

## Precision Dual *Difet*® Operational Amplifier

### FEATURES

- Very Low Noise:  $8\text{nV}/\sqrt{\text{Hz}}$  at 10kHz
- Low  $V_{os}$ : 1mV max
- Low Drift:  $10\mu\text{V}/^\circ\text{C}$  max
- Low  $I_B$ : 10pA max
- Fast Settling Time: 2 $\mu\text{s}$  to 0.01%
- Unity-Gain Stable

### APPLICATIONS

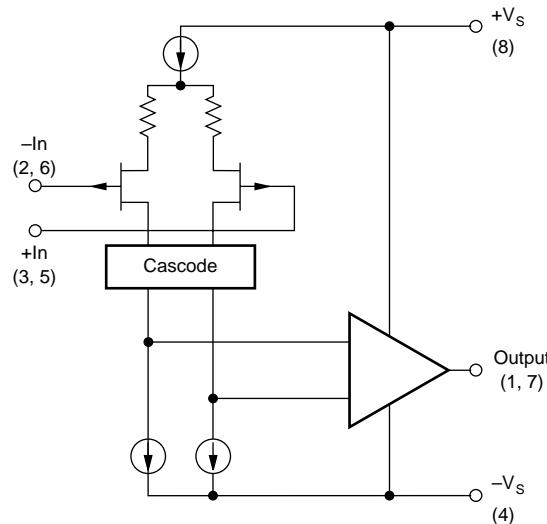

- Data Acquisition
- DAC Output Amplifiers
- Optoelectronics
- High-Impedance Sensor Amps
- High-Performance Audio Circuitry
- Medical Equipment, CT Scanners

### DESCRIPTION

The OPA2107 dual operational amplifier provides precision *Difet* performance with the cost and space savings of a dual op amp. It is useful in a wide range of precision and low-noise analog circuitry and can be used to upgrade the performance of designs currently using BIFET® type amplifiers.

The OPA2107 is fabricated on a proprietary dielectrically isolated (*Difet*) process. This holds input bias currents to very low levels without sacrificing other important parameters, such as input offset voltage, drift and noise. Laser-trimmed input circuitry yields excellent dc performance. Superior dynamic performance is achieved, yet quiescent current is held to under 2.5mA per amplifier. The OPA2107 is unity-gain stable.

The OPA2107 is available in DIP-8 and SO-8 packages.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Supply Voltage	$\pm 18V$
Input Voltage Range	$\pm V_S \pm 2V$
Differential Input Voltage	Total $V_S \pm 4V$
Operating Temperature	
P and U Packages	$-25^\circ C$ to $+85^\circ C$
Storage Temperature	
P and U Packages	$-40^\circ C$ to $+125^\circ C$
Output Short Circuit to Ground ( $T_A = +25^\circ C$ )	Continuous
Junction Temperature	$+175^\circ C$
Lead Temperature	
P Package (soldering, 10s)	$+300^\circ C$
U Package, SOIC (3s)	$+260^\circ C$

NOTE: Stresses above these ratings may cause permanent damage.

## ELECTROSTATIC DISCHARGE SENSITIVITY

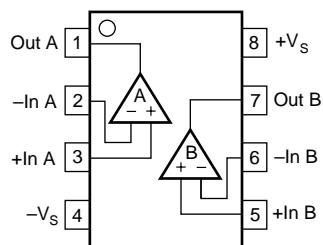

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

# APPLICATIONS INFORMATION AND CIRCUITS

The OPA2107 is unity-gain stable and has an excellent phase margin. This makes it easy to use in a wide variety of applications.

Power-supply connections should be bypassed with capacitors positioned close to the amplifier pins. In most cases, 0.1 $\mu$ F ceramic capacitors are adequate. Applications with larger load currents and fast transient signals may need up to 1 $\mu$ F tantalum bypass capacitors.

## INPUT BIAS CURRENT

The OPA2107 **Difet** input stages have very low input bias current—an order of magnitude lower than BIFET op amps. Circuit-board leakage paths can significantly degrade performance. This is especially evident with the SO-8 surface-mount package where pin-to-pin dimensions are particularly small. Residual soldering flux, dirt, and oils, which conduct leakage current, can be removed by proper cleaning. In most instances, a two-step cleaning process is adequate using a clean organic solvent rinse followed by deionized water. Each rinse should be followed by a 30-minute bake at 85°C.

