

F28M36x Concerto™ Microcontrollers

1 Device Overview

1.1 Features

- Master Subsystem — Arm® Cortex®-M3
 - 125 MHz
 - Embedded memory
 - Up to 1MB of flash (ECC)
 - Up to 128KB of RAM (ECC or parity)
 - Up to 64KB of shared RAM
 - 2KB of IPC Message RAM
 - Five Universal Asynchronous Receiver/Transmitters (UARTs)
 - Four Synchronous Serial Interfaces (SSIs) and a Serial Peripheral Interface (SPI)
 - Two Inter-integrated Circuits (I2Cs)
 - Universal Serial Bus On-the-Go (USB-OTG) + PHY
 - 10/100 ENET 1588 MII
 - Two Controller Area Network, D_CAN, modules (pin-bootable)
 - 32-channel Micro Direct Memory Access (μDMA)
 - Dual security zones (128-bit password per zone)
 - External Peripheral Interface (EPI)
 - Micro Cyclic Redundancy Check (μCRC) module
 - Four general-purpose timers
 - Two watchdog timer modules
 - Three external interrupts
 - Endianness: little endian
- Clocking
 - On-chip crystal oscillator and external clock input
 - Dynamic Phase-Locked Loop (PLL) ratio changes supported
- 1.2-V digital, 1.8-V analog, 3.3-V I/O design
- Interprocessor Communications (IPC)
 - 32 handshaking channels
 - Four channels generate IPC interrupts
 - Can be used to coordinate transfer of data through IPC Message RAMs
- Up to 142 individually programmable, multiplexed General-Purpose Input/Output (GPIO) pins
 - Glitch-free I/Os
- Control Subsystem — TMS320C28x 32-bit CPU
 - 150 MHz
 - C28x core hardware built-in self-test
 - Embedded memory
 - Up to 512KB of flash (ECC)
 - Up to 36KB of RAM (ECC or parity)
 - Up to 64KB of shared RAM
 - 2KB of IPC Message RAM
 - IEEE-754 single-precision Floating-Point Unit (FPU)
 - Viterbi, Complex Math, CRC Unit (VCU)
 - Serial Communications Interface (SCI)
 - SPI
 - I2C
 - 6-channel Direct Memory Access (DMA)
 - 12 Enhanced Pulse Width Modulator (ePWM) modules
 - 24 outputs (16 high-resolution)
 - Six 32-bit Enhanced Capture (eCAP) modules
 - Three 32-bit Enhanced Quadrature Encoder Pulse (eQEP) modules
 - Multichannel Buffered Serial Port (McBSP)
 - EPI
 - One security zone (128-bit password)
 - Three 32-bit timers
 - Endianness: little endian
- Analog Subsystem
 - Dual 12-bit Analog-to-Digital Converters (ADCs)
 - Up to 2.88 MSPS
 - Up to 24 channels
 - Four Sample-and-Hold (S/H) circuits
 - Up to six comparators with 10-bit Digital-to-Analog Converter (DAC)
- Package
 - 289-ball ZWT New Fine Pitch Ball Grid Array (nFBGA)
- Temperature options:
 - T: –40°C to 105°C Junction
 - S: –40°C to 125°C Junction

1.2 Applications

- Automated sorting equipment
- CNC control
- Central inverter
- String inverter
- AC drive control module
- Servo drive control module
- AC-input BLDC motor drive
- DC-input BLDC motor drive
- Industrial AC-DC
- Three phase UPS

1.3 Description

The Concerto family is a multicore system-on-chip microcontroller unit (MCU) with independent communication and real-time control subsystems. The F28M36x family of devices is the second series in the Concerto family.

The communications subsystem is based on the industry-standard 32-bit Arm Cortex-M3 CPU and features a wide variety of communication peripherals, including Ethernet 1588, USB OTG with PHY, Controller Area Network (CAN), UART, SSI, I2C, and an external interface.

The real-time control subsystem is based on TI's industry-leading proprietary 32-bit C28x floating-point CPU and features the most flexible and high-precision control peripherals, including ePWMs with fault protection, and encoders and captures—all as implemented by TI's TMS320C2000™ [Entry performance MCUs](#) and [Premium performance MCUs](#). In addition, the C28-CPU has been enhanced with the addition of the VCU instruction accelerator that implements efficient Viterbi, Complex Arithmetic, 16-bit FFTs, and CRC algorithms.

A high-speed analog subsystem and supplementary RAM memory is shared, along with on-chip voltage regulation and redundant clocking circuitry. Safety considerations also include Error Correction Code (ECC), parity, and code secure memory, as well as documentation to assist with system-level industrial safety certification.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE |
|----------------|-------------|-------------------|
| F28M36P63C2ZWT | nFBGA (289) | 16.0 mm x 16.0 mm |
| F28M36P53C2ZWT | nFBGA (289) | 16.0 mm x 16.0 mm |

