3.3V/5V 输入，D-CAP+™ 模式同步降压型集成场效应晶体管 (FET) 转换器
此转换器含 2 位 VID

查询样品: **TPS51463**

特性

- 拥有 **TI** 自主知识产权的集成 **FET** 转换器 **D-CAP+™** 模式架构
- 最小外部部件数量
- 支持所有多层陶瓷 **(MLCC)** 输出电容器与 **SP/POSCAP**
- "自动跳跃"模式
- **700kHz** 和 **1MHz** 可选频率
- 小型 **4mm x 4mm**，**24** 引脚，方形扁平无引线 **(QFN)** 封装

应用范围

- **5 V** 或 **3.3 V** 电轨的低电压应用步降
- 笔记本**/**台式机
- **Intel® Chief River** 平台超低电压 **(ULV)** 中央处理器 **(CPU)** 系统代理

说明

TPS51463 是一款采用 D-CAP+™ 技术的完全集成同步降压稳压器。 在系统尺寸最优的地方此器件用于最高5V压降，性能和优化的物料清单(BOM)是必要条件。

TPS51463 完全支持 Intel® Chief River 平台，一个具有集成 2 位 VID 功能的 ULV/CPU 系统代理应用。

TPS51463 还特有 2 个开关频率设置（700 kHz 和 1 MHz），跳跃模式，预偏置启动，可编程外部电容器软启动时间/电压转换时间，输出放电，内部 VBST 开关，2V 基准 (±1%)，电源正常和使能。

TPS51463 采用 4 mm × 4 mm，24 引脚，QFN 封装（绿色 RoHs 兼容且无铅），额定温度范围 -40°C 至 85°C。

PIN FUNCTIONS

PIN		I/O	DESCRIPTION
NO.	NAME		
19	PGND	I	Power ground. Source terminal of the rectifying low-side power FET.
20			
21			
22	VIN	I	Power supply input pin. Drain terminal of the switching high-side power FET.
23			
24			
1	GND	–	Signal ground.
2	VREF	O	2.0-V reference output. Connect a 0.22-µF ceramic capacitor to GND.
3	COMP	O	Connect series R-C to the VREF pin for loop compensation.
4	SLEW	I/O	Program the startup and voltage transition time using an external capacitor via 10-µA current source.
5	VOUT	I	Output voltage monitor input pin.
6	MODE	I	Allows selection of switching frequencies. (See Table 3)
7	SW	I/O	Switching node output. Connect to the external inductor.
8			
9			
10			
11			
12	BST	I	Power supply for internal high-side gate driver. Connect a 0.1-µF bootstrap capacitor between this pin and the SW pin.
13	EN	I	Enable of the SMPS.
14	VID0	I	2-bit VID input.
15	VID1		
16	PGOOD	O	Power good output. Connect pull-up resistor.
17	V5FILT	I	5-V power supply for analog circuits.
18	V5DRV	I	5-V power supply for the gate driver.
Thermal Pad		–	Connect directly to system GND plane with multiple vias.

Ceramic Output Capacitors	Panasonic	ECJ2FB0J226M
	Murata	GRM21BR60J226ME39L

APPLICATION INFORMATION

Functional Overview

The TPS51463 is a D-CAP+™ mode adaptive on-time converter. The output voltage is set using a 2-bit DAC that outputs a reference voltage in accordance with the code defined in Table 1. *VID-on-the-fly* transitions are supported with the slew rate controlled by a single capacitor on the SLEW pin. The converter automatically runs in discontinuous conduction mode (DCM) to optimize light-load efficiency. Two switching frequency selections are provided, (700 kHz and 1 MHz) to enable optimization of the power chain for the cost, size and efficiency requirements of the design.

In adaptive on-time converters, the controller varies the on-time as a function of input and output voltage to maintain a nearly constant frequency during steady-state conditions. In conventional constant on-time converters, each cycle begins when the output voltage crosses to a fixed reference level. However, in the TPS51463, the cycle begins when the current feedback reaches an error voltage level which is the amplified difference between the reference voltage and the feedback voltage.

PWM Operation

Referring to Figure 2, in steady state, continuous conduction mode, the converter operates in the following way.

