

# 具有开漏和推挽输出的 LMV7235 和 LMV7239 75ns、超低功耗、低压、轨至轨输入比较器

## 1 特性

- $V_S = 5V$ ,  $T_A = 25^\circ C$  (典型值, 除非另有说明)
- 传播延迟: 75ns
- 低电源电流: 65 $\mu A$
- 轨至轨输入
- 开漏和推挽输出
- 非常适合 2.7V 和 5V 单电源应用
- 采用节省空间的封装:
  - 5 引脚 SOT-23
  - 5 引脚 SC70

## 2 应用

- 便携式和电池供电类系统
- 机顶盒
- 高速差分线路接收器
- 窗口比较器
- 过零检测器
- 高速采样电路

## 3 说明

LMV7235 和 LMV7239 是 75ns 超低功耗低压比较器。这些器件可在 2.7V 至 5.5V 的完整电源电压范围内正常运行。这些器件可实现 75ns 的传播延迟, 而在 5V 电压下仅消耗 65 $\mu A$  的电源电流。

LMV7235 和 LMV7239 具有更大的轨至轨共模电压范围。输入共模电压范围可基于地电压向下扩展 200mV 并基于电源电压向上扩展 200mV, 从而允许接地感应和电源感应。

LMV7235 具有开漏输出。通过连接一个外部电阻器, 该比较器的输出可以用作电平转换器。

LMV7239 具有推挽式输出级。凭借此特性, 器件无需外部上拉电阻器即可运行。

LMV7235 和 LMV7239 采用 5 引脚 SC70 和 5 引脚 SOT-23 封装, 因此非常适合需要小尺寸和低功耗特性的系统。

器件信息(1)

器件型号	封装	封装尺寸 (标称值)
LMV7235、 LMV7239	SOT-23 (5)	2.90mm × 1.60mm
	SC70 (5)	2.00mm × 1.25mm

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Differential Input Voltage		± Supply Voltage	V
Output Short Circuit Duration		See <sup>(2)</sup>	
Supply Voltage (V <sup>+</sup> - V <sup>-</sup> )		6	V
<b>SOLDERING INFORMATION</b>			
Infrared or Convection (20 sec)		235	°C
Wave Soldering (10 sec)		260 (lead temp)	°C
Voltage at Input/Output Pins		(V <sup>+</sup> ) +0.3, (V <sup>-</sup> ) -0.3	V
Current at Input Pin <sup>(3)</sup>		±10	mA
Storage Temperature, T <sub>stg</sub>	-65	150	°C
Junction Temperature, T <sub>j</sub>		150	°C

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of ±30mA over long term may adversely affect reliability.
- (3) Limiting input pin current is only necessary for input voltages that exceed absolute maximum input voltage ratings.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1000	V
	Machine model (MM)	±100	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.

### 6.3 Recommended Operating Conditions

	MIN	MAX	UNIT
Supply Voltages (V <sup>+</sup> - V <sup>-</sup> )	2.7	5.5	V
Temperature Range <sup>(1)</sup>	-40	85	°C

- (1) The maximum power dissipation is a function of T<sub>J(MAX)</sub>, θ<sub>JA</sub>. The maximum allowable power dissipation at any ambient temperature is P<sub>D</sub> = (T<sub>J(MAX)</sub> - T<sub>A</sub>) / θ<sub>JA</sub>. All numbers apply for packages soldered directly onto a PCB.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	LMV7235, LMV7239		UNIT
	DGK (SC70)	DBV (SOT-23)	
	5 PINS	5 PINS	
R <sub>θJA</sub> Junction-to-ambient thermal resistance	478	265	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics, 2.7 V

Unless otherwise specified, all limits ensured for  $T_A = 25^\circ\text{C}$ ,  $V_{CM} = V^+/2$ ,  $V^+ = 2.7\text{ V}$ ,  $V^- = 0\text{ V}$ .

