

TPS22918 5.5V、2A、导通电阻为 52mΩ 的负载开关

1 特性

- 集成单通道负载开关
- 环境工作温度范围: -40°C 至 $+105^{\circ}\text{C}$
- 输入电压范围: 1V 至 5.5V
- 导通电阻 (R_{ON})
 - $R_{\text{ON}} = 52\text{m}\Omega$ ($V_{\text{IN}} = 5\text{V}$ 时的典型值)
 - $R_{\text{ON}} = 53\text{m}\Omega$ ($V_{\text{IN}} = 3.3\text{V}$ 时的典型值)
- 2A 最大持续开关电流
- 低静态电流
 - $8.3\mu\text{A}$ ($V_{\text{IN}} = 3.3\text{V}$ 时的典型值)
- 低控制输入阈值, 允许使用 1V 或电压更高的 GPIO
- 可调节快速输出放电 (QOD)
- 可通过 CT 引脚配置的上升时间
- 小外形尺寸晶体管 (SOT-23)-6 封装 (DBV)
 - $2.90\text{mm} \times 2.80\text{mm}$, 间距为 0.95mm , 高度为 1.45mm (带引线)
- 静电放电 (ESD) 性能经测试符合 JESD 22 规范
 - $\pm 2\text{kV}$ 人体模型 (HBM) 和 $\pm 1\text{kV}$ 带电器件模型 (CDM)

2 应用

- 工业系统
- 机顶盒
- 血糖仪
- 电子销售终端

简化电路原理图

3 说明

TPS22918 是一款单通道负载开关, 可对上升时间和快速输出放电进行配置。此器件包括一个 N 沟道金属氧化物半导体场效应晶体管 (MOSFET), 可在 1V 至 5.5V 的输入电压范围内运行并可支持 2A 的最大持续电流。此开关由一个开关输入控制, 能够直接连接低电压控制信号。

该器件的可配置上升时间可大幅降低大容量负载电容所产生的浪涌电流, 从而降低或消除电源压降。

TPS22918 具有一个可配置的快速输出放电 (QOD) 引脚, 用于控制器件的下降时间, 以便针对掉电或排序进行灵活设计。

TPS22918 采用小型、带引线的 SOT-23 封装 (DBV), 方便对焊接点进行外观检查。该器件在自然通风环境下的额定运行温度范围为 -40°C 至 $+105^{\circ}\text{C}$ 。

器件信息 (1)

| 部件号 | 封装 | 封装尺寸 (标称值) |
|----------|------------|-----------------|
| TPS22918 | SOT-23 (6) | 2.90mm x 1.60mm |

5 Pin Configuration and Functions

Pin Functions

| PIN | | I/O | DESCRIPTION |
|-----|------|-----|--|
| NO. | NAME | | |
| 1 | VIN | I | Switch input. Place ceramic bypass capacitor(s) between this pin and GND. See the Detailed Description section for more information. |
| 2 | GND | — | Device ground. |
| 3 | ON | I | Active high switch control input. Do not leave floating. |
| 4 | CT | O | Switch slew rate control. Can be left floating. See the Feature Description section for more information. |
| 5 | QOD | O | Quick Output Discharge pin. This functionality can be enabled in one of three ways. <ul style="list-style-type: none"> Placing an external resistor between VOUT and QOD Tying QOD directly to VOUT and using the internal resistor value (R_{PD}) Disabling QOD by leaving pin floating See the Quick Output Discharge (QOD) section for more information. |
| 6 | VOUT | O | Switch output. |

6 Specifications

6.1 Absolute Maximum Ratings

 Over operating free-air temperature range (unless otherwise noted) ⁽¹⁾ ⁽²⁾

| | | MIN | MAX | UNIT |
|------------------|---|------|-----|------|
| V _{IN} | Input voltage | -0.3 | 6 | V |
| V _{OUT} | Output voltage | -0.3 | 6 | V |
| V _{ON} | ON voltage | -0.3 | 6 | V |
| I _{MAX} | Maximum continuous switch current, ambient temperature = 70°C | | 2 | A |
| I _{PLS} | Maximum pulsed switch current, pulse < 300 μs, 2% duty cycle | | 2.5 | A |
| T _J | Maximum junction temperature | | 125 | °C |
| T _{stg} | Storage temperature | -65 | 150 | °C |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