2 Revision History

| Changes from December 15, 2017 to June 23, 2020 (from E Revision (December 2017) to F Revision) | Page |
|---|---------------------|
| • Global: Removed F28M36H53C2 and F28M36H33C2. | 1 |
| • Global: Replaced "emulator" with "JTAG debug probe". | 1 |
| • Section 1.1 (Features): Added "Three External Interrupts" feature. | 1 |
| • Section 1.2 (Applications): Updated section. | 2 |
| • Section 3.1 (Related Products): Updated section. | 9 |
| • Table 4-1 (Signal Descriptions): Updated DESCRIPTION of XRS, EMU0, and EMU1. | 15 |
| • Section 5.2 (ESD Ratings – Commercial): Changed title from "ESD Ratings" to "ESD Ratings – Commercial". | 42 |
| • Section 5.2: Added ANSI/ESDA/JEDEC JS-002 to charged-device model (CDM). | 42 |
| • Section 5.9.1.1 (Power Management and Supervisory Circuit Solutions): Updated section. | 52 |
| • Section 5.10.1.5 (ADC Electrical Data and Timing): Removed "Typical ADC Total Error" figure (was Figure 5-12 in SPRS825E). | 73 |
| • Table 5-38 (Electrical Characteristics of the Comparator/DAC): Changed "Comparator response time to PWM Trip Zone (Async)" parameter to "Comparator response time to GPIO". | 76 |
| • Table 5-75 (SPI Master Mode External Timing (Clock Phase = 0)): Updated MIN value (for both BRR EVEN and BRR ODD) for Parameter 23, $t_{d(SPC)M}$ | 145 |
| • Table 5-76 (SPI Master Mode External Timing (Clock Phase = 1)): Updated MIN value (for both BRR EVEN and BRR ODD) for Parameter 23, $t_{d(SPC)M}$ | 147 |
| • Table 6-7 (Control Subsystem Flash, ECC, OTP, Boot ROM): Removed references to 256KB Flash from 0010 0000 to 0011 FFFF. Changed SIZE (BYTES) of EPI0 from 2G to 2M. Added footnote about Control Subsystem having less address reach to EPI memory than the Master Subsystem. | 165 |
| • Table 6-8 (Master Subsystem Flash, ECC, OTP, Boot ROM): Updated M ADDRESS range 0068 0480 to 0070 01FF. | 166 |
| • Table 6-8: Removed references to 256KB Flash from 0022 0000 to 002D FFFF. | 166 |
| • Table 6-11 (Master Subsystem Analog and EPI): Added footnote about Control Subsystem having less address reach to EPI memory than the Master Subsystem. | 171 |
| • Section 6.18 (Code Security Module): Updated section. | 240 |
| • Section 7.1 (TI Reference Design): Changed section title from "TI Design or Reference Design" to "TI Reference Design". Updated section. | 244 |
| • Section 8 (Device and Documentation Support): Changed "Community Resources" section to "Support Resources" section. Updated section. | 245 |
| • Section 8.2 (Tools and Software): Updated section. | 246 |
| • Section 8.3 (Documentation Support): Updated section. | 247 |
| • Section 8.4 (Related Links): Updated section. | 248 |

3 Device Comparison

Table 3-1 lists the features of the F28M36x devices.

Table 3-1. Device Comparison

| FEATURE | TYPE ⁽¹⁾ | P63C2 | P53C2 | H53B2 | H33B2 |
|---|---------------------|----------------|-------|-------|-------|
| Master Subsystem — Arm Cortex-M3 | | | | | |

Table 3-1. Device Comparison (continued)

| FEATURE | | TYPE ⁽¹⁾ | P63C2 | P53C2 | H53B2 | H33B2 |
|--|---|---------------------|-------|-------|-------|-------|
| Packaging | | | | | | |
| Package Type | 289-Ball ZWT New Fine Pitch Ball Grid Array | | Yes | Yes | Yes | Yes |
| Junction Temperature (T _j) | T: -40°C to 105°C | – | Yes | Yes | Yes | Yes |
| | S: -40°C to 125°C | – | Yes | Yes | Yes | Yes |

- (1) A type change represents a major functional feature difference in a peripheral module. Within a peripheral type, there may be minor differences between devices that do not affect the basic functionality of the module. These device-specific differences are listed in the [C2000 Real-Time Control Peripherals Reference Guide](#) and in the peripheral reference guides.
- (2) The maximum frequency at which the Cortex-M3 core can run is 125 MHz. The clock divider before the Cortex-M3 core can only take values of /1, /2, or /4. For this reason, when the C28x is configured to run at the maximum frequency of 150 MHz, the fastest allowable frequency for the Cortex-M3 is 75 MHz. If the Cortex-M3 is configured to run at 125 MHz, the maximum frequency of the C28x is limited to 125 MHz. If the Cortex-M3 is configured to run at 100 MHz, the maximum frequency of the C28x is limited to 100 MHz.
- (3) The CAN module uses the popular IP known as D_CAN. This document uses the names “CAN” and “D_CAN” interchangeably to reference this peripheral.
- (4) Single EPI arbitrated between masters in Master and Control Subsystems.
- (5) An integer divide ratio must be maintained between the C28x and ADC clock frequencies. All MSPS and Conversion Time values are based on the maximum C28x clock frequency.

Table 3-2. Possible Speed Combinations for Cortex-M3 and C28x Cores

| | | | |
|------------------|---------|---------|---------|
| Cortex-M3 | 75 MHz | 125 MHz | 100 MHz |
| C28x | 150 MHz | 125 MHz | 100 MHz |

3.1 Related Products

For information about other devices in this family of products, see the following link:

[F28M35x Concerto™ Microcontrollers](#)

The F28M3x series of microcontrollers brings together connectivity and control by combining an Arm Cortex-M3 core with the C28x core on to one device. With F28M3x, applications such as solar inverters and industrial control can keep the benefits of separating the communication and control portions while maintaining a single-chip solution. In addition, F28M3x microcontrollers enable safety certifications in your system through enhanced hardware and safety features.

[TMS320F2838x Microcontrollers With Connectivity Manager](#)

The TMS320F2838x is a powerful 32-bit floating-point microcontroller unit (MCU) designed for advanced closed-loop control applications. The F2838x supports a dual-core C28x architecture along with a new Connectivity Manager that offloads critical communication tasks, significantly boosting system performance. The integrated analog and control peripherals with advanced connectivity peripherals like EtherCAT and Ethernet also let designers consolidate real-time control and real-time communications architectures, reducing requirements for multicontroller systems.

4 Terminal Configuration and Functions

4.1 Pin Diagrams

Figure 4-1 illustrates the ball locations for the 289-ball ZWT new fine pitch ball grid array package and is used in conjunction with Figure 4-2, Figure 4-3, Figure 4-4, and Figure 4-5 to locate signal names and ball grid numbers.

