TPS92561 – 针对发光二极管 (LED) 照明的相位可调光、单级升压控制器

特性

- 简单滞后控制
- 紧凑解决方案和简单物料清单
- 自然可调光三端双向可控硅 **(TRIAC)** 和反相位调光器
- 执行 **LED** 驱动电路，此电路效率大于 **90%**，功率因数大于 **0.9**，并且总谐波失真 **(THD)** 小于 **20%**
- 可编程输出过压保护
- 过热关断
- **VCC** 欠压闭锁
- 带外露焊盘的 **8** 引脚超薄型小外形尺寸 **(VSSOP)**（表面贴装小外形尺寸 **(MSOP)**）封装

应用范围

- 离线 **TRIAC** 可调光应用
- 离线不可调光灯
- 要求高效和尽可能低的物料清单 **(BOM)** 成本的灯
- 工业用和商用固态照明

说明

TPS92561 器件是一款升压控制器，此控制器用于采用高压、低电流 LED 的 LED 照明应用。 在照明应用使用升压转换器的方法可生产出体积尽可能小的转换器，并且可实现 90% 以上的高效率。 此器件包含一个具有固定偏移的电流感测比较器，从而实现简单滞后控制机制，此机制没有那些通常与升压转换器相关的环路补偿问题。 集成过压保护 (OVP) 和 VCC 稳压器进一步简化了设计过程，并且减少了外部组件数量。

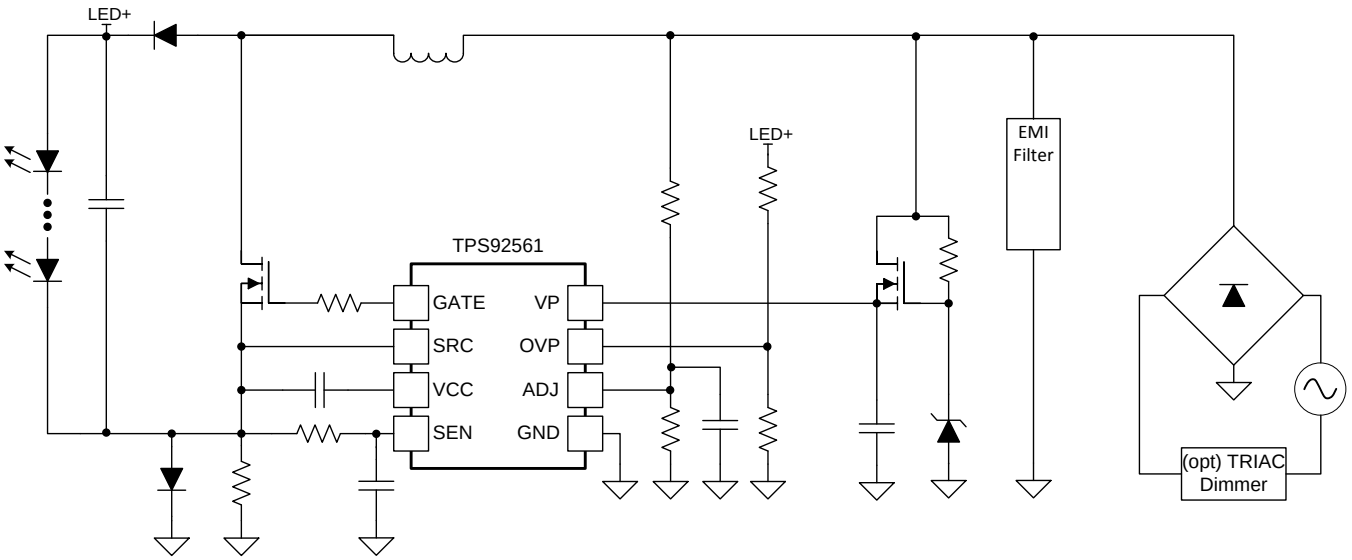

图 **1.** 典型应用电路原理图

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

Absolute Maximum Ratings(1)

Over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Pin voltage range(2)	SRC, SEN, ADJ, OVP	–0.3	5.0	V
	VP	–1.0	45.0	
	VCC	–0.3	12.0	
ESD rating(3)	Human body model (HBM)	1.5		kV
T_{stg}	Storage temperature range	–60	150	°C
T_J	Junction temperature range	Internally Limited		

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltages are with respect to network ground terminal.
(3) ESD testing is performed according to the respective JESD22 JEDEC standard.