6.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|--|-------|
| V _(ESD) | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 |
| | | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ±1000 |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

| | | | MIN | MAX | UNIT |
|---------------------|---|--------------------------------|------------------|-----------------|------|
| V _{IN} | Input voltage | | 0 | 5.5 | V |
| V _{ON} | ON voltage | | 0 | 5.5 | V |
| V _{OUT} | Output voltage | | | V _{IN} | V |
| V _{IH, ON} | High-level input voltage, ON | V _{IN} = 1 V to 5.5 V | 1 | 5.5 | V |
| V _{IL, ON} | Low-level input voltage, ON | V _{IN} = 1 V to 5.5 V | 0 | 0.5 | V |
| T _A | Operating free-air temperature range ⁽¹⁾ | | -40 | 105 | °C |
| C _{IN} | Input Capacitor | | 1 ⁽²⁾ | | μF |

- (1) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature [T_{A(MAX)}] is dependent on the maximum operating junction temperature [T_{J(MAX)}], the maximum power dissipation of the device in the application [P_{D(MAX)}], and the junction-to-ambient thermal resistance of the part/package in the application (θ_{JA}), as given by the following equation: T_{A(MAX)} = T_{J(MAX)} - (θ_{JA} × P_{D(MAX)}).
- (2) Refer to [Application and Implementation](#) section

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | TPS22918 | | UNIT |
|-------------------------------|--|-------|------|
| | DBV (SOT-23) | | |
| | 6 PINS | | |
| R _{θJA} | Junction-to-ambient thermal resistance | 183.2 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 151.6 | °C/W |
| R _{θJB} | Junction-to-board thermal resistance | 34.1 | °C/W |
| ψ _{JT} | Junction-to-top characterization parameter | 37.2 | °C/W |
| ψ _{JB} | Junction-to-board characterization parameter | 33.6 | °C/W |

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

Unless otherwise noted, the specification in the following table applies over the full ambient operating temperature $-40^{\circ}\text{C} \leq T_A \leq +105^{\circ}\text{C}$. Typical values are for $T_A = 25^{\circ}\text{C}$.

| PARAMETER | TEST CONDITIONS | T_A | MIN | TYP | MAX | UNIT | | |
|---|---|---|-----|-----|-------------------------|------------------|-----|---------------|

(1) Output pull down resistance varies with input voltage. Please see [Figure 7](#) for more information.

6.6 Switching Characteristics

Refer to the timing test circuit in [Figure 21](#) (unless otherwise noted) for references to external components used for the test condition in the switching characteristics table. Switching characteristics shown below are only valid for the power-up sequence where V_{IN} is already in steady state condition before the ON pin is asserted high. $V_{ON} = 5\text{ V}$, $T_A = 25\text{ }^\circ\text{C}$, QOD = Open.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |

7 Parameter Measurement Information

- (1) Rise and fall times of the control signal are 100 ns
- (2) Turn-off times and fall times are dependent on the time constant at the load. For TPS22918, the internal pull-down resistance R_{PD} is enabled when the switch is disabled. The time constant is $(R_{QOD} \parallel R_L) \times C_L$.