Figure 4-1. 289-Ball ZWT New Fine Pitch Ball Grid Array (Bottom View)

Figure 4-2 through Figure 4-5 show the terminal assignments on the 289-ball ZWT package in four quadrants (A, B, C, and D). See Table 4-1 for the complete multiplexed signal names.

| TERMINAL | | I/O/Z ⁽²⁾ | DESCRIPTION | PU or PD ⁽³⁾ | OUTPUT BUFFER STRENGTH |
|--------------------------|--------------|--|---|-------------------------|------------------------|
| NAME | ZWT BALL NO. | | | | |
| PF0_GPIO32 | D19 | I/O/Z | General-purpose input/output 32 | PU | 4 mA |
| M_CAN1RX | | I | CAN-1 receive data | | |
| M_MIIRXCK | | I | EMAC MII receive clock | | |
| M_I2C0SDA | | I/OD | I2C-0 data open-drain bidirectional port | | |
| M_TRACED2 | | O | Trace data 2 | | |
| C_I2CASDA | | I/OD | I2C-A data open-drain bidirectional port | | |
| C_SCIRXDA | | I | SCI-A receive data | | |
| C_ADCSOCAO | | O | ADC start-of-conversion A ⁽⁶⁾ | | |
| PF1_GPIO33 | E17 | I/O/Z | General-purpose input/output 33 | PU | 4 mA |
| M_CAN1TX | | O | CAN-1 transmit data | | |
| M_MIIRXER | | I | EMAC MII receive error | | |
| M_CCP3 | | I/O | Capture/Compare/PWM-3 (General-purpose Timer) | | |
| M_I2C0SCL | | I/OD | I2C-0 clock open-drain bidirectional port | | |
| M_TRACED3 | | O | Trace data 3 | | |
| C_I2CASCL | | I/OD | I2C-A clock open-drain bidirectional port | | |
| C_EPWMSYNCO | | O | Enhanced PWM sync out | | |
| C_ADCSOCBO | O | ADC start-of-conversion B ⁽⁶⁾ | | | |
| PF2_GPIO34 | P16 | I/O/Z | General-purpose input/output 34 | PU | 4 mA |
| M_MIIPHYINTR | | I | EMAC PHY MII interrupt | | |
| M_EPI0S32 ⁽⁵⁾ | | I/O | EPI-0 signal 32 | | |
| M_SSI1CLK | | I/O | SSI-1 clock | | |
| M_TRACECLK | | O | Trace clock | | |
| M_XCLKOUT | | O | External output clock | | |
| C_ECAP1 | | I/O | Enhanced Capture-1 input/output | | |
| C_SCIRXDA | | I | SCI-A receive data | | |
| C_XCLKOUT | | O | External output clock | | |
| Bmode_pin4 | I | Boot mode pin 4 | | | |
| PF3_GPIO35 | P17 | I/O/Z | General-purpose input/output 35 | PU | 4 mA |
| M_MIIMDC | | I | EMAC management data clock | | |
| M_EPI0S33 ⁽⁵⁾ | | I/O | EPI-0 signal 33 | | |
| M_SSI1FSS | | I/O | SSI-1 frame | | |
| M_U0TX | | O | UART-0 transmit data | | |
| M_TRACED0 | | O | Trace data 0 | | |
| C_SCITXDA | | O | SCI-A transmit data | | |
| Bmode_pin3 | | I | Boot mode pin 3 | | |
| PF4_GPIO36 | U14 | I/O/Z | General-purpose input/output 36 | PU | 4 mA |
| M_CCP0 | | I/O | Capture/Compare/PWM-0 (General-purpose Timer) | | |
| M_MIIMDIO | | I/O | EMAC management data input/output | | |
| M_EPI0S12 | | I/O | EPI-0 signal 12 | | |
| M_SSI1RX | | I | SSI-1 receive data | | |
| M_U0RX | | I | UART-0 receive data | | |
| C_SCIRXDA | | I | SCI-A receive data | | |

Table 4-1. Signal Descriptions⁽¹⁾ (continued)

| TERMINAL | | I/O/Z ⁽²⁾ | DESCRIPTION | PU or PD ⁽³⁾ | OUTPUT BUFFER STRENGTH |
|--------------------------|-----------------|----------------------|---|-------------------------------|------------------------------|
| NAME | ZWT BALL NO. | | | | |
| PF5_GPIO37 | U11 | I/O/Z | General-purpose input/output 37 | PU | 4 mA |
| M_CCP2 | | I/O | Capture/Compare/PWM-2 (General-purpose Timer) | | |
| M_MIIRXD3 | | I | EMAC MII receive data 3 | | |
| M_EPI0S15 | | I/O | EPI-0 signal 15 | | |
| M_SSI1TX | | O | SSI-1 transmit data | | |
| M_MIITXEN | | O | EMAC MII transmit enable | | |
| C_ECAP2 | | I/O | Enhanced Capture-2 input/output | | |
| PF6_GPIO38 | W12 | I/O/Z | General-purpose input/output 38. If configured as an output, place a capacitor with a value of 56 pF or greater near the pin. If configured as an input, place a series resistor with a value equal to 1 kΩ or greater near the pin. See the F28M36x Concerto™ MCUs Silicon Errata for details. NOTE: For this pin, only the USB0VBUS function is available on silicon revision 0 devices (GPIO and the four other functions listed are not available). | PU | 4 mA |
| M_USB0VBUS | | Analog | USB0 VBUS power (5-V tolerant) | | |
| M_CCP1 | | I/O | Capture/Compare/PWM-1 (General-purpose Timer) | | |
| M_MIIRXD2 | | I | EMAC MII receive data 2 | | |
| M_EPI0S38 ⁽⁵⁾ | | I/O | EPI-0 signal 38 | | |
| PF7_GPIO39 | D17 | I/O/Z | General-purpose input/output 39 | PU | 4 mA |
| M_CAN1TX | | O | CAN-1 transmit data | | |
| PG0_GPIO40 | V11 | I/O/Z | General-purpose input/output 40 | PU | 4 mA |
| M_U2RX | | I | UART-2 receive data | | |
| M_I2C1SCL | | I/OD | I2C-1 clock open-drain bidirectional port | | |
| M_USB0EPEN | | O | USB-0 external power enable (optionally used in the host mode) | | |
| M_EPI0S13 | | I/O | EPI-0 signal 13 | | |
| M_MIIRXD2 | | I | EMAC MII receive data 2 | | |
| M_U4RX | | I | UART-4 receive data | | |
| M_MIITXCK | | I | EMAC MII transmit clock | | |
| PG1_GPIO41 | U12 | I/O/Z | General-purpose input/output 41 | PU | 4 mA |
| M_U2TX | | O | UART-2 transmit data | | |
| M_I2C1SDA | | I/OD | I2C-1 data open-drain bidirectional port | | |
| M_EPI0S14 | | I/O | EPI-0 signal 14 | | |
| M_MIIRXD1 | | I | EMAC MII receive data 1 | | |
| M_U4TX | | O | UART-4 transmit data | | |
| M_MIITXER | | O | EMAC MII transmit error | | |
| PG2_GPIO42 | W14 | I/O/Z | General-purpose input/output 42 | PU | 4 mA |
| M_USB0DM | | Analog | USB0 data minus | | |
| M_MIICOL | | I | EMAC MII collision detect | | |
| M_EPI0S39 ⁽⁵⁾ | | I/O | EPI-0 signal 39 | | |