Thermal Characteristics

Over operating free-air temperature range (unless otherwise noted)

THERMAL METRIC(1)		TPS92561 DGN (8 PINS)	UNITS
θ_{JA}	Junction-to-ambient thermal resistance(2)	65.3	°C/W
θ_{JCtop}	Junction-to-case (top) thermal resistance(3)	64.8	
θ_{JB}	Junction-to-board thermal resistance(4)	44.8	
ψ_{JT}	Junction-to-top characterization parameter(5)	3.9	
ψ_{JB}	Junction-to-board characterization parameter(6)	44.6	
θ_{JCbot}	Junction-to-case (bottom) thermal resistance(7)	13.2	

(1) For more information about traditional and new thermal metrics, see the IC Package Thermal Metrics application report, SPRA953.
(2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specified JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
(5) The junction-to-top characterization parameter, θ_{JT}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA}, using a procedure described in JESD51-2a (sections 6 and 7).
(6) The junction-to-board characterization parameter, θ_{JB}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA}, using a procedure described in JESD51-2a (sections 6 and 7).
(7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

Recommended Operating Conditions

Table 1. Terminal Functions

PIN		DESCRIPTION	APPLICATION INFORMATION
NAME	NO.		
GATE	1	Gate driver output pin	Connect to the gate terminal of the low-side N-channel power FET. For off-line applications, use a gate resistance of ≥ 75 Ω.
SRC	2	Gate driver return	Connect to the source terminal of the low-side, N-channel power FET. By connecting SRC to the FET source, switching current spikes are not passed through the sense resistor.
VCC	3	Gate driver power rail	Connect a 0.47-µF minimum decoupling cap from this pin to SRC pin.
SEN	4	LED current sense pin	Current sense input. For off-line applications, connect to SEN and the current sensing resistor through an R-C filter with a time constant similar to the converter switching frequency.
GND	5	Ground	Connect to the system ground plane.
ADJ	6	LED current adjust pin	Converter reference. Can be connected to the converter rectified AC for high power factor, or to the LED output voltage for improved line regulation.
OVP	7	Overvoltage	Connect to resistor divider from VOUT (LED+) to detect overvoltage.
VP	8	Power supply of the integrated circuit (IC)	Connect to an appropriate voltage source to provide power for the IC. (VP ≤ 42 V) See Application Circuits for example diagrams.
PowerPAD			Solder to printed circuit board (PCB) with or without thermal vias to enhance thermal performance. Although it can be left floating, TI recommends to connect the PowerPAD™ to GND.

APPLICATION INFORMATION

Description

The TPS92561 device is a boost controller for phase cut dimmer compatible LED lighting applications. The device incorporates a current sense comparator with a fixed offset, allowing the construction of a hysteretic, off-line converter suitable for driving LEDs in a wide variety of applications.

The inductor peak-to-peak current ripple follows the device reference, the ADJ pin voltage (V_{ADJ}), and is bounded by the SEN pin hysteresis ($V_{SEN-HYS}$). By using a voltage divider from the rectified AC voltage, the inductor current can be made to follow the line closely and create conversions which result in high power factor and low THD. Boost converters also have an advantage when TRIAC dimming because of their inherent ability to draw continuous current from the line. This eliminates the need for additional hold current circuitry as the converter itself can draw power until the zero crossing point is reached. The continuous input current of a boost also reduces the input EMI filter requirements.

Basics of Operation

The main switch is turned on and off when the SEN comparator reaches trip points in a window around the ADJ reference. In cycle 1, the main switch is on until the current reaches the turn off threshold. In cycle 2, the switch is kept off until the turn on threshold is reached. In Figure 9, $V_{SEN-UPPER\_TH}$ and $V_{SEN-LOWER-TH}$ are assumed to be their typical value of 30 mV.

