

## TPS65233-1 具有 I<sup>2</sup>C 接口的 LNB 稳压器

## 1 特性

- 针对 LNB 和 I<sup>2</sup>C 的完整集成解决方案
- 与数字卫星设备控制 (DiSEqC) 1.x 兼容
- 支持 9V 和 12V 电源总线
- 高达 1000mA 的精确输出电流限值, 可通过外部电阻和 I<sup>2</sup>C 进行调节
- 具有低 R<sub>dson</sub> 内部电源开关的升压转换器
- 针对非 I<sup>2</sup>C 应用的专用使能引脚
- 具有推挽输出级的低噪声、低压降输出
- 内置精确 22kHz 音调发生器或外部引脚
- 可调软启动和 13V/18V 电压转换时间
- 符合主要卫星接收器系统规范
- LNB 短路动态保护
- 针对输出电压电平、输入电源欠压闭锁 (UVLO) 和 DiSEqC 音调输出的诊断
- 电缆断开诊断
- 采用 19 引脚 WQFN 3.00mm × 3.00mm (RTE) 封装

## 2 应用

- 机顶盒卫星接收器
- 电视卫星接收器
- PC 卡卫星接收器

### 3 说明

TPS65233-1 针对模拟和数字卫星接收器而设计，是一款具有 I<sup>2</sup>C 接口的单片稳压器，专门为碟形天线内的 LNB 下变频器或卫星多路切换开关盒提供 13V/18V 电源和 22kHz 音调信号。该器件将极少的组件数量，低功率耗散以及简单设计和 I<sup>2</sup>C 标准接口等特性完美结合，提供了一套完整的解决方案。

TPS65233-1 具备 高功率效率。此 升压转换器集成 了一个以 1MHz 开关频率运行的 120mΩ 功率金属氧化物半导体场效应晶体管 (MOSFET)。线性稳压器中的压降电压为 0.8V，能够最大限度地降低功率损耗。

TPS65233-1 提供了多种方法来生成 22kHz 信号。具有推挽输出级的集成线性稳压器在输出上生成洁净的 22kHz 音调信号，即使在零负载时也是如此。可由外部电阻器以  $\pm 10\%$  的精度来设定线性稳压器的电流限值。由 I<sup>2</sup>C 读取的全范围诊断可用于系统监视。

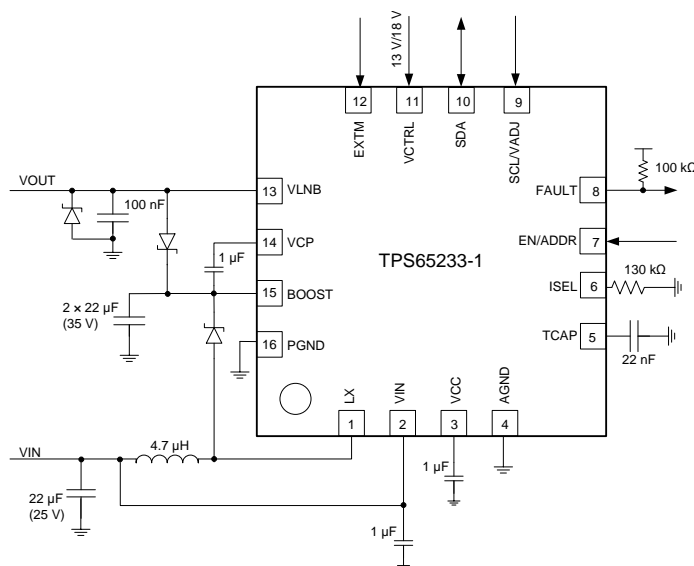

该器件采用 16 引脚 WQFN 3.00mm x 3.00mm (RTE) 封装。

## 5 Pin Configuration and Functions

Exposed pad must be soldered to PCB for optimal thermal performance.