PARAMETER		TEST CONDITIONS	MIN <sup>(1)</sup>	TYP <sup>(2)</sup>	MAX <sup>(1)</sup>	UNIT
$V_{OS}$	Input Offset Voltage		-6	±0.8	+6	mV
		At temp extremes	-8		+8	
$I_B$	Input Bias Current			30	400	nA
		At temp extremes			600	
$I_{OS}$	Input Offset Current			5	200	nA
		At temp extremes			400	
CMRR	Common-Mode Rejection Ratio	$0\text{ V} < V_{CM} < 2.7\text{ V}^{(3)}$	52	62		dB
PSRR	Power Supply Rejection Ratio	$V^+ = 2.7\text{ V}$ to $5\text{ V}$	65	85		dB
$V_{CM}$	Input Common-Mode Voltage Range	CMRR > 50 dB	$V^- - 0.1$	$-0.2$ to $2.9$	$V^+ + 0.1$	V
		At temp extremes	$V^-$		$V^+$	
$V_O$	Output Swing High (LMV7239 only)	$I_L = 4\text{ mA}$ , $V_{ID} = 500\text{ mV}$	$V^+ - 0.35$	$V^+ - 0.26$		V
		$I_L = 0.4\text{ mA}$ , $V_{ID} = 500\text{ mV}$		$V^+ - 0.02$		V
	Output Swing Low	$I_L = -4\text{ mA}$ , $V_{ID} = -500\text{ mV}$		230	350	mV
		At temp extremes			450	
		$I_L = -0.4\text{ mA}$ , $V_{ID} = -500\text{ mV}$		15		
$I_{SC}$	Output Short Circuit Current	Sourcing, $V_O = 0\text{ V}$ (LMV7239 only)		15		mA
		Sinking, $V_O = 2.7\text{ V}$ (LMV7235, $R_L = 10\text{ k}$ )		20		mA
$I_S$	Supply Current	No load		52	85	μA
		At temp extremes			100	
$t_{PD}$	Propagation Delay	Overdrive = 20 mV $C_{LOAD} = 15\text{ pF}^{(4)}$		96		ns
		Overdrive = 50 mV $C_{LOAD} = 15\text{ pF}^{(4)}$		87		ns
		Overdrive = 100 mV $C_{LOAD} = 15\text{ pF}^{(4)}$		85		ns
$t_{SKEW}$	Propagation Delay Skew (LMV7239 only)	Overdrive = 20 mV <sup>(5)</sup>		2		ns
$t_r$	Output Rise Time	LMV7239/LMV7239Q 10% to 90%		1.7		ns
		LMV7235 10% to 90% <sup>(4)</sup>		112		ns
$t_f$	Output Fall Time	90% to 10%		1.7		ns
$I_{LEAKAGE}$	Output Leakage Current (LMV7235 only)			3		nA

(1) All limits are ensured by testing or statistical analysis.

(2) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not guaranteed on shipped production material.

(3) CMRR is not linear over the common mode range. Limits are guaranteed over the worst case from 0 to  $V_{CC/2}$  or  $V_{CC/2}$  to  $V_{CC}$ .

(4) A 10k pullup resistor was used when measuring the LMV7235. The rise time of the LMV7235 is a function of the R-C time constant.

(5) Propagation Delay Skew is defined as the absolute value of the difference between  $t_{PDLH}$  and  $t_{PDHL}$ .

## 6.6 Electrical Characteristics, 5 V

Unless otherwise specified, all limits ensured for  $T_A = 25^\circ\text{C}$ ,  $V_{CM} = V^+/2$ ,  $V^+ = 5\text{ V}$ ,  $V^- = 0\text{ V}$ .

PARAMETER		TEST CONDITIONS	MIN <sup>(1)</sup>	TYP <sup>(2)</sup>	MAX <sup>(1)</sup>	UNIT
$V_{OS}$	Input Offset Voltage		-6	±1	+6	mV

## 7 Detailed Description

### 7.1 Overview

The LMV7235 and LMV7239 are ultra low power, low voltage, 75-ns comparators. They are ensured to operate over the full supply voltage range of 2.7 V to 5.5 V. These devices achieve a 75-ns propagation delay while consuming only 65  $\mu$ A of supply current at 5 V.