Figure 21. Test Circuit

Figure 22. Timing Waveforms

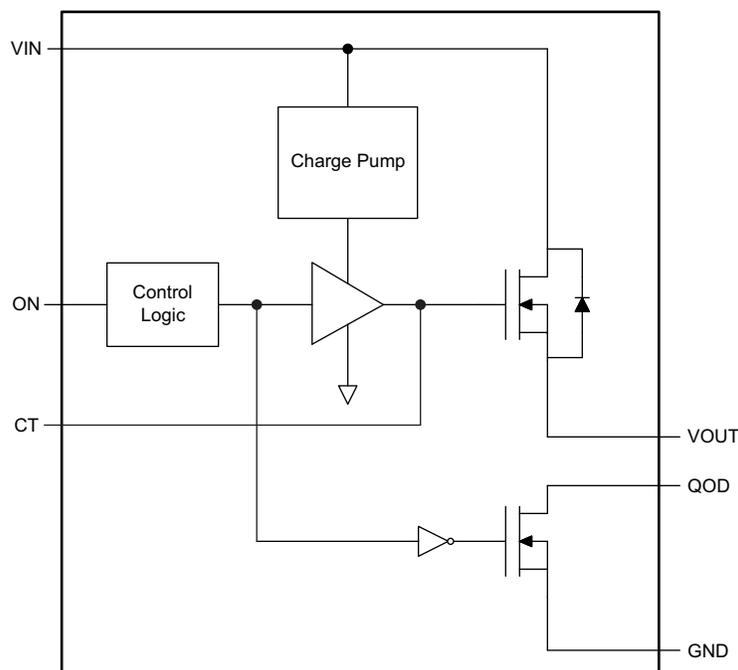

8 Detailed Description

8.1 Overview

The TPS22918 is a 5.5 V, 2 A load switch in a 6-pin SOT-23 package. To reduce voltage drop for low voltage and high current rails, the device implements a low resistance N-channel MOSFET which reduces the drop out voltage across the device.

The device has a configurable slew rate which helps reduce or eliminate power supply droop because of large inrush currents. Furthermore, the device features a QOD pin, which allows the configuration of the discharge rate of VOUT once the switch is disabled. During shutdown, the device has very low leakage currents, thereby reducing unnecessary leakages for downstream modules during standby. Integrated control logic, driver, charge pump, and output discharge FET eliminates the need for any external components which reduces solution size and bill of materials (BOM) count.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 On and Off Control

The ON pin controls the state of the switch. ON is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1 V or higher GPIO voltage. This pin cannot be left floating and must be driven either high or low for proper functionality.

8.3.2 Quick Output Discharge (QOD)

The TPS22918 includes a QOD feature. The QOD pin can be configured in one of three ways:

- QOD pin shorted to VOUT pin. Using this method, the discharge rate after the switch becomes disabled is controlled with the value of the internal resistance R_{PD} . The value of this resistance is listed in the [Electrical Characteristics](#) table.
- QOD pin connected to VOUT pin using an external resistor R_{EXT} . After the switch becomes disabled, the discharge rate is controlled by the value of the total resistance of the QOD. To adjust the total QOD resistance, [Equation 1](#) can be used:

$$R_{QOD} = R_{PD} + R_{EXT}$$

Where:

- R_{QOD} = Total output discharge resistance
- R_{PD} = Internal pulldown resistance
- R_{EXT} = External resistance placed between the VOUT and QOD pin. (1)
- QOD pin is unused and left floating. Using this method, there will be no quick output discharge functionality, and the output will remain floating after the switch is disabled.

The fall times of the device depend on many factors including the total resistance of the QOD, V_{IN} , and the output capacitance. When QOD is shorted to VOUT, the fall time will change over V_{IN} as the internal R_{PD} varies over V_{IN} . To calculate the approximate fall time of V_{OUT} for a given R_{QOD} , use [Equation 2](#) and [Table 1](#).

$$V_{CAP} = V_{IN} \times e^{-t/\tau}$$

Where:

- V_{CAP} = Voltage across the capacitor (V)
- t = Time since power supply removal (s)
- τ = Time constant equal to $R_{QOD} \times C_L$ (2)

The fall times' dependency on V_{IN} becomes minimal as the QOD value increases with additional external resistance. See [Table 1](#) for QOD fall times.