A circuit-board guard pattern effectively reduces errors due to circuit-board leakage (Figure 1). By encircling critical high-impedance nodes with a low-impedance connection at the same circuit potential, any leakage currents will flow harmlessly to the low-impedance node. Guard traces should be placed on all levels of a multiple-layer circuit board.

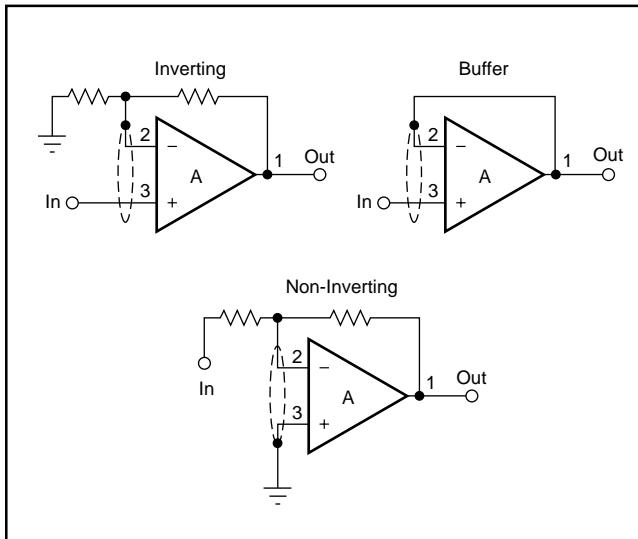

FIGURE 1. Connection of Input Guard.

