

LP5811 具有自主控制功能的同步升压 4 通道 RGBW LED 驱动器

1 特性

- 工作电压范围：
 - 输入电压 (V_{IN}) 范围：0.5V 至 5.5V
 - 启动时的最小输入电压为 1.8V
 - 逻辑引脚兼容 1.8V、3.3V 和 5V 电压
- 高效同步升压转换器
 - 输出电压 (V_{OUT}) 范围：3V 至 5.5V
 - 140m Ω (HS)/60m Ω (LS) MOSFET
 - 1.6A 谷值开关电流限值
 - $V_{IN} = 4.2V$ 、 $V_{OUT} = 5.0V$ 且 $I_{OUT} = 300mA$ 时效率为 95%
 - $V_{IN} > V_{OUT}$ 设置时进入直通模式
 - 在关断期间真正断开输入域输出之间的连接
- 4 个高精度恒定电流阱：
 - 每个电流阱为 0.1mA 至 51mA
 - 器件间误差：最大 $\pm 5\%$
 - 通道间误差：最大 $\pm 5\%$
 - 超低余量电压：25.5mA 时为 110mV (典型值)；51mA 时为 210mV (典型值)
 - 可为每个 LED 配置 PWM 相移
- 超低功耗：
 - 关断：当 EN 为低电平时， $I_{SD} = 0.1 \mu A$ (典型值)
 - 待机：当 EN 为高电平且 CHIP_EN 为 0 (保留数据) 时， $I_{STB} = 26 \mu A$ (典型值)
 - 有效：当 LED 电流为 25.5mA 时， $I_{NOR} = 0.45mA$ (典型值)
- 模拟调光 (电流增益控制)
 - 全局 1 位最大电流 (MC)：25.5 mA 或 51 mA
 - 单独 8 位点电流 (DC) 设置
- PWM 调光频率高达 24kHz，无可闻噪声
 - 单独的 8 位 PWM 调光分辨率
 - 线性或指数调光曲线
- 自主动画引擎控制
- 针对各个 LED 点进行开路/短路检测
- 集成的重影消除功能
- 1MHz (最大值) I²C 接口
- 工作温度范围：-40°C 至 85°C

2 应用

用于以下设备的 LED 动画和指示：

- 便携式和可穿戴电子产品 - 耳塞和充电盒、电子烟、智能手表
- 游戏和家庭娱乐 - 智能扬声器、RGB 鼠标、VR 耳机和控制器
- 物联网 (IOT) - 电子标签、可视门铃

- 网络 - 路由器、接入点
- 工业 HMI - 电动汽车充电器、工厂自动化

3 说明

LP5811 是一款具有自主动画引擎控制功能的同步升压 4 通道 RGBW LED 驱动器。该器件非常适合支持输入电压范围为 0.5V 至 5.5V 的电池供电应用，并且在点亮 LED 时具有 0.4mA (典型值) 的超低正常工作电流。

集成式同步升压转换器可保持出色的效率，并在宽工作电压范围内保持 LED 亮度稳定。可为不同的 LED 正向电压选择输出电压，范围为 3V 至 5.5V，阶跃为 0.1V。升压转换器不仅可为器件本身驱动的 LED 供电，还可为系统中的其他负载供电。如需绕过升压转换器， V_{OUT} 将用作 LED 驱动器块的电源输入。

该器件采用模拟调光和 PWM 调光两种方法实现强大的调光性能。每个 LED 的输出电流可在 0.1mA 至 25.5mA 或 0.2mA 至 51mA 之间以 256 个阶跃进行调节。8 位 PWM 发生器可对 LED 亮度进行平滑且无可闻噪声的调光控制。

自主动画引擎可以显著减少控制器的实时负载。每个 LED 都可通过相关寄存器进行配置，从而实现生动绚丽的照明效果。该器件可生成 6MHz 时钟信号，并将其用于同步多个器件之间的照明效果。

封装信息

图 6-2. LP5811 DRR Package 12-Pin WSON Top View

表 6-1. Pin Functions

PIN			TYPE ⁽¹⁾	DESCRIPTION
NAME	YBH	DRR		
EN	A1	11	I	Enable signal for the integrated boost converter.
VIN	A2	12	P	Power supply of the boost converter.
SW	A3	1	P	Switch pin of the integrated boost converter, which connects to the drain of low-side power FET and source of high-side rectifier FET. Connecting the inductor to this pin.
OUT0	B1	10	O	Current sink 0. If not used, this pin must be floating.
GND	B2	3	G	Ground. This pin must connect to the ground plane.
VOUT	B3	2	P	Boost converter output and power supply of the LED driver blocks. Connect to external power supply directly if need to bypass the boost converter.
OUT1	C1	9	O	Current sink 1. If not used, this pin must be floating.
SYNC	C2	4	I/O	Clock synchronous among multiple devices. If not used, this pin can connect to ground to save power.
SCL	C3	5	I	I ² C serial interface clock input.
OUT2	D1	8	O	Current sink 2. If not used, this pin must be floating.
OUT3	D2	7	O	Current sink 3. If not used, this pin must be floating.
SDA	D3	6	I/O	I ² C serial interface data input/output.