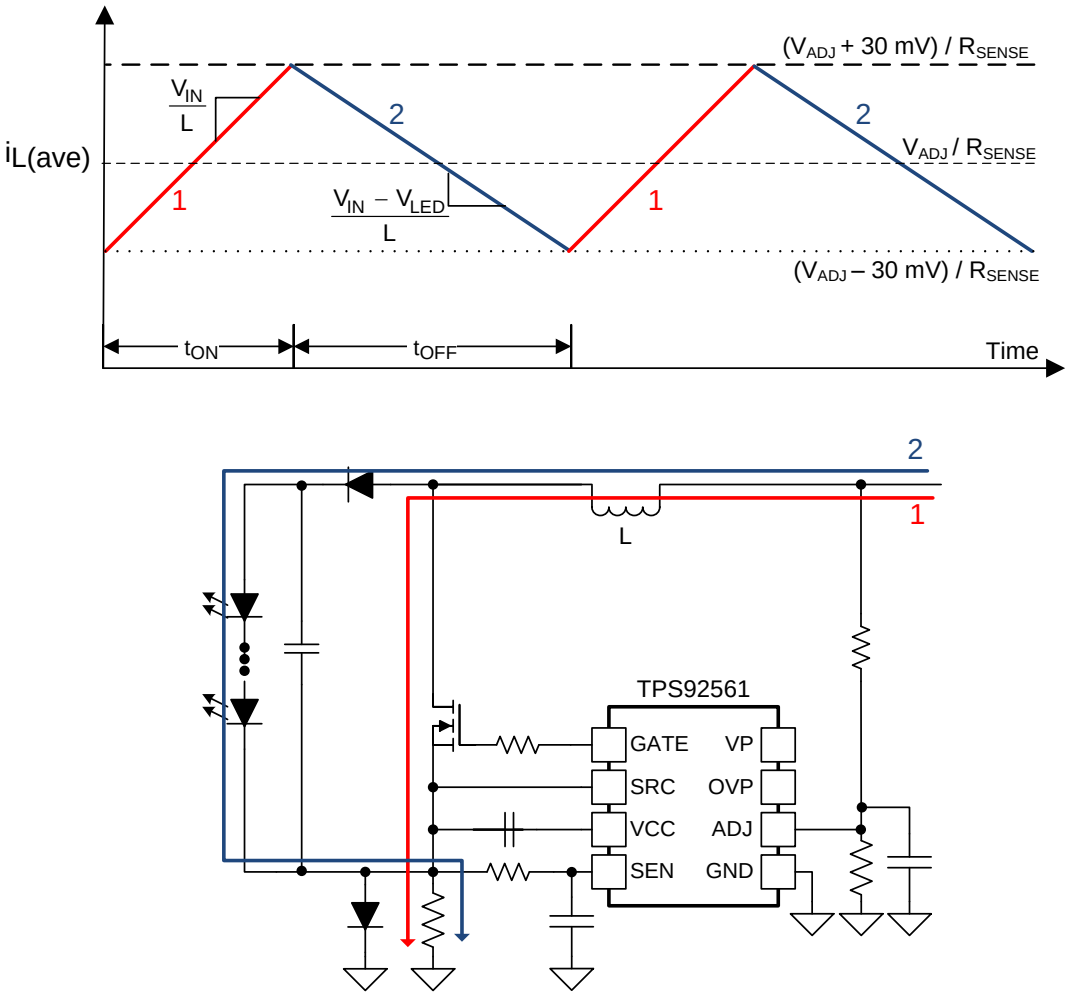

Figure 9. Basics of Hysteretic Boost Operation

Sample Scope Capture

The main inductor current varies in a window around the ADJ reference voltage:

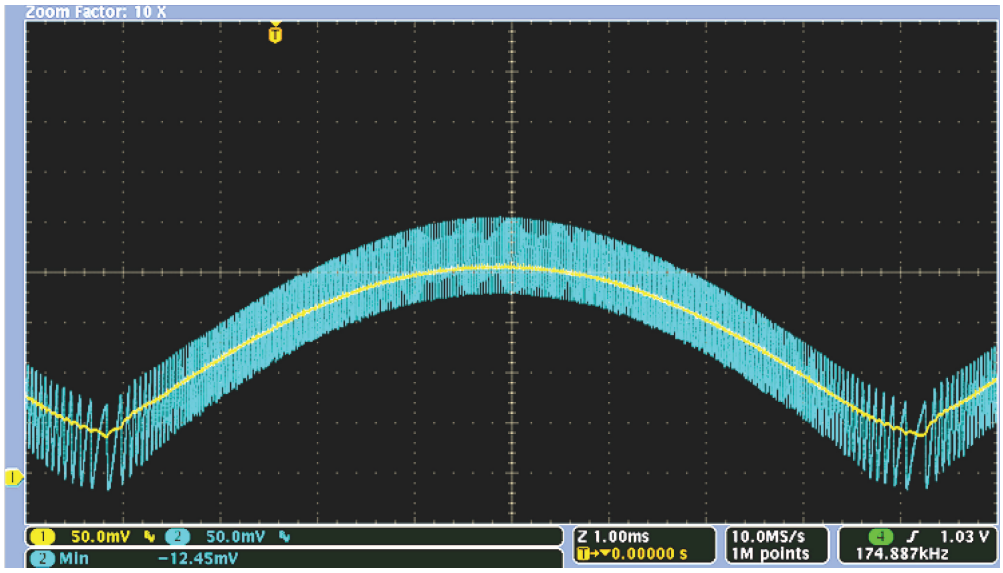

Figure 10. TPS92561 Operation Waveform (1 ms/div)
Yellow: ADJ Voltage (50 mV/div) Blue: R_{SENSE} Voltage (50 mV/div)

VCC Bias Supply and Start-Up

The TPS92561 device can be configured to obtain bias power in several different configurations: AUX winding from the main inductor (see Figure 15), a linear regulator from the input rectified AC (see Figure 16), or a linear regulator from the output LED voltage (see Figure 17). A linear regulator can be constructed from a resistor, a Zener diode, and a N-Channel MOSFET. Each configuration has benefits and trade-offs.

Table 2. VCC Bias Power Configurations

Bias Configuration	Description
Coupled inductor bias with linear regulator start-up (see Figure 15)	Highest efficiency bias choice
	Requires a custom magnetic, which can range in cost similar to an off-the-shelf single coil inductor
	Method to start the TPS92561 device (linear) still required, however, can be undersized for start-up condition only. VCC_{UVLO} has not been engineered to support resistive start-up methods.
Linear regulator from output (see Figure 16)	Lowest efficiency bias choice because output voltage is higher than input
	Ensures fast output turn off due to bias draining output capacitor
	Aids dimming performance under deep dimming, a stable bias is always available
	Lower capacitance value required at VP pin, output capacitor is doubling as VP capacitor
	Can be supplemented with charge pump bias circuit to achieve higher efficiency
Linear regulator from input (see Figure 17)	Better efficiency performance than linear regulator derived from output
	Higher VP capacitor value required

VCC and VP Connection

A bias voltage with a maximum of 42 V is connected to the VP pin to supply the internal 8.3 V (typical) VCC linear regulator. This voltage is also used to drive the main FET gate. Use a FET with a gate threshold at least 750 mV below the VCC voltage. The VCC capacitor ground must be placed at the SEN pin. This ensures the SEN voltage is free of switching spikes that occur at the edge of each switching cycle.