The LMV7235 and LMV7239 have a greater than rail-to-rail common-mode voltage range. The input common-mode voltage range extends 200 mV below ground and 200 mV above supply, allowing both ground and supply sensing.

### 7.2 Functional Block Diagram

**Figure 16. Simplified Schematic of LMV7239**

### 7.3 Feature Description

#### 7.3.1 Input Stage

The LMV7235 and LMV7239 are rail-to-rail input and output. The typical input common-mode voltage range of  $-0.2$  V below the ground to  $0.2$  V above the supply. The LMV7235 and LMV7239 use a complimentary PNP and NPN input stage in which the PNP stage senses common-mode voltage near  $V^-$  and the NPN stage senses common-mode voltage near  $V^+$ . If either of the input signals falls below the negative common mode limit, the parasitic PN junction formed by the substrate and the base of the PNP will turn on resulting in an increase of input bias current.

If one of the inputs goes above the positive common mode limit, the output will still maintain the correct logic level as long as the other input stays within the common mode range. However, the propagation delay will increase. When both inputs are outside the common-mode voltage range, current saturation occurs in the input stage, and the output becomes unpredictable.

The propagation delay does not increase significantly with large differential input voltages. However, large differential voltages greater than the supply voltage should be avoided to prevent damage to the input stage.

#### 7.3.2 Output Stage: LMV7239

The LMV7239 has a push-pull output. When the output switches, there is a low resistance path between  $V_{CC}$  and ground, causing high output sinking or sourcing current during the transition.

## Feature Description (continued)

Figure 17. LMV7239 Push-Pull Output Stage

### 7.3.3 Output Stage: LMV7235

The LMV7235 has an open drain that requires a pull-up resistor to a positive supply voltage for the output to switch properly. The internal circuitry is identical to the LMV7239 except that the upper P channel output device M4 is absent in the [Functional Block Diagram](#) above. When the internal output transistor is off, the output voltage will be pulled up to the external positive voltage by the external pull-up resistor. This allows the output to be OR'ed with other open drain outputs on the same bus. The output pull-up resistor can be connected to any voltage level between V- and V+ for level shifting applications.

Figure 18. LMV7235 Open Drain Output

## 7.4 Device Functional Modes

### 7.4.1 Capacitive and Resistive Loads

The propagation delay on the rising edge of the LMV7235 depends on the load resistance and capacitance values.

### 7.4.2 Noise

Most comparators have rather low gain. This allows the output to spend time between high and low when the input signal changes slowly. The result is the output may oscillate between high and low when the differential input is near zero. The high gain of this comparator eliminates this problem. Less than 1  $\mu\text{V}$  of change on the input will drive the output from one rail to the other rail. If the input signal is noisy, the output cannot ignore the noise unless some hysteresis is provided by positive feedback. (See [Hysteresis](#).)

### 7.4.3 Hysteresis

To improve propagation delay when low overdrive is needed hysteresis can be added.

## Device Functional Modes (continued)

### 7.4.3.1 Inverting Comparator With Hysteresis

The inverting comparator with hysteresis requires a three resistor network that is referenced to the supply voltage  $V^+$  of the comparator as shown in Figure 19. When  $V_{IN}$  at the inverting input is less than  $V_A$ , the voltage at the noninverting node of the comparator ( $V_{IN} < V_A$ ), the output voltage is high (for simplicity assume  $V_O$  switches as high as  $V^+$ ). The three network resistors can be represented as  $R_1 // R_3$  in series with  $R_2$ .