Table 4-1. Signal Descriptions⁽¹⁾ (continued)

| TERMINAL | | I/O/Z ⁽²⁾ | DESCRIPTION | PU or PD ⁽³⁾ | OUTPUT BUFFER STRENGTH |
|--------------------------|--------------|----------------------|--|-------------------------|------------------------|
| NAME | ZWT BALL NO. | | | | |
| PG3_GPIO43 | N17 | I/O/Z | General-purpose input/output 43 | PU | 4 mA |
| M_MIICRS | | I | EMAC MII carrier sense | | |
| M_MIIRXDV | | I | EMAC MII receive data valid | | |
| M_TRACED1 | | O | Trace data 1 | | |
| Bmode_pin1 | | I | Boot mode pin 1 | | |
| PG4_GPIO44 | D18 | I/O/Z | General-purpose input/output 44 | PU | 4 mA |
| M_CAN1RX | | I | CAN-1 receive data | | |
| PG5_GPIO45 | W15 | I/O/Z | General-purpose input/output 45 | PU | 4 mA |
| M_USB0DP | | Analog | USB0 data plus | | |
| M_CCP5 | | I/O | Capture/Compare/PWM-5 (General-purpose Timer) | | |
| M_MIITXEN | | O | EMAC MII transmit enable | | |
| M_EPI0S40 ⁽⁵⁾ | | I/O | EPI-0 signal 40 | | |
| PG6_GPIO46 | W13 | I/O/Z | General-purpose input/output 46. If configured as an output, place a capacitor with a value of 56 pF or greater near the pin. If configured as an input, place a series resistor with a value equal to 1 kΩ or greater near the pin. See the F28M36x Concerto™ MCUs Silicon Errata for details. NOTE: For this pin, only the USB0ID function is available on silicon revision 0 devices (GPIO and the three other functions listed are not available). | PU | 4 mA |
| M_USB0ID | | Analog | USB0 ID (5-V tolerant) | | |
| M_MIITXCK | | I | EMAC MII transmit clock | | |
| M_EPI0S41 ⁽⁵⁾ | | I/O | EPI-0 signal 41 | | |
| PG7_GPIO47 | W11 | I/O/Z | General-purpose input/output 47 | PU | 6 mA |
| M_MIITXER | | O | EMAC MII transmit error | | |
| M_CCP5 | | I/O | Capture/Compare/PWM-5 (General-purpose Timer) | | |
| M_EPI0S31 | | I/O | EPI-0 signal 31 | | |
| M_MIICRS | | I | EMAC MII carrier sense | | |
| Bmode_pin2 | | I | Boot mode pin 2 | | |
| PH0_GPIO48 | V10 | I/O/Z | General-purpose input/output 48 | PU | 4 mA |
| M_CCP6 | | I/O | Capture/Compare/PWM-6 (General-purpose Timer) | | |
| M_MIIPHYRST | | O | EMAC PHY MII reset | | |
| M_EPI0S6 | | I/O | EPI-0 signal 6 | | |
| M_SSI3TX | | O | SSI-3 transmit data | | |
| M_MIITXD3 | | O | EMAC MII transmit data 3 | | |
| C_ECAP5 | | I/O | Enhanced Capture-5 input/output | | |
| PH1_GPIO49 | U8 | I/O/Z | General-purpose input/output 49 | PU | 4 mA |
| M_CCP7 | | I/O | Capture/Compare/PWM-7 (General-purpose Timer) | | |
| M_EPI0S7 | | I/O | EPI-0 signal 7 | | |
| M_MIIRXD0 | | I | EMAC MII receive data 0 | | |
| M_SSI3RX | | I | SSI-3 receive data | | |
| M_MIITXD2 | | O | EMAC MII transmit data 2 | | |
| C_ECAP6 | | I/O | Enhanced Capture-6 input/output | | |

Table 4-1. Signal Descriptions⁽¹⁾ (continued)

| TERMINAL | | I/O/Z ⁽²⁾ | DESCRIPTION | PU or PD ⁽³⁾ | OUTPUT BUFFER STRENGTH |
|--------------|-----------------|------------------------|--|-------------------------------|------------------------------|
| NAME | ZWT BALL NO. | | | | |
| PH2_GPIO50 | V7 | I/O/Z | General-purpose input/output 50 | PU | 4 mA |
| M_EPI0S1 | | I/O | EPI-0 signal 1 | | |
| M_MIITXD3 | | O | EMAC MII transmit data 3 | | |
| M_SSI3CLK | | I/O | SSI-3 clock | | |
| M_MIITXD1 | | O | EMAC MII transmit data 1 | | |
| C_EQEP1A | | I | Enhanced QEP-1 input A | | |
| PH3_GPIO51 | U7 | I/O/Z | General-purpose input/output 51 | PU | 4 mA |
| M_USB0EPEN | | O | USB-0 external power enable (optionally used in the host mode) | | |
| M_EPI0S0 | | I/O | EPI-0 signal 0 | | |
| M_MIITXD2 | | O | EMAC MII transmit data 2 | | |
| M_SSI3FSS | | I/O | SSI-3 frame | | |
| M_MIITXD0 | | O | EMAC MII transmit data 0 | | |
| C_EQEP1B | I | Enhanced QEP-1 input B | | | |
| PH4_GPIO52 | U10 | I/O/Z | General-purpose input/output 52 | PU | 4 mA |
| M_USB0PFLT | | I | USB-0 external power error state (optionally used in the host mode) | | |
| M_EPI0S10 | | I/O | EPI-0 signal 10 | | |

