb	PSYS = 0 (Reserved)	PSYS = 0 (Reserved)

### 8.3.17 Input Source Dynamic Power Management

The charger supports Dynamic Power Management (DPM). Normally, the input power source provides power for the system load and/or charging the battery. When the input current exceeds the input current setting (IIN\_DPM), or the input voltage falls below the input voltage setting (VINDPM), the charger decreases the charge current to provide priority to the system load. As the system current rises, the available charge current drops accordingly towards zero. If the system load keeps increasing after the charge current drops down to zero, the system voltage starts to drop. As the system voltage drops below the battery voltage, the battery will discharge to supplement the heavy system load.

### 8.3.18 Input Current Optimizer (ICO)

For a recognized input adapter, IINDPM can be configured precisely to prevent adapter collapsing. When a third party unknown adapter is used, then input voltage regulation (VINDPM) feature can be leveraged to prevent input crash. With the increasing of input current, voltage drops along the input cable also increases and voltage measured at charger input port decreases accordingly. VINDPM feature can limit input power from adapter by regulating VBUS at certain value configured at InputVoltage register(0x0Bh/0Ah[]). However, the adapter may still overheat when it is kept running at its voltage limit for a long period of time. Therefore, it is preferred to operate the third party adapter slightly under its current rating. The Input Current Optimizer (ICO) feature can automatically maximize the power of unknown input adapter without continuously working under VINDPM. Note the ICO feature can only be employed when the adapter input current limit is at least 500 mA. Please contact factory for more detail information about ICO feature.

### 8.3.19 Two-Level Adapter Current Limit (Peak Power Mode)

Usually adapter can supply current higher than DC rating for a few milliseconds to tens of milliseconds. The charger employs two-level input current limit, or peak power mode, to fully utilize the overloading capability and minimize battery discharge during system load transient. The level 1 current limit, or  $I_{LIM1}$ , is the same as adapter DC current, set in IIN\_DPM register. The level 2 overloading current, or  $I_{LIM2}$ , is set in ILIM2\_VTH, as a percentage of  $I_{LIM1}$ .

When the charger detects input current surge and battery discharge due to load transient (both the adapter and battery support the system together), or when the charger detects the system voltage starts to drop below VSYS\_MIN setting due to load transient (only the adapter supports the system), the charger will first apply  $I_{LIM2}$  for  $T_{OVL D}$  (PKPWR\_TOVLD\_DEG register bits), and then  $I_{LIM1}$  for up to  $T_{MAX} - T_{OVL D}$  time.  $T_{MAX}$  is programmed in PKPWR\_TMAX register bits. After  $T_{MAX}$ , if the load is still high, another peak power cycle starts. Charging is disabled during  $T_{MAX}$  and  $T_{OVL D}$  already expires; once  $T_{MAX}$  expires, a new cycle starts and resumes charging automatically.

To prepare entering peak power follow below steps:

- Set EN\_IIN\_DPM=1b to enable input current dynamic power management.
- Set EN\_EXTILIM=0b to disable external current limit.
- Set register IIN\_HOST based on adapter output current rating as the level 1 current limit( $I_{LIM1}$ )
- Set register bits ILIM2\_VTH according to the adapter overload capability as the level 2 current limit( $I_{LIM2}$ ).
- Set register bits PKPWR\_TOVLD\_DEG as  $I_{LIM2}$  effective duration time for each peak power mode operation cycle based on adapter capability.
- Set register bits PKPWR\_TMAX as each peak power mode operation cycling time based on adapter capability.

Depends on the battery existence and charge status peak power mode can be finally enabled with two different approaches:

- When battery is depleted in which VBAT is lower than VSYS\_MIN setting or battery is removed, host need to set EN\_PKPWR\_VSYS=1b to enable peak power mode triggered by system voltage undershoot. The undershoot threshold is the VSYS\_MIN register setting which is the system regulation point before load transient happens. Typical application waveform refer to [图 9-22](#).
- When battery is not depleted in which VBAT is higher than VSYS\_MIN setting, host need to set EN\_PKPWR\_IIN\_DPM=1b to enable peak power mode triggered by input current overshoot. The overshoot threshold is IIN\_DPM register which is same as the level 1 current limit ( $I_{LIM1}$ ). Typical application waveform refer to [图 9-23](#).

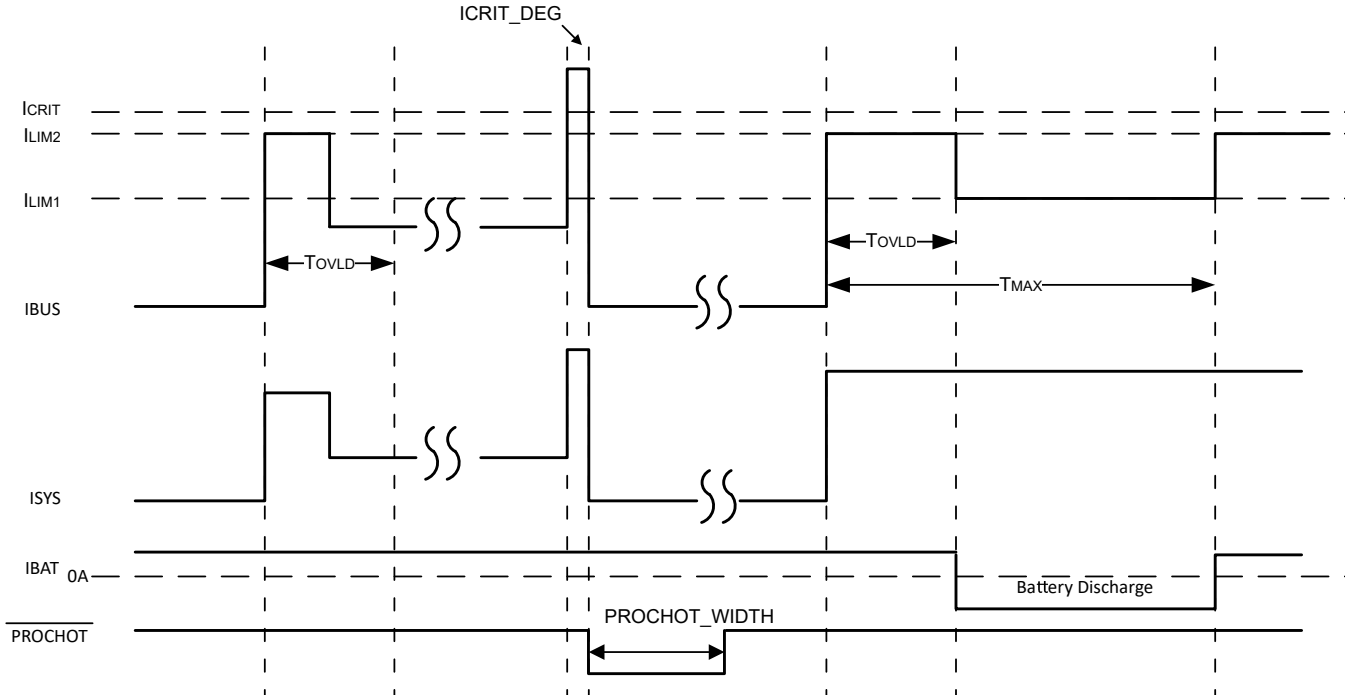

图 8-3. Two-Level Adapter Current Limit Timing Diagram

### 8.3.20 Processor Hot Indication

The events monitored by the processor hot function includes:

- ICRIT: adapter peak current, as 110% of  $I_{LIM2}$
- INOM: adapter average current (110% of  $I_{IN\_DPM}$ )
- IDCHG1: battery discharge current level 1
- IDCHG2: battery discharge current level 2, note IDCHG2 threshold is always larger than IDCHG1 threshold determined by IDCHG\_TH2 register setting.
- VBUS\_VAP: VBUS threshold to trigger PROCHOT in VAP mode 2 and 3.
- VSYS: system voltage on VSYS pin
- Adapter Removal: upon adapter removal (VBUS is lower than  $ACOK\_TH=3.2\text{ V}$  same as  $V_{VBUS\_CONVENZ}$  threshold)
- Battery Removal: upon battery removal (CELL\_BATPRESZ pin goes LOW)
- CMPOUT: Independent comparator output (CMPOUT pin HIGH to LOW)
- VINDPM: VBUS lower than 83%/91%/100% of VINDPM setting. The effective threshold PROCHOT\_VINDPM is determined by combination of register PROCHOT\_VINDPM\_80\_90 bit and LOWER\_PROCHOT\_VINDPM bit:
  - PROCHOT\_VINDPM=VINDPM register setting: LOWER\_PROCHOT\_VINDPM=0b;
  - PROCHOT\_VINDPM=83% VINDPM register setting:  
LOWER\_PROCHOT\_VINDPM=1b;PROCHOT\_VINDPM\_80\_90=0b;
  - PROCHOT\_VINDPM=91% VINDPM register setting:  
LOWER\_PROCHOT\_VINDPM=1b;PROCHOT\_VINDPM\_80\_90=1b;
- EXIT\_VAP: Every time when the charger exits VAP mode.

The threshold of ICRIT, IDCHG1, IDCHG2, VSYS or VINDPM, and the deglitch time of ICRIT, INOM, IDCHG1, IDCHG2, or CMPOUT are programmable through I<sup>2</sup>C register bits. Except the PROCHOT\_EXIT\_VAP is always enabled, the other triggering events can be individually enabled in ProchotOption1[7:0], PP\_IDCHG2 and PP\_VBUS\_VAP. When any enabled event in PROCHOT profile is triggered, PROCHOT is asserted low for a

single pulse with minimal width programmable in PROCHOT\_WIDTH register bits. At the end of the single pulse, if the PROCHOT event is still active, the pulse gets extended until the event is removed.

If the PROCHOT pulse extension mode is enabled by setting EN\_PROCHOT\_EXT= 1b, the PROCHOT pin will be kept low until host writes PROCHOT\_CLEAR= 0b, even if the triggering event has been removed.

If the PROCHOT\_VINDPM or PROCHOT\_EXIT\_VAP is triggered, PROCHOT pin will always stay low until the host clears it, no matter the PROCHOT is in one pulse mode or in extended mode. In order to clear PROCHOT\_VINDPM, host needs to write 0 to STAT\_VINDPM. In order to clear PROCHOT\_EXIT\_VAP, host needs to write 0 to STAT\_EXIT\_VAP.