Starting with the condition that the top FET is off and the bottom FET is on, the current feedback (V_{CS}) is higher than the error amplifier output (V_{COMP}). V_{CS} falls until it hits V_{COMP}, which contains a component of the output ripple voltage. V_{CS} is not directly accessible by measuring signals on pins of TPS51463. The PWM comparator senses where the two waveforms cross and triggers the on-time generator.
UDG-10187

Figure 2. D-CAP+™ Mode Basic Waveforms

The current feedback is an amplified and filtered version of the voltage between PGND and SW during low-side FET on-time. The TPS51463 also provides a single-ended differential voltage (V_{OUT}) feedback to increase the system accuracy and reduce the dependence of circuit performance on layout.

PWM Frequency and Adaptive on Time Control

In general, the on-time (at the SW node) can be estimated by Equation 1.

$$t_{ON} = \frac{V_{OUT}}{V_{IN}} \times \frac{1}{f_{SW}}$$

where

- f_{SW} is the frequency selected by the connection of the MODE pin   (1)

The on-time pulse is sent to the top FET. The inductor current and the current feedback rises to peak value. Each ON pulse is latched to prevent double pulsing. Switching frequency settings are shown in Table 3.

Non-Droop Configuration

The TPS51463 offers a non-droop solution only. The benefit of a non-droop approach is that load regulation is flat, therefore, in a system where tight DC tolerance is desired, the non-droop approach is recommended. For the Intel system agent application, non-droop is recommended as the standard configuration.

The non-droop approach can be implemented by connecting a resistor and a capacitor between the COMP and the VREF pins. The purpose of the type II compensation is to obtain high DC feedback gain while minimizing the phase delay at unity gain cross over frequency of the converter.

The value of the resistor (R_C) can be calculated using the desired unity gain bandwidth of the converter, and the value of the capacitor (C_C) can be calculated by knowing where the zero location is desired. An application tool that calculates these values is available from your local TI Field Application Engineer.

Figure 3 shows the basic implementation of the non-droop mode using the TPS51463.

UDG-11208
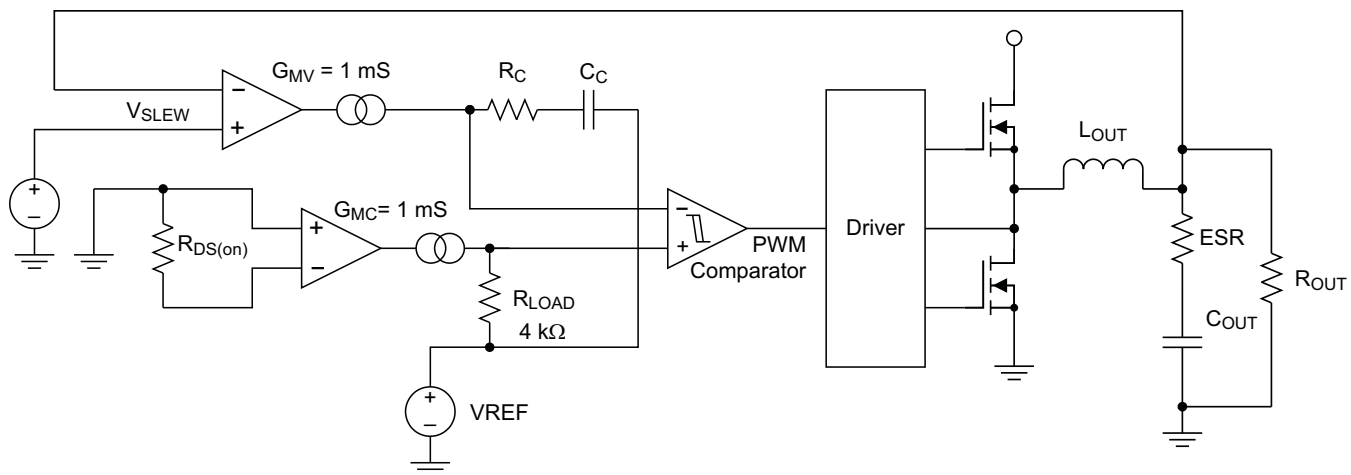

Figure 3. Non-Droop Mode Basic Implementation

Figure 4 shows the load regulation of the system agent rail using non-droop configuration.

Figure 5 shows the transient response of TPS51463 using non-droop configuration where C_{OUT} = 4 × 22 μF. The applied step load is from 0 A to 2 A.

