4 修订历史记录

Changes from Revision C (June 2017) to Revision D	Page
• Added device stamp to the TO-92 pinout top view	3
• Changed the TO-92S pin numbers in the <i>Pin Functions</i>	3

Changes from Revision B (April 2017) to Revision C	Page
• Removed <i>Electrical Characteristics: WSON/DQX</i> table; Combined the LPG and DQX <i>Electrical Characteristics</i> tables together	5
• Changed I_{OL} maximum value from: 39 μ A to: 40 μ A	5
• Changed leakage value from: 1 μ A to 3.5 μ A	5
• Moved the thermal response time parameters to the <i>Electrical Characteristics</i> table	5
• Added Missing Cross References	13

Changes from Revision A (June 2015) to Revision B	Page
• 已添加 全新 WSON/DQX 封装（整个数据表中）	1
• Changed updated package information.	3
• Added Electrical Characteristics - WSON/DQX Pulse Count to Temperature LUT	7
• Added -40 for Sample Calculations Table	14
• Added missing cross reference	15

Changes from Original (June 2015) to Revision A	Page
• 已添加 完整数据表。	1
• 已添加 澄清说明。	1

Pin Functions

NAME	PIN		TYPE	DESCRIPTION
	TO-92S	WSON		
VP	2	1	Input	Positive voltage pin; may be connected to system power supply or bias resistor.
VN	1	2	Output	Negative voltage pin; may be connected to system ground or a bias resistor.

6 Specifications

6.1 Absolute Maximum Ratings

 See ⁽¹⁾⁽²⁾.

	MIN	MAX	UNIT
Voltage drop (VP – VN)	–0.3	6	V
Storage temperature, T _{stg}	–65	175	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Soldering process must comply with Reflow Temperature Profile specifications. Refer to www.ti.com/packaging.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

	MIN	MAX	UNIT
Free-air temperature	–50	150	°C
Voltage drop (VP – VN)	2	5.5	V

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾	LMT01		UNIT
	DQX (WSON)	LPG (TO-92)	
	2 PINS	2 PINS	
R _{θJA} Junction-to-ambient thermal resistance	213	177	°C/W
R _{θJC(top)} Junction-to-case (top) thermal resistance	71	94	°C/W
R _{θJB} Junction-to-board thermal resistance	81	152	°C/W
ψ _{JT} Junction-to-top characterization parameter	2.4	33	°C/W
ψ _{JB} Junction-to-board characterization parameter	79	152	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics

Over operating free-air temperature range and operating VP-VN range (unless otherwise noted).

7 Detailed Description

7.1 Overview

The LMT01 temperature output is transmitted over a single wire using a train of current pulses that typically change from 34 μA to 125 μA . A simple resistor can then be used to convert the current pulses to a voltage. With a 10-k Ω resistor, the output voltage levels range from 340 mV to 1.25 V, typically. A simple microcontroller comparator or external transistor can be used convert this signal to valid logic levels the microcontroller can process properly through a GPIO pin. The temperature can be determined by gating a simple counter on for a specific time interval to count the total number of output pulses. After power is first applied to the device the current level will remain below 34 μA for at most 54 ms while the LMT01 is determining the temperature. When the temperature is determined, the pulse train begins. The individual pulse frequency is typically 88 kHz. The LMT01 will continuously convert and transmit data when the power is applied approximately every 104 ms (maximum).

