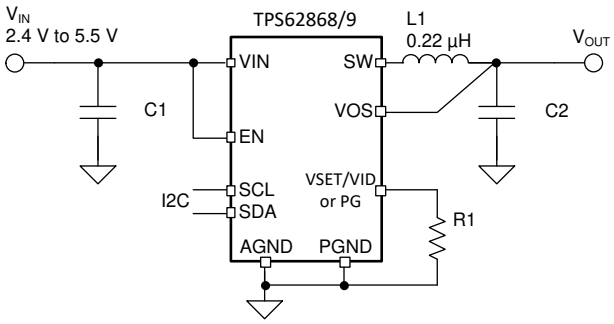
TEXAS INSTRUMENTS
TPS62868, TPS62869
ZHCSLJ2B – SEPTEMBER 2020 – REVISED JULY 2021

具有 I²C 接口、采用 QFN 封装的 TPS62868x 2.4V 至 5.5V 输入、4A/6A 同步降压转换器

1 特性

- 11mΩ 和 10.5mΩ 内部功率 MOSFET
- > 90% 效率（0.9V 输出）
- 可实现快速瞬态响应的 DCS-Control 拓扑
- 可通过 I²C 提供用于动态电压调节 (DVS) 的输出电压范围
  - 输出电压范围为 0.2V 至 0.8375V，步长为 2.5mV
  - 输出电压范围为 0.4V 至 1.675V，步长为 5mV
  - 输出电压范围为 0.8V 至 3.35V，步长为 10mV
- 1% 的输出电压精度
- 2.4MHz 开关频率
- 通过外部电阻器进行选择
  - 启动输出电压
  - I²C 目标地址
- I²C 接口选择
  - 节电模式或强制 PWM 模式
  - 输出放电
  - 断续或锁存短路保护
  - 输出电压斜坡速度
- 热预警和热关断
- 具有窗口比较器的电源正常指示器引脚选项
- 兼容 I²C 的接口速率高达 3.4Mbps
- 采用 1.5mm x 2.5mm x 1.0mm 9 引脚 QFN 封装，间距为 0.5mm
- 也可采用 WCSP 封装：TPS62866，采用 1.05mm x 1.78mm WCSP 封装且具有 I2C 接口的 6A 同步降压转换器
- 使用 TPS62868/9 并借助 WEBENCH® Power Designer 创建定制设计方案



典型应用

2 应用

- 为 FPGA、CPU、ASIC 或视频芯片组提供内核电源
- IP 网络摄像头
- 固态硬盘
- 光学模块
- LPDDR5 VDDQ 轨电源

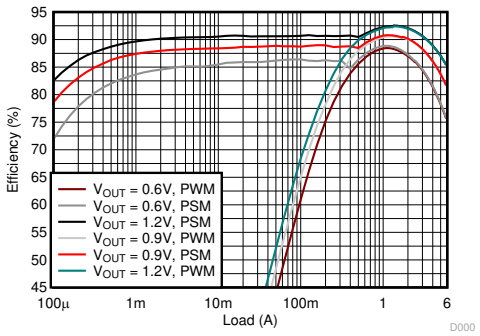
3 说明

TPS62868 和 TPS62869 器件是采用 I²C 接口的高频同步降压转换器，可提供高效、自适应和高功率密度解决方案。该转换器在中高负载条件下以 PWM 模式运行，并在轻负载时自动进入省电模式运行，从而在整个负载电流范围内保持高效率。该器件还可强制进入 PWM 模式运行，以实现最小的输出电压纹波。凭借其 DCS-Control 架构，这些器件可实现出色的负载瞬态性能并符合严格的输出电压精度要求。通过 I²C 接口和专用 VID 引脚，可快速调整输出电压，使负载的功耗适应相关应用不断变化的性能需求。

器件信息

器件型号	封装(1)	封装尺寸（标称值）
TPS62868	QFN (9)	1.5mm x 2.5mm x 1.0mm
TPS62869		

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。



V_{IN} = 3.3V 时的效率

4 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision A (December 2020) to Revision B (July 2021)	Page
• 将提到 I²C 的旧术语实例通篇更改为控制器和目标。	1
• Corrected start-up output voltage for TPS6286xxxC device variants in *Device Options* table	3
• Changed "VID" to "VSET/VID" in *Device Options* table	3
• Added inductor values to *Recommended Operating Conditons* table	5
• Corrected number of pins in *Thermal Information* table	5
• Added quiescent current specification for TPS6286x0A/C devices in *Electrical Characteristics* table	7
• Changed high-level input voltage threshold in *Electrical Characteristics table*	7
• Added separate enable delay time parameter for TPS6286x0C device variants	7
• Added footnote	7
• Added power-good deglitch block to *Functional Block Diagram*	12
• Added *100% Duty Cycle Mode Operation* section	13
• Added section describing the start-up output voltage for TPS6286xxC device variants	14
• Corrected value of C1 in *List of Components* table	22
• Updated data in *Thermal Derating* plot for V_{OUT} = 1.675 V	25
• Added typical application example for TPS6286x0A and TPS6286x0xC device variants	28
• Changed *Layout Example* image	31

Changes from Revision * (September 2020) to Revision A (December 2020)	Page
• 将器件状态从“预告信息”更改为“量产数据”	1

5 Device Options

PART NUMBER(1)	FULL OUTPUT VOLTAGE RANGE	START-UP OUTPUT VOLTAGE	DVS STEP SIZE	OUTPUT CURRENT	VSET/VID OR PG PIN
TPS628680ARQY	0.2 V to 0.8375 V	0.2 V to 0.575 V, Selectable	2.5 mV	4 A	VSET/VID
TPS6286800CRQY		0.5 V			PG
TPS628681ARQY	0.4 V to 1.675 V	0.4 V to 1.15 V, Selectable	5 mV		VSET/VID
TPS6286810CRQY		0.9 V			PG
TPS628682ARQY	0.8 V to 3.35 V	0.8 V to 2.3 V, Selectable	10 mV		VSET/VID
TPS6286820CRQY		1.2 V			PG
TPS628690ARQY	0.2 V to 0.8375 V	0.2 V to 0.575 V, Selectable	2.5 mV	6 A	VSET/VID
TPS6286900CRQY		0.5 V			PG
TPS628691ARQY	0.4 V to 1.675 V	0.4 V to 1.15 V, Selectable	5 mV		VSET/VID
TPS6286910CRQY		0.9 V			PG
TPS628692ARQY	0.8 V to 3.35 V	0.8 V to 2.3 V, Selectable	10 mV		VSET/VID
TPS6286920CRQY		1.2 V			PG

6 Pin Configuration and Functions

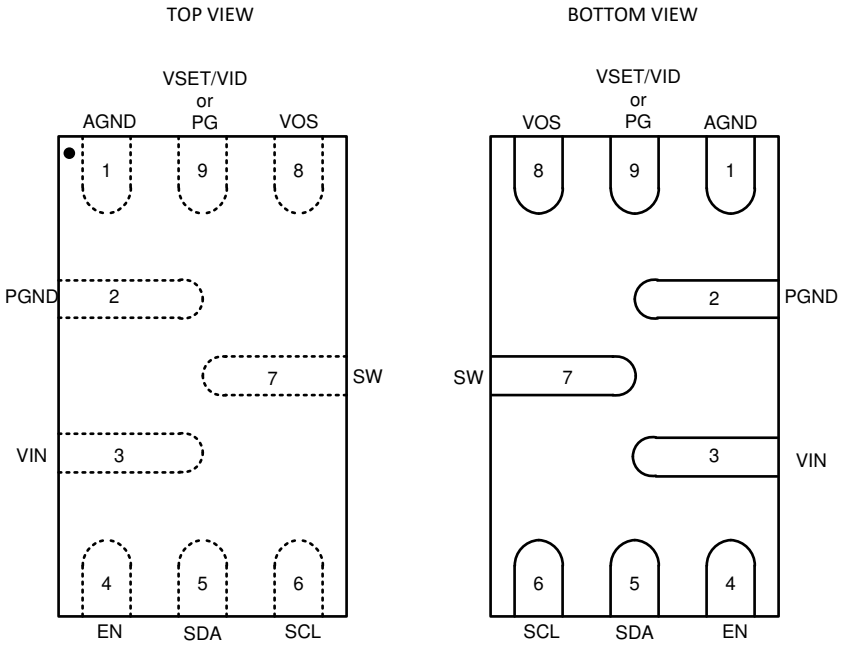

图 6-1. 9-Pin RQY QFN Package (Top View)