### Pin Functions

PIN		DESCRIPTION
NAME	NUMBER	
AGND	4	Analog ground. Connect all ground pins and power pad together.
BOOST	15	Output of the boost regulator and input voltage of the internal linear regulator
EN/ADDR	7	Enable pin to enable the whole chip; pull to ground to disable output, output will be pulled to ground. For I <sup>2</sup> C interface, pulling this pin high or low gives different I <sup>2</sup> C addresses.
EXTM	12	External modulation logic input pin which activates the 22-kHz tone output, feeding signal can be 22-kHz tone or logic high or low.
FAULT	8	This pin is an open drain output pin, it goes low if any fault flag is set.
ISEL	6	Connect a resistor to this pin to set the LNB output current limit.
LX	1	Switching node of the boost converter
PGND	16	Power ground for boost converter
SCL/VADJ	9	I <sup>2</sup> C compatible clock input; if I <sup>2</sup> C function is not used, connect this pin to low set output voltage 13 V/18 V, connect to high set output voltage 13.4 V/18.6 V
SDA	10	I <sup>2</sup> C compatible bi-directional data
TCAP	5	Connect a capacitor to this pin to set the rise time and fall time of the LNB output between 13 V and 18 V.
VCC	3	Internal 6.5-V power supply bias. Connect a 1-μF ceramic capacitor from this pin to ground. When V <sub>IN</sub> is 5 V, connect VCC to V <sub>IN</sub> .
VCP	14	Gate drive supply voltage, output of charge pump, connect a capacitor between this pin to pin BOOST.
VCTRL	11	Logic control pin for 13-V or 18-V voltage selection at LNB output
VIN	2	Input of internal linear regulator
VLNB	13	Output of the LNB power supply connected to satellite receiver or switch
Thermal pad	—	Must be soldered to PCB for optimal thermal performance. Have thermal vias on the PCB to enhance power dissipation.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range, all voltages are with respect to GND (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	VIN, LX, BOOST, VLNB	–1	30	V
	VCP		BOOST + 7	
	LX	–1	30	
	VCC, EN, FAULT, SCL, SDA, VCTRL, ISEL, EXTM	–0.3	7	
	TCAP	–0.3	3.6	
	PGND, AGND	–0.3	0.3	
Operating junction temperature, T <sub>J</sub>		–40	125	°C
Storage temperature, T <sub>stg</sub>		–55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, other pins <sup>(1)</sup>	2000	V
	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, pin 13 (VLNB) <sup>(1)</sup>	6000	
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VIN	Input operating voltage	4.5		20	V
T <sub>A</sub>	Junction temperature	–40		85	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS65233-1	UNIT
		RTE (WQFN)	
		16 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	43.4	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	45.6	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	15	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.6	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	15	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	3.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

 $T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ ,  $V_{IN} = 12\text{ V}$ ,  $f_{SW} = 1\text{ MHz}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

## 7 Detailed Description

### 7.1 Overview

The TPS65233-1 is a power management IC that integrates a boost converter, a LDO, and a 22-kHz tone generator that serves as a LNB power supply. This solution compiles the DiSEqC 1.x standard with or without I<sup>2</sup>C interface. Output current can be precisely programmed by an external resistor. There are five ways to generate the 22-kHz tone signal with or without I<sup>2</sup>C. Integrated boost features low  $R_{ds(on)}$  MOSFET and internal compensation. A fixed 1-MHz switching frequency is designed to reduce components size.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Boost Converter

The TPS65233-1 consists of an internal compensated boost converter and linear regulator. The boost converter tracks the output LNB voltage to within 800 mV even at loading 950 mA, to minimize power dissipation. Under conditions where the input voltage, VBOOST, is greater than the output voltage, VLN, the linear regulator must drop the differential voltage. When operating in these conditions, taken care to ensure that the safe operating temperature range of the TPS65233-1 is not exceeded. The boost converter operates at 1 MHz typical. The TPS65233-1 has internal pulse-by-pulse current limiting on the boost converter and DC current limiting on the LNB output to protect the IC against short circuits. When the LNB output is shorted, the LNB output current is limited. The current limit is set by the external resistor. And the IC will be shut down if the overcurrent condition lasts for more than 4 ms, the converter enters hiccup mode and will retry startup in 128 ms. At extremely light loads, the boost converter operates in a pulse-skipping mode.

## Feature Description (continued)

If two or more set top box LNB outputs are connected together, one output voltage could be set higher than others. The output with lower set voltage would be effectively turned off. Once the voltage drops to the set level, the LNB output with lower set output voltage will return to normal conditions.