The LMT01 uses thermal diode analog circuitry to detect the temperature. The temperature signal is then amplified and applied to the input of a $\Sigma\Delta$ ADC that is driven by an internal reference voltage. The $\Sigma\Delta$ ADC output is then processed through the interface circuitry into a digital pulse train. The digital pulse train is then converted to a current pulse train by the output signal conditioning circuitry that includes high and low current regulators. The voltage applied across the pins of the LMT01 is regulated by an internal voltage regulator to provide a consistent Chip V_{DD} that is used by the ADC and its associated circuitry.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Output Interface

The LMT01 provides a digital output in the form of a pulse count that is transmitted by a train of current pulses. After the LMT01 is powered up, it transmits a very low current of 34 μA for less than 54 ms while the part executes a temperature to digital conversion, as shown in [Figure 22](#). When the temperature-to-digital conversion is complete, the LMT01 starts to transmit a pulse train that toggles from the low current of 34 μA to a high current level of 125 μA . The pulse train total time interval is at maximum 50 ms. The LMT01 transmits a series of pulses equivalent to the pulse count at a given temperature as described in [Electrical Characteristics - TO-92/LPG Pulse Count to Temperature LUT](#). After the pulse count has been transmitted the LMT01 current level will remain low for the remainder of the 50 ms. The total time for the temperature to digital conversion and the pulse train time interval is 104 ms (maximum). If power is continuously applied, the pulse train output will repeat start every 104 ms (maximum).

Feature Description (continued)

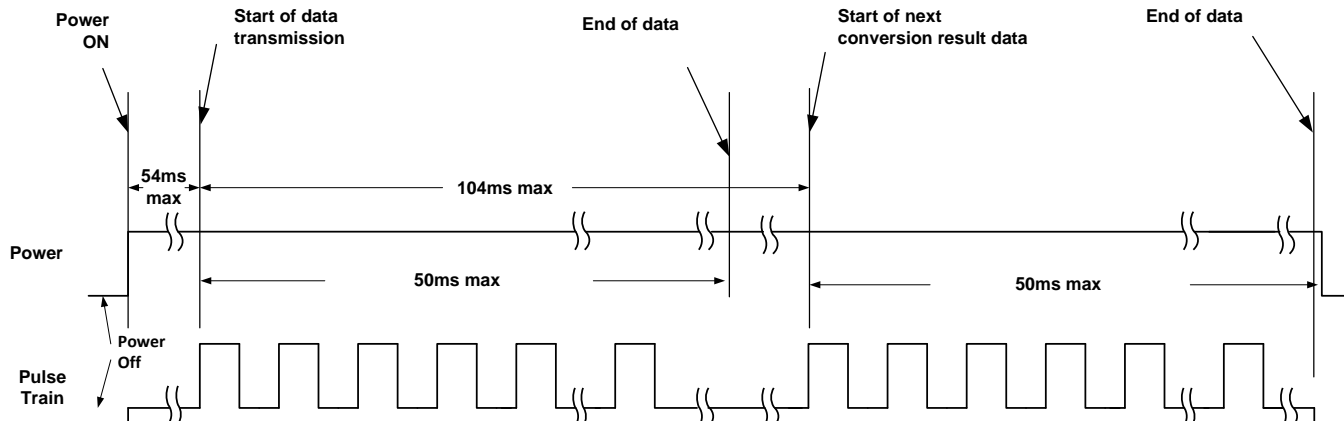

Figure 22. Temperature to Digital Pulse Train Timing Cycle

The LMT01 can be powered down at any time to conserve system power. Take care to ensure that a minimum power-down wait time of 50 ms is used before the device is turned on again.

7.3.2 Output Transfer Function

The LMT01 outputs at minimum 1 pulse and a theoretical maximum 4095 pulses. Each pulse has a weight of 0.0625°C. One pulse corresponds to a temperature less than -50°C while a pulse count of 4096 corresponds to a temperature greater than 200°C. Note that the LMT01 is only ensured to operate up to 150°C. Exceeding this temperature by more than 5°C may damage the device. The accuracy of the device degrades as well when 150°C is exceeded.

Two different methods of converting the pulse count to a temperature value are discussed in this section. The first method is the least accurate and uses a first order equation, and the second method is the most accurate and uses linear interpolation of the values found in the look-up table (LUT) as described in [Electrical Characteristics - TO-92/LPG Pulse Count to Temperature LUT](#).