Table 4-1. Signal Descriptions⁽¹⁾ (continued)

| TERMINAL | | I/O/Z ⁽²⁾ | DESCRIPTION | PU or PD ⁽³⁾ | OUTPUT BUFFER STRENGTH |
|-------------------------|-----------------|----------------------|---|-------------------------------|------------------------------|
| NAME | ZWT BALL NO. | | | | |
| Resets | | | | | |
| $\overline{\text{XRS}}$ | C1 | I/OD | Digital Subsystem Reset (in) and Watchdog/Power-on Reset (out). In most applications, TI recommends that the $\overline{\text{XRS}}$ pin be tied with the $\overline{\text{ARS}}$ pin. The Digital Subsystem has a built-in POR circuit, and during a power-on condition, this pin is driven low by the Digital Subsystem. This pin is also driven low by the Digital Subsystem when a watchdog reset occurs. During watchdog reset, the $\overline{\text{XRS}}$ pin is driven low for the watchdog reset duration of 512 OSCCLK cycles. If needed, an external circuitry may also drive this pin to assert device reset. In this case, this pin should be driven by an open-drain device. A noise filtering circuit can be connected to this pin. A resistor with a value from 2.2 k Ω to 10 k Ω should be placed between $\overline{\text{XRS}}$ and V_{DDIO} . If a capacitor is placed between $\overline{\text{XRS}}$ and V_{SS} for noise filtering, it should be 100 nF or smaller. These values will allow the watchdog to properly drive the $\overline{\text{XRS}}$ pin to V_{OL} within 512 OSCCLK cycles when the watchdog reset is asserted. Regardless of the source, a device reset causes the Digital Subsystem to terminate execution. The Cortex-M3 program counter points to the address contained at the location 0x00000004. The C28 program counter points to the address contained at the location 0x3FFFC0. When reset is deactivated, execution begins at the location designated by the program counter. The output buffer of this pin is an open-drain with an internal pullup. | PU | 4 mA |
| $\overline{\text{ARS}}$ | A3 | I/OD | Analog Subsystem Reset (in) and Power-on Reset (out). TI recommends that the $\overline{\text{ARS}}$ pin be tied with the $\overline{\text{XRS}}$ pin. The Analog Subsystem has a built-in POR circuit, and during a power-on condition, this pin is driven low by the Analog Subsystem. If needed, external circuitry may also drive this pin to assert a device reset. In this case, TI recommends that this pin be driven by an open-drain device. Regardless of the source, the Analog Subsystem reset causes the digital logic associated with the Analog Subsystem, to enter reset state. The output buffer of this pin is an open-drain with an internal pullup. | PU | 4 mA |

Table 4-1. Signal Descriptions⁽¹⁾ (continued)

| TERMINAL | | I/O/Z ⁽²⁾ | DESCRIPTION | PU or PD ⁽³⁾ | OUTPUT BUFFER STRENGTH |
|--------------------------|-------------------|----------------------|--|-------------------------------|------------------------------|
| NAME | ZWT BALL NO. | | | | |
| Clocks | | | | | |
| X1 | J19 | I | External oscillator input or on-chip crystal-oscillator input. To use the on-chip oscillator, a quartz crystal or a ceramic resonator must be connected across X1 and X2. See Figure 6-7 . | | |
| X2 | G19 | O | On-chip crystal-oscillator output. A quartz crystal or a ceramic resonator must be connected across X1 and X2. If X2 is not used, it must be left unconnected. See Figure 6-7 . | | |
| V _{SSOSC} | H18 | | Clock Oscillator Ground Pin. Use this pin to connect the GND of external crystal load capacitors or the ground pin of 3-terminal ceramic resonators with built-in capacitors. Do not connect to board ground. See Figure 6-7 . | | |
| V _{SSOSC} | H19 | | Clock Oscillator Ground Pin. Use this pin to connect the GND of external crystal load capacitors or the ground pin of 3-terminal ceramic resonators with built-in capacitors. Do not connect to board ground. See Figure 6-7 . | | |
| XCLKIN | see PJ7_GPIO63 | I | External oscillator input. This pin feeds a clock from an external 3.3-V oscillator to internal USB PLL module and to the CAN peripherals. | | |
| XCLKOUT | see PF2_GPIO34 | O/Z | External oscillator output. This pin outputs a clock divided-down from the internal PLL System Clock. The divide ratio is defined in the XPLLCLKCFG register. | | |
| Boot Pins | | | | | |
| Bmode_pin1 | see PG3_GPIO43 | I | One of four boot mode pins. Bmode_pin1 selects a specific configuration source from which the Concerto device boots on start-up. | PU | |
| Bmode_pin2 | see PG7_GPIO47 | I | One of four boot mode pins. Bmode_pin2 selects a specific configuration source from which the Concerto device boots on start-up. | PU | |
| Bmode_pin3 | see PF3_GPIO35 | I | One of four boot mode pins. Bmode_pin3 selects a specific configuration source from which the Concerto device boots on start-up. | PU | |
| Bmode_pin4 | see PF2_GPIO34 | I | One of four boot mode pins. Bmode_pin4 selects a specific configuration source from which the Concerto device boots on start-up. | PU | |
| JTAG | | | | | |
| $\overline{\text{TRST}}$ | N19 | I | JTAG test reset with internal pulldown. $\overline{\text{TRST}}$, when driven high, gives the scan system control of the operations of the device. If this signal is not connected or driven low, the device operates in its functional mode, and the test reset signals are ignored. NOTE: TRST is an active-low test pin and must be maintained low during normal device operation. An external pull-down resistor is required on this pin. The value of this resistor should be based on drive strength of the debugger pods applicable to the design. A 2.2-k Ω resistor generally offers adequate protection. Because the value of the resistor is application-specific, TI recommends that each target board be validated for proper operation of the debugger and the application. | PD | |
| TCK | L19 | I | JTAG test clock | | |
| TMS | M19 | I | JTAG test-mode select (TMS) with internal pullup. This serial control input is clocked into the TAP controller on the rising edge of TCK. | PU | |