**Figure 19. Inverting Comparator With Hysteresis**

The lower input trip voltage  $V_{A1}$  is defined as:

$$V_{A1} = V_{CC} R_2 / [(R_1 // R_3) + R_2] \quad (1)$$

When  $V_{IN}$  is greater than  $V_{A1}$ , the output voltage is low or very close to ground. In this case the three network resistors can be presented as  $R_2 // R_3$  in series with  $R_1$ .

The upper trip voltage  $V_{A2}$  is defined as:

$$V_{A2} = V_{CC} (R_2 // R_3) / [(R_1) + (R_2 // R_3)] \quad (2)$$

The total hysteresis provided by the network is defined as  $\Delta V_A = V_{A1} - V_{A2}$ .

$$\Delta V_A = \frac{+V_{CC} R_1 R_2}{R_1 R_2 + R_1 R_3 + R_2 R_3} \quad (3)$$

### 7.4.3.2 Non-Inverting Comparator With Hysteresis

A noninverting comparator with hysteresis requires a two resistor network, and a voltage reference ( $V_{REF}$ ) at the inverting input. When  $V_{IN}$  is low, the output is also low. For the output to switch from low to high,  $V_{IN}$  must rise up to  $V_{IN1}$  where  $V_{IN1}$  is calculated by:

$$\Delta V_{IN1} = \frac{V_{REF} (R_1 + R_2)}{R_2} \quad (4)$$

As soon as  $V_O$  switches to  $V_{CC}$ ,  $V_A$  steps to a value greater than  $V_{REF}$  which is given by:

**Device Functional Modes (continued)**

$$V_A = V_{IN} + \frac{(V_{CC} - V_{IN1})R_1}{R_1 + R_2} \tag{5}$$

To make the comparator switch back to its low state,  $V_{IN}$  must equal  $V_{REF}$  before  $V_A$  will again equal  $V_{REF}$ .  $V_{IN2}$  can be calculated by:

$$V_{IN2} = \frac{V_{REF}(R_1 + R_2) - V_{CC} R_1}{R_2} \tag{6}$$

The hysteresis of this circuit is the difference between  $V_{IN1}$  and  $V_{IN2}$ .

$$\Delta V_{IN} = V_{CC}R_1 / R_2 \tag{7}$$

**Figure 20. Noninverting Comparator With Hysteresis**

**Figure 21. Noninverting Comparator Thresholds**

**7.4.4 Zero Crossing Detector**

In a zero crossing detector circuit, the inverting input is connected to ground and the noninverting input is connected to a 100 mV<sub>PP</sub> AC signal. As the signal at the noninverting input crosses 0V, the comparator’s output changes state.

**Figure 22. Simple Zero Crossing Detector**

**7.4.4.1 Zero Crossing Detector With Hysteresis**

To improve switching times and centering the input threshold to ground a small amount of positive feedback is added to the circuit. Voltage divider  $R_4$  and  $R_5$  establishes a reference voltage,  $V_1$ , at the positive input. By making the series resistance,  $R_1$  plus  $R_2$  equal to  $R_5$ , the switching condition,  $V_1 = V_2$ , will be satisfied when  $V_{IN} = 0$ .

The positive feedback resistor,  $R_6$ , is made very large with respect to  $R_5 \parallel R_6 = 2000 R_5$ ). The resultant hysteresis established by this network is very small ( $\Delta V_1 < 10$  mV) but it is sufficient to insure rapid output voltage transitions.

## Device Functional Modes (continued)

Diode  $D_1$  is used to ensure that the inverting input terminal of the comparator never goes below approximately  $-100$  mV. As the input terminal goes negative,  $D_1$  will forward bias, clamping the node between  $R_1$  and  $R_2$  to approximately  $-700$  mV. This sets up a voltage divider with  $R_2$  and  $R_3$  preventing  $V_2$  from going below ground. The maximum negative input overdrive is limited by the current handling ability of  $D_1$ .

**Figure 23. Zero Crossing Detector With Hysteresis**

### 7.4.5 Threshold Detector

Instead of tying the inverting input to  $0$  V, the inverting input can be tied to a reference voltage. As the input on the noninverting input passes the  $V_{REF}$  threshold, the comparator's output changes state. It is important to use a stable reference voltage to ensure a consistent switching point.