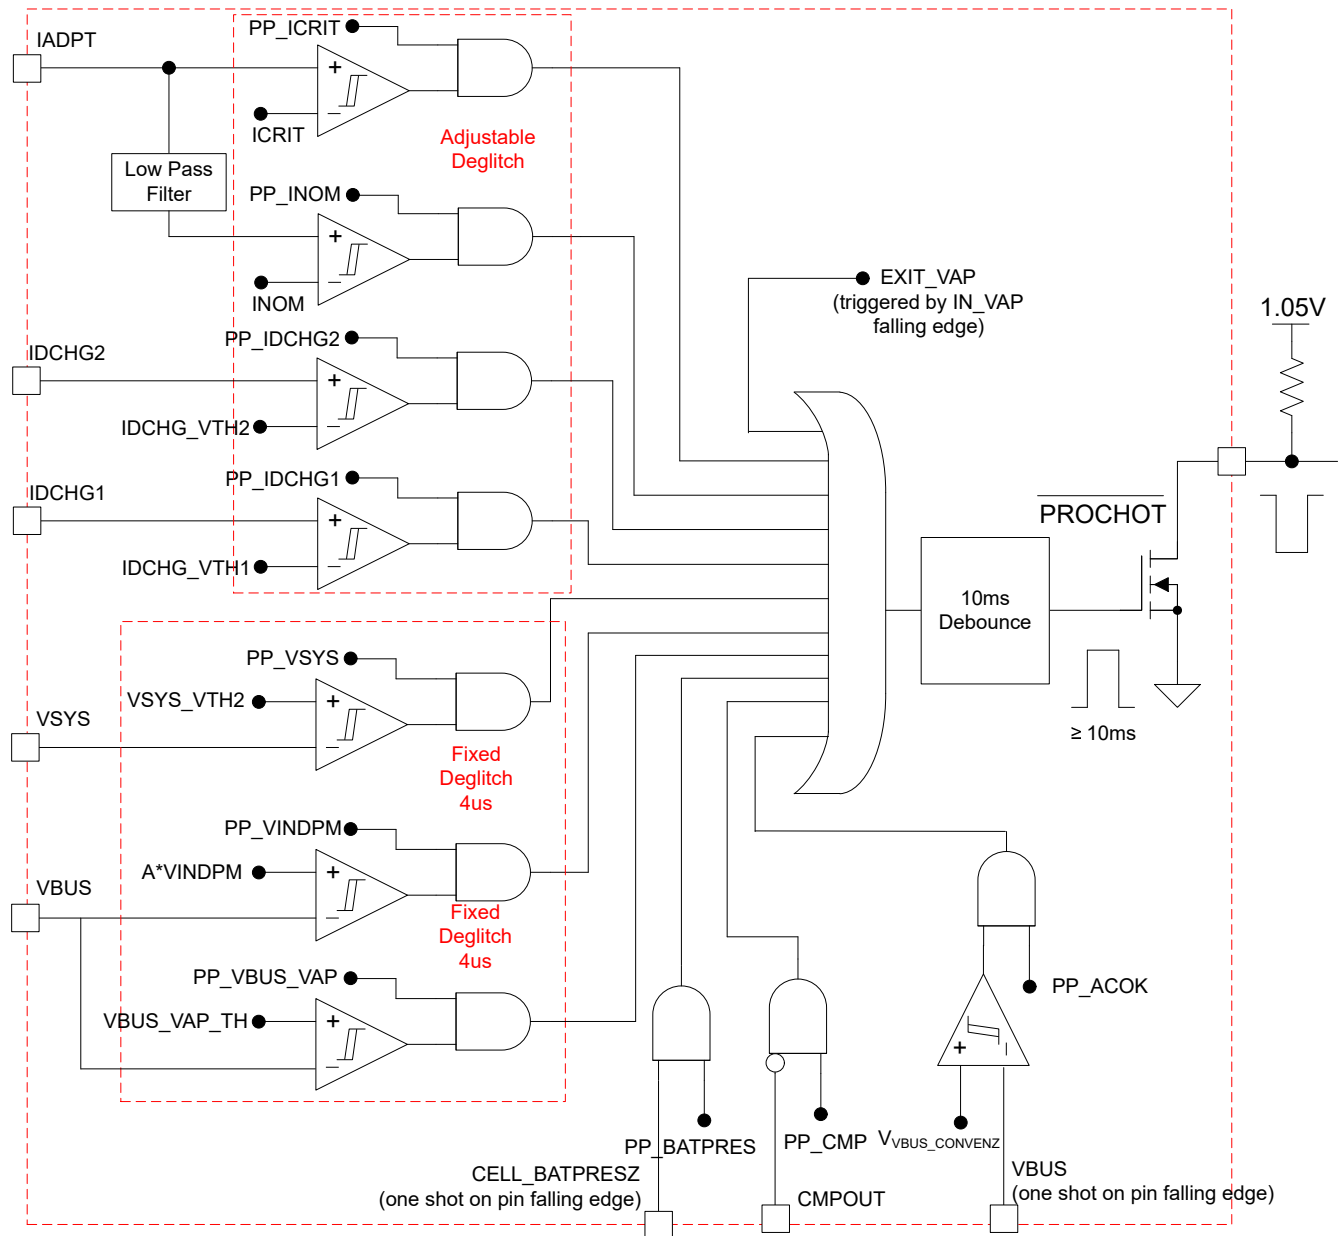

图 8-4. PROCHOT Profile

### 8.3.20.1 **PROCHOT** During Low Power Mode

During low power mode ( $EN\_LWPWR = 1$ ), the charger offers a low power **PROCHOT** function with very low quiescent current consumption ( $\sim 35 \mu A$ ), which uses the independent comparator to monitor the system voltage, and assert **PROCHOT** to CPU if the system power is too high and resulting system voltage is lower than specific threshold.

Below lists the register setting to enable **PROCHOT** monitoring system voltage in low power mode.

- $EN\_LWPWR = 1b$  to enable charger low power mode.
- $REG0x38[7:0] = 00h$
- $REG0x30[6:4] = 000b$
- Independent comparator threshold is always 1.2 V
- When  $EN\_PROCHOT\_LPWR = 1b$ , charger monitors system voltage. Connect **CMPIN** to voltage proportional to system voltage. **PROCHOT** triggers from HIGH to LOW when **CMPIN** voltage falls below 1.2 V.

图 8-5. **PROCHOT** Low Power Mode Implementation

### 8.3.20.2 **PROCHOT** Status

report which event in the profile triggers **PROCHOT** if the corresponding bit is set to 1. The status bit can be reset back to 0 after it is read by the host, when the current **PROCHOT** event is not active any more.

Assume there are two **PROCHOT** events, event A and event B. Event A triggers **PROCHOT** first, but event B is also active. Both status bits will be HIGH. At the end of the 10-ms **PROCHOT** pulse, if any of the **PROCHOT** event is still active (either A or B), the **PROCHOT** pulse is extended.

### 8.3.21 Device Protection

#### 8.3.21.1 Watchdog Timer

The charger includes a watchdog timer to terminate charging if the charger does not receive a write `ChargeVoltage()` or write `ChargeCurrent()` command within 175s (default value and adjustable via `WDTMR_ADJ`). When watchdog timeout occurs, all register values are kept unchanged except `ChargeCurrent()` resets to 0 A. Write `ChargeVoltage()` or write `ChargeCurrent()` commands must be resent to reset watchdog timer. Writing `WDTMR_ADJ = 00b` to disable watchdog timer or update new watchdog timer values can also

reset watchdog timer. New non-zero charge current value has to be written to ChargeCurrent() register to resume charging after watchdog timer expires.

#### **8.3.21.2 Input Overvoltage Protection (ACOV)**

The charger has fixed ACOV voltage threshold with hysteresis. When VBUS pin voltage is higher than  $V_{ACOV\_RISE}$  for more than 100  $\mu$ s, it is considered as adapter overvoltage. CHRГ\_OK pin will be pulled low by the charger, and the converter will be disabled. As system falls below battery voltage, BATFET will be turned on. When VBUS pin voltage falls below  $V_{ACOV\_FALL}$  for more than 1 ms, it is considered as adapter voltage returns back to normal voltage. CHRГ\_OK pin is pulled high by external pull-up resistor. The converter resumes if enable conditions are valid.

#### **8.3.21.3 Input Overcurrent Protection (ACOC)**

If the input current exceeds the 1.33 $\times$  or 2 $\times$  of ILIM2\_VTH set point ACOC\_TH (adjustable through ACOC\_VTH), after 250- $\mu$ s rising edge de-glitch time converter stops switching because of input overcurrent protection (ACOC). ACOС is a non-latch fault, if input current falls below set point, after 250-ms falling edge de-glitch time converter starts switching again. ACOС is disabled by default and need to be enabled by configuring EN\_ACOС=1b. When ACOС is triggered, its corresponding status bit Fault ACOС will be set and it can be cleared by host read.

#### **8.3.21.4 System Overvoltage Protection (SYSOVP)**

When the converter starts up, the BQ25730 reads CELL\_BATPRESZ pin configuration and sets ChargeVoltage() and SYSOVP threshold (1s - 6 V, 2s - 12 V, 3s/4s - 19.5 V and 5s - 25 V). Before ChargeVoltage() is written by the host, the battery configuration will change with CELL pin voltage. When SYSOVP happens, the device latches off the converter. Fault SYSOVP status bit is set to 1. The user can clear latch-off by either writing 0 to the Fault SYSOVP status bit or removing and plugging in the adapter again. After latch-off is cleared, the converter starts again.

#### **8.3.21.5 Battery Overvoltage Protection (BATOVP)**

Battery overvoltage may happen when user plugs in a wrong battery or a wrong regulation voltage is written into ChargeVoltage() register. The BATOVP rising threshold is 104% of regulation voltage set in ChargeVoltage() register, and falling threshold is 102% of regulation voltage set in ChargeVoltage() register. When BATOVP rising condition is triggered: if charge is enabled (charge current is not 0A) converter should shut down with both HS MOSFET and LS MOSFET turned off; if charge is disabled the converter should keep operating without disturbance until battery rise up system voltage to be high enough trigger SYSOVP. There is no user status bit to monitor. Note VBAT voltage used for BATOVP detection is based on SRN pin measurement. When BATOVP is triggered with charge enabled, 40-mA discharge current is added on VSYS pin will help discharge battery voltage.

#### **8.3.21.6 Battery Discharge Overcurrent Protection (BATOC)**

The charger monitors the battery discharge current to provide the battery overcurrent protection (BATOC) through voltage across SRN and SRP. BATOC can be enabled by configuring EN\_BATOC=1b. BATOC threshold is selected either 133% of IDCHG\_TH2 or 200% IDCHG\_TH2 through BATOC\_VTH bit. The threshold is also clamped between 100 mV and 360 mV SRN-SRP cross voltage.

When discharge current is higher than the threshold after 250- $\mu$ s deglitch time, BATOC fault is triggered, status bit Fault BATOC is set accordingly. Converter shuts down when BATOC is asserted to disable OTG operation and reduce discharge current. BATFET status is not impacted if need to supplement power to system.

BATOC is not a latch fault, therefore after BATOC fault is removed, with 250-ms relax time, converter resume switching automatically. But status bit Fault BATOC is only cleared by host read.

#### **8.3.21.7 Battery Short Protection (BATSP)**

For multicell operation, if BAT voltage falls below VSYS\_MIN during charging, the maximum charger current is limited to 384 mA. For single-cell operation, if BAT voltage falls below 3.0 V during charging, the maximum

charge current is limited to 384 mA; if BAT voltage is between 3.0 V and VSYS\_MIN then maximum charge current is limited to 2 A. Note VBAT voltage used for battery short detection is based on SRN pin measurement.