表 6-1. Pin Functions

PIN		DESCRIPTION
NAME	NO.	
AGND	1	Analog ground pin
VSET/VID	9	Start-up output voltage and device address selection pin. An external resistor must be connected. After start-up, the pin can be used to select the V_{OUT} registers for the output voltage (Low = V_{OUT} register 1; high = V_{OUT} register 2). See 节 8.4.4. This pin is pulled to GND when the device is in shutdown. The function after start-up depends on the device option. See the Device Options.
PG	9	Power-good open-drain output pin. The pullup resistor can be connected to voltages up to 5.5 V. If unused, leave it floating. This pin is pulled to GND when the device is in shutdown. The function after start-up depends on the device option. See 节 5.
VOS	8	Output voltage sense pin. This pin must be directly connected to the output capacitor.
PGND	2	Power ground pin
SW	7	Switch pin of the power stage
VIN	3	Power supply input voltage pin
EN	4	Device enable pin. To enable the device, this pin needs to be pulled high. Pulling this pin low disables the device. Do not leave floating.
SDA	5	I^2C serial data pin. Do not leave it floating. Connect it to AGND if not used.
SCL	6	I^2C serial clock pin. Do not leave it floating. Connect it to AGND if not used.

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted) (1)

		MIN	MAX	UNIT
Voltage(2)	VIN, EN, SDA, SCL, VOS, VSET/VID, VSET/PG	-0.3	6	V
	SW (DC)	-0.3	V_{IN} + 0.3	
	SW (AC, less than 10ns)(3)	-2.5	10	
I_{SOURCE_PG}	Source current at VSET/PG		1	mA
$I_{SINK\_SDA,SCL}$	Sink current at SDA, SCL		2	mA
T_J	Junction temperature	-40	150	°C
T_{stg}	Storage temperature	-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.
(3) While switching.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins(1)	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

Over operating junction temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{IN}	Input voltage		2.4		5.5	V
t_{F_VIN}	Falling transition time at VIN(1)				10	mV/µs
I_{OUT}	Output current, TPS62868 (2)		0		4	A
	Output current, TPS62869 (3)		0		6	
L	Output inductor	TPS628680x, TPS628690x		110		nH
		TPS628681x, TPS628682x, TPS628691x, TPS628692x		220		
T_J	Junction temperature		-40		125	°C

(1) The falling slew rate of V_{IN} should be limited if V_{IN} goes below V_{UVLO}.
(2) Lifetime is reduced when operating continuously at 4-A output current and the junction temperature is higher than 105 °C.
(3) Lifetime is reduced when operating continuously at 6-A output current and the junction temperature is higher than 85 °C.

7.4 Thermal Information

THERMAL METRIC(1)		TPS62868/ TPS62869 RQY		UNIT
		JEDEC 51-7	TPS62869RQYEVM-118	
		9 PINS	9 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	90.9	60.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	68.2	n/a(2)	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	25.0	n/a(2)	°C/W

THERMAL METRIC(1)		TPS62868/ TPS62869 RQY		UNIT
		JEDEC 51-7	TPS62869RQYEVM-118	
		9 PINS	9 PINS	
Ψ_{JT}	Junction-to-top characterization parameter	1.9	3.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	24.7	31.5	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.
(2) Not applicable to an EVM.

7.5 Electrical Characteristics

T_J = -40 °C to 125 °C, and V_{IN} = 2.4 V to 5.5 V. Typical values are at T_J = 25 °C and V_{IN} = 5 V, unless otherwise noted.

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY							
I_Q	Quiescent current	TPS6286x1A/C, TPS6286x2A/C	EN = High, no load, device not switching		4	10	µA
		TPS6286x0A/C			9	15	
I_{Q_VOS}	Operating quiescent current into VOS pin		EN = High, no load, device not switching, V_{VOS} = 1.8 V		18		µA
I_{SD}	Shutdown current		EN = Low, T_J = –40°C to 85°C		0.24	1	µA
V_{UVLO}	Undervoltage lockout threshold		V_{IN} rising	2.2	2.3	2.4	V
			V_{IN} falling	2.1	2.2	2.3	V

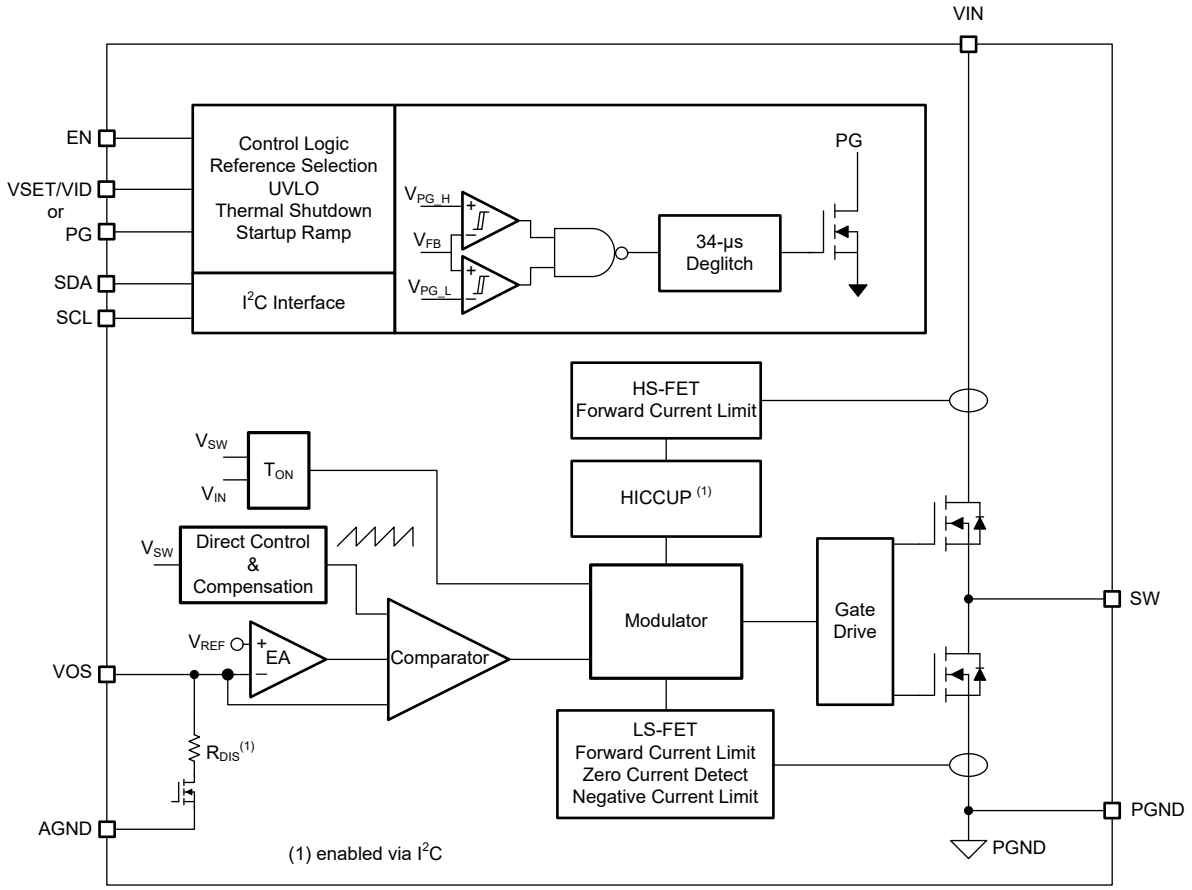
图 7-4. Shutdown Current

8 Detailed Description

8.1 Overview

The DCS-Control™ topology operates in PWM (pulse width modulation) mode for medium to heavy load conditions and in Power Save Mode at light load currents. In PWM mode, the converter operates with its nominal switching frequency of 2.4 MHz, having a controlled frequency variation over the input voltage range. Because DCS-Control supports both operation modes (PWM and PFM) within a single building block, the transition from PWM mode to Power Save Mode is seamless and without effects on the output voltage. The devices offer both excellent DC voltage and superior load transient regulation, combined with very low output voltage ripple.