### 7.3.2 Linear Regulator and Current Limit

The linear regulator is used to generate the 22-kHz tone signal by changing the reference voltage. The linear regulator features low drop out voltage to minimize power loss while keeping enough head room for the 0.68-V, 22-kHz tone. It also implements a tight current limit for over current protection. The current limit is set by an external resistor connected to the ISEL pin. The curve below shows the relationship between the current limit threshold and the resistor value.

**Figure 8. Linear Regulator Current Limit vs Resistor**

$$R_{SEL} (k\Omega) = 124.11 \times I_{SEL}^{-1.178} (A) \quad (1)$$

A 280-kΩ resistor sets the current to 0.5 A. The current limit can also be set by I<sup>2</sup>C through a register.

### 7.3.3 Charge Pump

The charge pump circuitry generates a voltage to drive the NMOS of the linear regulator. One end the charge pump capacitor is connected to the output of the boost converter. The voltage on the charge pump capacitor is about 6.25 V.

### 7.3.4 Slew Rate Control

When LNB output voltage transits from 13 V to 18 V or vice versa, the capacitor at pin TCAP controls the transition time. This transition is to make sure the boost converter can follow the voltage change. Usually boost converter has low bandwidth and can't response fast. The voltage at TCAP acts as the reference voltage of the linear regulator. The boost converter's reference is also based on TCAP with additional fixed voltage to generate 0.8 V above the output.

The charging and discharging current is 10 μA, thus the transition time can be calculated as:

$$T_{cad}(ms) = 0.5 \times \frac{C_{ss}(nF)}{I_{ss}(\mu A)} \quad (2)$$

A 22-nF capacitor generates a 1.1-ms transition time.

In light load conditions, when LNB output voltage is set from 18 to 13 V, the voltage might drops very slow, which might cause wrong logic detection at LNB side. The TPS65233-1 has an integrated pull down circuit to pull down the output during the transition. This ensures the voltage change can follow the voltage at TCAP. Meanwhile, when the 22-kHz tone signal is superimposing on the LNB output voltage, the pull down current can also provide a square wave instead of distorted waveforms, which could cause another detection problem.

## Feature Description (continued)

### 7.3.5 Short Circuit Protection, Hiccup, and Overtemperature Protection

The LNB output limit can be set by an external resistor. When short circuit conditions occur, the output current is clamped at the current limit for 4 ms. If the condition remains, the converter will shut down for 128 ms and then try restart. This hiccup behavior prevents the IC from overheating.

The low side MOSFET of the boost converter has a current limit threshold at 3.2 A, which serves as secondary protection. If the boost converter's peak current limit is triggered, the peak current will clamp at 3.2 A. If loading current continues to increase, output voltage starts to drop and output power drops.

Thermal shutdown prevents the chip from operating at exceedingly high temperatures. When the silicon die temperature exceeds 160°C, the output shuts down. When the temperature drops below its lower threshold, typically 140°C, the output is enabled.

When the chip is in over current protection or thermal shutdown, the I<sup>2</sup>C interface and some logic are still active. The Fault pin is pulled down to signal the processor. The Fault pin signal will remain low unless the following actions are taken:

1. If I<sup>2</sup>C interface is not used to control, Enable pin must be recycled in order to pull Fault pin back to high.
2. If I<sup>2</sup>C interface is used, the I<sup>2</sup>C master needs to read the OCP or OTP bit in the register, then the Fault pin returns to high.

## 7.4 Device Functional Modes

### 7.4.1 Tone Generation

A 22-kHz tone signal is superimposed at the LNB output voltage as a carrier for DiSEqC command. This tone signal can be generated by feeding an external 22-kHz clock at the EXTM pin. It can also be generated with its internal tone generator gated by control logic. The output stage of the regulator facilitates a push-pull circuit, so even at zero loading the 22-kHz tone at the output is still clear of distortion.

There are five ways to generate the 22-kHz tone signal at the output.