### 8.3.21.8 System Undervoltage Lockout (VSYS\_UVP) and Hiccup Mode

The charger VSYS\_UVP is enabled by POR ( VSYS\_UVP\_ENZ=0b) and can be disabled by writing VSYS\_UVP\_ENZ=1b. This protection is mainly defined to protect converter from system short circuit under both startup and steady state process. VSYS pin is used to monitor the system voltage, when VSYS is lower than 2.4 V (configurable through VSYS\_UVP register bits), there is 2-ms deglitch time, the IIN\_DPM is clamped to 0.5 A by the charger itself.

If hiccup mode is enabled with VSYS\_UVP\_NO\_HICCUP = 0b, after 2-ms deglitch time, the charger should shut down for 500 ms. The charger will restart for 10 ms if VSYS is still lower than 2.4 V, the charger should shut down again. This hiccup mode will be tried continuously, if the charger restart failed for 7 times in 90 second, the charger will be latched off. Fault VSYS\_UVP bit will be set to 1 to report a system short fault. The charger only can be enabled again by writing Fault VSYS\_UVP bit to 0b.

If hiccup mode is disabled VSYS\_UVP\_NO\_HICCUP = 1b. After 2-ms deglitch time, the charger should shut down and latched off. Fault VSYS\_UVP bit will be set to 1 to report a system short fault. The charger only can be enabled again once the host writes Fault VSYS\_UVP bit to 0b.

### 8.3.21.9 Thermal Shutdown (TSHUT)

The WQFN package has low thermal impedance, which provides good thermal conduction from the silicon to the ambient, to keep junction temperatures low. As added level of protection, the charger converter turns off for self-protection whenever the junction temperature reaches the 155°C. The charger stays off until the junction temperature falls below 135°C. During thermal shut down, the REGN LDO current limit is reduced to 16 mA and stays on. When the temperature falls below 135°C, charge can be resumed with soft start.

When thermal shut down is triggered, TSHUT status bit will be triggered. This status bit keep triggered until host read to clear it. If TSHUT is still present during host read, then this bit will try to be cleared when host read but finally keep triggered because TSHUT still exists.

## 8.4 Device Functional Modes

### 8.4.1 Forward Mode

When input source is connected to VBUS, BQ25730 is in forward mode to regulate system and charge battery.

#### 8.4.1.1 System Voltage Regulation with Narrow VDC Architecture

The device employs Narrow VDC architecture (NVDC) with BATFET separating the system from the battery. The minimum system voltage is set by VSYS\_MIN register REG0x0D/0C(). Even with a depleted battery, the system is regulated above the minimum system voltage.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode), and the system is regulated at VSYS\_MIN register value. As the battery voltage rises above the minimum system voltage, system voltage is regulated 150 mV above battery voltage when BATFET is turned off (no charging or no supplement current). When in charging or in supplement mode, the voltage difference between the system and battery is the  $V_{DS}$  of the BATFET and the BATFET is fully on.

#### 8.4.1.2 Battery Charging

The BQ25730 charges 1- to 5-cell battery in constant current (CC), and constant voltage (CV) mode. Based on CELL\_BATPREZ pin setting, the charger sets default battery voltage 4.2 V/cell to ChargeVoltage(). According to battery capacity, the host programs appropriate charge current to ChargeCurrent() register. When battery is full or battery is not in good condition to charge, host terminates charge by setting CHRГ\_INHIBIT bit to 1b, or setting ChargeCurrent() to zero.

## 8.4.2 USB On-The-Go

The BQ25730 supports USB OTG functionality to deliver power from the battery to other portable devices through USB port (reverse mode). The OTG output voltage is compliant with USB-C PD specification, including 5 V, 9 V, 15 V, and 20 V. The output current regulation is compliant with USB-C PD specification, including 500 mA, 1.5 A, 3 A and 5 A, and so forth.

Similar to forward operation, the device switches from PWM operation to PFM operation at light load to improve efficiency.

## 8.4.3 Pass Through Mode (PTM)-Patented Technology

The charger can be operated in the pass through mode (PTM) to improve efficiency. In PTM, the Buck and Boost high-side FETs (Q1 and Q4) are both turned on, while the Buck and Boost low-side FETs are both turned off. The input power is directly passed through the charger to the system. The switching losses of MOSFETs and the inductor core loss are saved. The charger quiescent current under PTM mode is also minimized to further increase light load efficiency. Charger will be transition from normal Buck-Boost operation to PTM operation by setting EN\_PTМ = 1b; and will transition out of PTM mode with host control by setting EN\_PTМ = 0b. Please contact factory for more detail information about PTM mode.

## 8.5 Programming

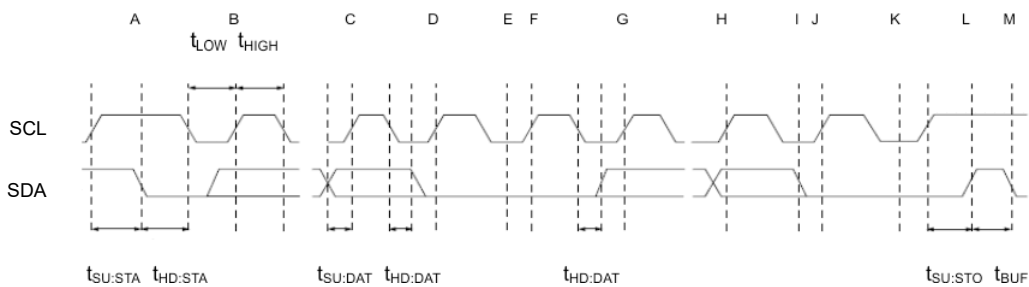

The charger supports battery-charger commands that use either Write-Word or Read-Word protocols, as summarized in 节 8.5.1.7. The I<sup>2</sup>C address is 6Bh(0b1101011) consist of 7 bits. Adding read(1b) and write(0b) to the end of address 7bits, the total 8bits data format address should be D6h (1101011\_0 for write)/ D7h(1101011\_1 for read). The ManufacturerID and DeviceID registers are assigned to identify the charger device. The ManufacturerID register command always returns 40h.

### 8.5.1 I<sup>2</sup>C Serial Interface

The BQ25730 uses I<sup>2</sup>C compatible interface for flexible charging parameter programming and instantaneous device status reporting. I<sup>2</sup>C is a bi-directional 2-wire serial interface. Only two bus lines are required: a serial data line (SDA) and a serial clock line (SCL). Devices can be considered as host or target when performing data transfers. A host is the device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a target device.

The device operates as a target device with address D6h, receiving control inputs from the host device like micro controller or a digital signal processor through REG00-REG3F. The I<sup>2</sup>C interface supports both standard mode (up to 100 kHz), and fast mode (up to 400 kHz). connecting to the positive supply voltage via a current source or pull-up resistor. When the bus is free, both lines are HIGH. The SDA and SCL pins are open drain.

#### 8.5.1.1 Timing Diagrams

图 8-7. I<sup>2</sup>C Read Timing

8.5.1.2 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. One clock pulse is generated for each data bit transferred.

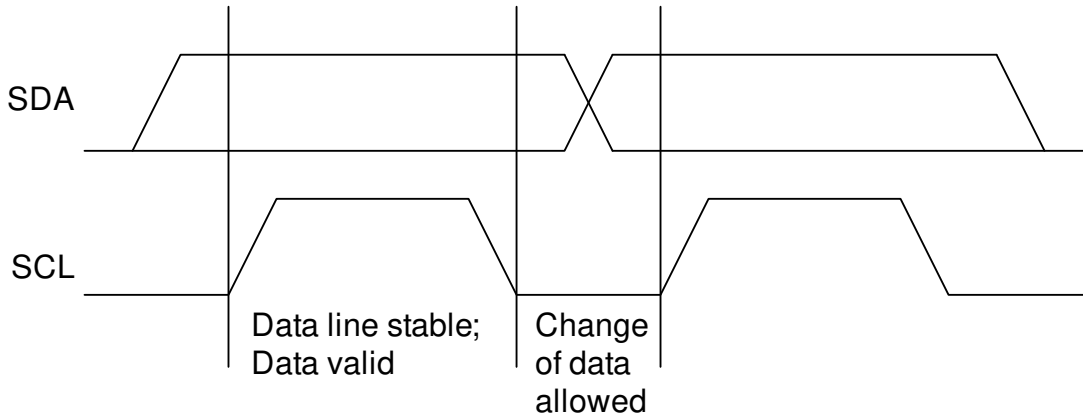

图 8-8. Bit Transfer on the I<sup>2</sup>C Bus

8.5.1.3 START and STOP Conditions

All transactions begin with a START (S) and can be terminated by a STOP (P). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition.

图 8-11. Complete Data Transfer

8.5.1.7 Single Read and Write

图 8-12. Single Write

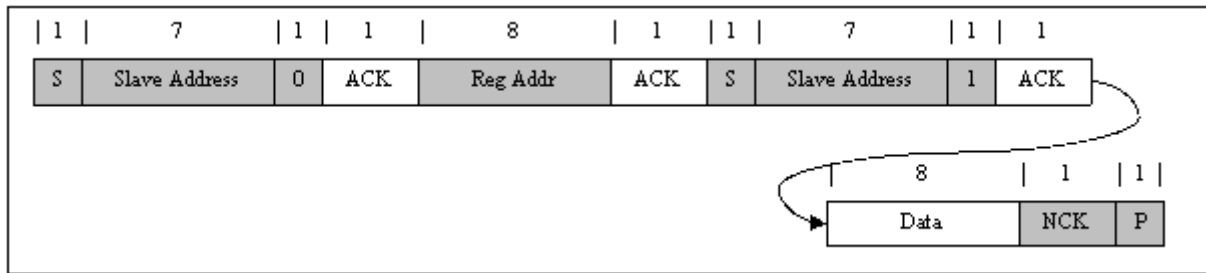

图 8-13. Single Read

If the register address is not defined, the charger IC send back NACK and go back to the idle state.

8.5.1.8 Multi-Read and Multi-Write

The charger device supports multi-read and multi-write.

图 8-14. Multi Write

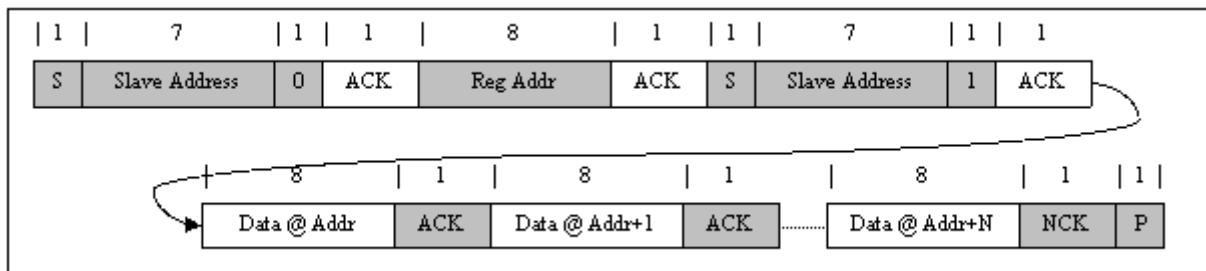

图 8-15. Multi Read

### 8.5.1.9 Write 2-Byte I<sup>2</sup>C Commands

A few I<sup>2</sup>C commands combine two 8-bit registers together to form a complete value. These commands include:

- ChargeCurrent()
- ChargeVoltage()
- IIN\_DPM()
- OTGVoltage()
- InputVoltage()

Host has to write LSB bit first and then move on to MSB bit. No other command can be inserted in between these two writes. The charger waits for the complete write to the two registers to decide whether to accept or ignore the new value.