(1) G: Ground Pin; P: Power Pin; I: Input Pin; I/O: Input/Output Pin; O: Output Pin.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage range at terminals	VIN, SW, VOUT, VCC	- 0.3	6	V
	SW spike at 10 ns	- 0.7	8	V
	SW spike at 1 ns	- 0.7	9	V
	OUT0, OUT1, OUT2, OUT3	- 0.3	6	V
	EN, SCL, SDA, SYNC	- 0.3	6	V
T _J	Junction temperature	- 40	150	°C
T _{stg}	Storage temperature	- 65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾	±4000	V
		Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage range	0.5		5.5	V
V _{OUT}	Output voltage setting range	3		5.5	V
L	Effective inductance range	0.37	1	2.9	μH
C _{IN}	Effective input capacitance range	1	4.7		μF
C _{OUT}	Effective output capacitance range	4	10	1000	μF
T _A	Ambient temperature	- 40		85	°C
T _J	Operating junction temperature	- 40		125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LP5813		UNIT
		YBH (DSBGA)	DRR (WSON)

7.6 Timing Requirements

Unless specified otherwise, typical characteristics apply over the full ambient temperature range ($-40^{\circ}\text{C} < T_A < +85^{\circ}\text{C}$), $V_{IN} = 3.6\text{ V}$, $V_{CC} = 5\text{ V}$, $C_{IN} = 1\text{ }\mu\text{F}$, $C_{OUT} = 1\text{ }\mu\text{F}$.

I ² C Timing Requirements		MIN	NOM	MAX	UNIT
Standard-mode					
f_{SCL}	SCL clock frequency	0		100	kHz
t_{HD_STA}	Hold time (repeated) START condition. After this period, the first clock pulse is generated.	4			μs
t_{LOW}	LOW period of the SCL clock	4.7			μs
t_{HIGH}	HIGH period of the SCL clock	4			μs
t_{SU_STA}	Set-up time for a repeated START condition	4.7			μs
t_{HD_DAT}	Data hold time	0			μs
t_{SU_DAT}	Data set-up time	250			ns
t_r	Rise time of both SDA and SCL signals			1000	ns
t_f	Fall time of both SDA and SCL signals			300	ns
t_{SU_STO}	Set-up time for STOP condition	4			μs
t_{BUF}	Bus free time between a STOP and START condition	4.7			μs
C_b	Capacitive load for each bus line			400	pF
Fast-mode					
f_{SCL}	SCL clock frequency	0		400	kHz

Unless specified otherwise, typical characteristics apply over the full ambient temperature range ($-40^{\circ}\text{C} < T_A < +85^{\circ}\text{C}$), $V_{IN} = 3.6\text{ V}$, $V_{CC} = 5\text{ V}$, $C_{IN} = 1\text{ }\mu\text{F}$, $C_{OUT} = 1\text{ }\mu\text{F}$.

I²C Timing Requirements		MIN	NOM	MAX	UNIT
t_{HD_STA}	Hold time (repeated) START condition. After this period, the first clock pulse is generated.	0.6			μs
t_{LOW}	LOW period of the SCL clock	1.3			μs
t_{HIGH}	HIGH period of the SCL clock	0.6			μs
t_{SU_STA}	Set-up time for a repeated START condition	0.6			μs
t_{HD_DAT}	Data hold time	0			μs
t_{SU_DAT}	Data set-up time	100			ns
t_r	Rise time of both SDA and SCL signals			300	ns
t_f	Fall time of both SDA and SCL signals			300	ns
t_{SU_STO}	Set-up time for STOP condition	0.6			μs
t_{BUF}	Bus free time between a STOP and START condition	1.3			μs
C_b	Capacitive load for each bus line			400	pF
Fast-mode Plus					
f_{SCL}	SCL clock frequency	0		1000	kHz
t_{HD_STA}	Hold time (repeated) START condition. After this period, the first clock pulse is generated.	0.26			μs
t_{LOW}	LOW period of the SCL clock	0.5			μs
t_{HIGH}	HIGH period of the SCL clock	0.26			μs
t_{SU_STA}	Set-up time for a repeated START condition	0.26			μs
t_{HD_DAT}	Data hold time	0			μs
t_{SU_DAT}	Data set-up time	50			ns
t_r	Rise time of both SDA and SCL signals			120	ns
t_f	Fall time of both SDA and SCL signals			120	ns
t_{SU_STO}	Set-up time for STOP condition	0.26			μs
t_{BUF}	Bus free time between a STOP and START condition	0.5			μs
C_b	Capacitive load for each bus line			550	pF
Misc. Timing Requirements					
f_{CLK_EX}	VSYNC input clock frequency		6		MHz

8 Typical Characteristics

Unless specified otherwise, typical characteristics apply over the full ambient temperature range ($-40^{\circ}\text{C} < T_A < +85^{\circ}\text{C}$), $V_{\text{IN}} = 3.6\text{ V}$, $C_{\text{IN}} = 1\text{ }\mu\text{F}$, $C_{\text{OUT}} = 1\text{ }\mu\text{F}$

9 Detailed Description

9.1 Overview

The LP5811 is a synchronous boost 4-channel RGBW LED driver with autonomous animation engine control. The device can support 1.8 V minimum start-up voltage and 0.5 V to 5.5 V input voltage range during operation. The integrated synchronous boost converter can output 3 V to 5.5 V, to provide enough forward voltage of LEDs.

The LP5811 has ultra-low operation current at active mode, consuming about 0.4 mA when LED maximum current setting is 25.5 mA. If all LEDs are turned off, the device will enter standby state to reduce power consumption with data retained. When 'chip_enable' bit setting is 0, initial state is entered with minimum power consumption to save power.