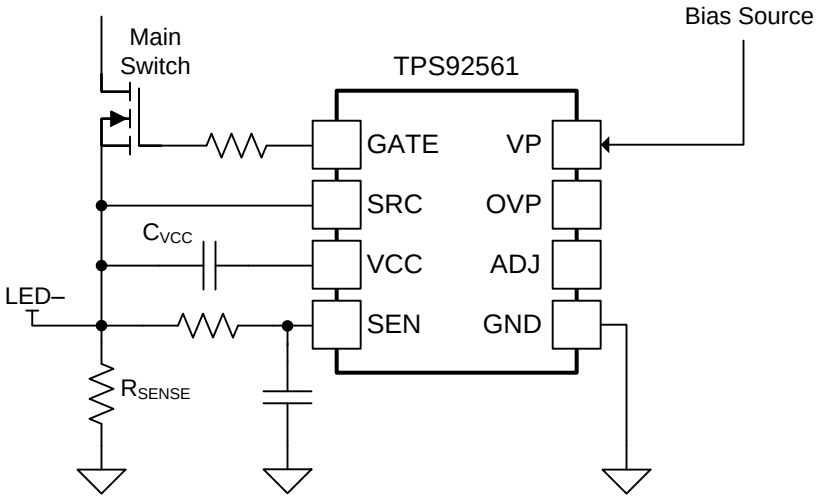

Figure 11. TPS92561 Bias, SRC, and C_{VCC} Connection

Output Current Control (ADJ, SEN)

The TPS92561 power stage design follows two rules:

1. Output current is determined by the ADJ reference voltage, the sense resistor selected, and the converter operating points, V_{IN} and V_{LED}.
2. Output frequency is determined by the inductance value and the SEN pin hysteresis V_{SEN}. For off-line applications, the effective hysteresis must be increased using an R-C filter on the SEN pin.

Because the TPS92561 device does not have leading edge blanking, the SEN pin filter must be used to obtain consistent operation. The SEN pin filter is typically set using an R-C with a corner frequency close to the desired switching frequency. Leading edge blanking was not implemented to allow high-frequency operation in other non-off-line applications.

At start up (V_{ADJ} < 90 mV) a small current is supplied to the V_{ADJ} divider to ensure a reference is available to begin converter switching. When the ADJ voltage is above 90 mV, the current source is shut off.

Setting the Output Current

Using the desired ADJ reference voltage, the input current can be calculated based on:

$$I_{in} = \frac{V_{ADJ}}{R_{SENSE}}$$

where V_{ADJ} can be DC, rectified AC derived, or other source. (1)

If V_{ADJ} is derived from a voltage divider from the input rectified AC, we can solve for the R9 resistor divider value based on, for example, a V_{ADJ} voltage of 150 mV, an R17 value of 374 Ω, and the average value of the sine wave:

$$R9 = \frac{\left(V_{IN_{RMS}} \times 0.9 \times R17\right)}{V_{ADJ}} - R17$$

(2)

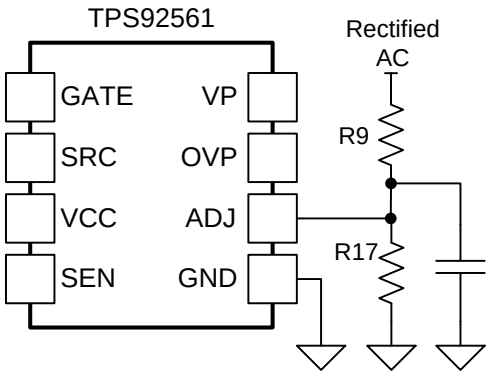

Figure 12. TPS92561 ADJ Connection

To find the R_{SENSE} value, where η is the converter efficiency, assume 0.9.

$$R_{SENSE} = \frac{V_{IN-RMS} \times V_{ADJ} \times \eta}{V_{LED} \times I_{LED}} \quad (3)$$

Selecting an Inductance

The TPS92561 device is hysteretic. Therefore, switching transitions are based on the sensed current in the inductor. There is no direct control of the switching frequency other then the relationship of the comparator hysteresis to the inductor ripple. A typical switching frequency of an off-line converter using a rectified AC injected reference could vary up to 50 kHz over a line cycle. This creates a spread-spectrum effect and helps reduced conducted EMI.

A typical line injected (using a divided down rectified AC as the reference) hysteretic boost converter reaches the peak switching frequency when $V_{LED} = 2 \times V_{RECTIFIED\ AC}$, or when the duty cycle D = 0.5. We call this operating point $V_{IN-FSW-PK}$. Use this voltage as the typical operating point for the design equations. Solve for the $V_{IN-FSW-PK}$ term based on:

$$\frac{V_{LED}}{V_{IN-FSW-PK}} = \frac{1}{1-D} \quad \text{or} \quad V_{IN-FSW-PK} = \frac{V_{LED}}{2} \quad (4)$$