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Power Save Mode

As the load current decreases, the device enters Power Save Mode (PSM) operation. PSM occurs when the inductor current becomes discontinuous, which is when it reaches 0 A during a switching cycle. Power Save Mode is based on a fixed on-time architecture, as shown in 方程式 1.

$$t_{ON} = \frac{V_{OUT}}{V_{IN}} \cdot 416\text{ns} \quad (1)$$

In Power Save Mode, the output voltage rises slightly above the nominal output voltage. This effect is minimized by increasing the output capacitor or inductor value.

When V_{IN} decreases to typically 15% above the V_{OUT}, the TPS6286x does not enter Power Save Mode, regardless of the load current. The device maintains output regulation in PWM mode.

8.3.2 Forced PWM Mode

With I^2C, set the device in forced PWM (FPWM) mode by the CONTROL register. The device switches at 2.4 MHz, even with a light load. This reduces the output voltage ripple and allows simple filtering of the switching frequency for noise-sensitive applications. Efficiency at light load is lower in FPWM mode.

8.3.3 100% Duty Cycle Mode Operation

There is no limitation for small duty cycles since even at very low duty cycles, the switching frequency is reduced as needed to always ensure a proper regulation.

If the output voltage level comes close to the input voltage, the device enters 100% mode. While the high-side switch is constantly turned on, the low-side switch is switched off. The difference between V_{IN} and V_{OUT} is determined by the voltage drop across the high-side MOSFET and the DC resistance of the inductor. The minimum V_{IN} that is needed to maintain a specific V_{OUT} value is estimated as:

$$V_{IN,MIN} = V_{OUT} + (R_{DS(ON)} + R_L) I_{OUT,MAX} \quad (2)$$

where

- $V_{IN,MIN}$ is the minimum input voltage to maintain an output voltage
- $I_{OUT,MAX}$ is the maximum output current
- $R_{DS(on)}$ is the high-side FET ON-resistance
- R_L is the inductor ohmic resistance (DCR)

8.3.4 Start-up

After enabling the device, there is an enable delay (t_{Delay}) before the device starts switching. During this period, the device sets the internal reference voltage, and determines the start-up output voltage through the resistor connected to the VSET/VID pin. After t_{delay}, all registers can be read and written by the I^2C interface.

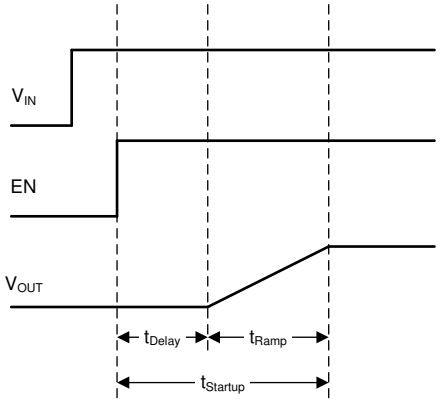


图 8-1. Start-up Sequence

After the enable delay, an internal soft start-up circuitry ramps up the output voltage with a period of 1 ms (t_{Ramp}). This avoids excessive inrush current and creates a smooth output voltage rising-slope. It also prevents excessive voltage drops of primary cells and rechargeable batteries with high internal impedance.

The device is able to start into a pre-biased output capacitor. It starts with the applied bias voltage and ramps the output voltage to its nominal value.

8.3.5 Switch Current Limit and HICCUP Short-Circuit Protection

The switch current limit prevents the device from high inductor current and from drawing excessive current from the battery or input voltage rail. Excessive current can occur with a shorted or saturated inductor or a heavy load

or shorted output circuit condition. If the inductor current reaches the threshold I_{LIM}, cycle by cycle, the high-side MOSFET is turned off and the low-side MOSFET is turned on, while the inductor current ramps down to the low-side MOSFET current limit.

When the high-side MOSFET current limit is triggered 32 times, the device stops switching. The device then automatically re-starts, with an internal soft start-up, after a typical delay time of 128 µs has passed. This is named HICCUP short-circuit protection. The device repeats this mode until the high load condition disappears.

The HICCUP is disabled by the CONTROL register bit Enable HICCUP. Disabling HICCUP changes the overcurrent protection to latching protection. The device stops switching after the high-side MOSFET current limit is triggered 32 times. Toggling the EN pin, removing and reapplying the input voltage, or writing to the CONTROL register bit Software Enable Device unlatches the device.

8.3.6 Undervoltage Lockout (UVLO)

To avoid mis-operation of the device at low input voltages, undervoltage lockout (UVLO) is implemented when the input voltage is lower than V_{UVLO}. The device stops switching and the output voltage discharge is active (if enabled through I^2C) when the device is in UVLO. When the input voltage recovers, the device automatically returns to operation with an internal soft start-up. During UVLO, the internal register values are kept.

The UVLO bit in the STATUS Register is set when the input voltage is less than the UVLO falling threshold. When the input voltage is below 1.8 V (typ.), all registers are reset.

8.3.7 Thermal Warning and Shutdown

When the junction temperature goes up to T_{JW}, the device gives a pre-warning indicator in the STATUS register. The device keeps running.

When the junction temperature exceeds T_{JSD}, the device goes into thermal shutdown, stops switching, and activates the output voltage discharge. When the device temperature falls below the threshold by 20°C, the device returns to normal operation automatically with an internal soft start-up. During thermal shutdown, the internal register values are kept.

8.4 Device Functional Modes

8.4.1 Enable and Disable (EN)

The device is enabled by setting the EN pin to a logic High. In shutdown mode (EN = Low), the internal power switches as well as the entire control circuitry are turned off, and all the registers are reset, except for the Enable Output Discharge bit. Do not leave the EN pin floating.

In shutdown mode (EN = Low), all registers cannot be read and written by the I^2C interface.

The typical threshold value of the EN pin is 0.61 V for rising input signals, and 0.51 V for falling input signals.

The device is also enabled or disabled by setting the bit, Software Enable Device in CONTROL register while EN = High. After being disabled/enabled by this bit, the device stops switching and has a new start-up beginning with t_{Ramp}. There is no T_{Delay} time and the registers are not reset.

8.4.2 Output Discharge

An internal MOSFET switch smoothly discharges the output through the VOS pin in shutdown mode (EN = Low or Software Enable Device bit = 0). The output discharge is also active when the device is in thermal shutdown and UVLO.

When the Enable Output Discharge bit is set to 0, the output discharge function is disabled. The input voltage must remain higher than 1 V (typ.) to keep the output discharge function operational and the status of the Enable Output Discharge bit retained. The Enable Output Discharge bit is reset on the rising edge of the EN pin.

8.4.3 Start-Up Output Voltage and I^2C Target Address Selection

During the ramp up period (t_{Ramp}), the output voltage ramps to the start-up output voltage first, then ramps up or down to the new value when the value of the output register is changed by I^2C interface commands.

8.4.3.1 TPS6286xxA Devices

During the enable delay (t_{Delay}), the start-up output voltage and device I²C target address are set by an external resistor connected to the VSET/VID pin through an internal R2D (resistor to digital) converter. 表 8-1 shows the options.