**Figure 4. 0.85-V Load Regulation**

**Figure 5. Transient Response**

Table 3. Mode Parameter Table

MODE	MODE CONNECTION	SWITCHING FREQUENCY (f_{SW})	VID1 = 1 VID0 = 0
7	100 kΩ	700 kHz	0.85 V
8	Open	1 MHz	0.85 V

Light Load Power Saving Features

The TPS51463 has an automatic pulse-skipping mode to provide excellent efficiency over a wide load range. The converter senses inductor current and prevents negative flow by shutting off the low-side gate driver. This saves power by eliminating re-circulation of the inductor current. Further, when the bottom FET shuts off, the converter enters discontinuous mode, and the switching frequency decreases, thus reducing switching losses as well.

Voltage Slewing

The TPS51463 ramps the SLEW voltage up and down to perform the output voltage transitioning. The timing is independent of switching frequency, as well as output resistive and capacitive loading. It is set by a capacitor from SLEW pin to GND, called C_{SLEW}, together with an internal current source of 10 µA. The slew rate is used to set the startup and voltage transition rate.

$$C_{SLEW} = \frac{I_{SLEW}}{SR}$$

$$t_{SS} = \frac{C_{SLEW} \times 0.9\,V}{I_{SLEW}} \tag{2}$$

where

- I_{SLEW} = 10 µA (nom)
- SR is the target output voltage slew rate, per Intel specification between 0.5 mV/µs and 10 mV/µs   (3)

For the current reference design, an SR of 1 mV/µs is targeted. The C_{SLEW} is calculated to be 10 nF. The slower slew rate is desired to minimize large inductor current perturbation during startup and voltage transitioning thus reducing the possibility of acoustic noise.

After the power up, when VID1 is transitioning from 0 to 1, TPS51463 follows the SLEW voltage entering the forced PWM mode to actively discharge the output voltage from 0.9 V to 0.85 V. The actual output voltage slew rate is approximately the same as the set slew rate while the bandwidth of the converter supports it and there is no overcurrent triggered by additional charging current flowing into the output capacitors. After SLEW transition is completed, PWM mode is maintained for 64 µs (16 clock cycles when the frequency is 1 MHz) to ensure voltage regulation.

Protection Features

The TPS51463 offers many features to protect the converter power chain as well as the system electronics.

5-V Undervoltage Protection (UVLO)

The TPS51463 continuously monitors the voltage on the V5FILT pin to ensure that the voltage level is high enough to bias the device properly and to provide sufficient gate drive potential to maintain high efficiency. The converter starts with approximately 4.3 V and has a nominal of 440 mV of hysteresis. If the 5-V UVLO limit is reached, the converter transitions the phase node into a 3-state function. And the converter remains in the off state until the device is reset by cycling 5 V until the 5-V POR is reached (2.3-V nominal). The power input does not have an UVLO function

Power Good Signals

The TPS51463 has one open-drain *power good* (PGOOD) pin. During startup, there is a 3 ms power good delay starting from the output voltage reaching the regulation point (excluding soft-start ramp-up time). And there is also a 1 ms power good high propagation delay. The PGOOD pin de-asserts as soon as the EN pin is pulled low or an undervoltage condition on V5FILT is detected. The PGOOD signal is blanked during VID voltage transitions to prevent false triggering during voltage slewing.

Output Overvoltage Protection (OVP)

In addition to the power good function described above, the TPS51463 has additional OVP and UVP thresholds and protection circuits.

An OVP condition is detected when the output voltage is approximately 120% × V_{SLEW}. In this case, the converter de-asserts the PGOOD signals and performs the overvoltage protection function. The converter remains in this state until the device is reset by cycling 5 V until the 5-V POR threshold (2.3 V nominal) is reached.

Output Undervoltage Protection (UVP)

Output undervoltage protection works in conjunction with the current protection described in the Overcurrent Protection and Overcurrent Limit sections. If the output voltage drops below 70% of V_{SLEW}, after an 8-µs delay, the device latches OFF. Undervoltage protection can be reset only by EN or a 5-V POR.