After the completion of LSB and MSB bytes, the two bytes will be updated at the same time. If host writes MSB byte first, the command will be ignored. If the time between write of LSB and MSB bytes exceeds watchdog timer, both the LSB and MSB commands will be ignored.

## 8.6 Register Map

表 8-7. Charger Command Summary

I <sup>2</sup> C ADDR (MSB/LSB)	REGISTER NAME	TYPE	DESCRIPTION	LINKS
01/00h	ChargeOption0()	R/W	Charge Option 0	<a href="#">Go</a>
03/02h	ChargeCurrent()	R/W	7-bit charge current setting LSB 128 mA, Range 0 mA - 16256 mA (R <sub>SR</sub> =5mΩ)	<a href="#">Go</a>
05/04h	ChargeVoltage()	R/W	12-bit charge voltage setting LSB 8 mV, Default: 1S-4200mV, 2S-8400mV, 3S-12600mV, 4S-16800mV, 5S-21000mV	<a href="#">Go</a>
07/06h	OTGVoltage()	R/W	12-bit OTG voltage setting LSB 8 mV, Range: 3000 mV - 24000 mV	<a href="#">Go</a>
09/08h	OTGCurrent()	R/W	7-bit OTG output current setting LSB 100 mA, Range: 0 A - 12700 mA (R <sub>AC</sub> =5mΩ)	<a href="#">Go</a>
0B/0Ah	InputVoltage()	R/W	8-bit input voltage setting LSB 64 mV, Range: 3200 mV - 19520 mV	<a href="#">Go</a>
0D/0Ch	VSYS_MIN()	R/W	8-Bit minimum system voltage setting LSB: 100 mV, Range: 1000 mV - 23000 mV Default: 1S-3.6V, 2S-6.6V, 3S-9.2V, 4S-12.3V, 5S-15.4V	<a href="#">Go</a>
0F/0Eh	IIN_HOST()	R/W	6-bit Input current limit set by host LSB: 100 mA, Range: 100 mA - 10000 mA with 100 mA offset (R <sub>AC</sub> =5mΩ)	<a href="#">Go</a>
21/20h	ChargerStatus()	R with R/W bits	Charger Status	<a href="#">Go</a>
23/22h	ProchotStatus()	R and R/W bits	Prochot Status	<a href="#">Go</a>
25/24h	IIN_DPM()	R	7-bit input current limit in use LSB: 100 mA, Range: 100 mA - 10000 mA (R <sub>AC</sub> =5mΩ)	<a href="#">Go</a>

BIT	FIELD	TYPE	RESET	DESCRIPTION
2	EN_LDO	R/W	1b	<p>LDO Mode Enable</p> <p>When battery voltage is below minimum system voltage (REG0x0C()), the charger is in pre-charge with LDO mode enabled.</p> <p>0b: Disable LDO mode, BATFET fully ON. Precharge current is set by battery pack internal resistor.</p> <p>1b: Enable LDO mode, Precharge current is set by the ChargeCurrent register and clamped below 384 mA (2 cell - 4 cell, 1cell VBAT&lt;3.0V) or 2A (1cell 3.0V&lt;VBAT&lt;3.6V). The system is regulated by the VSYS_MIN register. &lt;default at POR&gt;</p>
1	EN_IIN_DPM	R/W	1b	<p>IIN_DPM Enable</p> <p>Host writes this bit to enable IIN_DPM regulation loop. When the IIN_DPM is disabled by the charger (refer to IIN_DPM_AUTO_DISABLE), this bit goes LOW.</p> <p>0b: IIN_DPM disabled</p> <p>1b: IIN_DPM enabled &lt;default at POR&gt;</p>
0	CHRG_INHIBIT	R/W	0b	<p>Charge Inhibit</p> <p>When this bit is 0, battery charging will start with valid values in the ChargeVoltage() register and the ChargeCurrent register.</p> <p>0b: Enable Charge &lt;default at POR&gt;</p> <p>1b: Inhibit Charge</p>

### 8.6.2 ChargeCurrent Register (I<sup>2</sup>C address = 03/02h) [reset = 0000h]

To set the charge current, write 16-bit ChargeCurrent() command (REG0x03/02h()) using the data format listed [图 8-17](#).

With 5-mΩ sense resistor, the charger provides charge current range of 0 A to 16.256 A, with a 128-mA step resolution. With 10-mΩ sense resistor, the charger provides charge current range of 0 A to 8.128 A, with a 64-mA step resolution.

Upon POR, ChargeCurrent() is 0 A. Below scenarios will also reset Charge current to zero:

- CELL\_BATPRESZ going LOW (battery removal).
- STAT\_AC is not valid(Adapter removal).
- RESET\_REG is asserted and reset all registers.
- Charge voltage is written to be 0 V.
- Watch dog event is triggered.

Charge current is not reset in force converter latch off fault (REG0x20[2]), and ACOC/TSHUT/SYSOVP/ACOV/VSYS\_UVP/BATOVP/BATOC faults.

### 8.6.2.1 Battery Pre-Charge Current Clamp

During pre-charge, BATFET works in linear mode (LDO mode) (default EN\_LDO= 1b). For 2-4 cell battery, the system is regulated at V<sub>SYS\_MIN</sub> register and the pre-charge current is clamped at 384 mA. For 1 cell battery, the pre-charge to fast charge threshold is 3 V, and the pre-charge current is clamped at 384 mA. However, the BATFET stays in LDO mode operation until battery voltage is above minimum system voltage (~3.6 V). During battery voltage from 3 V to 3.6 V, the fast charge current is clamped at 2 A.

### 8.6.3 ChargeVoltage Register (I<sup>2</sup>C address = 05/04h) [reset value based on CELL\_BATPRESZ pin setting]

To set the output charge voltage, write a 16-bit ChargeVoltage register command (REG0x05/04h()) using the data format listed in 图 8-18, 表 8-12, and 表 8-13. The charger provides charge voltage range from 1.024 V to 23.000 V, with 8-mV step resolution. Any write below 1.024 V or above 23.000 V is ignored.

Upon POR, ChargeVoltage() is by default set as 4200 mV for 1 s, 8400 mV for 2 s, 12600 mV for 3 s or 16800 mV for 4 s, 21000 mV for 5s. After CHRГ\_OK goes high, the charge will start when the host writes the charging current to ChargeCurrent() register, the default charging voltage is used if ChargeVoltage() is not programmed. If the battery is different from 4.2 V/cell, the host has to write to ChargeVoltage() before ChargeCurrent() register for correct battery voltage setting. Writing ChargeVoltage() to 0 should keep ChargeVoltage() value unchanged, and force ChargeCurrent() register to zero to disable charge.

The SRN pin senses the battery voltage for voltage regulation and should be connected as close to the battery as possible.

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

表 8-14. ChargerStatus Register (I<sup>2</sup>C address = 21h) Field Descriptions

BIT	FIELD	TYPE	RESET	DESCRIPTION
7	STAT_AC	R	0b	Input source status. STAT_AC is valid as long as VBUS go within 3.5-V to 26-V range. It is different from CHRG_OK bit, When CHRG_OK is valid, STAT_AC must be valid, but if STAT_AC is valid, it is not necessary CHRG_OK is valid. There are Force converter off, ACOC, TSHUT, SYSOVP, VSYS_UVP, BATOV can pull low CHRG_OK. 0b: Input not present 1b: Input is present
6	ICO_DONE	R	0b	After the ICO routine is successfully executed, the bit goes 1. 0b: ICO is not complete 1b: ICO is complete
5	IN_VAP	R	0b	0b: Charger is not operated in VAP mode 1b: Charger is operated in VAP mode Digital status bit indicates VAP has enabled(1) or disabled(0). The enable of VAP mode only follows the host command, which is not blocked by any status of /PROCHOT. The exit of VAP mode also follows the host command, except that any faults will exit VAP mode automatically. STAT_EXIT_VAP (REG0x22[8]) becomes 1 which will pull low /PROCHOT until host clear. The host can enable VAP by setting OTG/VAP/FRS pin high and 0x32[5]=0, disable VAP by setting either OTG/VAP/FRS pin low or 0x32[5]=1. Any faults in VAP When IN_VAP bit goes 0->1, charger should disable VINDPM, IIN_DPM, ICRT, ILIM pin, disable PP_ACOK if it is enabled, enable PP_VSYS if it is disabled. When IN_VAP bit goes 1->0, charger should enable VINDPM, IIN_DPM, ICRT, ILIM pin function.
4	IN_VINDPM	R	0b	0b: Charger is not in VINDPM during forward mode, or voltage regulation during OTG mode 1b: Charger is in VINDPM during forward mode, or voltage regulation during OTG mode
3	IN_IIN_DPM	R	0b	0b: Charger is not in IIN_DPM during forward mode. 1b: Charger is in IIN_DPM during forward mode.
2	IN_FCHRG	R	0b	0b: Charger is not in fast charge 1b: Charger is in fast charger

BIT	FIELD	TYPE	RESET	DESCRIPTION
1	IN_PCHRG	R	0b	0b: Charger is not in pre-charge 1b: Charger is in pre-charge
0	IN_OTG	R	0b	0b: Charger is not in OTG 1b: Charge is in OTG

表 8-15. ChargerStatus Register (I<sup>2</sup>C address = 20h) Field Descriptions

BIT	FIELD	TYPE	RESET	DESCRIPTION
7	Fault ACOV	R	0b	The status are latched if triggered until a read from host. 0b: No fault 1b: ACOV
6	Fault BATOC	R	0b	The status is latched if triggered until a read from host. Fault indicator for BATOC only during normal operation. However, in PTM mode when EN_BATOC=1b, this status bit is fault indicator for both BATOVP and BATOC; when EN_BATOC=0b, this status bit is not effective. 0b: No fault 1b: BATOC is triggered
5	Fault ACOC	R	0b	The status is latched if triggered until a read from host. 0b: No fault 1b: ACOC
4	Fault SYSOVP	R/W	0b	SYSOVP Status and Clear. SYSOVP fault is latched until a clear from host by writing this bit to 0. When the SYSOVP occurs, this bit is HIGH. During the SYSOVP, the converter is disabled. After the SYSOVP is removed, the user must write a 0 to this bit or unplug the adapter to clear the SYSOVP condition to enable the converter again. 0b: Not in SYSOVP <default at POR> 1b: In SYSOVP. When SYSOVP is removed, write 0 to clear the SYSOVP latch.
3	Fault VSYS_UVP	R/W	0b	VSYS_UVP fault status and clear. VSYS_UVP fault is latched until a clear from host by writing this bit to 0. 0b: No fault <default at POR> 1b: When system voltage is lower than VSYS_UVP, then 7 times restart tries are failed.
2	Fault Force_Converter_Off	R	0b	The status is latched if triggered until a read from host. 0b: No fault 1b: Force converter off triggered (when FORCE_CONV_OFF (REG0x30[3])=1b)
1	Fault_OTG_OVP	R	0b	The status is latched if triggered until a read from host. 0b: No fault 1b: OTG OVP fault is triggered
0	Fault_OTG_UVP	R	0b	The status is latched if triggered until a read from host. 0b: No fault 1b: OTG UVP fault is triggered

### 8.6.5 ProchotStatus Register (I<sup>2</sup>C address = 23/22h) [reset = B800h]

All the status bits in REG0x22[6:0] will be reset after host read.