The LP5811 supports both analog dimming and PWM dimming. In analog dimming, the output current of each LED can be adjusted with 256 steps. In PWM dimming, the integrated 8-bit configurable PWM generator enables smooth brightness dimming control. Optional exponential PWM dimming can be activated for individual LED to achieve a human-eye-friendly visual performance.

The LP5811 integrates autonomous animation engine, with no need for brightness control commands from controller. Each LED has an individual animation engine which can be configured through the related registers. The device can generate a 6 MHz clock signal, which synchronizes the lighting effects among multiple devices.

The LP5811 has 4 different material versions with different I²C chip address. Up to 4 LP581x devices can be connected to the same I²C bus and controlled individually. The LP5811 materials and corresponding chip addresses are shown in 节 5.

9.2 Functional Block Diagram

图 9-1. Functional Block Diagram

9.3 Feature Description

9.3.1 Synchronous Boost Converter

The integrated synchronous boost converter is designed to operate with 0.5 V to 5.5 V input voltage supply with 1.6 A (typ.) valley switch current limit. The LP5811 operates at quasi-constant frequency pulse width modulation (PWM) mode, when driving moderate and heavy load. The switching frequency is 1 MHz when the input voltage is above 1.5 V. The frequency is reduced to 0.5 MHz gradually when the input voltage decreases from 1.5 V to 1 V, and keeps at 0.5 MHz when the input voltage is below 1 V. At light load conditions, the boost converter operates at pulse frequency modulation (PFM) mode. During PWM operation, the converter works at adaptive constant on-time valley current mode to achieve excellent line regulation and load regulation, by which a smaller inductor and ceramic capacitors can be supported. Internal loop compensation simplifies the design complexity, and also minimizes the external components.

When powering up, the default output voltage is 3 V. The output voltage can be configured at 'Dev_config_0' register from 3 V to 5.5 V, with 0.1 V step. The integrated boost works as a general boost converter, which can power not only the LEDs driven by the device itself, but also other loads in the system.

9.3.1.1 Undervoltage Lockout

The LP5811 has a built-in undervoltage lockout (UVLO) circuit to make sure the device working properly. When the input voltage is above the UVLO rising threshold 1.8 V, the boost of LP5811 can be enabled. After the LP5811 completes soft-start process and the output voltage rises above 2.2 V, the LP5811 can work with the input voltage down to 0.5 V. When the input voltage is below UVLO falling threshold 0.4 V, the device shuts down.

9.3.1.2 Enable and Soft Start

When the input voltage is above the UVLO rising threshold 1.8 V and the EN pin is pulled to a voltage above 1.2 V, the boost of LP5811 is enabled and starts up. At the beginning, the LP5811 charges the boost output capacitor with a constant current when the output voltage is below 0.4 V. When the output voltage is charged above 0.4 V, the LP5811 has capability to drive 200 mA load. After the output voltage reaches the input voltage, the boost of LP5811 starts switching, and the output voltage continually ramps up to default voltage 3 V. The typical start-up time is 450 μ s from EN pulled high to output reaching default voltage 3 V, at the application that input voltage is 2.5 V, output effective capacitance is 10 μ F, and no load. When the EN is below 0.42 V, the internal enable comparator turns the device into shutdown mode. In the shutdown mode, the device is entirely turned off and the output is disconnected from input power supply.

9.3.1.3 Switching Frequency

The LP5811 switches at quasi-constant 1-MHz frequency when the input voltage is above 1.5 V. When the input voltage is lower than 1.5 V, the switching frequency is reduced gradually to 0.5 MHz, which improves the boost efficiency and gets higher boost ratio. When the input voltage is below 1 V, the switching frequency is fixed at quasi-constant 0.5 MHz.

9.3.1.4 Current Limit Operation

The LP5811 uses a valley current limit sensing scheme. The inductor current is detected during the switching off-time, by sensing the voltage across the synchronous rectifier.

When the load current increases, such that the inductor current is above the current limit within the whole switching cycle, the off-time increases to discharge the inductor current. The current decreases below the limit before the next on-time. When the current limit is reached, the output voltage decreases if the load current continually increases.

The maximum continuous output current ($I_{OUT(CL)}$), before entering current limit (CL) operation, can be defined by [方程式 1](#).

$$I_{OUT(CL)} = (1 - D) \times \left(I_{LIM} + \frac{1}{2} \Delta I_{L(P-P)} \right) \quad (1)$$

where

- D is the duty cycle
- $\Delta I_{L(P-P)}$ is the inductor ripple current

The duty cycle can be estimated by [方程式 2](#).

$$D = 1 - \frac{V_{IN} \times \eta}{V_{OUT}} \quad (2)$$

where

- V_{OUT} is the output voltage of the boost converter
- V_{IN} is the input voltage of the boost converter
- η is the efficiency of the converter, use 90% for most applications

The peak-to-peak inductor ripple current is calculated by [方程式 3](#).

$$\Delta I_{L(P-P)} = \frac{V_{IN} \times D}{L \times f_{SW}} \quad (3)$$

where

- L is the inductance value of the inductor
- f_{SW} is the switching frequency
- D is the duty cycle
- V_{IN} is the input voltage of the boost converter

9.3.1.5 Boost PWM Mode

The LP5811 uses a quasi-constant 1.0-MHz frequency pulse width modulation (PWM) at moderate to heavy load current. Based on the input voltage to output voltage ratio, a circuit predicts the required on-time. At the beginning of the switching cycle, the main switching low-side FET is turned on. The input voltage is applied across the inductor and the inductor current ramps up. In this phase, the output capacitor is discharged by the load current. When the on-time expires, the low-side FET is turned off, and the high-side rectifier FET is turned on. The inductor transfers its stored energy to replenish the output capacitor and supplies the load. The inductor current declines because the output voltage is higher than the input voltage. When the inductor current hits the valley current threshold determined by the output of the error amplifier, the next switching cycle starts again.