The output transfer function appears to be linear and can be approximated by [Equation 1](#):

$$\text{Temp} = \left(\frac{\text{PC}}{4096} \times 256^\circ\text{C} \right) - 50^\circ\text{C}$$

where

- PC is the Pulse Count
- Temp is the temperature reading

(1)

Table 1 shows some sample calculations using [Equation 1](#).

Table 1. Sample Calculations Using [Equation 1](#)

TEMPERATURE (°C)	NUMBER OF PULSES
-49.9375	1
-49.875	2
-40	160
-20	480
0	800
30	1280
50	1600
100	2400
150	3200

The curve shown in [Figure 23](#) shows the output transfer function using [Equation 1](#) (blue line) and the look-up table (LUT) found in [Electrical Characteristics - TO-92/LPG Pulse Count to Temperature LUT](#) (red line). The LMT01 output transfer function as described by the LUT appears to be linear, but upon close inspection, it can be seen as truly not linear. To actually see the difference, the accuracy obtained by the two methods must be compared.

Figure 23. LMT01 Output Transfer Function

For more exact temperature readings the output pulse count can be converted to temperature using linear interpolation of the values found in [Electrical Characteristics - TO-92/LPG Pulse Count to Temperature LUT](#).

The curves in [Figure 24](#) and [Figure 25](#), show the accuracy of typical units when using the [Equation 1](#) and linear interpolation using [Electrical Characteristics - TO-92/LPG Pulse Count to Temperature LUT](#), respectively. When compared, the improved performance when using the LUT linear interpolation method can clearly be seen. For a limited temperature range of 25°C to 80°C, the error shown in [Figure 24](#) is flat, so the linear equation will provide good results. For a wide temperature range, TI recommends that linear interpolation and the LUT be used.

Figure 24. LMT01 Typical Accuracy When Using First Order Equation [Equation 1](#) – 92 Typical Units Plotted at (VP – VN) = 2.15 V

Figure 25. LMT01 Accuracy Using Linear Interpolation of LUT Found In [Electrical Characteristics - TO-92/LPG Pulse Count to Temperature LUT](#) – 92 typical units plotted at (VP – VN) = 2.15 V

7.3.3 Current Output Conversion to Voltage

The minimum voltage drop across the LMT01 must be maintained at 2.15 V during the conversion cycle. After the conversion cycle, the minimum voltage drop can decrease to 2.0 V. Thus the LMT01 can be used for low voltage applications. See [Application Information](#) for more information on low voltage operation and other information on picking the actual resistor value for different applications conditions. The resistor value is dependent on the power supply level and the variation and the threshold level requirements of the circuitry the resistor is driving (that is, MCU, GPIO, or Comparator).

LMT01

ZHCSE14D – JUNE 2015 – REVISED JUNE 2018

www.ti.com.cn

Stray capacitance can be introduced when connecting the LMT01 through a long wire. This stray capacitance influences the signal rise and fall times. The wire inductance has negligible effect on the AC signal integrity. A simple RC time constant model as shown in [Figure 26](#) can be used to determine the rise and fall times.

Figure 26. Simple RC Model for Rise and Fall Times

$$t_{HL} = R \times C \times \ln \left(\frac{V_F - V_S}{V_F - V_{HL}} \right)$$

where

- RC as shown in [Figure 26](#)
 - V_{HL} is the target high level
 - the final voltage $V_F = 125 \mu\text{A} \times R$
 - the start voltage $V_S = 34 \mu\text{A} \times R$
- (2)

For the 10% to 90% level rise time (t_r), [Equation 2](#) simplifies to:

$$t_r = R \times C \times 2.197$$

(3)

Take care to ensure that the LMT01 voltage drop does not exceed 300 mV under reverse bias conditions, as given in the [Absolute Maximum Ratings](#).