### 8.6.6 IIN\_DPM Register (I<sup>2</sup>C address = 25/24h) [reset = 4100h]

IIN\_DPM register reflects the actual input current limit programmed in the register, either from IIN\_HOST register or from ICO.

After ICO, the current limit used by DPM regulation may differ from the IIN\_HOST register settings. The actual DPM limit is reported in IIN\_DPM register.

To read the nominal or typical input current limit

- When using a 10-mΩ sense resistor (RSNS\_RAC=0b). There is 50-mA offset at code 0. Note this offset is only applied to code 0, not applied to other codes.
- When using a 5-mΩ sense resistor (RSNS\_RAC=1b). There is 100-mA offset at code 0. Note this offset is only applied to code 0, not applied to other codes.

To read the maximum input current limit, need to add 100 mA/200 mA offset based on above nominal input current limit reading approach.

- When using a 10-mΩ sense resistor (RSNS\_RAC=0b). There is 150-mA offset at code 0 and this 150 mA offset is only applied to code 0, 100-mA offset should be added for all other non-zero codes.
- When using a 5-mΩ sense resistor (RSNS\_RAC=1b). There is 300-mA offset at code 0 and this 300 mA offset is only applied to code 0, 200-mA offset should be added for all other non-zero codes

1	PSYS_RATIO	R/W	1b	PSYS Gain Ratio of PSYS output current vs total system power 0b: 0.25 μA/W 1b: 1 μA/W <default at POR>
0	RESERVED	R/W	1b	RESERVED

表 8-29. ChargeOption1 Register (I<sup>2</sup>C address = 30h) Field Descriptions

BIT	FIELD	TYPE	RESET	DESCRIPTION
7	CMP_REF	R/W	0b	Independent Comparator internal Reference 0b: 2.3 V <default at POR> 1b: 1.2 V
6	CMP_POL	R/W	0b	Independent Comparator output Polarity 0b: When CMPIN is above internal threshold, CMPOUT is LOW (internal hysteresis) <default at POR> 1b: When CMPIN is below internal threshold, CMPOUT is LOW (external hysteresis)
5-4	CMP_DEG	R/W	00b	Independent comparator deglitch time, only applied to the falling edge of CMPOUT (HIGH → LOW). 00b: Independent comparator is enabled with output deglitch time 5 μs <default at POR> 01b: Independent comparator is enabled with output deglitch time of 2 ms 10b: Independent comparator is enabled with output deglitch time of 20 ms 11b: Independent comparator is enabled with output deglitch time of 5 sec
3	FORCE_CONV_OFF	R/W	0b	Force Converter Off function When independent comparator triggers, (CMPOUT pin pulled down) converter latches off, at the same time, CHRГ_OK signal goes LOW to notify the system. Charge current is also set to zero internally, but charge current register setting keeps the same. To get out of converter latches off, firstly the CMPOUT should be released to high and secondly FORCE_CONV_OFF bit should be cleared (=0b). 0b: Disable this function <default at POR> 1b: Enable this function
2	EN_PTM	R/W	0b	PTM enable register bit, it will automatically reset to zero 0b: disable PTM. <default at POR> 1b: enable PTM.
1	EN_SHIP_DCHG	R/W	0b	Discharge SRN for Shipping Mode. Used to discharge VBAT pin capacitor voltage which is necessary for battery gauge device shipping mode. When this bit is 1, discharge SRN pin down in 140 ms 20 mA. When 140 ms is over, this bit is reset to 0b automatically. If this bit is written to 0b by host before 140 ms expires, VSYS should stop discharging immediately. Note if after 140-ms SRN voltage is still not low enough for battery gauge device entering ship mode, the host may need to start a new 140-ms discharge cycle. 0b: Disable shipping mode <default at POR> 1b: Enable shipping mode
0	AUTO_WAKEUP_EN	R/W	0b	Auto Wakeup Enable When this bit is HIGH, if the battery is below VSYS_MIN, the device should automatically enable 256-mA charging current for 30 mins. When the battery is charged up above minimum system voltage, charge will terminate and the bit is reset to LOW. The charger will also exit auto wake up if host write a new charge current value to charge current register Reg0x02(). 0b: Disable <default at POR> 1b: Enable

### 8.6.14 ProchotOption0 Register (I<sup>2</sup>C address = 37/36h) [reset = 4A81h(2S~5s) 4A09(1S)]

To set VSYS\_TH1 threshold to trigger discharging VBUS in VAP mode, write a 6-bit VSYS\_TH1 register command (REG0x36<7:2>()) using the data format listed in 图 8-29, 表 8-34, and 表 8-35. The charger Measure on VSYS with fixed 5- $\mu$ s deglitch time. Trigger when SYS pin voltage is below the thresholds. The threshold range from 3.2 V (000000b) to 9.5 V (111111b) for 2s~5s and 3.2 V (000000b) to 3.9 V (000111b) for 1S, with 100-mV step resolution. There is a fixed DC offset which is 3.2 V. Under 1S application writing beyond 3.9 V will be ignored. For example 000111b and xxx111b result in same VSYS\_TH1 setting 3.9 V. Upon POR, the VSYS\_TH1 threshold to trigger VBUS discharge in VAP mode is 3.4 V (000010b) for 1S and 6.400 V (100000b) for 2s~5s.

### 8.6.18 Vmin Active Protection Register (I<sup>2</sup>C address = 3F/3Eh) [reset = 006Ch(2s~5s)/0004h(1S)]

To set the VAP VBUS  $\overline{\text{PROCHOT}}$  trigger threshold, write a 7-bit Vmin Active Protection register command (REG0x3F[7:1]) using the data format listed in 图 8-33 and 表 8-42. The charger provides VAP mode VBUS  $\overline{\text{PROCHOT}}$  trigger threshold range from 3.2 V (0000000b) to 15.9 V (1111111b), with 100-mV step resolution. There is a fixed offset of 3.2 V. Upon POR, the VBUS  $\overline{\text{PROCHOT}}$  trigger threshold is 3.2 V (0000000b).

To set VSYS\_TH2 Threshold to assert STAT\_VSYS, write a 6-bit Vmin Active Protection register command (REG0x3E[7:2]) using the data format listed in 图 8-33 and 表 8-43. The charger Measure on VSYS with fixed 5- $\mu$ s deglitch time. Trigger when SYS pin voltage is below the thresholds. The threshold range from 3.2 V (000000b) to 9.5 V (111111b) for 2s~5s and 3.2 V (000000b) to 3.9 V (000111b) for 1S, with 100-mV step resolution. There is a fixed DC offset which is 3.2 V. Under 1S application writing beyond 3.9 V will be ignored. For example, xxx111b and 000111b result in same VSYS\_TH2 setting 3.9 V. Upon POR, the VSYS  $\overline{\text{PROCHOT}}$  trigger threshold is 3.2 V (000000b) for 1S and 5.9 V (011011b) for 2s~5s .

### 8.6.21 InputVoltage(VINDPM) Register (I<sup>2</sup>C address = 0B/0Ah) [reset =VBUS-1.28V]

To set the input voltage limit, write a 16-bit InputVoltage register command (REG0x0B/0A()) using the data format listed in 图 8-36, 表 8-48, and 表 8-49.

If the input voltage drops more than the InputVoltage register allows, the device enters VINDPM and reduces the charge current. The default setting is 1.28 V below the no-load VBUS voltage. There is a fixed DC offset 3.2 V for all codes.

### 8.6.22 VSYS\_MIN Register (I<sup>2</sup>C address = 0D/0Ch) [reset value based on CELL\_BATPRESZ pin setting]

To set the minimum system voltage, write a 16-bit VSYS\_MIN register command (REG0x0D/0C()) using the data format listed in 图 8-37, 表 8-50, and 表 8-51. The charger provides minimum system voltage range from 1.0V to 23.0V, with 100-mV step resolution. Any write below 1.0V or above 23.0V is ignored. Upon POR, the VSYS\_MIN register is 3.6 V for 1 S, 6.6V for 2 S and 9.2 V for 3 S, and 12.3 V for 4 S, and 15.4 V for 5S. Writing VSYS\_MIN to 0 will set it to the default value based on CELL\_BATPRESZ pin.

### 8.6.23 IIN\_HOST Register (I<sup>2</sup>C address = 0F/0Eh) [reset = 2000h]

To set the nominal or typical input current limit based on the adapter rated current. Write a 7-bit IIN\_HOST register command using the data format listed below.

When using a 10-m $\Omega$  sense resistor (RSNS\_RAC=0b), the charger provides a nominal input-current limit range of 50 mA to 6350 mA, with 50-mA resolution. The upper boundary is implemented through DAC clamp, writing value higher than limitation will be neglected. The lower boundary is implemented through 50-mA offset at code 0. Note this offset is only applied to code 0, not applied to other codes. The default nominal input current limit is 3.25 A. Upon adapter removal, the input current limit is reset to the default value of 3.25 A.

When using a 5-m $\Omega$  sense resistor (RSNS\_RAC=1b) referring to 节 8.3.5, the input-current limit range can be found under certain IADPT pin, EN\_FAST\_5MOHM bit status. The lower boundary is implemented through 100-mA offset at code 0. Note this offset is only applied to code 0, not applied to other codes. The default current limit is 3.2 A. Due to the USB current setting requirement, the register setting specifies the maximum current instead of the typical current. Upon adapter removal, the nominal input current limit is reset to the default value of 3.2 A.

To set the maximum input current limit based on adapter rated current. Additional 100-mA (10-m $\Omega$  sense resistor)/200-mA (5-m $\Omega$  sense resistor) offset should be added based on above nominal input current limit to obtain the maximum input current limit.

The ACP and ACN pins are used to sense R<sub>AC</sub> with the default value of 5 m $\Omega$ . For a 10-m $\Omega$  sense resistor, a larger sense voltage is given and a better regulation accuracy, but at the cost of higher conduction loss.

Instead of using the internal IIN\_DPM loop, the user can build up an external input current regulation loop and have the feedback signal on the ILIM\_HIZ pin.