Table 4-1. Signal Descriptions⁽¹⁾ (continued)

| TERMINAL | | I/O/Z ⁽²⁾ | DESCRIPTION | PU or PD ⁽³⁾ | OUTPUT BUFFER STRENGTH |
|----------|-----------------|----------------------|---|-------------------------------|------------------------------|
| NAME | ZWT BALL NO. | | | | |
| TDI | K19 | I | JTAG test data input (TDI) with internal pullup. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK. | PU | |
| TDO | T19 | O | JTAG scan out, test data output (TDO). The contents of the selected register (instruction or data) are shifted out of TDO on the falling edge of TCK. | | 4 mA |
| EMU0 | P19 | I/O/Z | <p>Emulator pin 0. When $\overline{\text{TRST}}$ is driven high, this pin is used as an interrupt to or from the JTAG debug probe system and is defined as input/output through the JTAG scan. This pin is also used to put the device into boundary-scan mode. With the EMU0 pin at a logic-high state and the EMU1 pin at a logic-low state, a rising edge on the TRST pin would latch the device into boundary-scan mode.</p> <p>NOTE: An external pullup resistor is required on this pin. The value of this resistor should be based on the drive strength of the debugger pods applicable to the design. A 2.2-kΩ to 4.7-kΩ resistor is generally adequate. Because the value of the resistor is application-specific, TI recommends that each target board be validated for proper operation of the debugger and the application.</p> <p>NOTE: If EMU0 is 0 and EMU1 is 1 when coming out of reset, the device enters Wait-in-Reset mode. WIR suspends bootloader execution, allowing the JTAG debug probe to connect to the device and to modify FLASH contents.</p> | PU | 4 mA |
| EMU1 | R19 | I/O/Z | <p>Emulator pin 1. When $\overline{\text{TRST}}$ is driven high, this pin is used as an interrupt to or from the JTAG debug probe system and is defined as input/output through the JTAG scan. This pin is also used to put the device into boundary-scan mode. | V _{SS} | W18 | | | | |
| V _{SS} | W19 | | | | |

(1) Throughout this table, Master Subsystem signals are denoted by the color blue; Control Subsystem signals are denoted by the color green; and Analog Subsystem signals are denoted by the color orange.

(2) I = Input, O = Output, Z = High Impedance, OD = Open Drain

(3) PU = Pullup, PD = Pulldown

- GPIO_MUX1 pullups can be enabled or disabled by Cortex-M3 software (disabled on reset).
- GPIO_MUX2 pullups can be enabled or disabled by C28x software (disabled on reset).
- AIO_MUX1 and AIO_MUX2 terminals do not have pullups or pulldowns.
- All other pullups are always enabled (XRS, ARS, TMS, TDI, EMU0, EMU1).
- All pulldowns are always enabled (VREG18EN, VREG12EN, TRST).

(4) All I/Os, except for GPIO199, are glitch-free during power up and power down. See [Section 6.11](#).

(5) This muxing option is only available on silicon Revision A devices; this muxing option is not available on silicon Revision 0 devices.

(6) Output from the Concerto ePWM is meant for the external ADC (if present).

5 Specifications

5.1 Absolute Maximum Ratings⁽¹⁾⁽²⁾

over operating free-air temperature range (unless otherwise noted)

| | | MIN | MAX | UNIT |
|-------------------------------------|--|------|-----------------|------|
| Supply voltage | V _{DDIO} (I/O and Flash) with respect to V _{SS} | -0.3 | 4.6 | V |
| | V _{DD18} with respect to V _{SS} | -0.3 | 2.5 | |
| | V _{DD12} with respect to V _{SS} | -0.3 | 1.5 | |
| Analog voltage | V _{DDA} with respect to V _{SSA} | -0.3 | 4.6 | V |
| Input voltage | V _{IN} (3.3 V) | -0.3 | 4.6 | V |
| Output voltage | V _O | -0.3 | 4.6 | V |
| Supply ramp rate | V _{DDIO} , V _{DD18} , V _{DD12} , V _{DDA} with respect to V _{SS} | | 10 ⁵ | V/s |
| Input clamp current | I _{IK} (V _{IN} < 0 or V _{IN} > V _{DDIO}) ⁽³⁾ | -20 | 20 | mA |
| Output clamp current | I _{OK} (V _O < 0 or V _O > V _{DDIO}) | -20 | 20 | mA |
| Free-Air temperature | T _A | -40 | 125 | °C |
| Junction temperature ⁽⁴⁾ | T _J | -40 | 150 | °C |
| Storage temperature ⁽⁴⁾ | T _{stg} | -65 | 150 | °C |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS}, unless otherwise noted.
- (3) Continuous clamp current per pin is ±2 mA.
- (4) Long-term high-temperature storage or extended use at maximum temperature conditions may result in a reduction of overall device life. For additional information, see [Semiconductor and IC Package Thermal Metrics](#).

5.2 ESD Ratings – Commercial

| | | VALUE | UNIT |
|---|--|-------|------|
| F28M36P63C2, F28M36P53C2, F28M36H53B2, F28M36H33B2 in 289-ball ZWT package | | | |
| V _(ESD) Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 | V |
| | Charged-device model (CDM), per JEDEC specification JESD22-C101 or ANSI/ESDA/JEDEC JS-002 ⁽²⁾ | ±500 | |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

| | | MIN | NOM | MAX | UNIT |
|---|--------------------------|------|-----|-------|------|
| Device supply voltage, I/O, $V_{DDIO}^{(1)}$ | | 2.97 | 3.3 | 3.63 | V |
| Device supply voltage, Analog Subsystem, V_{DD18} (when internal VREG is disabled and 1.8 V is supplied externally) | | 1.71 | 1.8 | 1.995 | V |
| Device supply voltage, Master and Control Subsystems, V_{DD12} (when internal VREG is disabled and 1.2 V is supplied externally) | | 1.14 | 1.2 | 1.32 | V |
| Supply ground, V_{SS} | | | 0 | | V |
| Analog supply voltage, $V_{DDA}^{(1)}$ | | 2.97 | 3.3 | 3.63 | V |
| Analog ground, V_{SSA} | | | 0 | | V |
| Device clock frequency (system clock) <i>Master Subsystem</i> | P63C2, P53C2 | | 2 | 125 | MHz |
| | H53B2, H33B2 | | 2 | 100 | |
| Device clock frequency (system clock) <i>Control Subsystem</i> | | | 2 | 150 | MHz |
| Junction temperature, T_J | T version | | -40 | 105 | °C |
| | S version ⁽²⁾ | | -40 | 125 | |

(1) V_{DDIO} and V_{DDA} should be maintained within approximately 0.3 V of each other.