Table 1. QOD Fall Times

| V_{IN} (V) | ⁽¹⁾ FALL TIME (μ s) 90% - 10%, $C_{IN} = 1 \mu$ F, $I_{OUT} = 0$ A, $V_{ON} = 0$ V | | | | | |

(1) TYPICAL VALUES WITH QOD SHORTED TO VOUT

8.3.2.1 QOD when System Power is Removed

The adjustable QOD can be used to control the power down sequencing of a system even when the system power supply is removed. When the power is removed, the input capacitor discharges at V_{IN} . Past a certain V_{IN} level, the strength of the R_{PD} will be reduced. If there is still remaining charge on the output capacitor, this will result in longer fall times. For further information regarding this condition, refer to [Shutdown Sequencing During Unexpected System Power Loss](#).

8.3.2.2 Internal QOD Considerations

Special considerations must be taken when using the internal R_{PD} by shorting the QOD pin to the VOUT pin. The internal R_{PD} is a pulldown resistance designed to quickly discharge a load after the switch has been disabled. Care must be used to ensure that excessive current does not flow through R_{PD} during discharge so that the maximum T_J of 125°C is not exceeded. When using only the internal R_{PD} to discharge a load, the total capacitive load must not exceed 200 μF . Otherwise, an external resistor, R_{EXT} , must be used to ensure the amount of current flowing through R_{PD} is properly limited and the maximum T_J is not exceeded. To ensure the device is not damaged, the remaining charge from C_L must decay naturally through the internal QOD resistance and should not be driven.

8.3.3 Adjustable Rise Time (CT)

A capacitor to GND on the CT pin sets the slew rate of V_{OUT} . The CT capacitor will charge up until shortly after the switch is turned on and V_{OUT} becomes stable. Once V_{OUT} become stable, the capacitor will discharge to ground. An approximate formula for the relationship between CT and the slew rate is shown in [Equation 3](#):

$$SR = 0.55 \times CT + 30$$

where

- SR = slew rate (in $\mu\text{s}/\text{V}$)
- CT = the capacitance value on the CT pin (in pF)
- The units for the constant 30 are $\mu\text{s}/\text{V}$. The units for the constant 0.52 are $\mu\text{s}/(\text{V} \times \text{pF})$. (3)

This equation accounts for 10% to 90% measurement on V_{OUT} and does not apply for $CT = 0$ pF. Use [Table 2](#) to determine rise times for when $CT = 0$ pF.

Rise time can be calculated by multiplying the input voltage by the slew rate. [Table 2](#) contains rise time values measured on a typical device.

Table 2. Rise Time Table

| CTx (pF) | RISE TIME (μs) 10% - 90%, $C_L = 0.1 \mu\text{F}$, $C_{IN} = 1 \mu\text{F}$, $R_L = 10 \Omega$ | | | | | | |
|----------|---|-------------|-------------|-------------|-------------|-------------|-------------|
| | VIN = 5 V | VIN = 3.3 V | VIN = 2.5 V | VIN = 1.8 V | VIN = 1.5 V | VIN = 1.2 V | VIN = 1.0 V |
| 0 | 135 | 95 | 75 | 60 | 50 | 45 | 40 |
| 220 | 650 | 455 | 350 | 260 | 220 | 185 | 160 |
| 470 | 1260 | 850 | 655 | 480 | 415 | 340 | 300 |
| 1000 | 2540 | 1680 | 1300 | 960 | 810 | 660 | 560 |
| 2200 | 5435 | 3580 | 2760 | 2020 | 1715 | 1390 | 1220 |
| 4700 | 12050 | 7980 | 6135 | 4485 | 3790 | 3120 | 2735 |
| 10000 | 26550 | 17505 | 13460 | 9790 | 8320 | 6815 | 5950 |

(1) Typical values at 25°C with a 25 V X7R 10% ceramic capacitor on CT.

As the voltage across the capacitor approaches the capacitor rated voltage, the effective capacitance reduces. Depending on the dielectric material used, the voltage coefficient changes. See [Table 3](#) for the recommended minimum voltage rating for the CT capacitor. If using $V_{IN} = 1.2$ V or 4 V, it is recommended to use the higher of the two CT Voltage ratings specified.

