

4-Channel Audio Volume Control

FEATURES

- **DIGITALLY-CONTROLLED ANALOG VOLUME CONTROL:**
Four Independent Audio Channels
Serial Control Interface
Zero Crossing Detection
Mute Function
- **WIDE GAIN AND ATTENUATION RANGE:**
+31.5dB to -95.5dB with 0.5dB Steps
- **LOW NOISE AND DISTORTION:**
120dB Dynamic Range
0.0004% THD+N at 1kHz (U-Grade)
0.0002% THD+N at 1kHz (A-Grade)
- **NOISE-FREE LEVEL TRANSITIONS**
- **LOW INTERCHANNEL CROSSTALK:**
-130dBFS
- **POWER SUPPLIES:** $\pm 5V$ Analog, +5V Digital
- **AVAILABLE IN AN SOP-28 PACKAGE**

APPLICATIONS

- **AUDIO AMPLIFIERS**
- **MIXING CONSOLES**
- **MULTI-TRACK RECORDERS**
- **BROADCAST STUDIO EQUIPMENT**
- **MUSICAL INSTRUMENTS**
- **EFFECTS PROCESSORS**
- **A/V RECEIVERS**
- **CAR AUDIO SYSTEMS**

DESCRIPTION

The PGA4311 is a high-performance, 4-channel audio volume control designed for professional and high-end consumer audio systems. Using high performance operational amplifier stages internal to the PGA4311 yields low noise and distortion, while providing the capability to drive 600Ω loads directly without buffering. The 3-wire serial control interface allows for connection to a wide variety of host controllers, in addition to support for daisy-chaining of multiple PGA4311 devices.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Supply Voltage, V_{A+}	+5.5V
V_{A-}	-5.5V
V_{D+}	+5.5V
V_{A+} to V_{D+}	< $\pm 0.3V$
Analog Input Voltage	0V to V_{A+} , V_{A-}
Digital Input Voltage	-0.3V to V_{D+}
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-65°C to +150°C
Junction Temperature	+150°C
Lead Temperature (soldering, 10s)	+300°C
Package Temperature (IR reflow, 10s)	+235°C

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability.

**ELECTROSTATIC
DISCHARGE SENSITIVITY**

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

GENERAL DESCRIPTION

The PGA4311 is a four-channel audio volume control. It may be used in a wide array of professional and consumer audio equipment. The PGA4311 is fabricated in a sub-micron CMOS process.

The heart of the PGA4311 is a resistor network, an analog switch array, and a high-performance op amp stage. The switches are used to select taps in the resistor network that, in turn, determine the gain of the amplifier stage. Switch selections are programmed using a serial control port. The serial port allows connection to a wide variety of host controllers. See Figure 1 for a functional block diagram of the PGA4311.

POWER-UP STATE

On power up, "power-up reset" is activated for about 100ms during which the circuit is in hardware $\overline{\text{MUTE}}$ state and all internal flip-flops are reset. At the end of this period, the offset calibration is initiated without any external signals. Once this has been completed, the gain byte value for all channels are set to 00_{HEX} , or the software $\overline{\text{MUTE}}$ condition. The gain will remain at this setting until the host controller programs new settings for for each channel via the serial control port.

Figure 1. PGA4311 Block Diagram.

If during normal operation the power supply voltage drops below $\pm 3.2\text{V}$, the circuit enters a hardware **MUTE** state. A power-up sequence will be initiated if the power-supply voltage returns to greater than $\pm 3.2\text{V}$.

ANALOG INPUTS AND OUTPUTS

The PGA4311 includes four independent channels. Each channel has a corresponding input and output pin. The input and output pins are unbalanced, and referenced to analog ground.

The input and output pins may swing within 1.25V of the analog power supplies, V_{A+} and V_{A-} . Given $V_{A+} = +5\text{V}$ and $V_{A-} = -5\text{V}$, the maximum input or output voltage range is 7.5Vp-p .

For optimal performance, it is best to drive the PGA4311 with a low source impedance. A source impedance of 600Ω or less is recommended. Source impedances up to $2\text{k}\Omega$ will cause minimal degradation of THD+N. Please refer to the "THD+N vs Source Impedance" plot in the Typical Characteristics section of the datasheet.

SERIAL CONTROL PORT

The serial control port is utilized to program the gain settings for the PGA4311. The serial control port includes three input pins and one output pin. The inputs include $\overline{CS}$ (pin 14), SDI (pin 13), and SCLK (pin 15). The sole output pin is SDO (pin 16).