**Figure 24. Threshold Detector**

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LMV7235 and LMV7239 are single supply comparators with 75 ns of propagation delay and only 65  $\mu$ A of supply current.

### 8.2 Typical Applications

#### 8.2.1 Square Wave Oscillator

Figure 25. Square Wave Oscillator

##### 8.2.1.1 Design Requirements

A typical application for a comparator is as a square wave oscillator. The circuit in Figure 25 generates a square wave whose period is set by the RC time constant of the capacitor  $C_1$  and resistor  $R_4$ .

##### 8.2.1.2 Detailed Design Procedure

The maximum frequency is limited by the large signal propagation delay of the comparator and by the capacitive loading at the output, which limits the output slew rate.

Figure 26. Square Wave Oscillator Timing Thresholds

Consider the output of Figure 25 to be high to analyze the circuit. That implies that the inverted input ( $V_C$ ) is lower than the noninverting input ( $V_A$ ). This causes the  $C_1$  to be charged through  $R_4$ , and the voltage  $V_C$  increases until it is equal to the noninverting input. The value of  $V_A$  at this point is:

$$V_{A1} = \frac{V_{CC} \cdot R_2}{R_2 + R_1 \parallel R_3} \quad (8)$$

If  $R_1 = R_2 = R_3$ , then  $V_{A1} = 2 V_{CC}/3$

## Typical Applications (continued)

At this point the comparator switches pulling down the output to the negative rail. The value of  $V_A$  at this point is:

$$V_{A2} = \frac{V_{CC}(R_2 \parallel R_3)}{R_1 + (R_2 \parallel R_3)} \quad (9)$$

If  $R_1 = R_2 = R_3$ , then  $V_{A2} = V_{CC}/3$ .

The capacitor  $C_1$  now discharges through  $R_4$ , and the voltage  $V_C$  decreases until it is equal to  $V_{A2}$ , at which point the comparator switches again, bringing it back to the initial stage. The time period is equal to twice the time it takes to discharge  $C_1$  from  $2V_{CC}/3$  to  $V_{CC}/3$ , which is given by  $R_4 C_1 \ln 2$ . Hence the formula for the frequency is:

$$F = 1/(2 \cdot R_4 \cdot C_1 \cdot \ln 2) \quad (10)$$

The LMV7239 should be used for a symmetrical output. The LMV7235 will require a pullup resistor on the output to function, and will have a slightly asymmetrical output due to the reduced sourcing current.

### 8.2.1.3 Application Curves

Figure 27 shows the simulated results of an oscillator using the following values:

1.  $R_1 = R_2 = R_3 = R_4 = 100 \text{ k}\Omega$
2.  $C_1 = 100 \text{ pF}$ ,  $C_L = 20 \text{ pF}$
3.  $V_+ = 5 \text{ V}$ ,  $V_- = \text{GND}$
4.  $C_{\text{STRAY}}$  (not shown) from  $V_a$  to  $\text{GND} = 10 \text{ pF}$

**Figure 27. Square Wave Oscillator Output Waveform**

### 8.2.2 Crystal Oscillator

A simple crystal oscillator using the LMV7235 or LMV7239 is shown in Figure 28. Resistors  $R_1$  and  $R_2$  set the bias point at the comparator's noninverting input. Resistors,  $R_3$  and  $R_4$  and capacitor  $C_1$  set the inverting input node at an appropriate DC average level based on the output. The crystal's path provides resonant positive feedback and stable oscillation occurs. The output duty cycle for this circuit is roughly 50%, but it is affected by resistor tolerances and to a lesser extent by the comparator

## Typical Applications (continued)

Figure 28. Crystal Oscillator

### 8.2.3 Infrared (IR) Receiver

The LMV7235 and LMV7239 can also be used as an infrared receiver. The infrared photo diode creates a current relative to the amount of infrared light present. The current creates a voltage across  $R_D$ . When this voltage level crosses the voltage applied by the voltage divider to the inverting input, the output transitions.