In non-I<sup>2</sup>C mode, only option 1 and option 2 are supported in TPS65233-1. EXTM can be tone envelope or 22 kHz burst pulse as shown in [Figure 9](#). Option 3 and option 4 are designed for I<sup>2</sup>C interface communication mode. In I<sup>2</sup>C communication mode, TGATE bit must be written through I<sup>2</sup>C bus. If there is no bandwidth of I<sup>2</sup>C bus to write TGATE bit, there is a supplemental option 5 to generate 22-kHz tone, as shown in [Figure 10](#). In option 5, bit TMODE and TGATE must be set as 1.

**Device Functional Modes (continued)**

 Option 1, Non-I<sup>2</sup>C Mode, bit I2C\_CON = 0

 Option 2, Non-I<sup>2</sup>C Mode, bit I2C\_CON = 0

 Option 3, I<sup>2</sup>C Mode, bit I2C\_CON = 1 and TMODE = 0

 Option 4, I<sup>2</sup>C Mode, EXTM = 0, bit I2C\_CON = 1, and TMODE = 1

**Figure 9. Four Ways to Generate 22-kHz Tone**

## Device Functional Modes (continued)

Option 5: I<sup>2</sup>C Mode, gated by EXT\_M, TMODE, and TGATE = 1

**Figure 10. Supplemental Option for 22-kHz Tone in I<sup>2</sup>C Mode**

### 7.4.2 Serial Interface

I<sup>2</sup>C is a 2-wire serial interface developed by Philips Semiconductor (see I<sup>2</sup>C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pull-up structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I<sup>2</sup>C compatible devices connect to the I<sup>2</sup>C bus through open drain I/O pins, SDA and SCL. A master device, usually a microcontroller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A slave device receives and transmits data on the bus under control of the master device.

The TPS65233-1 device works as a slave and supports the following data transfer modes, as defined in the I<sup>2</sup>C-Bus Specification: standard mode (100 kbps), and fast mode (400 kbps). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents remain intact as long as supply voltage remains above 4.5 V (typical).

The data transfer protocol for standard and fast modes is exactly the same; therefore, they are referred to as F/S-mode in this document. The TPS65233-1 device supports 7-bit addressing; 10-bit addressing and general call address are not supported.

The TPS65233-1 device has a 7-bit address with the 2 LSB bits set by EN pin. Connecting EN to ground set the address 0x60H, connecting to high set the address 0x61H.

**Table 1. I<sup>2</sup>C Address Selection**

EN/ADDR PIN	I <sup>2</sup> C ADDRESS	ADDRESS FORMAT (A6...A0)
Connect to ground	0x60H	110 0000
Connect to high	0x61H	110 0001

## 7.5 Programming

### 7.5.1 I<sup>2</sup>C Update Sequence

The TPS65233-1 requires a start condition, a valid I<sup>2</sup>C address, a register address byte, and a data byte for a single update. After the receipt of each byte, the TPS65233-1 device acknowledges by pulling the SDA line low during the high period of a single clock pulse. The TPS65233-1 performs an update on the falling edge of the LSB byte.

When the TPS65233-1 is disabled (EN pin tied to ground) the device can still be updated via the I<sup>2</sup>C interface.

1	1	0	19.2
1	1	1	19.8

### 7.6.2 Control Register 2 - Address: 0x01H

**Table 5. Control Register 2 - Address: 0x01H**

BIT	FIELD	TYPE	RESET	DESCRIPTION
7	—	R/W	—	—
6	—	R/W	—	—
5	—	R/W	—	—

**Table 5. Control Register 2 - Address: 0x01H (continued)**

BIT	FIELD	TYPE	RESET	DESCRIPTION
4	TONE_POS1	R/W	0	00: tone above Vout; 01: tone in the middle of Vout; 10: tone below Vout
3	TONE_POS0	R/W	1	
2	CL1	R/W	0	
1	CL0	R/W	0	Current limit set bits
0	CL_EXT	R/W	1	1: current limit set by external resistor; 0: current limit set by register

Some tone detection circuits in LNB are sensitive to the position of the tone on the output voltage. The TPS65233-1 provides options to select the position by setting the TONE\_POS1 and TONE\_POS0 bits, as illustrated below.