The LP5811 has a built-in compensation circuit that can accommodate a wide range of input voltage, output voltage, inductor value, and output capacitor value for stable operation.

9.3.1.6 Boost PFM Mode

The LP5811 works at PFM to improve efficiency at light load. When the load current decreases, the inductor valley current set by the output of the error amplifier no longer regulates the output voltage. When the inductor valley current hits the low limit, the output voltage exceeds the setting voltage as the load current decreases further. When the feedback voltage hits the PFM reference voltage (0.6 V typical), the LP5811 works at PFM. When the feedback voltage rises and hits the PFM reference voltage, the device continues switching for several cycles because of the delay time of the internal comparator — then it stops switching. The load is supplied by the output capacitor, and the output voltage declines. When the feedback voltage falls below the PFM reference voltage, after the delay time of the comparator, the device starts switching again to ramp up the output voltage.

[图 9-2](#) shows the waveform of voltage when the device works at PWM and PFM.

图 9-2. Output Voltage in PWM Mode and PFM

9.3.2 Analog Dimming

The current gain of each LED can be controlled by 2 methods to achieve analog dimming in the LP5811.

- Global 1-bit Maximum Current (MC) control for all LEDs without external resistor
- Individual 8-bit Dot Current (DC) control for each LED

The maximum output current I_{OUT_max} of each current sink can be programmed by the 1-bit max_current. The default value of max_current is 0h, which means the LED maximum current is set to 25.5 mA in default.

表 9-1. Maximum Current (MC) bit setting

1 bit Maximum Current (MC)		I_{OUT_MAX} (mA)
Binary	Decimal	
0 (default)	0 (default)	25.5 (default)
1	1	51

The LP5811 can individually adjust the peak current of each LED by using Dot Current (DC) function. The brightness deviation among the LED bins can be minimized, to achieve uniform display performance. The current is adjusted with 256 steps from 0 to 100% of I_{OUT_MAX} , which is programmed in an 8-bit register whose default value is 80h.

表 9-2. Dot Current (DC) bits setting

8-bits Dot Current (DC) Register		Ratio of I_{OUT_MAX}
Binary	Decimal	
0000 0000	0	0%
0000 0001	1	0.39%
0000 0010	2	0.78%
---	---	---
1000 0000 (default)	128 (default)	50.2% (default)
---	---	---
1111 1101	253	99.2%
1111 1110	254	99.6%
1111 1111	255	100%

By configuring the MC and DC, the peak current of each current sink can be calculated as [方程式 4](#):

$$I_{OUT} (mA) = I_{OUT_max} \times \frac{DC}{255} \quad (4)$$

The average current of each LED in TCM drive mode and mix drive mode is shown as 方程式 5:

$$I_{AVE} (mA) = \frac{I_{OUT}}{N} \times \frac{DC}{255} \times D_{PWM} \quad (5)$$

- N is the total scan number setting.
- D_{PWM} is the PWM duty.

9.3.3 PWM Dimming

The LP5811 supports 8-bit PWM dimming with 24 kHz or 12 kHz frequency, which is configured by 'PWM_Fre' bit in Dev_config_1 register. An internal 6 MHz oscillator is used to generate the PWM clock. SYNC pin can be configured as PWM clock input or output by configure 'vsync_out_en' bit in Dev_Config_11 register. If multiple LP5811 are used in the system with autonomous animation engine control, all devices can refer the same clock signal, which comes from one of LP5811 or external controller, to avoid animation mismatch in long time operation.

Each LED can be configured into 3 different PWM alignment phases: Forward, Middle, and Backward. The alignment phase of each LED is set by 'phase_align' bits in Dev_Config_7 to Dev_Config_10 registers. By turning on the LEDs in different phase, the peak current load from boost or the system power supply is greatly decreased. The input current ripple and ceramic-capacitor audible ringing can also be reduced. 图 9-3 shows the PWM alignment phases. In the forward alignment, the rising edge of PWM pulse is fixed at the beginning of PWM period. In the middle alignment, the middle point of PWM pulse is fixed at the middle of PWM period, while the pulse spreads to both directions. In the backward alignment, the falling edge of PWM pulse is fixed at the end of PWM period.

图 9-3. PWM Alignment Scheme

The LP5811 allow users to configure the dimming scale as exponential curve or linear curve, through the 'exp_en' bits in Dev_Config_5 and Dev_Config_6 registers. A human-eye-friendly visual performance can be achieved by using the internal exponential scale. The linear scale has great linearity between PWM duty cycle and PWM setting value, which provides flexible approach for external controlled gamma correction algorithm. The 8-bit linear and exponential curves are shown as 图 9-4.