Overcurrent Protection

Both positive and negative overcurrent protection are provided in the TPS51463:
- Overcurrent Limit (OCL)
- Negative OCL (level same as positive OCL)

Overcurrent Limit

If the sensed current value is above the OCL setting, the converter delays the next ON pulse until the current drops below the OCL limit. Current limiting occurs on a pulse-by-pulse basis. The TPS51463 uses a valley current limiting scheme where the DC OCL trip point is the OCL limit plus half of the inductor ripple current. The minimum valley OCL is 4 A over process and temperature.

During the overcurrent protection event, the output voltage likely droops until the UVP limit is reached. Then, the converter de-asserts the PGOOD pin, and then latches OFF after an 8-µs delay. The converter remains in this state until the device is reset by EN or a 5VFILT POR.

$$I_{OCL(dc)} = I_{OCL(valley)} + \frac{1}{2} \times I_{P-P}$$

(4)

Negative OCL

The negative OCL circuit acts when the converter is sinking current from the output capacitor(s). The converter continues to act in a *valley* mode, the absolute value of the negative OCL set point is typically -5 A.

Thermal Protection

Thermal Shutdown

The TPS51463 has an internal temperature sensor. When the temperature reaches a nominal 125°C, the device shuts down until the temperature cools by approximately 10°C. Then the converter restarts.

DESIGN PROCEDURE

The simplified design procedure steps using the TPS51463 converter application are outlined in this section.

Step One

Determine the specifications.

The System Agent Rail requirements provide the following key parameters:

1. V_{00} = 0.90 V
2. V_{10} = 0.85 V
3. $I_{CC(max)}$ = 4 A
4. $I_{DYN(max)}$ = 2 A
5. $I_{CC(tdc)}$ = 3 A

Step Two

Determine system parameters.

The input voltage range and operating frequency are of primary interest. For example:

1. V_{IN} = 5 V
2. f_{SW} = 1 MHz

Step Three

Determine inductor value and choose inductor.

Smaller values of inductor have better transient performance but higher ripple and lower efficiency. Higher values have the opposite characteristics. It is common practice to limit the ripple current to 25% to 50% of the maximum current. In this case, use 37.5%:

$$I_{P-P} = 4\,A \times 0.375 = 1.5\,A$$

(5)

At f_{SW} = 1 MHz, with a 5-V input and a 0.85-V output:

$$L = \frac{V \times dT}{I_{P-P}} = \frac{\left(V_{IN} - V_{10}\right) \times \left(\dfrac{V_{10}}{\left(f_{SW} \times V_{IN}\right)}\right)}{I_{P-P}} = \frac{\left(5 - 0.85\right) \times \left(\dfrac{0.85}{\left(1 \times 5\right)}\right)}{1.5\,A} = 0.47\,\mu H$$

(6)

For this application, a 0.42-µH, 1.55-mΩ inductor from NEC-TOKIN with part number MPCG0740LR42C is chosen.

Step Four

Set the output voltage.

The output voltage is determined by the VID settings. The actual voltage set point for each VID setting is listed in Table 1. No external resistor dividers are needed for this design.

Step Five

Calculate C_{SLEW}.

VID pin transition and soft-start time is determined by C_{SLEW} and 10 µA of internal current source.

$$C_{SLEW} = \frac{I_{SLEW}}{SR_{DAC}} = \frac{10\,\mu A}{1\,mV\!\Big/\!\mu s} = 10\,nF$$

(7)

The slower slew rate is desired to minimize large inductor current perturbation during startup and voltage transition, thus reducing the possibility of acoustic noise.

Given the C_{SLEW}, use Equation 8 to calculate the soft start time.

$$t_{SS} = \frac{C_{SLEW} \times 0.9\,V}{I_{SLEW}} = \frac{10\,nF \times 0.9\,V}{10\,\mu A} = 900\,\mu s$$

(8)

Step Six

Calculate OCL.

The DC OCL level of TPS51463 design is determined by Equation 9,

$$I_{OCL(dc)} = I_{OCL(valley)} + \frac{1}{2} \times I_{P-P} = 4\,A + \frac{1}{2} \times 1.5\,A = 4.75\,A$$

(9)

The minimum valley OCL is 4 A over process and temperature, and I_{P-P} = 1.5 A, the minimum DC OCL is calculated to be 4.75A.

Step Seven

Determine the output capacitance.

To determine COUT based on transient and stability requirement, first calculate the the minimum output capacitance for a given transient.