Table 3. Recommended CT Capacitor Voltage Rating

| V_{IN} (V) | RECOMMENDED CT CAPACITOR VOLTAGE RATING (V) |
|--------------|---|
| 1 V to 1.2 V | 10 |
| 1.2 V to 4 V | 16 |
| 4 V to 5.5 V | 20 |

8.4 Device Functional Modes

Table 4 describes the connection of the VOUT pin depending on the state of the ON pin.

Table 4. VOUT Connection

| ON | QOD CONFIGURATION | TPS22918 VOUT |
|----|--|-----------------------------|
| L | QOD pin connected to VOUT with R_{EXT} | GND (via $R_{EXT}+R_{PD}$) |
| L | QOD pin tied to VOUT directly | GND (via R_{PD}) |
| L | QOD pin left open | Open |
| H | Any valid QOD configuration | VIN |

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

This section highlights some of the design considerations when implementing this device in various applications. A PSPICE model for this device is also available in the product page of this device on www.ti.com (See the [器件支持](#) section for more information).

9.2 Typical Application

This typical application demonstrates how the TPS22918 can be used to power downstream modules.

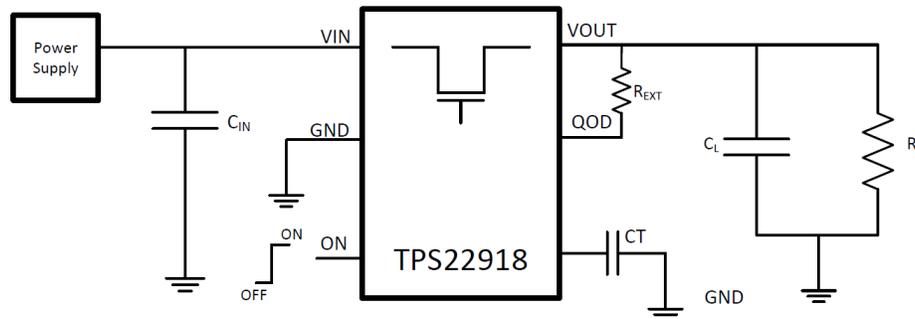

Figure 23. Typical Application Schematic

9.2.1 Design Requirements

For this design example, use the values listed in [Table 5](#) as the design parameters:

Table 5. Design Parameters

| DESIGN PARAMETER | EXAMPLE VALUE |
|-----------------------------------|---------------|
| V_{IN} | 5 V |
| Load Current | 2 A |
| C_L | 22 μ F |
| Desired Fall Time | 4 ms |
| Maximum Acceptable Inrush Current | 400 mA |

9.2.2 Detailed Design Procedure

9.2.2.1 Input Capacitor (C_{IN})

To limit the voltage drop on the input supply caused by transient in-rush currents when the switch turns on into a discharged load capacitor or short-circuit, a capacitor needs to be placed between V_{IN} and GND. A 1 μ F ceramic capacitor, C_{IN} , placed close to the pins, is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop during high-current application. When switching heavy loads, it is recommended to have an input capacitor about 10 times higher than the output capacitor to avoid excessive voltage drop.

9.2.2.2 Output Capacitor (C_L) (Optional)

Because of the integrated body diode in the MOSFET, a C_{IN} greater than C_L is highly recommended. A C_L greater than C_{IN} can cause V_{OUT} to exceed V_{IN} when the system supply is removed. This could result in current flow through the body diode from V_{OUT} to V_{IN} . A C_{IN} to C_L ratio of 10 to 1 is recommended for minimizing V_{IN} dip caused by inrush currents during startup.

9.2.2.3 Shutdown Sequencing During Unexpected System Power Loss

Microcontrollers and processors often have a specific shutdown sequence in which power needs to be removed. Using the adjustable Quick Output Discharge function of the TPS22918, adding a load switch to each power rail can be used to manage the power down sequencing in the event of an unexpected system power loss (i.e. battery removal). To determine the QOD values for each load switch, first confirm the power down order of the device you wish to power sequence. Be sure to check if there are voltage or timing margins that must be maintained during power down. Next, consult QOD Fall Time Table in the [Quick Output Discharge \(QOD\)](#) feature description to determine appropriate C_{OUT} and R_{QOD} values for each power rail's load switch so that the load switches' fall times correspond to the order in which they need to be powered down. In the above example, we would like this power rail's fall time to be 4 ms. Using [Equation 2](#), to determine the appropriate R_{QOD} to achieve our desired fall time.