 Option 1, TONE\_POS1=0, TONE\_POS0=0, Tone above V<sub>LNB</sub>

 Option 2, TONE\_POS1=0, TONE\_POS0=1, Tone in the middle of V<sub>LNB</sub>

 Option 2, TONE\_POS1=1, TONE\_POS0=0, Tone below V<sub>LNB</sub>
**Figure 14. Tone Position Programmed by TONE\_POS1, TONE\_POS0 Bits**

In addition to programming the LDO's current continuously via an external resistor, internal registers also provide options to program the current limit. There are four options that can be selected.

**Table 6. Current Limit Selection Bits**

CL1	CL0	CURRENT LIMIT (mA)
0	0	400
0	1	600
1	0	750
1	1	1000

### 7.6.3 Status Register 1 - Address: 0x02H

The TPS65233-1 has a full range of diagnostic flags for operation and debug. If any of the flags are triggered, the FAULT pin is pulled low sending an interrupt signal to processor. The processor then can read the status register to check the error conditions. The status bits are described in the following table. Among these bits, TSD and OCP are different from the others. Once TSD and OCP are set to 1, the FAULT pin logic is latched low and the processor must reset the bits in order to release the fault conditions. Other bits change as conditions change without latch.

**Table 7. Status Register 1 - Address: 0x02H**

BIT	FIELD	TYPE	RESET	DESCRIPTION
7	—	—	—	—
6	T125	R	0	1: if die temperature T > 125°C; 0: if die temperature T < 125°C
5	LDO_ON	R	0	1: internal LDO is turned on and boost converter is on; 0: Internal LDO is turned off but boost converter is on
4	Reserved	R	0	Reserved
3	TSD	R	0	1: thermal shutdown occurs; 0: thermal shutdown does not occur. FAULT pin pull low and latch, I <sup>2</sup> C master need to read and release
2	OCP	R	0	Overcurrent protection. If over current conditions last for more than 48 ms. 1: Overcurrent protection triggered. 0: Overcurrent protection conditions released. FAULT pin pull low and latch, I <sup>2</sup> C master need to read and release
1	CABLE_GOOD	R	0	Cable connection good. 1: Output current above 50 mA; 0: Output current less than 50 mA
0	VOUT_GOOD	R	0	LNB output voltage in range. 1: In range; 0: Out of range