表 8-1. Start-up Output Voltage and I²C Target Address Options

RESISTOR (E96 SERIES, ±1% ACCURACY) AT VSET/VID	START-UP OUTPUT VOLTAGE (TYP)	I²C TARGET ADDRESS
249 kΩ	Voltage Factor * 1.15 V	0b1000110 (0x46)
205 kΩ	Voltage Factor * 1.10 V	0b1000101 (0x45)
162 kΩ	Voltage Factor * 1.05 V	0b1000100 (0x44)
133 kΩ	Voltage Factor * 1.00 V	0b1000011 (0x43)
105 kΩ	Voltage Factor * 0.95 V	0b1000010 (0x42)
86.6 kΩ	Voltage Factor * 0.90 V	0b1000001 (0x41)
68.1 kΩ	Voltage Factor * 0.85 V	0b1001000 (0x48)
56.2 kΩ	Voltage Factor * 0.80 V	0b1001001 (0x49)
44.2 kΩ	Voltage Factor * 0.75 V	0b1001010 (0x4A)
36.5 kΩ	Voltage Factor * 0.70 V	0b1001011 (0x4B)
28.7 kΩ	Voltage Factor * 0.65 V	0b1001100 (0x4C)
23.7 kΩ	Voltage Factor * 0.60 V	0b1001101 (0x4D)
18.7 kΩ	Voltage Factor * 0.55 V	0b1001110 (0x4E)
15.4 kΩ	Voltage Factor * 0.50 V	0b1001111 (0x4F)
12.1 kΩ	Voltage Factor * 0.45 V	0b1000000 (0x40)
10 kΩ	Voltage Factor * 0.40 V	0b1000111 (0x47)

表 8-2. Device Option Voltage Factors

DEVICE OPTION	VOLTAGE FACTOR
TPS6286x**0**A	0.5
TPS6286x**1**A	1
TPS6286x**2**A	2

The R2D converter has an internal current source which applies current through the external resistor, and an internal ADC which reads back the resulting voltage level. Depending on the level, the correct start-up output voltage and I²C target address are set. Once this R2D conversion is finished, the current source is turned off to avoid current flowing through the external resistor. Ensure that there is no additional current path or capacitance greater than 30 pF from this pin to GND during R2D conversion, otherwise a false value is set.

8.4.3.2 TPS6286xxxC Devices

The start-up output voltage, voltage factor, and I²C target address of the TPS6286xxxC devices are factory-set according to 表 8-3.

表 8-3. Device Option Start-Up Voltage, Voltage Factor, and I²C Target Address

DEVICE OPTION	VOLTAGE FACTOR	START-UP OUTPUT VOLTAGE	I²C TARGET ADDRESS
TPS6286x0xC	0.5	0.5 V	0b1000010 (0x42)
TPS6286x1xC	1	0.9 V	
TPS6286x2xC	2	1.2 V	

8.4.4 Select Output Voltage Registers (VID)

After the start-up period ($t_{Startup}$), the output voltage can be selected between two output voltage registers by the VID pin. When VID is pulled low, the output voltage is set by 表 8-6. When VID is pulled high, the output voltage is set by 表 8-7. This is also called dynamic voltage scaling (DVS).

During an output voltage change through I^2C or the VSET/VID pin, the device can be set in FPWM by the Enable FPWM Mode during Output Voltage Change bit in CONTROL register. The output voltage change speed is set by the Voltage Ramp Speed bit.

8.4.5 Power Good (PG)

The TPS62868 and TPS62869 families provide device options with the PG pin instead of a VSET/VID pin. Refer to 节 5 to see the according device options.

The PG pin goes high impedance once the output voltage is above 91% and less than 110% of the nominal voltage, and is driven low once the voltage is out of the range. The PG pin is an open-drain output and is specified to sink up to 1 mA. The power good output requires a pullup resistor connecting to any voltage rail less than 5.5 V. The PG signal can be used for sequencing of multiple rails by connecting it to the EN pin of other converters. Leave the PG pin unconnected when not used.

The PG has a deglitch time, before the signal goes high or low, during normal operation.

表 8-4. PG Pin Logic

DEVICE CONDITIONS		LOGIC STATUS	
		HIGH	LOW
Enable	$0.91 \times V_{OUT\_NOM} \leqslant V_{VOS} \leqslant 1.11 \times V_{OUT\_NOM}$	√	
	$V_{VOS} < 0.91 \times V_{OUT\_NOM}$ or $V_{VOS} > 1.11 \times V_{OUT\_NOM}$		√
Shutdown	EN = Low		√
Thermal Shutdown	$T_J > T_{JSD}$		√
UVLO	$1.8\ V < V_{IN} < V_{UVLO}$		√
Power Supply Removal	$V_{IN} < 1.8\ V$	undefined	

8.5 Programming

8.5.1 Serial Interface Description

I2C™ is a 2-wire serial interface developed by Philips Semiconductor, now NXP Semiconductors. The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is *idle*, both SDA and SCL lines are pulled high. All the I^2C-compatible devices connect to the I^2C bus through open drain I/O pins, SDA and SCL. A *controller* device, usually a microcontroller or a digital signal processor, controls the bus. The controller is responsible for generating the SCL signal and device addresses. The controller also generates specific conditions that indicate the START and STOP of data transfer. A *target* device receives or transmits data on the bus under control of the controller device, or both.

The device works as a *target* and supports the following data transfer *modes*, as defined in the I^2C-Bus Specification: standard mode (100 kbps) and fast mode (400 kbps), fast mode plus (1 Mbps), and high-speed mode (3.4 Mbps). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents remain intact as long as the input voltage remains above 1.8 V.

The data transfer protocol for standard and fast modes is exactly the same, therefore, they are referred to as F/S-mode in this document. The protocol for high-speed mode is different from F/S-mode, and it is referred to as HS-mode.

It is recommended that the I^2C controller initiates a STOP condition on the I^2C bus after the initial power up of SDA and SCL pullup voltages to ensure reset of the I^2C engine.

8.5.2 Standard-, Fast-, and Fast-Mode Plus Protocol

The controller initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in 图 8-2. All I^2C-compatible devices recognize a start condition.

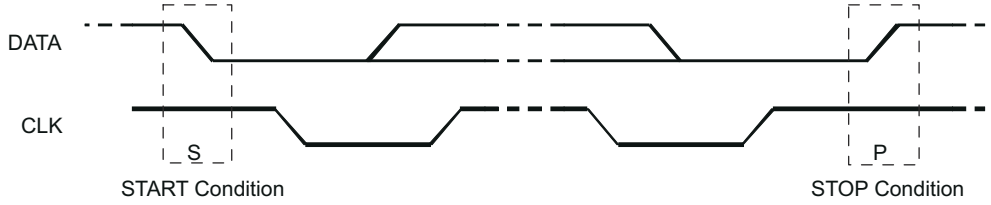

图 8-2. START and STOP Conditions

The controller then generates the SCL pulses, and transmits the 7-bit address and the read/write direction bit R/$\overline{W}$ on the SDA line. During all transmissions, the controller ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse (see 图 8-3). All devices recognize the address sent by the controller and compare it to their internal fixed addresses. Only the target device with a matching address generates an acknowledge (see 图 8-4) by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the controller knows that communication link with a target has been established.

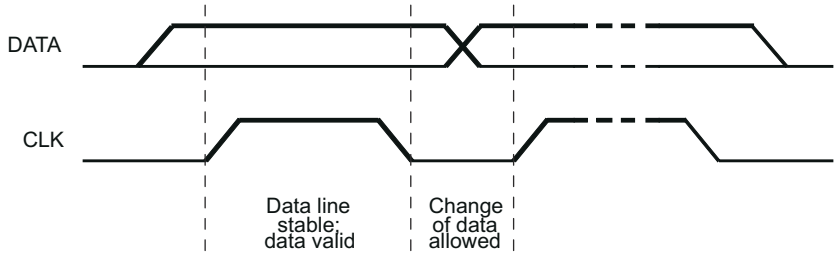

图 8-3. Bit Transfer on the Serial Interface

The controller generates further SCL cycles to either transmit data to the target (R/$\overline{W}$ bit 0) or receive data from the target (R/$\overline{W}$ bit 1). In either case, the receiver needs to acknowledge the data sent by the transmitter. So an acknowledge signal can either be generated by the controller or by the target, depending on which one is the receiver. 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary.