In order to disable ILIM\_HIZ pin, the host can write EN\_EXTILIM=0b to disable ILIM\_HIZ pin, or pull ILIM\_HIZ pin above 4.0 V.

## 9 Application and Implementation

### 备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 9.1 Application Information

The BQ2573xEVM evaluation module (EVM) is a complete charger module for evaluating the BQ25730. The application curves were taken using the BQ2573xEVM.

As shown in 图 9-1, at the charger VSYS terminal, a minimum 7- $\mu$ F effective MLCC capacitance ( $7 \times 10^{-6}$  F 0603 package MLCC) is suggested for a 45-W to 65-W adapter, and two more 10- $\mu$ F MLCC capacitors are needed when power reaches 90 W. Overall 50- $\mu$ F effective capacitance on VSYS net is necessary (POSCAP is preferred). These capacitors do not have to be placed at the charger VSYS output terminal; all capacitors connected to VSYS net can be counted including the input capacitor of the next stage converters.

### 9.2 Typical Application

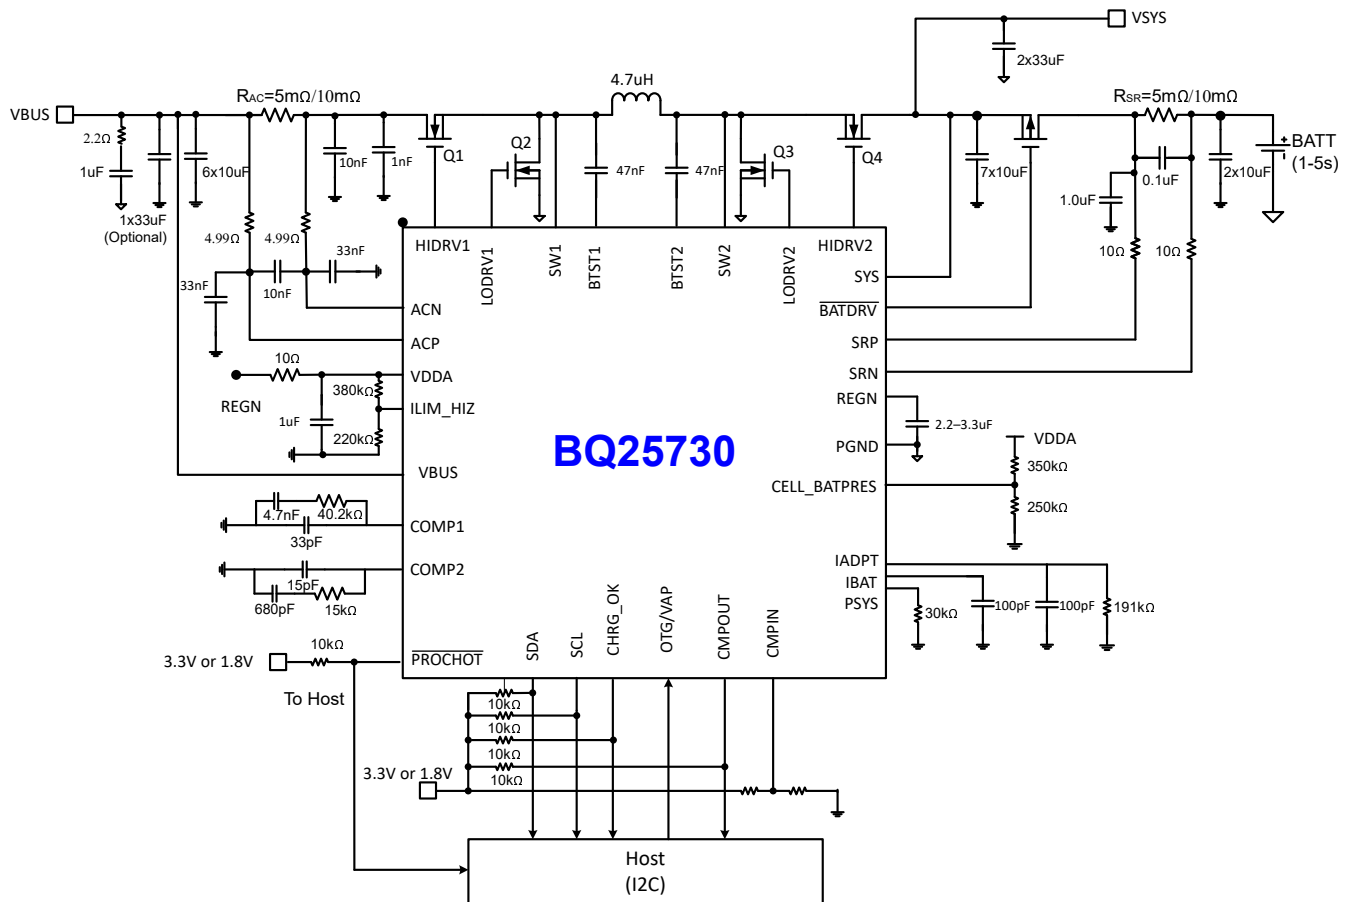

图 9-1. Application Diagram of BQ25730 with Power Path

#### 9.2.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage <sup>(2)</sup>	3.5 V < Adapter Voltage < 26V
Input Current Limit <sup>(2)</sup>	3.2 A for 65-W adapter

DESIGN PARAMETER	EXAMPLE VALUE
Battery Charge Voltage <sup>(1)</sup>	8400 mV for 2s battery
Battery Charge Current <sup>(1)</sup>	3072 mA for 2s battery
Minimum System Voltage <sup>(1)</sup>	6600 mV for 2s battery

(1) Refer to battery specification for settings.

(2) Refer to adapter specification for settings for Input Voltage and Input Current Limit.

## 9.2.2 Detailed Design Procedure

The parameters are configurable using the evaluation software. The simplified application circuit (see [图 9-1](#), as the application diagram) shows the minimum component requirements. Inductor, capacitor, and MOSFET selection are explained in the rest of this section. Refer to the EVM user's guide for the complete application schematic.

### 9.2.2.1 Input Snubber and Filter for Voltage Spike Damping

During adapter hot plug-in, the parasitic inductance and input capacitor from the adapter cable form a second order system. The voltage spike at VBUS pin maybe beyond IC maximum voltage rating and damage IC. The input filter must be carefully designed and tested to prevent overvoltage event on VBUS pin.

There are several methods to damp or limit the overvoltage spike during adapter hot plug-in. An electrolytic capacitor with high ESR as an input capacitor can damp the overvoltage spike well below the IC maximum pin voltage rating. A high current capability TVS Zener diode can also limit the overvoltage level to an IC safe level. However these two solutions may not save cost or have small size.

A cost effective and small size solution is shown in [图 9-2](#). The R1 and C1 are composed of a damping RC network to damp the hot plug-in oscillation. As a result the over voltage spike is limited to a safe level. D1 is used for reverse voltage protection for VBUS pin. C2 is VBUS pin decoupling capacitor and it should be placed as close as possible to VBUS pin. C2 value should be less than C1 value so R1 can dominate the equivalent ESR value to get enough damping effect. R2 is used to limit inrush current of D1 to prevent D1 getting damage when adapter hot plug-in. R2 and C2 should have 10- $\mu$ s time constant to limit the dv/dt on VBUS pin to reduce inrush current when adapter hot plug in. R1 has high inrush current. R1 package must be sized enough to handle inrush current power loss according to resistor manufacturer's data sheet. The filter components' value always need to be verified with real application and minor adjustments may need to fit in the real application circuit.

图 9-2. Input Filter

### 9.2.2.2 ACP-ACN Input Filter

The BQ25730 has average current mode control. The input current sensing through ACP/ACN is critical to recover inductor current ripple. Parasitic inductance on board will generate high frequency ringing on ACP-ACN which overwhelms converter sensed inductor current information. It is also difficult to manage parasitic inductance created based on different PCB layout. Larger parasitic inductance will generate larger sense current ringing which could cause the average current control loop to go into oscillation. Therefore ACP-ACN sensing information need to be conditioned.

For real system board condition, we suggest using below circuit design to get best result and filter noise induced from different PCB parasitic factor. With time constant of filter from 47 ns to 200 ns, the filter is effective and the delay of on the sensed signal is small, therefore there is no concern for average current mode control. If 400-kHz

switching frequency is employed, 10 nF is recommended for C<sub>DIFF</sub>; if 800-kHz switching frequency is chosen, then C<sub>DIFF</sub> can be left open.

图 9-3. ACN-ACP Input Filter

### 9.2.2.3 Inductor Selection

The BQ25730 has two selectable fixed switching frequency. Higher switching frequency allows the use of smaller inductor and capacitor values. Inductor saturation current should be higher than the charging current ( $I_{CHG}$ ) plus half the ripple current ( $I_{RIPPLE}$ ):

$$I_{SAT} \geq I_{CHG} + (1/2) I_{RIPPLE} \quad (2)$$

The inductor ripple current in buck operation depends on input voltage ( $V_{IN}$ ), duty cycle ( $D_{BUCK} = V_{OUT}/V_{IN}$ ), switching frequency ( $f_S$ ) and inductance ( $L$ ):

$$I_{RIPPLE\_BUCK} = V_{IN} \times D_{BUCK} \times (1 - D_{BUCK}) / (f_S \times L) \quad (3)$$

During boost operation, the duty cycle is:

$$D_{BOOST} = 1 - (V_{IN}/V_{BAT})$$

and the ripple current is:

$$I_{RIPPLE\_BOOST} = (V_{IN} \times D_{BOOST}) / (f_S \times L)$$

The maximum inductor ripple current happens with  $D = 0.5$  or close to 0.5. For example, the battery charging voltage range is from 9 V to 12.6 V for 3-cell battery pack. For 20-V adapter voltage, 10-V battery voltage gives the maximum inductor ripple current. Another example is 4-cell battery, the battery voltage range is from 12 V to 16.8 V, and 12-V battery voltage gives the maximum inductor ripple current.

Usually inductor ripple is designed in the range of (20 - 40%) maximum charging current as a trade-off between inductor size and efficiency for a practical design.

### 9.2.2.4 Input Capacitor

Input capacitor should have enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the charging current (plus system current there is any system load) when duty cycle is 0.5 in buck mode. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current occurs where the duty cycle is closest to 50% and can be estimated by 方程式 4:

$$I_{CIN} = I_{CHG} \times \sqrt{D \times (1 - D)} \quad (4)$$

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed in front of  $R_{AC}$  current sensing and as close as possible to the power stage half bridge MOSFETs. Capacitance after  $R_{AC}$  before power stage half bridge should be limited to  $10 \text{ nF} + 1 \text{ nF}$  referring to 图 9-3 diagram. Because too large capacitance after  $R_{AC}$  could filter out  $R_{AC}$  current sensing ripple information. Voltage rating of the capacitor must be higher than normal input voltage level, 25-V rating or higher capacitor is preferred for 19-V to 20-V input voltage.

Ceramic capacitors (MLCC) show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the input capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high input voltages and small capacitor packages. See the manufacturer's data sheet about the derating performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required effective capacitance value at the operating point.