Because fall times are measured from 90% of V_{OUT} to 10% of V_{OUT} , the equation becomes:

$$.5 V = 4.5 V \times e^{-(4 \text{ ms}) / (R \times (22 \mu\text{F}))} \quad (4)$$

$$R_{QOD} = 83.333 \Omega \quad (5)$$

Refer to [Figure 7](#), R_{PD} at $V_{IN} = 5 V$ is approximately 25 Ω . Using [Equation 1](#), the required external QOD resistance can be calculated:

$$83.333 \Omega = 25 \Omega + R_{EXT} \quad (6)$$

$$R_{EXT} = 58.333 \Omega \quad (7)$$

[Figure 24](#) through [Figure 29](#) are scope shots demonstrating an example of the QOD functionality when power is removed from the device (both ON and V_{IN} are disconnected simultaneously). The input voltage is decaying in all scope shots below.

- Initial $V_{IN} = 3.3 V$
- QOD = Open, 500 Ω , or shorted to V_{OUT}
- $C_L = 1 \mu\text{F}$, 10 μF
- V_{OUT} is left floating

NOTE: V_{IN} may appear constant in some figures. This is because the time scale of the scope shot is too small to show the decay of C_{IN} .

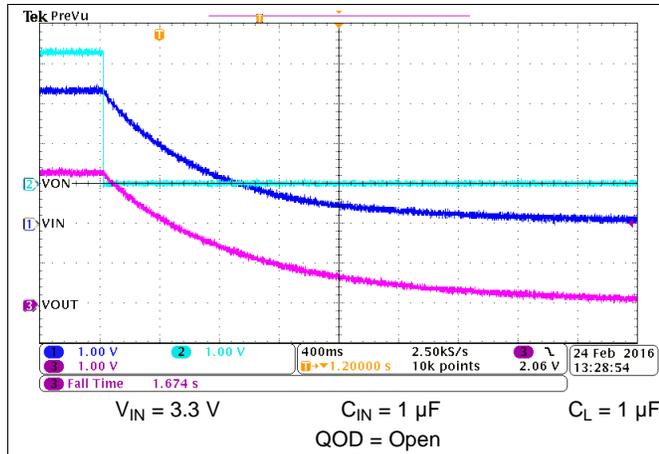

Figure 24. t_F at $V_{IN} = 3.3\text{ V}$

Figure 25. t_F at $V_{IN} = 3.3\text{ V}$

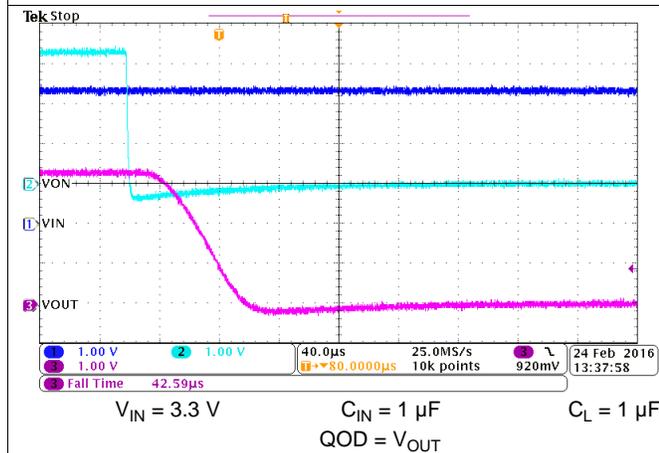

Figure 26. t_F at $V_{IN} = 3.3\text{ V}$

Figure 28. t_F at $V_{IN} = 3.3\text{ V}$

Figure 29. t_F at $V_{IN} = 3.3\text{ V}$

9.2.2.4 VIN to VOUT Voltage Drop

The VIN to VOUT voltage drop in the device is determined by the R_{ON} of the device and the load current. The R_{ON} of the device depends upon the VIN conditions of the device. Refer to the R_{ON} specification of the device in the [Electrical Characteristics](#) table of this data sheet. When the R_{ON} of the device is determined based upon the VIN conditions, use [公式 8](#) to calculate the VIN to VOUT voltage drop:

$$\Delta V = I_{LOAD} \times R_{ON}$$

where

- ΔV = voltage drop from VIN to VOUT
- I_{LOAD} = load current
- R_{ON} = On-resistance of the device for a specific V_{IN}

An appropriate I_{LOAD} must be chosen such that the I_{MAX} specification of the device is not violated. (8)

9.2.2.5 Inrush Current

Use [公式 9](#) to determine how much inrush current will be caused by the C_L capacitor:

$$I_{INRUSH} = C_L \times \frac{dV_{OUT}}{dt}$$

where

- I_{INRUSH} = amount of inrush caused by C_L
- C_L = capacitance on VOUT
- dt = Output Voltage rise time during the ramp up of VOUT when the device is enabled
- dV_{OUT} = change in V_{OUT} during the ramp up of VOUT when the device is enabled (9)

The appropriate rise time can be calculated using the design requirements and the inrush current equation. As we are calculating the rise time (measured from 10% to 90% of V_{OUT}), we will account for this in our dV_{OUT} parameter (80% of $V_{OUT} = 4$ V).

$$400 \text{ mA} = 22 \text{ } \mu\text{F} \times 4 \text{ V}/dt \quad (10)$$

$$dt = 220 \text{ } \mu\text{s} \quad (11)$$

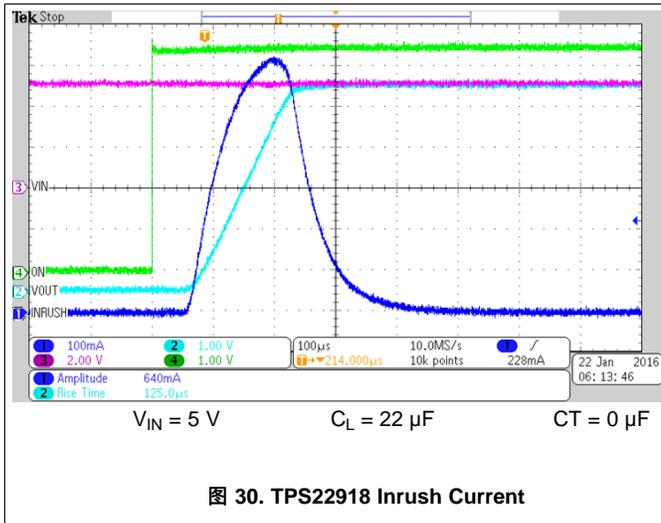

To ensure an inrush current of less than 400 mA, choose a C_T value that will yield a rise time of more than 220 μs . Consulting [Table 2](#) at $V_{IN} = 5$ V, $C_T = 220 \text{ } \mu\text{F}$ will provide a typical rise time of 650 μs . Inputting this rise time and voltage into [公式 9](#), yields:

$$I_{Inrush} = 22 \text{ } \mu\text{F} \times 4 \text{ V} / 650 \text{ } \mu\text{s} \quad (12)$$

$$I_{Inrush} = 135 \text{ mA} \quad (13)$$

This inrush current can be seen in the [Application Curves](#) below. An appropriate C_L value should be placed on VOUT such that the I_{MAX} and I_{PLS} specifications of the device are not violated.

9.2.3 Application Curves

10 Power Supply Recommendations

The device is designed to operate from a V_{IN} range of 1 V to 5.5 V. This supply must be well regulated and placed as close to the device terminal as possible with the recommended 1- μ F bypass capacitor. If the supply is located more than a few inches from the device terminals, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 1 μ F may be sufficient.