To signal the end of the data transfer, the controller generates a stop condition by pulling the SDA line from low to high while the SCL line is high (see 图 8-2). This releases the bus and stops the communication link with the addressed target. All I^2C compatible devices must recognize the stop condition. Upon the receipt of a stop condition, all devices know that the bus is released, and they wait for a start condition followed by a matching address.

Attempting to read data from register addresses not listed in this section results in 0x00 being read out.

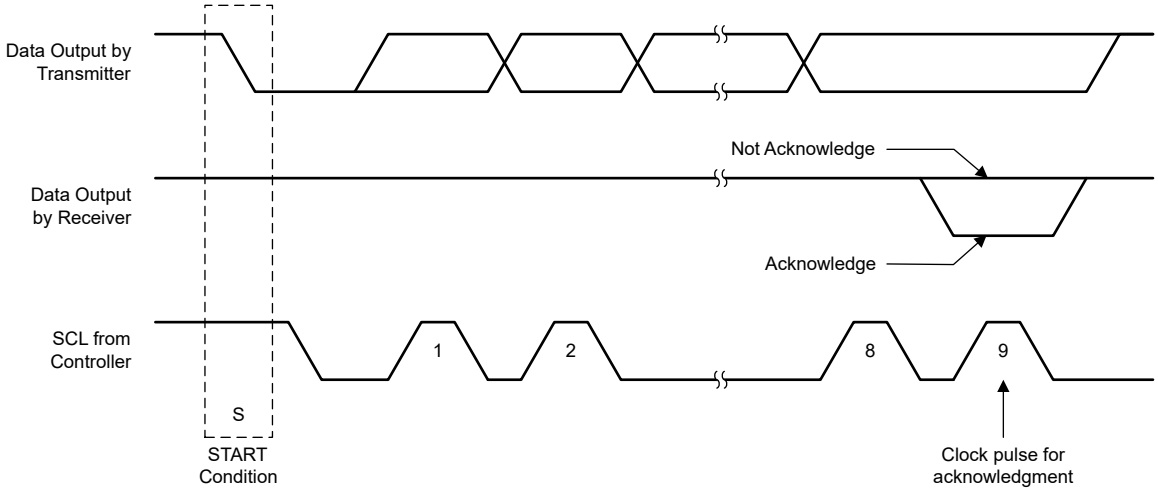

图 8-4. Acknowledge on the I²C Bus

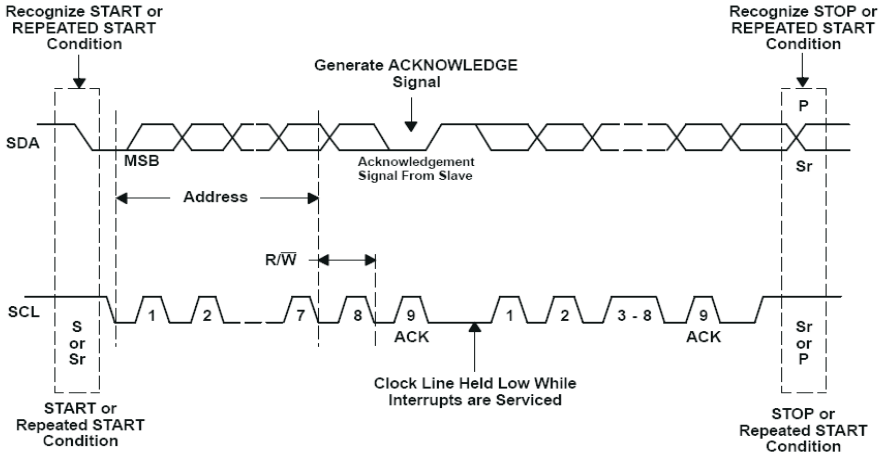

图 8-5. Bus Protocol

8.5.3 HS-Mode Protocol

The controller generates a start condition followed by a valid serial byte containing HS controller code 00001XXX. This transmission is made in F/S-mode at no more than 400 kbps. No device is allowed to acknowledge the HS controller code, but all devices must recognize it and switch their internal setting to support 3.4 Mbps operation.

The controller then generates a *repeated start condition* (a repeated start condition has the same timing as the start condition). After this repeated start condition, the protocol is the same as F/S-mode, except that transmission speeds up to 3.4 Mbps are allowed. A stop condition ends the HS-mode and switches all the internal settings of the target devices to support the F/S-mode. Instead of using a stop condition, repeated start conditions must be used to secure the bus in HS-mode.

Attempting to read data from register addresses not listed in this section results in 0x00 being read out.

8.5.4 I²C Update Sequence

The sequence requires a start condition, a valid I²C target address, a register address byte, and a data byte for a single update. After the receipt of each byte, the device acknowledges by pulling the SDA line low during the high period of a single clock pulse. A valid I²C address selects the device. The device performs an update on the falling edge of the acknowledge signal that follows the LSB byte.

图 8-6. “Write” Data Transfer Format in Standard-, Fast, and Fast-Plus Modes

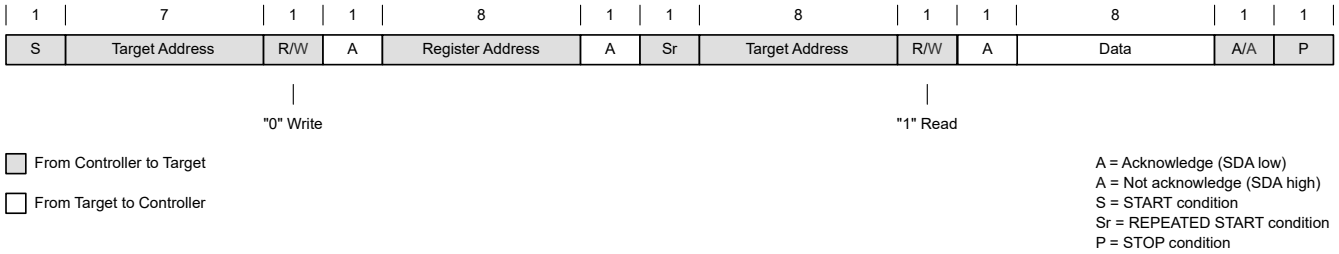

图 8-7. “Read” Data Transfer Format in Standard-, Fast, and Fast-Plus Modes

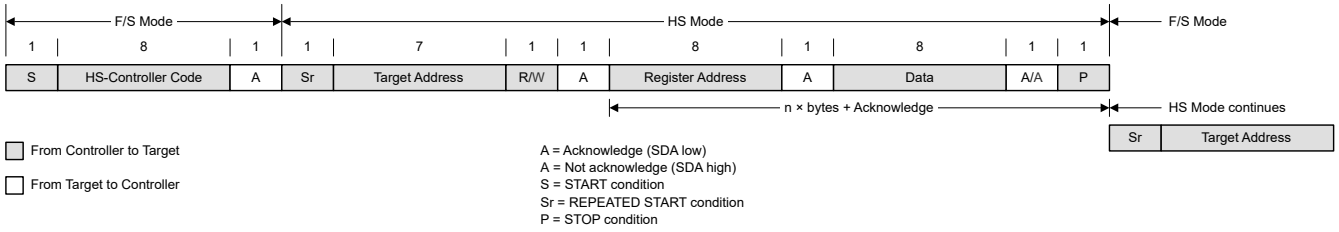

图 8-8. Data Transfer Format in HS-Mode

8.5.5 I²C Register Reset

The I²C registers can be reset by:

- Pulling the input voltage below 1.8 V (typ.)
- A high to low transition on EN
- Setting the Reset bit in the CONTROL register. When Reset is set to 1, all registers are reset to the default values and a new start-up is begun immediately. After t_{Delay}, the I²C registers can be programmed again.