The $\overline{CS}$ pin functions as the chip select input. Data may be written to the PGA4311 only when $\overline{CS}$ is LOW. SDI is the serial data input pin. Control data is provided as a 32-bit word at the SDI pin, 8 bits each for each channel gain setting.

Data is formatted as MSB first, straight binary code. SCLK is the serial clock input. Data is clocked into SDI on the rising edge of SCLK.

SDO is the serial data output pin, and is used when daisy-chaining multiple PGA4311 devices. Daisy-chain operation is described in detail later in this section. SDO is a tri-state output, and assumes a high impedance state when $\overline{CS}$ is HIGH. Data appears at SDO on the falling edge of SCLK.

The protocol for the serial control port is shown in Figure 2. See Figure 3 for detailed timing specifications for the serial control port.

Figure 2. Serial Interface Protocol.

Figure 3. Serial Interface Timing Requirements.

GAIN SETTINGS

The gain for each channel is set by its corresponding 8-bit code, [7:0] (see Figure 2). The gain code data is straight binary format. If we let N equal the decimal equivalent of [7:0], then the following relationships exist for the gain settings:

For N = 0:

Mute Condition. The input multiplexer is connected to analog ground.

For N = 1 to 255:

$$\text{Gain (dB)} = 31.5 - [0.5 \text{ w } (255 - N)]$$

This results in a gain range of +31.5dB (with N = 255) to -95.5dB (with N = 1).

Changes in gain setting may be made with or without zero crossing detection. The operation of the zero crossing detector and timeout circuitry is discussed later in this data sheet.

DAISY-CHAINING MULTIPLE PGA4311 DEVICES

In order to reduce the number of control signals required to support multiple PGA4311 devices on a printed circuit board, the serial control port supports daisy-chaining of multiple PGA4311 devices. Figure 4 shows the connection requirements for daisy-chain operation. This arrangement allows a 3-wire serial interface to control many PGA4311 devices.

As shown in Figure 4, the SDO pin from device #1 is connected to the SDI input of device #2, and is repeated for additional devices. This in turn forms a large shift register, in which gain data may be written for all PGA4311s connected to the serial bus. The length of the shift register is $32 \cdot N$ bits, where N is equal to the number of PGA4311 devices included in the chain. The $\overline{CS}$ input must remain LOW for $32 \cdot N$ SCLK periods, where N is the number of devices connected in the chain, in order to allow enough SCLK cycles to load all devices.

ZERO CROSSING DETECTION

The PGA4311 includes a zero crossing detection function that can provide for noise-free level transitions. The concept is to change gain settings on a zero crossing of the input signal, thus minimizing audible glitches. This function is enabled or disabled using the ZCEN input. When ZCEN is LOW, zero crossing detection is disabled. When ZCEN is HIGH, zero crossing detection will be enabled.

The zero crossing detection takes effect with a change in gain setting for a corresponding channel. The new gain setting will not be implemented until either positive slope zero crossing is detected or a time-out period of 16ms has elapsed. In the case of a time-out, the new gain setting takes effect with no attempt to minimize audible artifacts.

Figure 4. Daisy-Chaining Multiple PGA4311 Devices.

MUTE FUNCTION

Muting can be achieved by either hardware or software control. Hardware muting is accomplished via the MUTE input, and software muting by loading all zeroes into the volume control register.

MUTE disconnects the internal buffer amplifiers from the output pins and terminates the outputs with 10kΩ resistors to ground. The mute is activated with a zero crossing detection (independent of the zero cross enable status) or an 16ms time-out to eliminate any audible “clicks” or “pops”. MUTE also initiates an internal offset calibration.

A software mute is implemented by loading all zeroes into the volume control register. The internal amplifier is set to unity gain with the amplifier input connected to AGND.

APPLICATIONS INFORMATION

This section includes additional information that is pertinent to designing the PGA4311 into an end application.

RECOMMENDED CONNECTION DIAGRAM

Figure 5 depicts the recommended connections for the PGA4311. Power-supply bypass capacitors should be placed as close to the PGA4311 package as physically possible.

PRINTED CIRCUIT BOARD (PCB) LAYOUT GUIDELINES

It is recommended that the ground planes for the digital and analog sections of the PCB be separate from one another. The planes should be connected at a single point. See Figure 6 for the recommended PCB floor plan for the PGA4311.

Figure 5. Recommended Connection Diagram.

Figure 6. Typical PCB Layout Floor Plan.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