(2) Operation above $T_J = 105^\circ\text{C}$ for extended duration will reduce the lifetime of the device. See [Calculating Useful Lifetimes of Embedded Processors](#) for more information.

5.4 Power Consumption Summary

Table 5-1. Current Consumption at 150-MHz C28x SYSCLKOUT and 75-MHz M3SSCLK

| MODE | TEST CONDITIONS ⁽¹⁾ | VREG ENABLED | | | | VREG DISABLED | | | | | | | |

NOTE

The peripheral-I/O multiplexing implemented in the device prevents all available peripherals from being used at the same time because more than one peripheral function may share an I/O pin. It is, however, possible to turn on the clocks to all the peripherals at the same time, although such a configuration is not useful. If the clocks to all the peripherals are turned on at the same time, the current drawn by the device will be more than the numbers specified in the current consumption table.

5.5 Electrical Characteristics

over recommended operating conditions (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | | MIN | TYP | MAX | UNIT | |
|-----------------|--|--|--|-----------------------------|-----|-------------------------|------|----|
| V _{IL} | Low-level input voltage (3.3 V) | | | V _{SS} – 0.3 | | V _{DDIO} * 0.3 | V | |
| V _{IH} | High-level input voltage (3.3 V) | | | V _{DDIO} * 0.7 | | V _{DDIO} + 0.3 | V | |
| V _{OL} | Low-level output voltage | I _{OL} = I _{OL} MAX | | | | V _{DDIO} * 0.2 | V | |
| V _{OH} | High-level output voltage | I _{OH} = I _{OH} MAX | | V _{DDIO} * 0.8 | | | V | |
| | | I _{OH} = 50 μA | | V _{DDIO} – 0.2 | | | | |
| I _{IL} | Input current (low level) | Pin with pullup enabled | V _{DDIO} = 3.3 V, V _{IN} = 0 V | All GPIO pins | | –50 | –230 | μA |
| | | | | $\overline{\text{XRS}}$ pin | | –50 | –230 | |
| | | | | $\overline{\text{ARS}}$ pin | | –100 | –400 | |
| | | Pin with pulldown enabled | V _{DDIO} = 3.3 V, V _{IN} = 0 V | | | ±2 ⁽¹⁾ | | |
| I _{IH} | Input current (high level) | Pin with pullup enabled | V _{DDIO} = 3.3 V, V _{IN} = V _{DDIO} | | | ±2 ⁽¹⁾ | μA | |
| | | Pin with pulldown enabled | V _{DDIO} = 3.3 V, V _{IN} = V _{DDIO} | 50 | | 200 | | |
| I _{OL} | Low-level output sink current, V _{OL} = V _{OL(MAX)} | All GPIO/AIO pins | | | | 4 | mA | |
| | | Group 2 ⁽²⁾ | | | | 8 | | |
| I _{OH} | High-level output source current, V _{OH} = V _{OH(MIN)} | All GPIO/AIO pins | | | | –4 | mA | |
| | | Group 2 ⁽²⁾ | | | | –8 | | |
| I _{OZ} | Output current, pullup or pulldown disabled | V _O = V _{DDIO} or 0 V | | | | ±2 ⁽¹⁾ | μA | |
| C _I | Input capacitance | | | | 2 | | pF | |
| | Digital Subsystem POR reset release delay time | Time after POR event is removed to $\overline{\text{XRS}}$ release | | | 50 | | μs | |
| | Analog Subsystem POR reset release delay time | Time after POR event is removed to $\overline{\text{ARS}}$ release | | 400 | | 800 | μs | |
| | VREG V _{DD18} output | Internal VREG18 on | | 1.77 | | 1.935 | V | |
| | VREG V _{DD12} output | Internal VREG12 on | | | 1.2 | | V | |

(1) For GPIO38 and GPIO46 (USB OTG pins), this parameter is ±8 μA.

(2) Group 2 pins are as follows: PD3_GPIO19, PE2_GPIO26, PE3_GPIO27, PH6_GPIO54, PH7_GPIO55, EMU0, TDO, EMU1, PD0_GPIO16, AIO7, AIO4.

5.6 Thermal Resistance Characteristics for ZWT Package (Revision 0 Silicon)

| | | °C/W ⁽¹⁾ | AIR FLOW (lfm) ⁽²⁾ |
|----------------------------------|---|---------------------|-------------------------------|
| R _{θJC} | Junction-to-case thermal resistance | 10.5 | 0 |
| R _{θJB} | Junction-to-board thermal resistance | 12.8 | 0 |
| R _{θJA} (High k PCB) | Junction-to-free air thermal resistance | 23.0 | 0 |
| | | 20.5 | 150 |
| | | 19.5 | 250 |
| | | 18.5 | 500 |
| Psi _{JT} | Junction-to-package top | 0.5 | 0 |
| | | 0.6 | 150 |
| | | 0.8 | 250 |
| | | 1.0 | 500 |
| Psi _{JB} | Junction-to-board | 12.9 | 0 |
| | | 12.9 | 150 |
| | | 12.8 | 250 |
| | | 12.7 | 500 |

(1) These values are based on a JEDEC defined 2S2P system (with the exception of the Theta JC [R_{θJC}] value, which is based on a JEDEC defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environmental Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Package Thermal Measurements*

(2) lfm = linear feet per minute

5.7 Thermal Resistance Characteristics for ZWT Package (Revision A Silicon)

| | | °C/W ⁽¹⁾ | AIR FLOW (lfm) ⁽²⁾ |
|----------------------------------|---|---------------------|-------------------------------|
| R _{θJC} | Junction-to-case thermal resistance | 7.5 | 0 |
| R _{θJB} | Junction-to-board thermal resistance | 10.5 | 0 |
| R _{θJA} (High k PCB) | Junction-to-free air thermal resistance | 20.6 | 0 |
| | | 17.9 | 150 |
| | | 16.8 | 250 |
| | | 15.6 | 500 |
| Psi _{JT} | Junction-to-package top | 0.25 | 0 |
| | | 0.35 | 150 |
| | | 0.42 | 250 |
| | | 0.53 | 500 |
| Psi _{JB} | Junction-to-board | 10.4 | 0 |
| | | 10.5 | 150 |
| | | 10.4 | 250 |
| | | 10.3 | 500 |