8.6 Register Map

表 8-5. Register Map

REGISTER ADDRESS (HEX)	REGISTER NAME	FACTORY DEFAULT (HEX)	DESCRIPTION
0x01	V_{OUT} Register 1	0x64	Sets the target output voltage
0x02	V_{OUT} Register 2	0x64	Sets the target output voltage
0x03	CONTROL Register	0x6F	Sets miscellaneous configuration bits
0x05	STATUS Register	0x00	Returns status flags

8.6.1 Target Address Byte

7	6	5	4	3	2	1	0
1	x	x	x	x	x	x	R/$\overline{W}$

The target address byte is the first byte received following the START condition from the controller device. The target addresses can be assigned by an external resistor, see 表 8-1.

8.6.2 Register Address Byte

7	6	5	4	3	2	1	0
0	0	0	0	0	D2	D1	D0

Following the successful acknowledgment of the target address, the bus controller sends a byte to the device, which contains the address of the register to be accessed.

8.6.3 V_{OUT} Register 1

表 8-6. V_{OUT} Register 1 Description

REGISTER ADDRESS 0X01 READ/WRITE			
BIT	FIELD	VALUE (HEX)	OUTPUT VOLTAGE (TYP)
7:0	VO1_SET	0x00	Voltage Factor * 400 mV
		0x01	Voltage Factor * 405 mV
		...	
		0x64	Voltage Factor * 900 mV
		...	
		0xFE	Voltage Factor * 1670 mV
		0xFF	Voltage Factor * 1675 mV

8.6.4 V_{OUT} Register 2

表 8-7. V_{OUT} Register 2 Description

REGISTER ADDRESS 0X02 READ/WRITE			
BIT	FIELD	VALUE (HEX)	OUTPUT VOLTAGE (TYP)
7:0	VO2_SET	0x00	Voltage Factor * 400 mV
		0x01	Voltage Factor * 405 mV
		...	
		0x64	Voltage Factor * **900 mV** (default value)
		...	
		0xFE	Voltage Factor * 1670 mV
		0xFF	Voltage Factor * 1675 mV

8.6.5 CONTROL Register

表 8-8. CONTROL Register Description

REGISTER ADDRESS 0X03 WRITE ONLY				
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	Reset	R/W	0	1 - Reset all registers to default.
6	Enable FPWM Mode during Output Voltage Change	R/W	1	0 - Keep the current mode status during output voltage change 1 - Force the device in FPWM during output voltage change.
5	Software Enable Device	R/W	1	0 - Disable the device. All registers values are still kept. 1 - Re-enable the device with a new start-up without the t_{Delay} period.
4	Enable FPWM Mode	R/W	0	0 - Set the device in power save mode at light loads. 1 - Set the device in forced PWM mode at light loads.
3	Enable Output Discharge	R/W	1	0 - Disable output discharge. 1 - Enable output discharge.
2	Enable HICCUP	R/W	1	0 - Disable HICCUP. Enable latching protection. 1 - Enable HICCUP, Disable latching protection.
0:1	Voltage Ramp Speed	R/W	11	00 - 20mV/µs (0.25 µs/step) 01 - 10 mV/µs (0.5 µs/step) 10 - 5 mV/µs (1 µs/step) 11 - 1 mV/µs (5 µs/step, default)

8.6.6 STATUS Register

表 8-9. STATUS Register Description

REGISTER ADDRESS 0X05 READ ONLY(1)				
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:5	Reserved			
4	Thermal Warning	R	0	1: Junction temperature is higher than 130°C.
3	HICCUP	R	0	1: Device has HICCUP status once.
2	Reserved			
1	Reserved			
0	UVLO	R	0	1: The input voltage is less than UVLO threshold (falling edge).

(1) All bit values are latched until the device is reset, or the STATUS register is read. Then, the STATUS register is reset to its default values.

9 Application and Implementation

Note

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客 户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

9.1 Application Information

The following section discusses the design of the external components to complete the power supply design for several input and output voltage options by using typical applications as a reference.

9.2 Typical Application

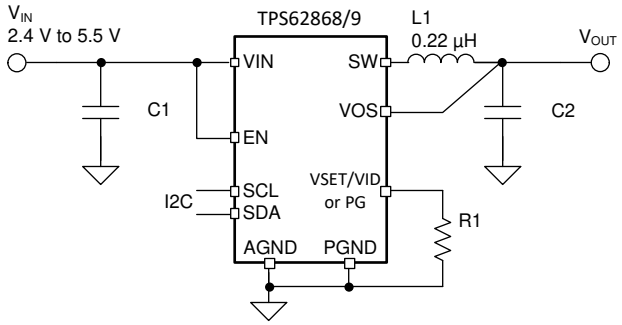

图 9-1. Typical Application

9.2.1 Design Requirements

For this design example, use the parameters listed in 表 9-1 as the input parameters.

表 9-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	2.4 V to 5.5 V
Output voltage	0.9 V
Maximum output current	6 A

表 9-2 lists the components used for the example.

表 9-2. List of Components of 表 9-1

REFERENCE	DESCRIPTION	MANUFACTURER(1)
C1	2 × 10 µF, Ceramic capacitor, 6.3 V, X7R, size 0603, CL10B106MQ8NRNC	Samsung Electro-Mechanics
C2	2 × 22 µF, Ceramic capacitor, 6.3 V, X7R, size 0805, GRM21BZ70J226ME44L	Murata
L1	0.22 µH, Power inductor, XAL4020-221ME (12 A, 5.81 mΩ)	Coilcraft
R1	Depending on the start-up output voltage, size 0603	Std

(1) See *Third-party Products* disclaimer.

9.2.2 Detailed Design Procedure

9.2.2.1 Setting The Output Voltage

The initial output voltage is set by an external resistor connected to the VSET/VID pin, according to 表 8-1. After the soft start-up, the output voltage can be changed in the V_{OUT} Registers. Refer to 表 8-6 and 表 8-7.

9.2.2.2 Output Filter Design

The inductor and the output capacitor together provide a low-pass filter. To simplify this process, 表 9-3 outlines possible inductor and capacitor value combinations for most applications. Checked cells represent combinations that are proven for stability by simulation and lab test. Further combinations should be checked for each individual application.

表 9-3. Matrix of Output Capacitor and Inductor Combinations

NOMINAL L [µH](2)	NOMINAL C_{OUT} [µF](3)			
	22	2 x 22 or 47	3 x 22	150
0.24		+(1)	+	+

(1) This LC combination is the standard value and recommended for most applications.
(2) Inductor tolerance and current derating is anticipated. The effective inductance can vary by 20% and –30%.
(3) Capacitance tolerance and bias voltage derating is anticipated. The effective capacitance can vary by 20% and –30%.

9.2.2.3 Inductor Selection

The main parameter for the inductor selection is the inductor value and then the saturation current of the inductor. To calculate the maximum inductor current under static load conditions, 方程式 3 is given.

$$I_{L,MAX} = I_{OUT,MAX} + \frac{\Delta I_L}{2}$$

$$\Delta I_L = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f_{SW}} \quad (3)$$

where

- $I_{OUT,MAX}$ = maximum output current
- ΔI_L = inductor current ripple
- f_{SW} = switching frequency
- L = inductor value

It is recommended to choose a saturation current for the inductor that is approximately 20% to 30% higher than $I_{L,MAX}$. In addition, DC resistance and size must also be taken into account when selecting an appropriate inductor. 表 9-4 lists recommended inductors.

表 9-4. List of Recommended Inductors

INDUCTANCE [µH]	CURRENT RATING, I_{SAT} [A]	DIMENSIONS [L x W x H mm]	DC RESISTANCE [mΩ]	PART NUMBER
0.22	18.7	4 x 4 x 2	5.81	Coilcraft, XAL4020-221ME
0.24	6.6	2 x 1.6 x 1.2	13	Murata, DFE201612E-R24M

9.2.2.4 Capacitor Selection

The input capacitor is the low-impedance energy source for the converter which helps to provide stable operation. A low-ESR multilayer ceramic capacitor is recommended for best filtering and must be placed between VIN and PGND as close as possible to those pins. For most applications, 8 µF is a sufficient value for the effective input capacitance, though a larger value reduces input current ripple.

