TMP20 的 4 μA (最大) 电源电流会将器件的自发热限制为低于 0.01°C 。当 V_{+} 低于 0.5V 时，器件处于关断模式，耗电不到 20nA (典型值)。

TMP20 采用 5 引线 SC70 或 6 引线 SOT-563 封装，可降低所需的总体布板空间。

(4) V_{OUT} is calculated from temperature with the following equation:

(6) The TMP20 transfer function requires the output voltage to rise above the 1.8-V supply as the temperature decreases below 15°C . When operating at a 1.8-V supply, it is normal for the TMP20 output to approach 1.8 V and remain at that voltage as the temperature continues to decrease below 15°C . This condition does not damage the device. Once the temperature rises above 15°C , the output voltage resumes changing as the temperature changes, according to the transfer function specified in this document. For more information about the transfer function, see [Transfer Function](#).

7 Detailed Description

7.1 Overview

The TMP20 device is a precision analog output temperature sensor. The temperature range of operation is -55°C to $+130^{\circ}\text{C}$ with supply voltages of 2.7 V to 5.5 V. The TMP20 operates from power-supply voltages as low as 1.8 V over a temperature range of 15°C to 130°C .

TI recommends power supply bypassing; use a 100-nF capacitor placed as closely as possible to the supply pin.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Transfer Function

The analog output of the TMP20 over the -55°C to $+130^{\circ}\text{C}$ temperature range corresponds to the parabolic transfer function shown in

添加了接收文档更新通知部分:

$$V_{\text{OUT}} = \left(-3.88 \times 10^{-6} \times T^2\right) + \left(-1.15 \times 10^{-2} \times T\right) + 1.8639 \text{ V}$$

Where:

- the temperature (T) is in $^{\circ}\text{C}$. (1)

When solving for temperature, the equation is shown as 公式 2:

$$T = -1481.96 + \sqrt{2.1962 \times 10^6 + \frac{(1.8639 - V_{\text{O}})}{3.88 \times 10^{-6}}} \quad (2)$$

These equations apply over the entire operating range of -55°C to $+130^{\circ}\text{C}$.

A simplified linear transfer function referenced at 25°C is shown in 公式 3:

$$V_{\text{OUT}} = -11.69 \text{ mV}/^{\circ}\text{C} \times T + 1.8863 \text{ V} \quad (3)$$

Linear transfer functions are calculated for limited temperature ranges by calculating the slope and offset for that limited range, where slope is calculated by 公式 4:

$$m = -7.76 \times 10^{-6} \times T - 0.0115$$

Where:

- T equals the temperature at the middle of the temperature range of interest (4)

The offset in the linear transfer function is calculated with 公式 5:

$$b = \left(V_{\text{OUT}}(T_{\text{MAX}}) + V_{\text{OUT}}(T) - m \times (T_{\text{MAX}} + T)\right) / 2$$

where

- $V_{\text{OUT}}(T_{\text{MAX}})$ is the calculated output voltage at T_{MAX} as determined from 添加了接收文档更新通知部分. (5)

$V_{\text{OUT}}(T)$ is the calculated output voltage at T as calculated by 添加了接收文档更新通知部分.

7.3.1.1 Example 1

Determine the linear transfer function for -40°C to $+110^{\circ}\text{C}$.

$T_{\text{MIN}} = -40^{\circ}\text{C}$; $T_{\text{MAX}} = 110^{\circ}\text{C}$; therefore, $T = 35^{\circ}\text{C}$

$$m = -11.77 \text{ mV}/^{\circ}\text{C}$$

$$V_{\text{OUT}}(110^{\circ}\text{C}) = 0.5520 \text{ V}$$

$$V_{\text{OUT}}(35^{\circ}\text{C}) = 1.4566 \text{ V}$$

$$b = 1.8576 \text{ V}$$

The linear transfer function for -40°C to $+110^{\circ}\text{C}$ is shown in 公式 6:

$$V_{\text{OUT}} = -11.77 \text{ mV}/^{\circ}\text{C} \times T + 1.8576 \text{ V} \quad (6)$$

7.4 Device Functional Modes

The singular functional mode of the TMP20 is an analog output inversely proportional to temperature.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Output Drive and Capacitive Loads

When used in noisy environments, adding a capacitor from the output to ground with a series resistor filters the TMP20 output; this configuration is shown in 图 11. The TMP20 can drive up to 1 nF of load capacitance while sourcing and sinking 600 μ A. Under this condition, capacitive loads in the range of 1 nF to 10 μ F require a 150- Ω series output resistor to achieve a stable temperature measurement. The output impedance of the TMP20 is typically 10 Ω when sinking currents and less than 1 Ω when sourcing current, as shown in 图 1.

(1) A series resistor (R) may be required depending upon the amount of capacitance (C) and the amount of source and sink current drawn from the output of the TMP20.

图 11. TMP20 Output Filtering

8.2 Typical Application

图 12. Suggested Connections to a MCU ADC

8.2.1 Design Requirements

ADCs that are found in microcontrollers (such as the MSP430 line of microcontrollers) take charge during the sampling phase. A high sampling frequency results in too much charge pulled into the ADC and sags the output voltage of the TMP20, which results in a reading that is hotter than normal. To mitigate this, place a capacitor (C_F) between the TMP20 and the ADC. The capacitor functions as a charge reservoir.

8.2.2 Detailed Design Procedure

The size of C_F depends on the size of the internal sampling capacitor and the sampling frequency. The charge requirements may vary because not all ADCs have identical input stages. This general ADC application is shown as an example only.

8.2.3 Application Curves

图 13 shows the quiescent current versus temperature.

图 13. Quiescent Current vs Temperature

9 Power Supply Recommendations

The low supply current and supply range of 1.8 V to 5.5 V enable the TMP20 to be powered from multiple supply sources.

Power supply bypassing is optional and is typically dependent on the noise of the power supply. In noisy systems, adding bypass capacitors may be necessary to decrease the noise that couples to the output of the TMP20.

10 Layout

10.1 Layout Guidelines

The substrate on the TMP20AIDCK package is directly connected through conductive epoxy to the flag that connects pin 2 on the lead frame. Consequently, pin 2 is the best lead for a conductive thermal connection to the TMP20 die. The optimal electrical connection for this pin is ground (GND).

CAUTION

Do not attempt to connect pin 2 (DCK package) to any electrical potential other than ground.

If it is not possible to connect pin 2 to ground, it is possible to electrically isolate this pin (that is, leave it floating). Take care when electrically isolating this pin because any noise or electromagnetic interference or radio frequency interference (EMI or RFI) spikes that couple in through this pin can cause erroneous temperature results.