Equation 11 and Equation 10 can be used to estimate the amount of capacitance needed for a given dynamic load step/release. Please note that there are other factors that may impact the amount of output capacitance for a specific design, such as ripple and stability. Equation 11 and Equation 10 are used only to estimate the transient requirement, the result should be used in conjunction with other factors of the design to determine the necessary output capacitance for the application.

$$C_{OUT(min\_under)} = \frac{L \times \Delta I_{LOAD(max)}^2 \times \left(\dfrac{V_{VOUT} \times t_{SW}}{V_{IN(min)}} + t_{MIN(off)} \right)}{2 \times \Delta V_{LOAD(insert)} \times \left(\left(\dfrac{V_{IN(min)} - V_{VOUT}}{V_{IN(min)}} \right) \times t_{SW} - t_{MIN(off)} \right) \times V_{VOUT}}$$

(10)

$$C_{OUT(min\_over)} = \frac{L_{OUT} \times \left(\Delta I_{LOAD(max)} \right)^2}{2 \times \Delta V_{LOAD(release)} \times V_{VOUT}}$$

(11)

Equation 10 and Equation 11 calculate the minimum C_{OUT} for meeting the transient requirement, which is 78.6 µF, given the following parameters:

- ±3% voltage allowance for load step and release
- MLCC capacitance derating of 50% due to DC and AC bias effect

In this reference design, 4, 22-µF capacitors are used in order to provide this amount of capacitance.

Step Eight

Determine the stability based on the output capacitance C_{OUT}.

In order to achieve stable operation. The 0-dB frequency, f_0 should be kept less than 1/5 of the switching frequency (1 MHz). (See Figure 3)

$$f_0 = \frac{1}{2\pi} \times \frac{G_M}{C_{OUT}} \times \frac{R_C}{R_S} = 150\,kHz$$

where

- $R_S = R_{DS(on)} \times G_{MC} \times R_{LOAD}$ (12)

$$R_C = \frac{f_0 \times R_S \times 2\pi \times C_{OUT}}{G_M} = \frac{150\,kHz \times 53m\Omega \times 2\pi \times 88\,\mu F}{1mS} \approx 5\,k\Omega$$

(13)

Using 4, 22-µF capacitors, the compensation resistance, R_C can be calculated to be approximately 5 kΩ.

The purpose of the comparator capacitor (C_C) is to reduce the DC component to obtain high DC feedback gain. However, as it causes phase delay, another zero to cancel this effect at f_0 is needed. This zero can be determined by values of C_C and the compensation resistor, R_C.

$$f_Z = \frac{1}{2\pi \times R_C \times C_C} = \frac{f_0}{10}$$

(14)

And since R_C has previously been derived, the value of C_C is calculated to be 2.2 nF. In order to further boost phase margin, a value of 3.3-nF is chosen for this reference design.

Step Nine

Select decoupling and peripheral components.

For TPS51463 peripheral capacitors use the following minimum values of ceramic capacitance. X5R or better temperature coefficient is recommended. Tighter tolerances and higher voltage ratings are always appropriate.

- V5DRV decoupling ≥ 2.2 µF, ≥ 10 V
- V5FILT decoupling ≥ 1 µF, ≥10 V
- VREF decoupling 0.22 µF to 1 µF, ≥ 4 V
- Bootstrap capacitors ≥ 0.1 µF, ≥ 10 V
- Pull-up resistors on PGOOD, 100 kΩ

Layout Considerations

Good layout is essential for stable power supply operation. Follow these guidelines for an efficient PCB layout.

- Connect PGND pins (or at least one of the pins) to the thermal PAD underneath the device. Also connect GND pin to the thermal PAD underneath the device. Use four vias to connect the thermal pad to internal ground planes.
- Place VIN, V5DRV, V5FILT and 2VREF decoupling capacitors as close to the device as possible.
- Use wide traces for the VIN, VOUT, PGND and SW pins. These nodes carry high current and also serve as heat sinks.
- Place feedback and compensation components as close to the device as possible.
- Keep analog signals (SLEW, COMP) away from noisy signals (SW, VBST).

PACKAGE OPTION ADDENDUM

PACKAGING INFORMATION

Orderable part number (1)	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS51463RGER	Active	Production	VQFN (RGE) | 24	3000 | LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPS 51463

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