Select the approximate highest desired frequency (for example, f_{SW-PK} of 65 kHz could be used), then design the SEN pin filter with corner frequency equal to f_{SW-PK}. The filter and the internal hysteresis define the inductor ripple for a given inductance. This has the effect of increasing the SEN pin hysteresis $V_{SEN-HYS-2}$ to approximately 140 mV. Select a C12 value between 1000 and 4700 pF. Solve for the resistor R12 in the filter based on:

$$R_{12} = \frac{1}{2\pi \times f_{SW-PK} \times C_{12}} \quad (5)$$

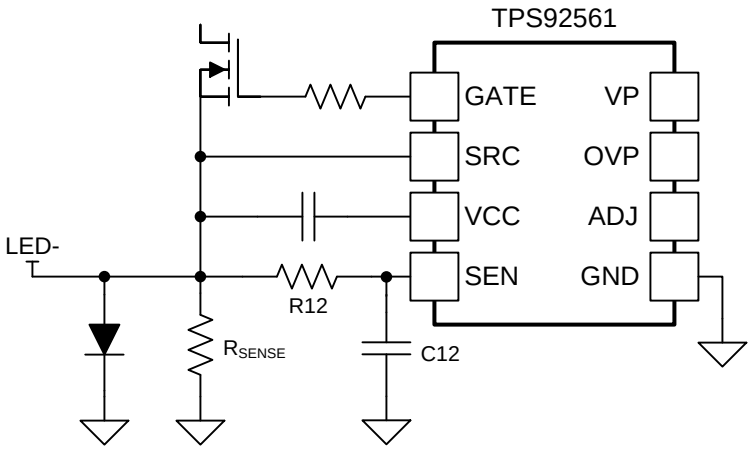

Figure 13. Current Sense

With the effective hysteresis, calculate the inductor peak-to-peak, Δi_{L-PP} ripple current using:

$$\Delta i_{L-PP} = \frac{V_{SEN-HYS-2}}{R_{SENSE}} \quad (6)$$

To find the converter inductance, L, substitute into:

$$L = \frac{V_{IN-FSW-PK} \times D \times \left(\frac{1}{f_{SW-PK}}\right)}{\Delta i_{L-PP}} \quad (7)$$

To further aid in the converter design, see the TPS92561 design tool, TI literature number *SLUC517*.

Important Design Consideration: Diode in Parallel With Sense Resistance

Figure 13 shows a diode in use in parallel with the R_{SENSE} resistor. The diode clamps the SEN pin voltage when the boost converter is first powered up. Because a boost converter utilizes a diode connected to the output, the output capacitor is charged immediately when power is applied.

CAUTION

The current charging the output capacitor when V_{IN} is applied flows through the sense resistors, and if it is not clamped by the diode, can exceed the TPS92561 SEN pin rating, which may damage the device.

Gate Driver Operation

An additional aid to converter operation and radiated EMI is to slow the main FET switching speed. This can be accomplished by adding a resistor in series with the FET gate. A fast turn off diode across the resistor could also be implemented to improve efficiency. For off-line designs, use a gate resistance value ≥ 75 Ω.

As in all power converters grounding and layout are key considerations. Give careful attention to the layout of the sense resistors, GND pin, VCC, and SRC connections, as well as the FET Gate and Source connections. All should follow short and low-inductance paths. For examples, see the TPS92561 EVM User's Guide, *SLUUAU9*.

Overcurrent Protection

The TPS92561 device inherently limits the main switch current, but cannot implement output short circuit protection because of the converter (boost) topology. To implement LED short-circuit protection in a boost converter requires a blocking switch or other means to open the path to the output, which adds significant cost and complexity to the solution and is not commonly used. An input fuse should be used as output overcurrent protection.

Overvoltage Protection (OVP)

Overvoltage protection is implemented using a resistor voltage divider to the output. Note that the output voltage is high (> 200 V) so the resistor divider should contain a high (> 1 MΩ) value. Also use a small cap on OVP.