## 8 Application and Implementation

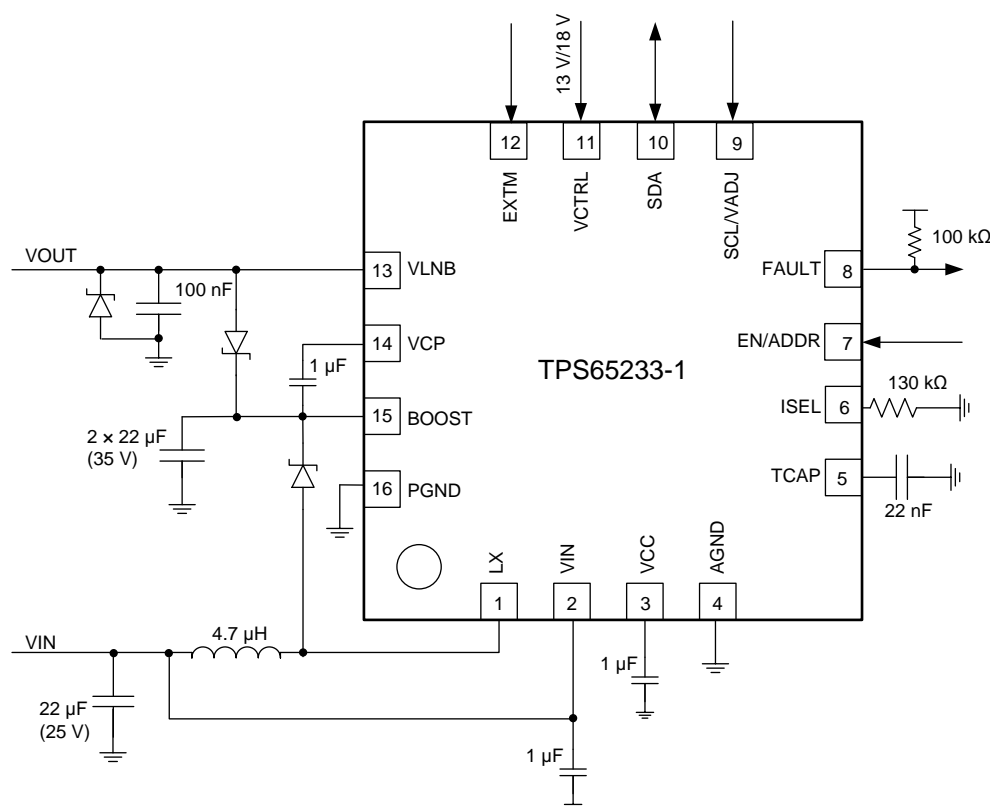

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

TPS65233-1 is a monolithic voltage regulator, specifically to provide the 13-V/18-V power supply and the 22-kHz tone signaling to the LNB down-converter, with I<sup>2</sup>C interface. I<sup>2</sup>C GUI software is shared with TPS65233 which is available on [ti.com](http://ti.com).

### 8.2 Typical Application

**Figure 15. Application Schematic**

#### 8.2.1 Detailed Design Procedure

##### 8.2.1.1 Capacitor Selection

In TPS65233-1, a 1-MHz non-synchronous boost converter is integrated and the boost converter features the internal compensation network. 4.7 µH and 10 µH boost inductor are recommended. TPS65233-1 works fine with both ceramic capacitor and electrolytic capacitor. The ceramic capacitors rated at least X7R, 1206 size are preferred for the lower LNB output ripple. Table 8 shows the recommended ceramic capacitors list for both 4.7 µH and 10 µH boost inductors. Minimum output capacitor at the output of the boost converter is 2 x 10-µF/25-V ceramic capacitor when 4.7-µH inductor is selected.

Boost converter is stable with both ceramic capacitor and electrolytic capacitor. If lower cost is demanded, a 100-µF electrolytic and a 1-µF/35-V ceramic capacitor work well, this solution provides lower system cost.

**Table 8. Boost Inductor and Capacitor Selections**

BOOST INDUCTOR	BOOST OUTPUT CAPACITOR (CERAMIC)
10 $\mu$ H	2 $\times$ 22 $\mu$ F, 25 V, 1206
	2 $\times$ 10 $\mu$ F, 35 V, 1206
	1 $\times$ 22 $\mu$ F, 35 V, 1206
	2 $\times$ 22 $\mu$ F, 35 V, 1206
4.7 $\mu$ H	2 $\times$ 10 $\mu$ F, 25 V, 1206
	2 $\times$ 22 $\mu$ F, 25 V, 1206
	1 $\times$ 22 $\mu$ F, 35 V, 1206
	2 $\times$ 10 $\mu$ F, 35 V, 1206
	2 $\times$ 22 $\mu$ F, 35 V, 1206

## 9 Power Supply Recommendations

The devices are designed to operate from an input supply ranging from 4.5 V to 20 V. The input supply should be well regulated. If the input supply is located more than a few inches from the converter an additional bulk capacitance typically 100  $\mu\text{F}$  may be required in addition to the ceramic bypass capacitors.

## 10 Layout

### 10.1 Layout Guidelines

The TPS65233-1 is designed to layout in a 2-layer PCB. [Figure 32](#) shows the recommended layout practice. It is critical to make sure the GND of the input capacitor, output capacitor, and boost converter are connected at one point on the same layer as shown below. PGND and AGND are in different regions and are connected to the thermal pad. Other components are connected to AGND.

### 10.2 Layout Example

**Figure 32. 2-Layer PCB Layout**

## 11 器件和文档支持

### 11.1 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范和标准且不一定反映 TI 的观点；请见 TI 的[使用条款](#)。

**TI E2E™ 在线社区** **TI 工程师对工程师 (E2E) 社区**。此社区的创建目的是为了促进工程师之间协作。在 e2e.ti.com 中，您可以咨询问题、共享知识、探索思路，在同领域工程师的帮助下解决问题。

**设计支持** **TI 参考设计支持** 可帮助您快速查找有帮助的 E2E 论坛、设计支持工具以及技术支持的联系信息。

### 11.2 商标

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.3 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