### 9.2.2.5 Output Capacitor

Output capacitor also should have enough ripple current rating to absorb output switching ripple current. To get good loop stability, the resonant frequency of the output inductor and output capacitor should be designed between 10 kHz and 20 kHz. The preferred ceramic capacitor is 25-V X7R or X5R for output capacitor. Minimum 7 pcs of 10- $\mu\text{F}$  0603 package capacitor is suggested to be placed as close as possible to Q3&Q4 half bridge (between Q4 drain and Q3 source terminal). Total minimum output effective capacitance along VSYS distribution line is 50  $\mu\text{F}$  refers to 表 9-1. Recommend to place minimum 20- $\mu\text{F}$  MLCC capacitors after the charge current sense resistor for best stability.

Ceramic capacitors show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the output capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high output voltages and small capacitor packages. See the manufacturer's data sheet about the derating performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required capacitance value at the operating point. Considering the 25-V 0603 package MLCC capacitance derating under 21-V to 23-V output voltage, the recommended practical capacitors configuration at VSYS output terminal can also be found in 表 9-1. Tantalum capacitors (POSCAP) can avoid dc-bias effect and temperature variation effect which are recommend to be used along VSYS output distribution line to meet total minimum effective output capacitance requirement.

表 9-1. Minimum Output Capacitance Requirement

OUTPUT CAPACITORS vs TOTAL INPUT POWER	65 W	90 W	130 W
Minimum Effective Output Capacitance	50 $\mu\text{F}$	50 $\mu\text{F}$	50 $\mu\text{F}$
Minimum output capacitors at charger VSYS output terminal	7*10 $\mu\text{F}$ (0603 25 V MLCC)	9*10 $\mu\text{F}$ (0603 25 V MLCC)	9*10 $\mu\text{F}$ (0603 25 V MLCC)
Additional output capacitors along VSYS distribution line	2*22 $\mu\text{F}$ (25 V~35 V POSCAP)	2*22 $\mu\text{F}$ (25 V~35 V POSCAP)	2*22 $\mu\text{F}$ (25 V~35 V POSCAP)

### 9.2.2.6 Power MOSFETs Selection

Four external N-channel MOSFETs are used for a synchronous switching battery charger. The gate drivers are integrated into the IC with 6 V of gate drive voltage. 30 V or higher voltage rating MOSFETs are preferred for 19-V to 20-V input voltage.

Figure-of-merit (FOM) is usually used for selecting proper MOSFET based on a tradeoff between the conduction loss and switching loss. For the top side MOSFET, FOM is defined as the product of a MOSFET's on-resistance,  $R_{DS(ON)}$ , and the gate-to-drain charge,  $Q_{GD}$ . For the bottom side MOSFET, FOM is defined as the product of the MOSFET's on-resistance,  $R_{DS(ON)}$ , and the total gate charge,  $Q_G$ .

$$FOM_{top} = R_{DS(on)} \cdot Q_{GD}; FOM_{bottom} = R_{DS(on)} \cdot Q_G \quad (5)$$

The lower the FOM value, the lower the total power loss. Usually lower  $R_{DS(ON)}$  has higher cost with the same package size.

The top-side MOSFET loss includes conduction loss and switching loss. Taking buck mode operation as an example the power loss is a function of duty cycle ( $D=V_{OUT}/V_{IN}$ ), charging current ( $I_{CHG}$ ), MOSFET's on-resistance ( $R_{DS(ON\_top)}$ ), input voltage ( $V_{IN}$ ), switching frequency ( $f_s$ ), turn-on time ( $t_{on}$ ) and turn-off time ( $t_{off}$ ):

$$P_{top} = P_{con\_top} + P_{sw\_top} \quad (6)$$

$$P_{con\_top} = D \cdot I_{L\_RMS}^2 \cdot R_{DS(on)\_top}; \quad (7)$$

$$I_{L\_RMS}^2 = I_{L\_DC}^2 + I_{ripple}^2 / 12 \quad (8)$$

- $I_{L\_DC}$  is the average inductor DC current under buck mode;
- $I_{ripple}$  is the inductor current ripple peak-to-peak value;

$$P_{sw\_top} = P_{IV\_top} + P_{Qoss\_top} + P_{Gate\_top}; \quad (9)$$

The first item  $P_{con\_top}$  represents the conduction loss which is straight forward. The second term  $P_{sw\_top}$  represents the multiple switching loss items in top MOSFET including voltage and current overlap losses ( $P_{IV\_top}$ ), MOSFET parasitic output capacitance loss ( $P_{Qoss\_top}$ ) and gate drive loss ( $P_{Gate\_top}$ ). To calculate voltage and current overlap losses ( $P_{IV\_top}$ ):

$$P_{IV\_top} = 0.5x V_{IN} \cdot I_{valley} \cdot t_{on} \cdot f_s + 0.5x V_{IN} \cdot I_{peak} \cdot t_{off} \cdot f_s \quad (10)$$

$$I_{valley} = I_{L\_DC} - 0.5 \cdot I_{ripple} \text{ (inductor current valley value);} \quad (11)$$

$$I_{peak} = I_{L\_DC} + 0.5 \cdot I_{ripple} \text{ (inductor current peak value);} \quad (12)$$

- $t_{on}$  is the MOSFET turn-on time that  $V_{DS}$  falling time from  $V_{IN}$  to almost zero (MOSFET turn on conduction voltage);
- $t_{off}$  is the MOSFET turn-off time that  $I_{DS}$  falling time from  $I_{peak}$  to zero;

The MOSFET turn-on and turn-off times are given by:

$$t_{on} = \frac{Q_{SW}}{I_{on}}, \quad t_{off} = \frac{Q_{SW}}{I_{off}} \quad (13)$$

where  $Q_{SW}$  is the switching charge,  $I_{on}$  is the turn-on gate driving current, and  $I_{off}$  is the turn-off gate driving current. If the switching charge is not given in MOSFET datasheet, it can be estimated by gate-to-drain charge ( $Q_{GD}$ ) and gate-to-source charge ( $Q_{GS}$ ):

$$Q_{sw} = Q_{GD} + Q_{GS} \quad (14)$$

Gate driving current can be estimated by REGN voltage ( $V_{REGN}$ ), MOSFET plateau voltage ( $V_{plt}$ ), total turn-on gate resistance ( $R_{on}$ ), and turn-off gate resistance ( $R_{off}$ ) of the gate driver:

$$I_{on} = \frac{V_{REGN} - V_{plt}}{R_{on}}, \quad I_{off} = \frac{V_{plt}}{R_{off}} \quad (15)$$

To calculate top MOSFET parasitic output capacitance loss ( $P_{Qoss\_top}$ ):

$$P_{Qoss\_top} = 0.5 \cdot V_{IN} \cdot Q_{oss} \cdot f_s \quad (16)$$

- $Q_{oss}$  is the MOSFET parasitic output charge which can be found in MOSFET datasheet;

To calculate top MOSFET gate drive loss ( $P_{\text{Gate\_top}}$ ):

$$P_{\text{Gate\_top}} = V_{\text{IN}} \cdot Q_{\text{Gate\_top}} \cdot f_{\text{S}} \quad (17)$$

- $Q_{\text{Gate\_top}}$  is the top MOSFET gate charge which can be found in MOSFET datasheet;
- Note here  $V_{\text{IN}}$  is used instead of real gate drive voltage 6 V because, the gate drive 6 V is generated based on LDO from  $V_{\text{IN}}$  under buck mode, the total gate drive related loss are all considered when  $V_{\text{IN}}$  is used for gate drive loss calculation .

The bottom-side MOSFET loss also includes conduction loss and switching loss:

$$P_{\text{bottom}} = P_{\text{con\_bottom}} + P_{\text{sw\_bottom}} \quad (18)$$

$$P_{\text{con\_bottom}} = (1 - D) \cdot I_{\text{L\_RMS}}^2 \cdot R_{\text{DS(on)\_bottom}}; \quad (19)$$

$$P_{\text{sw\_bottom}} = P_{\text{RR\_bottom}} + P_{\text{Dead\_bottom}} + P_{\text{Gate\_bottom}}; \quad (20)$$

The first item  $P_{\text{con\_bottom}}$  represents the conduction loss which is straight forward. The second term  $P_{\text{sw\_bottom}}$  represents the multiple switching loss items in bottom MOSFET including reverse recovery losses ( $P_{\text{RR\_bottom}}$ ), Dead time body diode conduction loss ( $P_{\text{Dead\_bottom}}$ ) and gate drive loss ( $P_{\text{Gate\_bottom}}$ ). The detail calculation can be found below:

$$P_{\text{RR\_bottom}} = V_{\text{IN}} \cdot Q_{\text{rr}} \cdot f_{\text{S}} \quad (21)$$

- $Q_{\text{rr}}$  is the bottom MOSFET reverse recovery charge which can be found in MOSFET data sheet;

$$P_{\text{Dead\_bottom}} = V_{\text{F}} \cdot I_{\text{valley}} \cdot f_{\text{S}} \cdot t_{\text{dead\_rise}} + V_{\text{F}} \cdot I_{\text{peak}} \cdot f_{\text{S}} \cdot t_{\text{dead\_fall}} \quad (22)$$

- $V_{\text{F}}$  is the body diode forward conduction voltage drop;
- $t_{\text{dead\_rise}}$  is the SW rising edge deadtime between top and bottom MOSFETs which is around 40 ns;
- $t_{\text{dead\_fall}}$  is the SW falling edge deadtime between top and bottom MOSFETs which is around 30 ns;

$P_{\text{Gate\_bottom}}$  can follow the same method as top MOSFET gate drive loss calculation approach refer to [方程式 17](#).

P-channel MOSFETs is used for battery charging BATFET. The gate drivers are internally integrated into the IC with 10 V of gate drive voltage. 20 V or higher voltage rating MOSFETs are preferred for 1- to 4-cell battery application, 30 V or higher voltage rating MOSFETs are preferred for 5-cell battery application, the Ciss of P-channel MOSFET should be chosen less than 5 nF.

图 9-21. FRS Transition Waveform

## 10 Power Supply Recommendations

The valid adapter range is from 3.5 V ( $V_{VBUS\_CONVEN}$ ) to 26 V with at least 500-mA current rating. When CHRG\_OK goes HIGH, the system is powered from adapter through the charger. When adapter is removed, the system is connected to battery through BATFET. Typically the battery depletion threshold should be greater than the VSYS\_MIN so that the battery capacity can be fully utilized for maximum battery run time.

## 11 Layout

### 11.1 Layout Guidelines

Proper layout of the components to minimize high frequency current path loop (see 节 11.2) is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Here is a PCB layout priority list for proper layout.