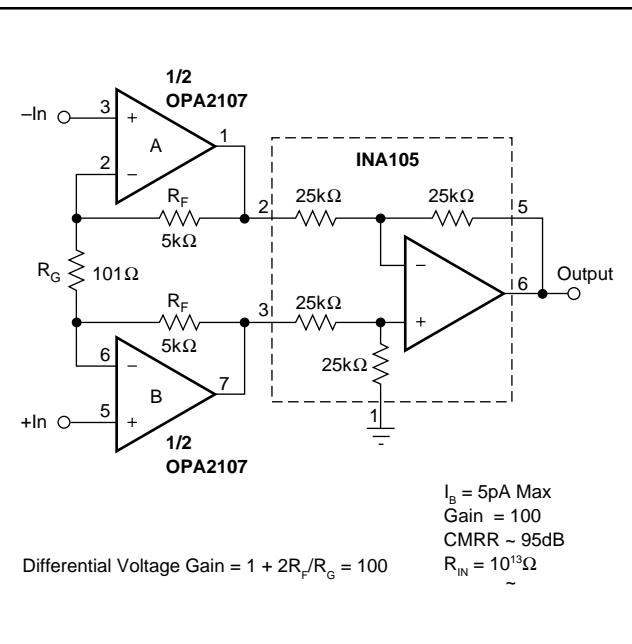

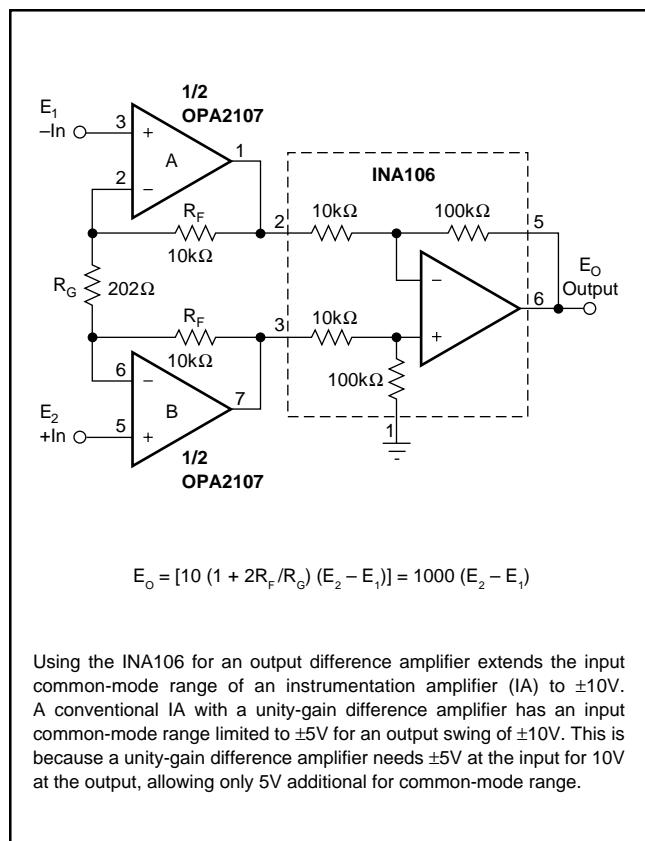

FIGURE 2. FET Input Instrumentation Amplifier.

Using the INA106 for an output difference amplifier extends the input common-mode range of an instrumentation amplifier (IA) to  $\pm 10V$ . A conventional IA with a unity-gain difference amplifier has an input common-mode range limited to  $\pm 5V$  for an output swing of  $\pm 10V$ . This is because a unity-gain difference amplifier needs  $\pm 5V$  at the input for 10V at the output, allowing only 5V additional for common-mode range.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

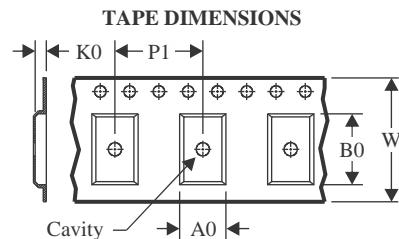

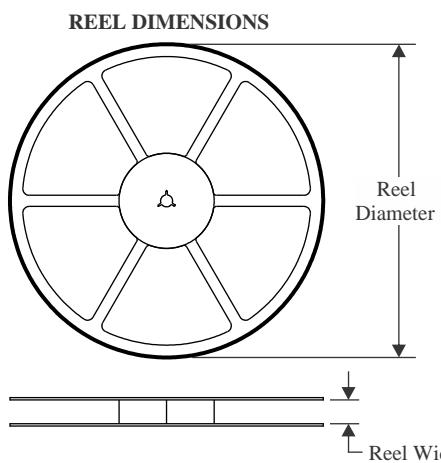

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a " ~ " will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

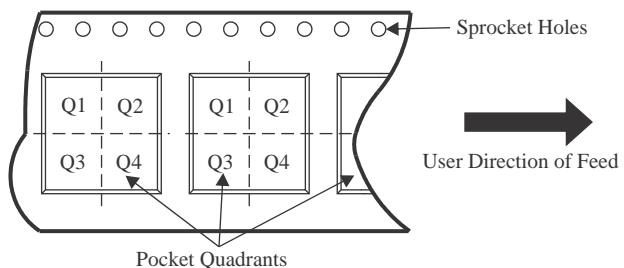

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# PACKAGE OUTLINE

## SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

### NOTES:

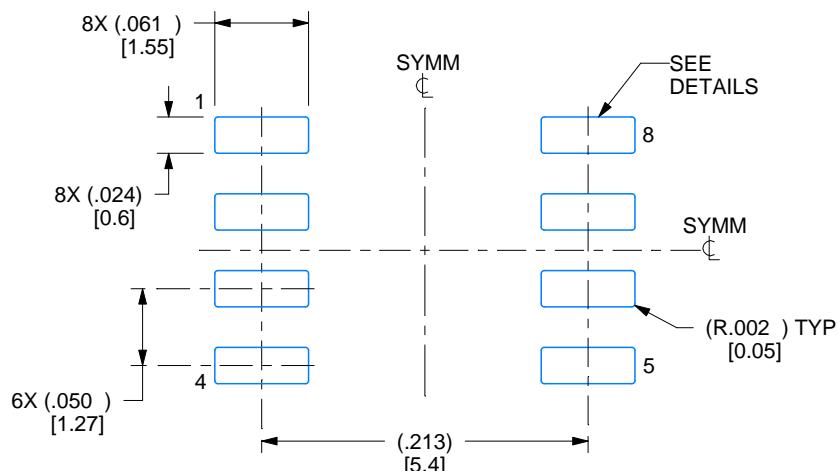

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.