7.4 Device Functional Modes

The only functional mode the LMT01 has is that it provides a pulse count output that is directly proportional to temperature.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Mounting, Temperature Conductivity, and Self-Heating

The LMT01 can be applied easily in the same way as other integrated-circuit temperature sensors. It can be glued or cemented to a surface to ensure good temperature conductivity. The temperatures of the lands and traces to the leads of the LMT01 also affect the temperature reading, so they must be as thin as possible.

Alternatively, the LMT01 can be mounted inside a sealed-end metal tube, and then can be dipped into a bath or screwed into a threaded hole in a tank. As with any IC, the LMT01 and accompanying wiring and circuits must be kept insulated and dry to avoid excessive leakage and corrosion. Printed-circuit coatings are often used to ensure that moisture cannot corrode the leads or circuit traces.

The junction temperature of the LMT01 is the actual temperature being measured by the device. The thermal resistance junction-to-ambient ($R_{\theta JA}$) is the parameter (from [Thermal Information](#)) used to calculate the rise of a device junction temperature (self-heating) due to its average power dissipation. The average power dissipation of the LMT01 is dependent on the temperature it is transmitting as it effects the output pulse count and the voltage across the device. [Equation 4](#) is used to calculate the self-heating in the die temperature of the LMT01 (T_{SH}).

$$T_{SH} = \left[I_{OL} \times \frac{t_{CONV}}{(t_{CONV} + t_{DATA})} \times V_{CONV} \right] + \left[\left(\frac{PC}{4096} \times \frac{(I_{OL} + I_{OH})}{2} \right) + \left(\frac{(4096 - PC)}{4096} \times I_{OL} \right) \right] \times \frac{t_{DATA}}{(t_{CONV} + t_{DATA})} \times V_{DATA} \times R_{\theta JA}$$

where

- T_{SH} is the ambient temperature
- I_{OL} and I_{OH} are the output low and high current level, respectively
- V_{CONV} is the voltage across the LMT01 during conversion
- V_{DATA} is the voltage across the LMT01 during data transmission
- t_{CONV} is the conversion time
- t_{DATA} is the data transmission time
- PC is the output pulse count
- $R_{\theta JA}$ is the junction to ambient package thermal resistance (4)

Plotted in the curve [Figure 27](#) are the typical average supply current (black line using left y axis) and the resulting self-heating (red and violet lines using right y axis) during continuous conversions. A temperature range of -50°C to $+150^{\circ}\text{C}$, a V_{CONV} of 5 V (red line) and 2.15 V (violet line) were used for the self-heating calculation. As can be seen in the curve, the average power supply current and thus the average self-heating changes linearly over temperature because the number of pulses increases with temperature. A negligible self-heating of about $45\text{m}^{\circ}\text{C}$ is observed at 150°C with continuous conversions. If temperature readings are not required as frequently as every 100 ms, self-heating can be minimized by shutting down power to the part periodically thus lowering the average power dissipation.

Application Information (continued)

Figure 27. Average Current Draw and Self-Heating Over Temperature

8.2 Typical Application

8.2.1 3.3-V System VDD MSP430 Interface - Using Comparator Input

Figure 28. MSP430 Comparator Input Implementation

8.2.1.1 Design Requirements

The design requirements listed in are used in the detailed design procedure.

Table 2. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
VDD	3.3 V
VDD minimum	3.0 V
LMT01 VP – VN minimum during conversion	2.15 V
LMT01 VP – VN minimum during data transmission	2.0 V
Noise margin	50 mV minimum
Comparator input current over temperature range of interest	< 1 µA
Resistor tolerance	1%

8.2.1.2 Detailed Design Procedure

First, select the R and determine the maximum logic low voltage and the minimum logic high voltage while ensuring that when the LMT01 is converting, the minimum ($V_P - V_N$) requirement of 2.15 V is met.