The architecture of the device allows the use of tiny ceramic output capacitors with low equivalent series resistance (ESR). These capacitors provide low output voltage ripple and are recommended. To keep its low resistance up to high frequencies and to get narrow capacitance variation with temperature, TI recommends using X7R or X5R dielectrics. The recommended minimum output effective capacitance is 30 µF; this capacitance can vary over a wide range as outline in the output filter selection table.

9.3.2 Detailed Design Procedure

9.3.2.1 Setting the Output Voltage

The start-up output voltage of the TPS6286900C device is factory-programmed to 0.5 V and therefore no additional external components are needed. After start-up, the output voltage can be changed by using the I²C interface to program the VOUT Register 1.

9.3.2.2 Output Filter Design

The inductor and output capacitor form a low-pass filter. To simplify the design process, 表 9-7 outlines possible inductor and capacitor combinations for most applications. Checked cells represent combinations that have been proven for stability by simulation and lab testing. Further combinations, not listed in , should be checked for the specific application.

表 9-7. Matrix of Output Capacitor and Inductor Combinations

图 9-26. Switching Frequency

10 Power Supply Recommendations

The device is designed to operate from an input voltage supply range from 2.4 V to 5.5 V. Ensure that the input power supply has a sufficient current rating for the application. The power supply must avoid a fast ramp down. The falling ramp speed must be slower than 10 mV/µs, if the input voltage drops below V_{UVLO}.

11 Layout

11.1 Layout Guidelines

The printed-circuit-board (PCB) layout is an important step to maintain the high performance of the device.

- The input/output capacitors and the inductor must be placed as close as possible to the IC. This keeps the power traces short. Routing these power traces direct and wide results in low trace resistance and low parasitic inductance.
- The low side of the input and output capacitors must be connected properly to the PGND to avoid a GND potential shift.
- The sense traces connected to the VOS pin is a signal trace. Special care must be taken to avoid noise being induced. Keep the trace away from SW.
- Refer to 图 11-1 for an example of component placement, routing, and thermal design.

11.2 Layout Example

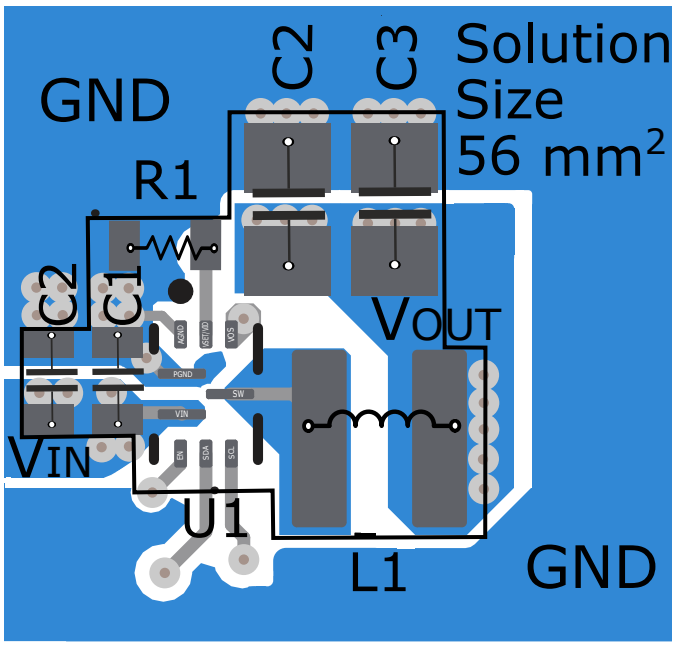

图 11-1. Layout Example

11.2.1 Thermal Considerations

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power dissipation limits of a given component.

Two basic approaches for enhancing thermal performance are improving the power dissipation capability of the PCB design and introducing airflow in the system. For more details on how to use the thermal parameters, see the *Semiconductor and IC Package Thermal Metrics Application Report*.

12 Device and Documentation Support

12.1 Device Support

12.1.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

12.2 Documentation Support

12.2.1 Related Documentation

For related documentation, see the following:

Texas Instruments, *Semiconductor and IC Package Thermal Metrics Application Report*

12.3 支持资源

TI E2E™ 支持论坛是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

12.4 接收文档更新通知

要接收文档更新通知，请导航至 ti.com 上的器件产品文件夹。点击 *订阅更新* 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

12.5 Trademarks

DCS-Control™ is a trademark of TI.
I2C™ is a trademark of NXP Semiconductors.
TI E2E™ is a trademark of Texas Instruments.
WEBENCH® is a registered trademark of Texas Instruments.
所有商标均为其各自所有者的财产。

12.6 术语表

TI 术语表　　本术语表列出并解释了术语、首字母缩略词和定义。

12.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

重要声明和免责声明

TI 提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做出任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保或其他要求。这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。

TI 提供的产品受 TI 的销售条款 (https:www.ti.com/legal/termsofsale.html) 或 ti.com 上其他适用条款/TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

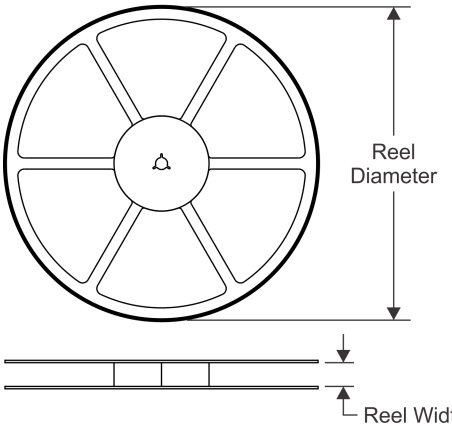
(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

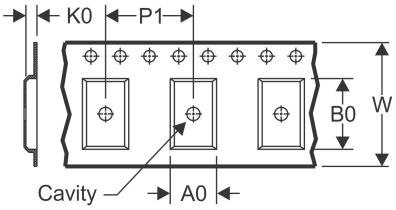
Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