图 9-4. Linear and Exponential PWM Dimming Curves

9.3.4 Autonomous Animation Engine Control

The LP5811 supports both manual mode and autonomous mode to control the DC and PWM of each LED. In manual mode, the LEDs are directly controlled by the related configuration registers and reflect the value immediately. In autonomous mode, the autonomous animation engine is applied for each LED, which can realize vivid lighting effects without external processor control. The animation engine pattern is composed by 3 animation engine units (AEU) and 2 animation pause units (APU) for complex and flexible control. One AEU is formed by 4 slopers, which is used for fading effect.

After setting up all animation engine pattern configurations, sending start_cmd to the device can let the animation running autonomously, to free external controller real-time loading. The PWM value and unit status of each LED can be read from PWM_value registers and pattern_status registers. To make sure the precision of reading results, sending pause_cmd to pause the animation firstly is recommended.

9.3.4.1 Animation Engine Pattern

Each LED of the LP5811 has own animation engine, to achieve premium visual lighting effects. One whole animation engine pattern is defined as 图 9-5. 3 animation engine units (AEU) and 2 animation pause units (APU) compose the animation engine pattern. AEU2 and AEU3 can be skipped by setting the playback times to 0. The LED current of each LEDs in the autonomous mode is set through the Autonomous_DC registers.

图 9-5. Animation engine pattern

The whole animation pattern includes two APUs and three AEUs with several playback times:

- APU_x (x = 1, 2): Animation pause unit, each unit includes one timing value T.
- AEU_x (x = 1, 2, 3): Animation engine unit, including 5 PWM values PWM1 to PWM5 and 4 time values T1 to T4.
- PT: Playback times of AEU1+AEU2+AEU3, which has 2-bit value to set 0/1/2/Infinite times.
- PT_x: Playback times of AEU_x (x=1/2/3), which has 2-bit value to set 0/1/2/Infinite times.

9.3.4.2 Sloper

Sloper is the basic element to achieve autonomous fade-in and fade-out animations. It can achieve 256 steps fade-in or fade-out effects from 'PWM_Start' to 'PWM_End' within a target time period T as 图 9-6. The 8-bit PWM steps, which is configurable in animation pattern PWM setting registers, help to achieve extremely smooth effects. Exponential dimming curve can also be supported in the sloper.

图 9-6. Sloper curve demonstration

The programmable time T is selectable from 0 to around 8 s with 16 levels shown in 表 9-3.

表 9-3. Programmable time options

Register value	0h	1h	2h	3h	4h	5h	6h	7h	8h	9h	Ah	Bh	Ch	Dh	Eh	Fh
Time (Typ.)	0 s	0.09 s	0.18 s	0.36 s	0.54 s	0.80 s	1.07 s	1.52 s	2.06 s	2.50 s	3.04 s	4.02 s	5.01 s	5.99 s	7.06 s	8.05 s

9.3.4.3 Animation Engine Unit (AEU)

The AEU is the most important unit to achieve autonomous animation effects. One AEU is formed by 4 slopers. There are 5 PWM values and 4 time values can be configured in the AEU. Each PWMx (x = 1, 2, ..., 5) can be arbitrarily programmed from 0 to 255, The Tx (x = 1, 2, 3, 4) is selectable from 0 to 8 s with 16 levels referring to 表 9-3. If two adjacent PWM values are equal, the brightness keeps unchange within the time setting. When a Tx is set to 0, this sloper is skipped. To avoid flicker happens due to PWM value suddenly changes, the begin and end PWM of this sloper need to be the same.

Typical breathing effect example is illustrated as 图 9-7.

图 9-7. Animation engine unit - Example 1

Advanced breathing effect example is shown in 图 9-8. 2 different fading speeds are set in the PWM rising and falling phases, to achieve a complex animation.

图 9-8. Animation engine unit - Example 2

9.3.4.4 Animation Pause Unit (APU)

The APU is defined as the pausing time at the beginning and the end of the animation pattern. The APU contains 1 time value which is selectable from 0 to 8 s with 16 levels referring to 表 9-3. If the value is set as 0, the APU is skipped. The brightness of APU1 uses the PWM1 value of the AEU following the APU1, while the brightness of APU2 uses the PWM5 value of the AEU in front of APU2. One animation pattern example is shown in 图 9-9. Only AEU2 is enabled in the pattern, so that the brightness of APU1 uses the PWM1 value of AEU2, and the brightness of APU2 uses PWM5 value of AEU2.

图 9-9. APU example

9.3.5 Protections and Diagnostics

9.3.5.1 Overvoltage Protection

The boost of LP5811 has an output overvoltage protection (OVP) to protect the device. When the output voltage is above 5.7 V, the boost stops switching. Once the output voltage falls 0.1 V below the OVP threshold, the boost resumes operating again.

9.3.5.2 Output Short-to-Ground Protection

The boost of LP5811 starts to limit the boost current when the boost output voltage is below 1.8 V. The lower the boost output voltage reaches, the smaller the output current decreases. When the VOUT pin is short to ground and the boost output voltage is less than 0.4 V, the output current is limited to approximately 350 mA. Once the short circuit is released, the LP5811 goes through the soft start-up again to the regulated output voltage.

9.3.5.3 LED Open Detections

The LP5811 integrates LED open detection (LOD) for the fault caused by any open LED. The threshold for LOD is 90 mV when max current is set as 25.5 mA, and 180 mV when max current is set as 51 mA. To have enough detection time, LOD can only be performed when the PWM setting of this LED is above 25. If the voltage on the cathode of this LED is lower than the LOD threshold in continuously 3 cycles, LED open of this LED is reported to the corresponding LOD_status register.