- Select R using minimum $V_P - V_N$ during data transmission (2 V) and maximum output current of the LMT01 (143.75 μA)
 - $R = (3.0 \text{ V} - 2 \text{ V}) / 143.75 \mu\text{A} = 6.993 \text{ k}$ the closest 1% resistor is 6.980 k
 - 6.993 k is the maximum resistance so if using 1% tolerance resistor the actual resistor value needs to be 1% less than 6.993 k and 6.98 k is 0.2% less than 6.993 k thus 6.81 k must be used.
- Check to see if the 2.15-V minimum voltage during conversion requirement for the LMT01 is met with the maximum I_{OL} of 39 μA and maximum R of 6.81 k + 1%:
 - $V_{LMT01} = 3 \text{ V} - (6.81 \text{ k} \times 1.01) \times 39 \mu\text{A} = 2.73 \text{ V}$
- Find the maximum low level voltage range using the maximum R of 6.81 k and maximum I_{OL} of 39 μA :
 - $V_{RLmax} = (6.81 \text{ k} \times 1.01) \times 39 \mu\text{A} = 268 \text{ mV}$
- Find the minimum high level voltage using the minimum R of 6.81 k and minimum I_{OH} of 112.5 μA :
 - $V_{RHmin} = (6.81 \text{ k} \times 0.99) \times 112.5 \mu\text{A} = 758 \text{ mV}$

Now select the MSP430 comparator threshold voltage that enables the LMT01 to communicate to the MSP430 properly.

- The MSP430 voltage is selected by selecting the internal V_{REF} and then choosing the appropriate 1 of n/32 settings for n of 1 to 31.
 - $V_{MID} = (V_{RLmax} - V_{RHmin}) / 2 + V_{RHmin} = (758 \text{ mV} - 268 \text{ mV}) / 2 + 268 \text{ mV} = 513 \text{ mV}$
 - $n = (V_{MID} / V_{REF}) \times 32 = (0.513 / 2.5) \times 32 = 7$
- To prevent oscillation of the comparator, output hysteresis must be implemented. The MSP430 allows this by enabling different n for the rising edge and falling edge of the comparator output. For a falling comparator output transition, N must be set to 6.
- Determine the noise margin caused by variation in comparator threshold level. Even though the comparator threshold level theoretically is set to V_{MID} , the actual level varies from device to device due to V_{REF} tolerance, resistor divider tolerance, and comparator offset. For proper operation, the COMP_B worst case input threshold levels must be within the minimum high and maximum low voltage levels presented across R, V_{RHmin} and V_{RLmax} , respectively

$$V_{CHmax} = V_{REF} \times (1 + V_{REF_TOL}) \times \frac{(N + N_TOL)}{32} + COMP_OFFSET$$

where

- V_{REF} is the MSP430 COMP_B reference voltage for this example at 2.5 V
 - V_{REF_TOL} is the tolerance of the V_{REF} of 1% or 0.01,
 - N is the divisor for the MSP430 or 7
 - N_TOL is the tolerance of the divisor or 0.5
 - $COMP_OFFSET$ is the comparator offset specification or 10 mV
- (5)

$$V_{CLmin} = V_{REF} \times (1 - V_{REF_TOL}) \times \frac{(N - N_TOL)}{32} - COMP_OFFSET$$

where

- V_{REF} is the MSP430 COMP_B reference voltage for this example at 2.5 V,
 - V_{REF_TOL} is the tolerance of the V_{REF} of 1% or 0.01,
 - N is the divisor for the MSP430 for the hysteresis setting or 6,
 - N_TOL is the tolerance of the divisor or 0.5,
 - $COMP_OFFSET$ is the comparator offset specification or 10 mV
- (6)

The noise margin is the minimum of the two differences:

$$(V_{RHmin} - V_{CHmax}) \text{ or } (V_{CHmin} - V_{RLmax})$$
(7)

which works out to be 145 mV.

Figure 29. Pulse Count Signal Amplitude Variation

8.2.1.2.1 Setting the MSP430 Threshold and Hysteresis

The comparator hysteresis determines the noise level that the signal can support without causing the comparator to trip falsely and resulting in an inaccurate pulse count. The comparator hysteresis is set by the precision of the MSP430 and what thresholds it is capable of. For this case, as the input signal transitions high, the comparator threshold is dropped by 77 mV. If the noise on the signal is kept below this level as it transitions, the comparator will not trip falsely. In addition, the MSP430 has a digital filter on the COMP_B output that be used to further filter output transitions that occur too quickly.