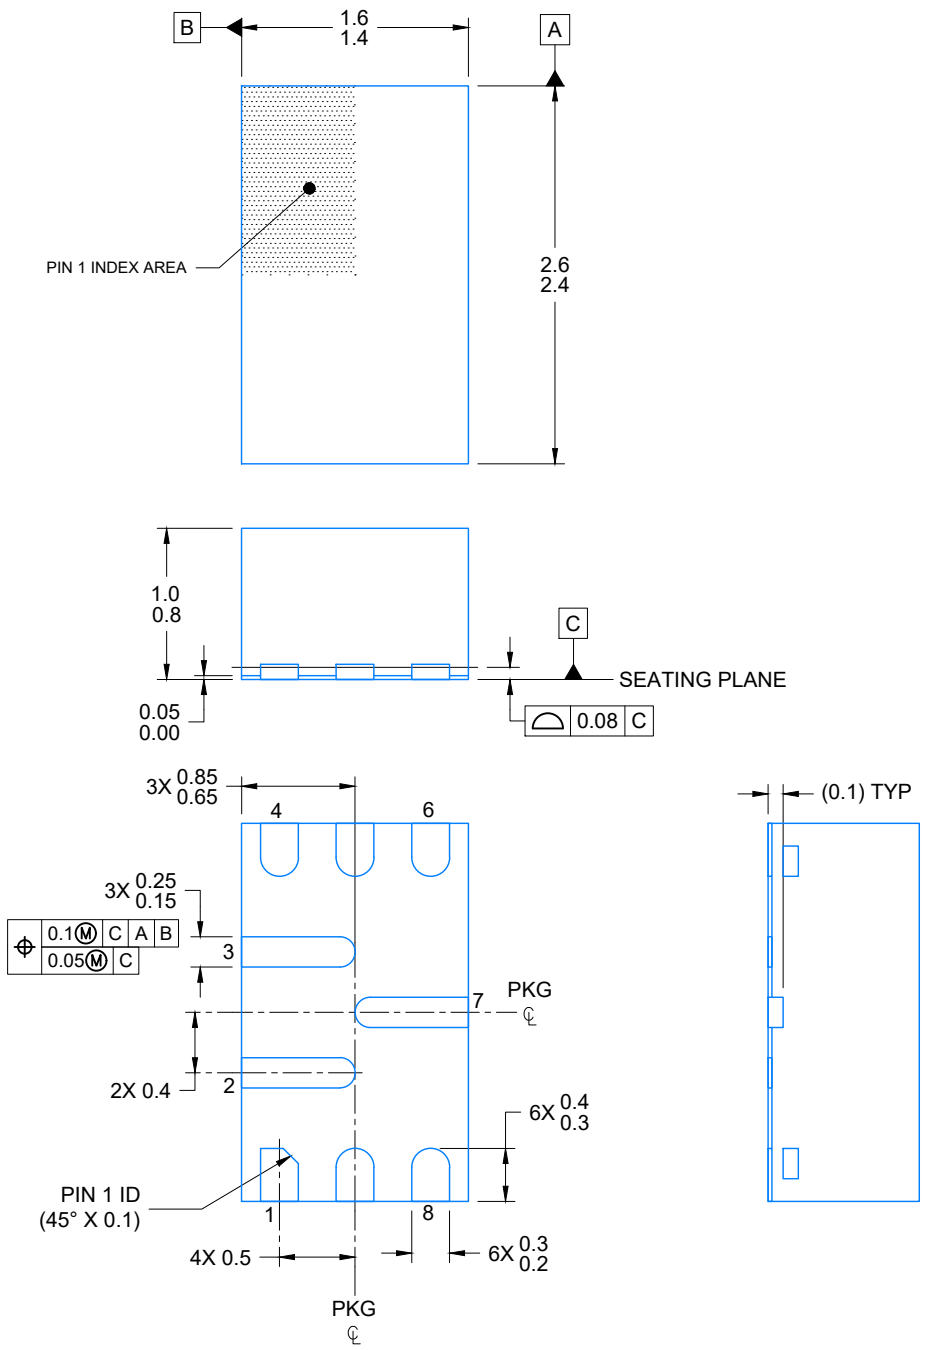
PACKAGE OUTLINE

RQY0009A

VQFN-HR - 1 mm max height

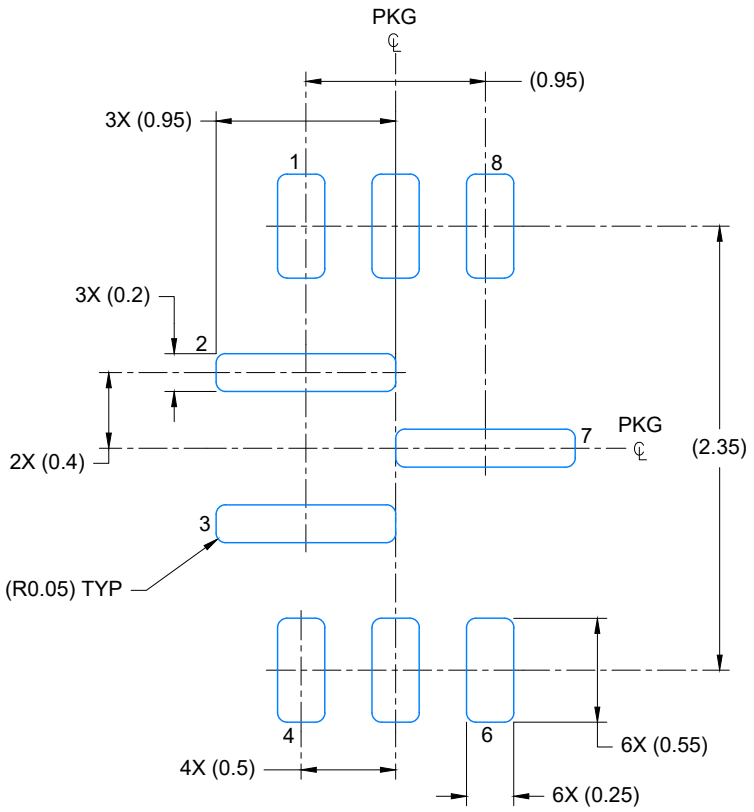
PLASTIC QUAD FLATPACK- NO LEAD



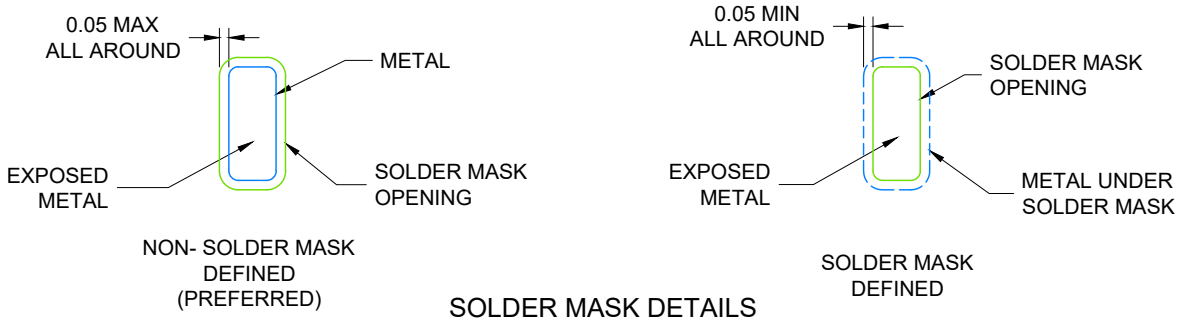
4225639/A 03/2020

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 25X

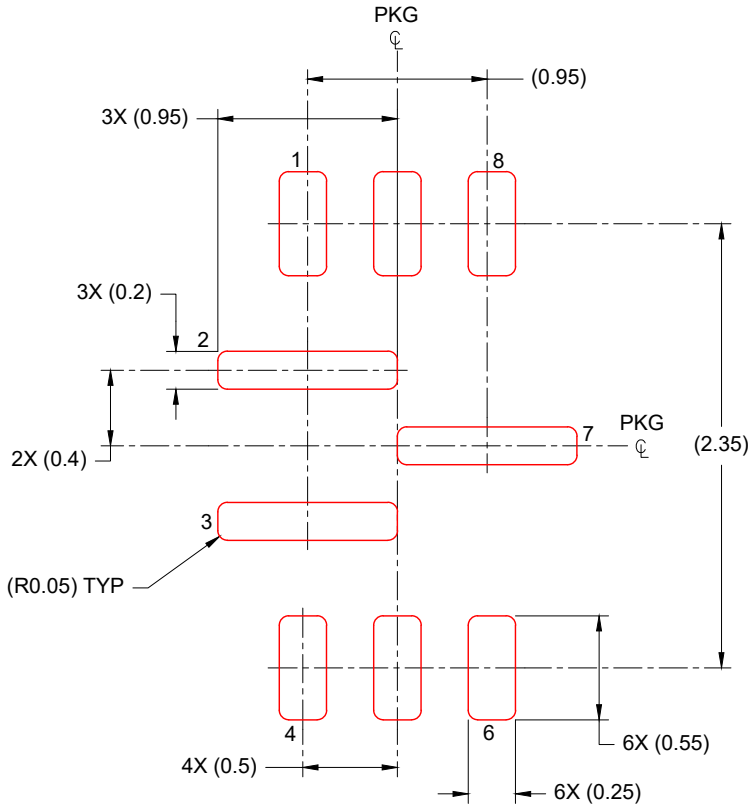


SOLDER MASK DETAILS
NOT TO SCALE

4225639/A 03/2020

NOTES: (continued)

3. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
4. Solder mask tolerances between and around signal pads can vary based on board fabrication site.



SOLDER PASTE EXAMPLE
BASED ON 0.1mm THICK STENCIL
SCALE: 25X

4225639/A 03/2020

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做出任何明示或暗示的担保，包括但不限于对适销性、与某特定用途的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保法规或其他要求。