The TPS22918 operates regardless of power sequencing order. The order in which voltages are applied to V_{IN} and ON will not damage the device as long as the voltages do not exceed the absolute maximum operating conditions. If voltage is applied to ON before V_{IN} , the slew rate of V_{OUT} will not be controlled.

11 Layout

11.1 Layout Guidelines

V_{IN} and V_{OUT} traces should be as short and wide as possible to accommodate for high current.

The V_{IN} pin should be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 1- μ F ceramic with X5R or X7R dielectric. This capacitor should be placed as close to the device pins as possible.

11.2 Layout Example

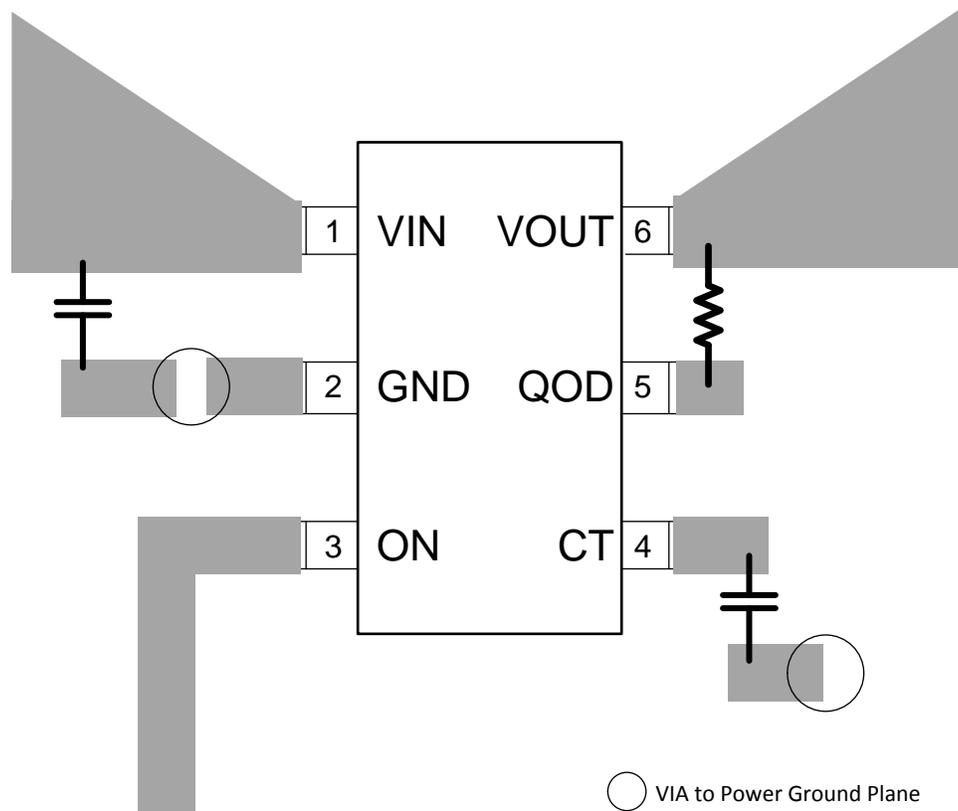

图 32. Recommended Board Layout

11.3 Thermal Considerations

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effects that parasitic trace inductances may have on normal and short-circuit operation. Using wide traces for VIN, VOUT, and GND helps minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance.

The maximum IC junction temperature should be restricted to 125°C under normal operating conditions. To calculate the maximum allowable dissipation, $P_{D(max)}$ for a given output current and ambient temperature, use 公式 14:

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{\theta_{JA}}$$

where

- $P_{D(MAX)}$ = maximum allowable power dissipation
- $T_{J(MAX)}$ = maximum allowable junction temperature (125°C for the TPS22918)
- T_A = ambient temperature of the device
- θ_{JA} = junction to air thermal impedance. Refer to the [Thermal Information](#) table. This parameter is highly dependent upon board layout. (14)

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