First pick a value for R18, for example 1.6 MΩ and select the desired overvoltage protection voltage V_{OVP}. Using the $V_{OVP-UPTH}$ value (1.19 V, typical) the trip point can then be computed using:

$$R19 = \frac{R18 \times V_{OVP-UPTH}}{V_{OVP} - V_{OVP-UPTH}} \quad (8)$$

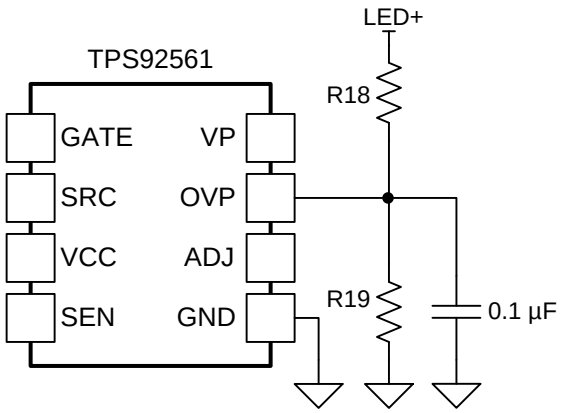

Figure 14. Overvoltage Protection Circuit

When the OVP trip point is reached the converter shuts off until the OVP voltage drops below the level controlled by the OVP hysteresis, $V_{OVP-HYS}$ (44 mV, typical). After OVP is reached, switching begins again when V_{LED} falls to the restart voltage (one $V_{OVP-HYS}$ term ignored):

$$V_{OVP\_RESTART} = V_{OVP} - \left(\frac{V_{OVP-HYS}}{R19}\right)R18 \tag{9}$$

Output Bulk Capacitor

The required output bulk capacitor, C_{BULK}, stores energy during the input voltage zero crossing interval and limits the twice the line frequency ripple component flowing through the LEDs. The following equation describes the calculation of the output capacitor value:

$$C_{BULK} \geq \frac{P_{IN}}{4\pi \times f_L \times R_{LED} \times V_{LED} \times I_{LED(ripple)}} \tag{10}$$

where

- R_{LED} is the dynamic resistance of LED string
- $I_{LED(ripple)}$ is the peak-to-peak LED ripple current
- f_L is line frequency

R_{LED} is found by computing the difference in LED forward voltage divided by the difference in LED current for a given LED using the manufacturer's V_F versus I_F curve. For more details, see Application Note 1656.

In typical applications, the solution size becomes a limiting factor and dictates the maximum dimensions of the bulk capacitor. When selecting an electrolytic capacitor, manufacturer recommended de-rating factors should be applied based on the worst case capacitor ripple current, output voltage, and operating temperature to achieve the desired operating lifetime.

Phase Dimming

After following the design procedure for a TPS92561 non-dimming design, the creation of a TRIAC dimmer compatible design only requires the addition of an input snubber (R-C), as shown in Figure 17. Ideally, a capacitor value of 3× the input filter capacitance would be implemented to ensure sufficient damping of the input filter resonance. However, capacitance values as low as 2× tested successfully. If the input voltage is used to provide the converter reference, dimming occurs naturally with the decreasing ADJ set point and decreased power transfer due to shorter line-cycle conduction times.

Application Circuits

Target LED lamp applications include:

- A-15, A-19, A-21, A-23
- R-20, R-25, R-27, R-30, R-40
- PS-25, PS-30, PS-35
- BR-30, BR-38, BR-40
- PAR-20, PAR-30, PAR-30L
- MR-16, GU-10
- G-25, G-30, G-40

Applications also include: fluorescent replacement, recessed (canister) type lighting replacement, and new LED-specific lighting form factors.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

4225480/C 11/2024

NOTES: (continued)

10. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
11. Board assembly site may have different recommendations for stencil design.

重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做出任何明示或暗示的担保，包括但不限于对适销性、与某特定用途的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保法规或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的相关应用。严禁以其他方式对这些资源进行复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。对于因您对这些资源的使用而对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，您将全额赔偿，TI 对此概不负责。

TI 提供的产品受 TI 销售条款)、TI 通用质量指南 或 ti.com 上其他适用条款或 TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。 除非德州仪器 (TI) 明确将某产品指定为定制产品或客户特定产品，否则其产品均为按确定价格收入目录的标准通用器件。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