The LOD flags can be cleared by writing 1h to 'lod_clear' bit in Fault_Clear register. If the LED open status is removed, the related 'lod_status' bit is set to 0 automatically.

The 'lod_action' bit in Dev_config_12 register can determine the action once open fault is detected. When the 'lod_action' bit is set to 1h, the dot where LED open happens is turned off to avoid any unpredictable issue. When the 'lod_action' bit is 0, no additional action is taken after LOD is detected. LED open fault detection and action is only executed in NORMAL state.

9.3.5.4 LED Short Detections

The LP5811 integrates LED short detection (LSD) for the fault caused by any short LED. The threshold of LSD is able to configure from $(0.35 \times V_{OUT})$ V to $(0.65 \times V_{OUT})$ V by configuring lsd_threshold in Dev_config_12 register. To have enough detection time, LSD can only be performed when the PWM setting of this LED is above 25. If the voltage on the cathode of this LED is higher than the LSD threshold in continuously 3 cycles, LED short of this LED is reported to the corresponding LSD_status register.

The LSD flags can be cleared by writing 1h to lsd_clear in Fault_CLR register. If the LED short status is removed, the related lsd_status bit is set to 0 automatically.

The 'lsd_action' bit in Dev_config_12 register can determine the reaction once open fault is detected. When the 'lsd_action' bit is set to 1h, all LEDs are turned off which is called one fails all fail (OFAF) action, to prevent potential damage caused by the short issue. The device enters to STANDBY state after sending 'lsd_clear' command. When the 'lsd_action' bit is 0, no additional action is taken after LSD is detected. LSD detection is only executed in NORMAL state.

9.3.5.5 Thermal Shutdown

The LED driver of LP5811 goes into thermal shutdown state once the junction temperature exceeds 150°C. All LEDs turn off to avoid damaging the device. When the junction temperature drops below the thermal shutdown recovery temperature 130°C, the LED driver starts operating again.

The boost converter of LP5811 stops switching and is shutdown once the junction temperature exceeds 155°C, and the power on reset of the LED driver part is also triggered. When the junction temperature drops below the thermal shutdown recovery temperature, typically 130°C, the LP5811 enters shutdown state, and then the device needs to be configured again for normal operations.

9.4 Device Functional Modes

The 图 9-10 shows the main state machine of the LED driver.

图 9-10. LP5811 functional modes

- **SHUTDOWN:** The device enters into SHUTDOWN after VIN power up.
- **INITIAL:** The device enters into INITIAL state from SHUTDOWN when EN is pulled high.
- **STANDBY:** The device enters into STANDBY state from INITIAL when Chip_EN is set to 1. The device can also enter into STANDBY from NORMAL when no LED is effective, or Stop_cmd is received, or from OFAF when LSD_Clear = 1.
- **NORMAL:** The device enters NORMAL state from STANDBY when one or more LEDs are effective: for manual mode, at least one LED is enable (PWM and DC setting is not 0); for autonomous mode, at least one LED is enable and Start_cmd is received.

9.5 Programming

The LP5811 is compatible with I²C standard specification. The device supports standard mode (100-kHz maximum), fast mode (400-kHz maximum), and fast plus mode (1-MHz maximum). The device has 4 different chip address versions, which allows connecting up to four parallel devices in one I²C bus.

I²C Data Transactions

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, state of the data line can only be changed when clock signal is LOW. START and STOP conditions classify the beginning and the end of the data transfer session. A START condition is defined as the SDA signal transitioning from HIGH to LOW while SCL line is HIGH. A STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The bus leader always generates START and STOP conditions. The bus is considered to be busy after a START condition and free after a STOP condition. During data transmission, the bus leader can generate repeated START conditions. First START and repeated START conditions are functionally equivalent.

Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the leader. The leader releases the SDA line (HIGH) during the acknowledge clock pulse. The device pulls down the SDA line during the 9th clock pulse, signifying an acknowledge. The device generates an acknowledge after each byte has been received.

There is one exception to the acknowledge after every byte rule. When the leader is the receiver, the receiver must indicate to the transmitter an end of data by not acknowledging (*negative acknowledge*) the last byte clocked out of the follower. This negative acknowledge still includes the acknowledge clock pulse (generated by the leader), but the SDA line is not pulled down.

I²C Data Format

The address and data bits are transmitted MSB first with 8-bits length format in each cycle. Each transmission is started with Address Byte 1, which are divided into 5 bits of the chip address, 2 higher bits of the register address, and 1 read/write bit. The other 8 lower bits of register address are put in Address Byte 2. The device supports both independent mode and broadcast mode. The auto-increment feature allows writing / reading several consecutive registers within one transmission. If not consecutive, a new transmission must be started. The Bit 4 and Bit 3 are determined by the device, which can refer to 节 5.

表 9-4. I²C Data Format

Address Byte1	Chip Address					Register Address		R/W
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Independent	1	0	1	Bit 4	Bit 3	9 th bit	8 th bit	R: 1 W: 0
Broadcast	1	1	0	1	1			
Address Byte2	Register Address							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
	7 th bit	6 th bit	5 th bit	4 th bit	3 rd bit	2 nd bit	1 st bit	0 bit

10 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

10.1 Application Information

The LP5811 is a 12 LEDs synchronous boost RGB LED driver with autonomous animation engine control. The device is ideal to support battery-powered applications with 0.5 V to 5.5 V input voltage range. The LP5811 has ultra-low operation current at active mode, and it only consumes 0.4 mA when LED current is set at 25mA. In battery powered applications like e-tag, earbud, e-cigarettes, VR headset, RGB mouse, smart speaker, and other handheld devices, LP5811 is ideal to provide premium LED lighting effects with low power consumption and small package.