表 11-1. PCB Layout Guidelines

RULES	COMPONENTS	FUNCTION	IMPACT	GUIDELINES
1		PCB layer stack up	Thermal, efficiency, signal integrity	Multi-layer PCB is suggested. Allocate at least one ground layer. The BQ257XXEVM uses a 4-layer PCB (top layer, ground layer, signal layer and bottom layer).
2	CBUS, RAC, Q1, Q2	Input loop	High frequency noise, ripple	VBUS capacitors, RAC, Q1 and Q2 form a small loop 1. It is best to put them on the same side. Connect them with large copper to reduce the parasitic resistance. Move part of CBUS to the other side of PCB for high density design. After RAC before Q1 and Q2 power stage recommend to put 10 nF + 1 nF (0402 package) decoupling capacitors as close as possible to IC to decoupling switching loop high frequency noise.
3	R <sub>AC</sub> , Q1, L1, Q4	Current path	Efficiency	The current path from VBUS to VSYS, through R <sub>AC</sub> , Q1, L1, Q4, has low impedance. Pay attention to via resistance if they are not on the same side. The number of vias can be estimated as 1 to 2A/via for a 10-mil via with 1 oz. copper thickness.
4	CSYS, Q3, Q4	Output loop	High frequency noise, ripple	VSYS capacitors, Q3 and Q4 form a small loop 2. It is best to put them on the same side. Connect them with large copper to reduce the parasitic resistance. Move part of CSYS to the other side of PCB for high density design.
5	QBAT, R <sub>SR</sub>	Current path	Efficiency, battery voltage detection	Place QBAT and R <sub>SR</sub> near the battery terminal. The current path from VBAT to VSYS, through R <sub>SR</sub> and QBAT, has low impedance. Pay attention to via resistance if they are not on the same side. The device detects the battery voltage through SRN near battery terminal.
6	Q1, Q2, L1, Q3, Q4	Power stage	Thermal, efficiency	Place Q1, Q2, L1, Q3 and Q4 next to each other. Allow enough copper area for thermal dissipation. The copper area is suggested to be 2x to 4x of the pad size. Multiple thermal vias can be used to connect more copper layers together and dissipate more heat.
7	R <sub>AC</sub> , R <sub>SR</sub>	Current sense	Regulation accuracy	Use Kelvin-sensing technique for R <sub>AC</sub> and R <sub>SR</sub> current sense resistors. Connect the current sense traces to the center of the pads, and run current sense traces as differential pairs.
8	Small capacitors	IC bypass caps	Noise, jittering, ripple	Place VBUS cap, VCC cap, REGN caps near IC.
9	BST capacitors	HS gate drive	High frequency noise, ripple	Place HS MOSFET boost strap circuit capacitor close to IC and on the same side of PCB board. Capacitors SW1/2 nodes are recommended to use wide copper polygon to connect to power stage and capacitors BST1/2 node are recommended to use at least 8mil trace to connected to IC BST1/2 pins.

表 11-1. PCB Layout Guidelines ( 续 )

RULES	COMPONENTS	FUNCTION	IMPACT	GUIDELINES
10		Ground partition	Measurement accuracy, regulation accuracy, jitters, ripple	Separate analog ground(AGND) and power grounds(PGND) is preferred. PGND should be used for all power stage related ground net. AGND should be used for all sensing, compensation and control network ground for example ACP/ACN/COMP1/COMP2/CMPIN/CMPOUT/IADPT/IBAT/PSYS. Connect all analog grounds to a dedicated low-impedance copper plane, which is tied to the power ground underneath the IC exposed pad. If possible, use dedicated COMP1, COMP2 AGND traces. Connect analog ground and power ground together using power pad as the single ground connection point.

## 11.2 Layout Example

### 11.2.1 Layout Example Reference Top View

Based on the above layout guidelines, the buck-boost charger layout example top view is shown below including all the key power components.

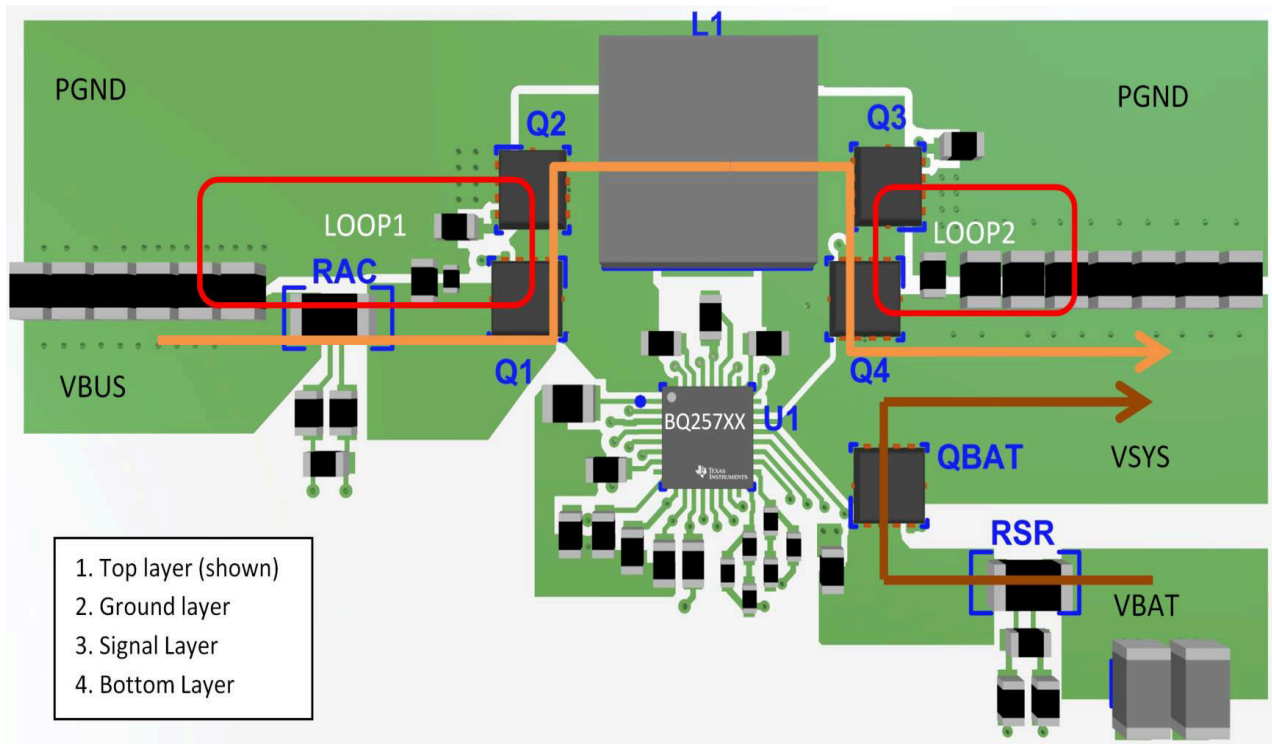

图 11-1. Buck-Boost Charger Layout Reference Example Top View

### 11.2.2 Inner Layer Layout and Routing Example

For both input sensing resistor and charging current sensing resistor, differential sensing and routing method are suggested and highlighted in below figure. Use wide trace for gate drive traces, minimum 15 mil trace width. Connect all analog grounds to a dedicated low-impedance copper plane, which is tied to the power ground underneath the IC exposed pad. Suggest using dedicated COMP1, COMP2 analog ground traces shown in below figure.

图 11-2. Buck-Boost Charger Gate Drive/Current Sensing/AGND Signal Layer Routing Example

## 12 Device and Documentation Support

### 12.1 Device Support

#### 12.1.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

### 12.2 Documentation Support

#### 12.2.1 Related Documentation

For related documentation see the following:

- [Semiconductor and IC Package Thermal Metrics Application Report](#)
- [BQ2571x Evaluation Module User's Guide](#)
- [QFN/SON PCB Attachment Application Report](#)

### 12.3 接收文档更新通知

要接收文档更新通知，请导航至 [ti.com](https://www.ti.com) 上的器件产品文件夹。点击 [通知](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

### 12.4 支持资源

[TI E2E™ 中文支持论坛](#) 是工程师的重要参考资料，可直接从专家处获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题，获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [使用条款](#)。

### 12.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

### 12.6 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

### 12.7 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

## 13 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision * (February 2021) to Revision A (January 2024)	Page
• 向特性中添加了 IEC 62368-1 CB 认证.....	1
• Changed pin name from OT/VAP/FRS to OTG/VAP/FRS in 表 6-1 .....	5
• Changed $V_{SYS\_MIN\_REG\_ACC}$ from REG0x3E to REG0x0D/0C in 节 7.5 .....	9
• Updated 节 8.3.5 .....	28
• Changed from REG0x15 to REG0x04 in 节 8.3.7 .....	29
• Changed < and > in 节 8.3.16.2 .....	32
• Changed from REG0x34 to REG0x38 and voltage rises above to voltage falls below in 节 8.3.20.1 .....	36
• Changed IIN_DPM() Description from 50 mA to 100 mA in 表 8-7 .....	44
• Updated WDTMR_ADJ and IIN_DPM_AUTO_DISABLE Descriptions in 表 8-8 .....	46
• Updated EN_CMP_LATCH and EN_LDO Descriptions in 表 8-9 .....	46
• Changed from REG0x15 to REG0x05/04 in 节 8.6.3 .....	51
• Changed from REG0x21 to REG0x22 in IN_VAP Description in 表 8-14 .....	53
• Deleted not from 1b in IN_IIN_DPM Description in 表 8-14 .....	53
• Changed from REG0x23[7,2],REG0x23[6:0] to REG0x22 and cleared to reset in 节 8.6.5 .....	55
• Changed from TSHUT to Reserved and updated STAT_EXIT_VAP Description in 表 8-16 .....	55
• Changed from 128mA to 256mA and REG0x14 to REG0x02 in AUTO_WAKEUP_EN Description in 表 8-29 ..	63
• Changed from Vmin Active Protection to VSYS_TH1 and from REG0x37 to REG0x36 in 节 8.6.14 .....	69
• Changed from 0x22H to 0x25/24 in ILIM2_VTH Description and from REG0x33 to REG0x36 in PROCHOT_VINDPM_80_90 Description in 表 8-34 .....	69
• Changed from REG0x3D to REG0x0B/0A in LOWER_PROCHOT_VINDPM Description in 表 8-35 .....	69
• Changed IDCHG_DEG1 Reset from 00b to 01b in 表 8-36 .....	71
• Changed from 0b to 1b in PP_VBUS_VAP Description in 表 8-40 .....	75
• Changed from REG37 to REG0x3E in EN_VSYSTH2_FOLLOW_VSYSTH1 Description in 表 8-43 .....	77
• Changed from REG0x09 to REG0x09/08 in 节 8.6.20 and values in bit descriptions in 表 8-46 .....	81
• Changed from REG0x3E to REG0x0D/0C in 节 8.6.22 .....	83
• Updated third paragraph in 节 8.6.23 .....	84

## 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">BQ25730RSNR</a>	Active	Production	QFN (RSN)   32	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25730
BQ25730RSNR.A	Active	Production	QFN (RSN)   32	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25730
BQ25730RSNRG4	Active	Production	QFN (RSN)   32	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25730
BQ25730RSNRG4.A	Active	Production	QFN (RSN)   32	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25730

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