Figure 29. IR Receiver

### 8.2.4 Window Detector

Figure 30. Window Detector

A window detector monitors the input signal to determine if it falls between two voltage levels. Both outputs are true (high) when  $V_{REF1} < V_{IN} < V_{REF2}$

**Typical Applications (continued)**

**Figure 31. Window Detector Output Signal**

The comparator outputs A and B are high only when  $V_{REF1} < V_{IN} < V_{REF2}$ , or "within the window", where these are defined as:

$$V_{REF1} = R_3 / (R_1 + R_2 + R_3) \times V_+ \quad (11)$$

$$V_{REF2} = (R_2 + R_3) / (R_1 + R_2 + R_3) \times V_+ \quad (12)$$

To determine if the input signal falls outside of the two voltage levels, both inputs on each comparators can be reversed to invert the logic.

The LMV7235 with an open drain output should be used if the outputs are to be tied together for a common logic output.

Other names for window detectors are: threshold detector, level detector, and amplitude trigger or detector.

## 9 Power Supply Recommendations

To minimize supply noise, power supplies should be decoupled by a 0.01- $\mu$ F ceramic capacitor in parallel with a 10- $\mu$ F capacitor.

Due to the nanosecond edges on the output transition, peak supply currents will be drawn during the time the output is transitioning. Peak current depends on the capacitive loading on the output. The output transition can cause transients on poorly bypassed power supplies. These transients can cause a poorly bypassed power supply to "ring" due to trace inductance and low self-resonance frequency of high ESR bypass capacitors.

Treat the LMV7235 and LMV72391 as high-speed devices. Keep the ground paths short and place small (low ESR ceramic) bypass capacitors directly between the  $V_+$  and  $V_-$  pins.

Output capacitive loading and output toggle rate will cause the average supply current to rise over the quiescent current.

## 10 Layout

### 10.1 Layout Guidelines

Proper grounding and the use of a ground plane will help to ensure the specified performance of the LMV7235 and LMV72391. Minimizing trace lengths, reducing unwanted parasitic capacitance and using surface-mount components will also help. Comparators are very sensitive to input noise.

The LMV7235 and LMV72391 require a high-speed layout. Follow these layout guidelines:

1. Use printed-circuit board with a good, unbroken low-inductance ground plane.
2. Place a decoupling capacitor (0.1- $\mu$ F, ceramic surface-mount capacitor) as close as possible to  $V_{CC}$  pin.
3. On the inputs and the output, keep lead lengths as short as possible to avoid unwanted parasitic feedback around the comparator. Keep inputs away from output.
4. Solder the device directly to the printed-circuit board rather than using a socket.
5. For slow moving input signals, take care to prevent parasitic feedback. A small capacitor (1000 pF or less) placed between the inputs can help eliminate oscillations in the transition region. This capacitor causes some degradation to  $t_{PD}$  when the source impedance is low.
6. The top-side ground plane runs between the output and inputs.
7. Ground trace from the ground pin runs under the device up to the bypass capacitor, shielding the inputs from the outputs.

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范, 并且不一定反映 TI 的观点; 请参阅 TI 的 [《使用条款》](#)。

**TI E2E™ 在线社区** *TI 的工程师对工程师 (E2E) 社区*。此社区的创建目的在于促进工程师之间的协作。在 [e2e.ti.com](http://e2e.ti.com) 中, 您可以咨询问题、分享知识、拓展思路并与同行工程师一道帮助解决问题。

**设计支持** *TI 参考设计支持* 可帮助您快速查找有帮助的 E2E 论坛、设计支持工具以及技术支持的联系信息。

### 11.6 商标

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.7 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序, 可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级, 大至整个器件故障。精密的集成电路可能更容易受到损坏, 这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