10.2 Typical Application

10.2.1 Application

图 10-1 shows an example of typical application, which uses one LP5811 to drive RGB LEDs through I²C communication.

图 10-1. Typical Application - LP5811 Driving RGB LEDs

图 10-2. Typical Application - LP5811 Driving RGB LEDs

10.2.2 Design Parameters

表 10-1 shows the typical design parameters of [Typical Application 1](#).

表 10-1. Design Parameters

PARAMETER	VALUE
Input voltage	3.6 V to 4.2 V by one Li-on battery cell
Output voltage	4.5 V
Inductor	1 μ H
Output capacitor	22 μ F
RGB LED count	4
LED maximum average current (red, green, blue)	12.75 mA, 10.2 mA, 10.2 mA
LED peak current (red, green, blue)	51 mA, 40.8 mA, 40.8 mA
LED PWM frequency	6 kHz

The different color of LEDs are put as below configuration.

Red LEDs: LED_A1, LED_B1, LED_C1, LED_D1

Green LEDs: LED_A0, LED_B0, LED_C0, LED_D0

Blue LEDs: LED_A2, LED_B2, LED_C2, LED_D2

10.2.3 Detailed Design Procedure

This section will showcase the detailed design procedures for LP5811 including boost components selection, LED driver manual and autonomous modes application examples.

10.2.3.1 Inductor Selection

The inductor is the most important component in power regulator design, which affects steady-state operation, transient behavior, and loop stability. There are three important inductor specifications, inductor value, saturation current, and dc resistance (DCR).

The integrated boost converter in LP5811 is designed to work with inductor values between 0.37 μ H and 2.9 μ H. 1 μ H is recommended in typical application. The inductor peak current can be calculated by [方程式 8](#). Using the minimum input voltage, maximum output voltage, and maximum load current of the application can calculate the worst case.

In a boost regulator, the inductor dc current can be calculated by [方程式 6](#).

$$\Delta I_{L(DC)} = \frac{V_{OUT} \times I_{OUT}}{V_{IN} \times \eta} \quad (6)$$

where

- V_{OUT} is the output voltage of the boost converter
- I_{OUT} is the output current of the boost converter
- V_{IN} is the input voltage of the boost converter
- η is the power-conversion efficiency, use 90% for most cases

The inductor ripple current is calculated by [方程式 7](#).

$$\Delta I_{L(P-P)} = \frac{V_{IN} \times D}{L \times f_{SW}} \quad (7)$$

where

- D is the duty cycle, which can be calculated by [方程式 2](#)

- L is the inductance value of the inductor
- f_{SW} is the switching frequency
- V_{IN} is the input voltage of the boost converter

Therefore, the inductor peak current is calculated by [方程式 8](#).

$$\Delta I_{L(P)} = \Delta I_{L(DC)} + \frac{\Delta I_{L(P-P)}}{2} \quad (8)$$

Inductor peak-to-peak current is recommended to be designed less than 40% of the average inductor current, with maximum output current setting. Large inductor value reduces the magnetic hysteresis losses in the inductor and improves EMI performance with small inductor ripple, but the load transient response time increases. The saturation current of the inductor must be higher than the calculated peak inductor current.

表 10-2. Recommended Inductors

Part Number	L (μH)	DCR MAX (mΩ)	SATURATION CURRENT (A)	SIZE L×W×H (mm)	VENDOR
XEL4030-102ME	1	9.78	9.0	4.0 × 4.0 × 3.1	Coilcraft
74438357010	1	13.5	9.6	4.1 × 4.1 × 3.1	Würth Elektronik
HBME042A-1R0MS-99	1	11.5	7.0	4.1 × 4.1 × 2.1	Cyntec

10.2.3.2 Output Capacitor Selection

The output capacitor is selected to meet the requirements of output ripple and loop stability. The ripple voltage is related to capacitor capacitance and equivalent series resistance (ESR). Assuming a ceramic capacitor with zero ESR, the minimum capacitance for a given ripple voltage can be calculated by [方程式 9](#).

$$C_{OUT} = \frac{I_{OUT} \times D_{MAX}}{f_{SW} \times V_{RIPPLE}} \quad (9)$$

where

- D_{MAX} is the maximum switching duty cycle
- V_{RIPPLE} is the peak-to-peak output ripple voltage
- I_{OUT} is the maximum output current
- f_{SW} is the switching frequency

The ESR impact on the output ripple must be considered if tantalum or aluminum electrolytic capacitors are used. The output peak-to-peak ripple voltage caused by the ESR of the output capacitors can be calculated by [方程式 10](#).

$$V_{RIPPLE(ESR)} = I_{L(P)} \times R_{ESR} \quad (10)$$

The derating of a ceramic capacitor under dc bias voltage, aging, and ac signal need to be considered during design. For example, the dc bias voltage can significantly reduce capacitance. A ceramic capacitor can lose more than 50% of capacitance at the rated voltage. Therefore, enough the voltage rating margin must be left to get adequate capacitance at the required output voltage. Increasing the output capacitor can make the output ripple voltage smaller in PWM mode.