8.2.1.3 Application Curves

8.3 System Examples

The LMT01 device can be configured in a number of ways. Transistor level shifting can be used so that the output pulse of the device can be read with a GPIO (see Figure 32). An isolation block can be inserted to achieve electrical isolation (see Figure 33). Multiple LMT01 devices can be controlled with GPIOs enabling temperature monitor for multiple zones. Lastly, the LMT01 device can be configured to have a common ground with a high side signal (see Figure 35).

System Examples (continued)

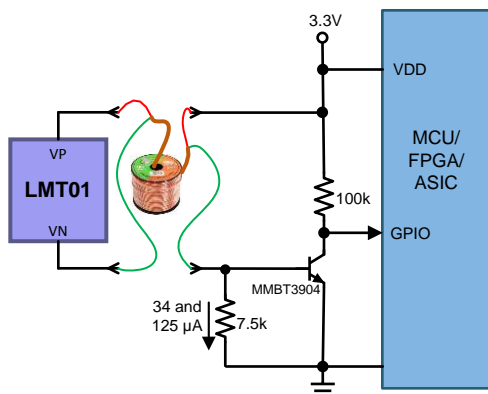

Figure 32. Transistor Level Shifting

Figure 33. Isolation

Note: to turn off an LMT01 set the GPIO pin connected to VP to high impedance state as setting it low would cause the off LMT01 to be reverse biased. Comparator input of MCU must be used.

Figure 34. Connecting Multiple Devices to One MCU Input Pin

System Examples (continued)

Note: the VN of the LMT01 must be connected to the MCU GND.

Figure 35. Common Ground With High-Side Signal

9 Power Supply Recommendations

Because the LMT01 is only a 2-pin device the power pins are common with the signal pins, thus the LMT01 has a floating supply that can vary greatly. The LMT01 has an internal regulator that provides a stable voltage to internal circuitry.

Take care to prevent reverse biasing of the LMT01 as exceeding the absolute maximum ratings may cause damage to the device.

Power supply ramp rate can effect the accuracy of the first result transmitted by the LMT01. As shown in Figure 36 with a 1-ms rise time, the LMT01 output code is at 1286, which converts to 30.125°C. The scope photo shown in Figure 37 reflects what happens when the rise time is too slow. In Figure 37, the power supply (yellow trace) is still ramping up to final value while the LMT01 (red trace) has already started a conversion. This causes the output pulse count to decrease from the previously shown 1286, to 1282 (or 29.875°C). Thus, for slow ramp rates, TI recommends that the first conversion be discarded. For even slower ramp rates, more than one conversion may have to be discarded as TI recommends that either the power supply be within final value before a conversion is used or that ramp rates be faster than 2.5 ms.

10 Layout

10.1 Layout Guidelines

The LMT01 can be mounted to a PCB as shown in [Figure 38](#) and [Figure 39](#). Take care to make the traces leading to the pads as small as possible to minimize their effect on the temperature the LMT01 is measuring.

11 器件和文档支持

11.1 接收文档更新通知

要接收文档更新通知，请导航至 TI.com.cn 上的器件产品文件夹。单击右上角的 [通知我](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

11.2 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [《使用条款》](#)。

TI E2E™ 在线社区 [TI 的工程师对工程师 \(E2E\) 社区](#)。此社区的创建目的在于促进工程师之间的协作。在 e2e.ti.com 中，您可以咨询问题、分享知识、拓展思路并与同行工程师一道帮助解决问题。

设计支持 [TI 参考设计支持](#) 可帮助您快速查找有帮助的 E2E 论坛、设计支持工具以及技术支持的联系信息。

11.3 商标

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.4 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