TI recommends using the X5R or X7R ceramic output capacitor in the range of 4 μF to 1000 μF effective capacitance. 10 μF effective capacitance is recommended in typical application, which means around 22 μF rated capacitance. If the output capacitor is below the range, the boost regulator can potentially become unstable.

10.2.3.3 Input Capacitor Selection

Multilayer X5R or X7R ceramic capacitors are excellent choices for the input decoupling of the integrated boost converter, because of the extremely low ESR and small footprint. Input capacitors must be located as close as possible to the device. While a 10- μ F input capacitor is sufficient for most applications, large capacitance is used to reduce input current ripple. When the input power is supplied through long wire and only ceramic capacitor is put, the load step at the output induces ringing at the VIN pin. This ringing couples back to the output and influence loop stability or even damage the device. In this circumstance, placing additional bulk capacitance (tantalum or aluminum electrolytic capacitor) between ceramic input capacitor and the power supply can reduce the ringing.

10.2.3.4 Program Procedure

After VIN powering up, the boost converter can be enabled by pulling EN to High. After around 1 ms for boost output and internal oscillator stable, the device can be initialized by configuring chip_en = 1. Then the CONFIG registers can be set to the expected configuration. After updating the CONFIG registers, one update command must be sent to make the configuration effective. Either manual mode or autonomous mode can be selected for each LED. A new configuration is only effective once update command is received.

The detailed program procedure is illustrated as:

图 10-3. Program Procedure

10.2.3.5 Programming Example

To get the design parameters in 表 10-1, the following program steps can be referred.

After properly providing the power supplies to LP5811,

1. Set chip_en = 1 to enable the device. **(Write 01h to register 000h)**
2. Set boost_vout = Fh to set 4.5 V boost output voltage, and max_current = 1h to set 51 mA maximum output LED current. **(Write 1Fh to register 001h)**
3. Set led_mode = 4h to configure the LED drive mode as TCM 4 scans. **(Write 20h to register 002h)**
4. Set lsd_threshold = 3h is recommended to avoid incorrect LSD detection. **(Write 0Bh to register 00Dh)**

Let the PWM frequency, scan order, manual or autonomous mode, linear or exponential dimming curve, phase align method, vsync mode, blank time, clamp settings as default. (In other application requirements, these functions can be set)

5. Send update command to complete configuration settings **(Write 55h to register 010h)**
6. Read back config_err_status to check if the configuration is proper **(Read register 300h)**
7. Enable all 12 LEDs **(Write F0h to register 020h and FFh to register 021h)**

8. Set 50 mA peak current for red LEDs (**Write FFh to registers 035h, 038h, 03Bh, 03Eh**), and 40 mA peak current for green and blue LEDs (**Write CCh to registers 034h, 036h, 037h, 039h, 03Ah, 03Ch, 03Dh, 03Fh**)
9. Set 100% duty cycle to illuminate the LEDs (**Write FFh to registers 044h - 04Fh**)

10.2.4 Application Performance Plots

10.3 Power Supply Recommendations

The device is designed to operate from an input voltage supply range from 0.5 V to 5.5 V, with minimum 1.8V start up input voltage. This input supply must be well regulated. If the input supply is located more than a few inches from the converter, additional bulk capacitance is required near to the ceramic bypass capacitors. A typical choice is a tantalum or aluminum electrolytic capacitor with a value of 100 μF .

The LP5811 can also work normally by powering from VOUT with 2.7 V to 5.5 V voltage range, to bypass the integrated boost converter. In direct drive mode or mix drive mode, an external LED supply with 2.7 V to 5.5 V voltage range is supported to power up the LEDs in direct drive configurations.

10.4 Layout

10.4.1 Layout Guidelines

As for all switching power supplies, especially those running at high switching frequency and high currents, layout is an important design step. If the layout is not carefully done, the regulator could suffer from instability and noise problems. To maximize efficiency, switch rise and fall time are very fast. To prevent radiation of high frequency noise (for example, EMI), proper layout of the high-frequency switching path is essential. Minimize the length and area of all traces connected to the SW pin, and always use a ground plane under the switching regulator to minimize interplane coupling. The input capacitor needs not only to be close to the VIN pin, but also to the GND pin in order to reduce input supply ripple. The most critical current path for all boost converters is from the switching FET, through the rectifier FET, then the output capacitors, and back to ground of the switching FET. This high current path contains nanosecond rise and fall time and must be kept as short as possible. Therefore, the output capacitor not only must be close to the VOUT pin, but also to the GND pin to reduce the overshoot at the SW pin and VOUT pin. For OUTx (x = 0, 1, 2, 3), low inductive and resistive path of switch load loop can help to provide a high slew rate. Therefore, path of adjacent outputs must be short and wide and avoid

parallel wiring and narrow trace. For better thermal performance, TI suggest to make copper polygon connected with each pin bigger.

10.4.2 Layout Example

11 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

11.1 Documentation Support

11.2 接收文档更新通知

要接收文档更新通知，请导航至 ti.com 上的器件产品文件夹。点击 [通知](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

11.3 支持资源

[TI E2E™ 中文支持论坛](#) 是工程师的重要参考资料，可直接从专家处获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题，获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [使用条款](#)。

11.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

11.5 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "--" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