(1) These values are based on a JEDEC defined 2S2P system (with the exception of the Theta JC [R_{θJC}] value, which is based on a JEDEC defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environmental Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Package Thermal Measurements*

(2) lfm = linear feet per minute

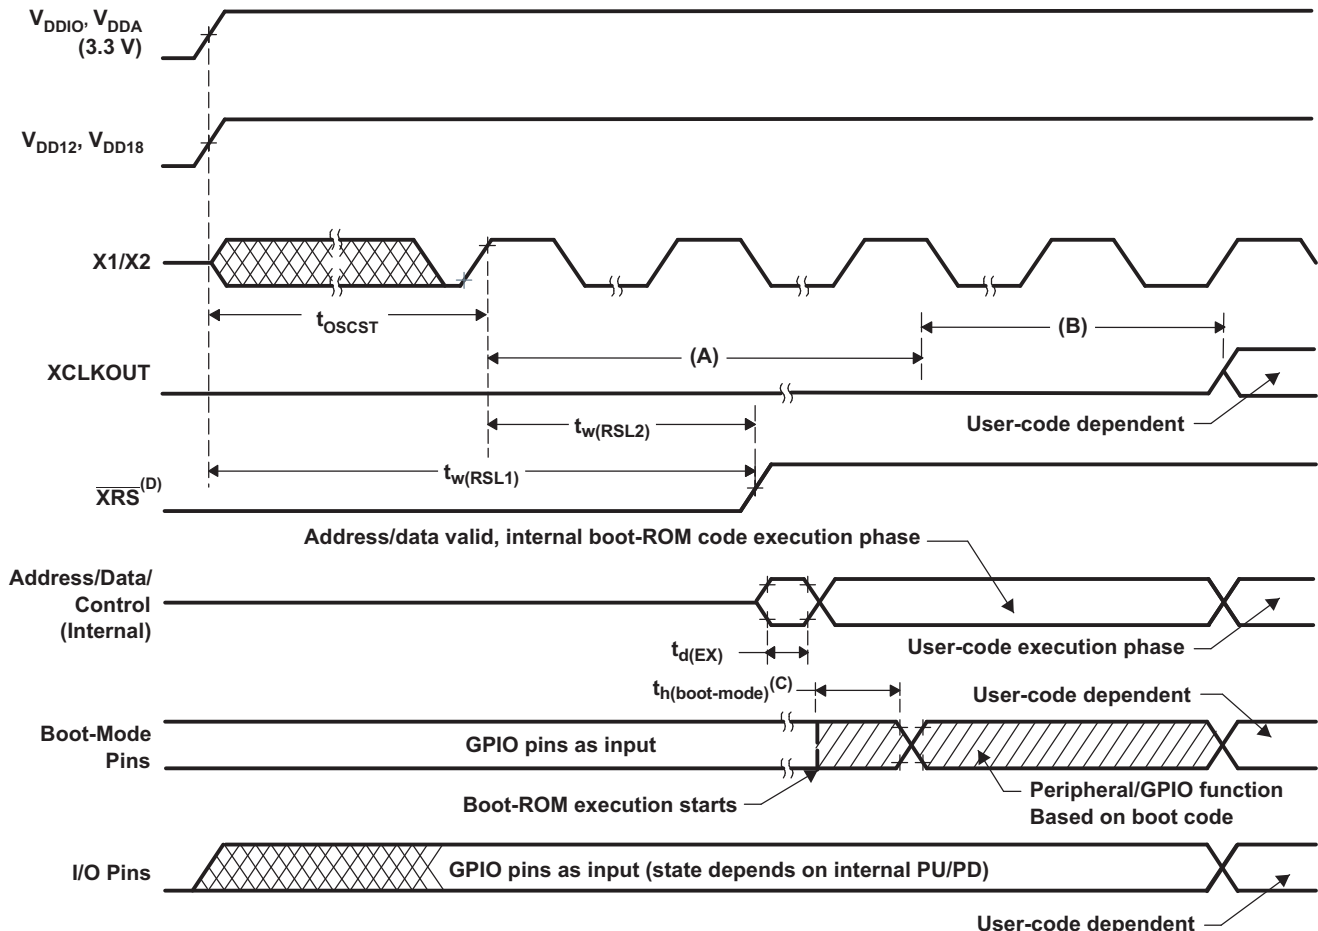

5.8 Thermal Design Considerations

Based on the end-application design and operational profile, the I_{DD12} , I_{DD18} , and I_{DDIO} currents could vary. Systems that exceed the recommended maximum power dissipation in the end product may require additional thermal enhancements. Ambient temperature (T_A) varies with the end application and product design. The critical factor that affects reliability and functionality is T_J , the junction temperature, not the ambient temperature. Hence, care should be taken to keep T_J within the specified limits. T_{case} should be measured to estimate the operating junction temperature T_J . T_{case} is normally measured at the center of the package top-side surface. For more details about thermal metrics and definitions, see [Semiconductor and IC Package Thermal Metrics](#).

5.9 Timing and Switching Characteristics

5.9.1 Power Sequencing

There is no power sequencing requirement needed to ensure the device is in the proper state after reset or to prevent the I/Os from glitching during power up and power down. (All I/Os, except for GPIO199, are glitch-free during power up and power down.) No voltage larger than a diode drop (0.7 V) above V_{DDIO} should be applied to any digital pin (for analog pins, this value is 0.7 V above V_{DDA}) before powering up the device. Voltages applied to pins on an unpowered device can bias internal p-n junctions in unintended ways and produce unpredictable results.

- Upon power up, PLLSYSCLK is OSCCLK/8. Because the XCLKOUTDIV bits in the XCLK register come up with a reset state of 0, PLLSYSCLK is further divided by 4 before PLLSYSCLK appears at XCLKOUT. XCLKOUT = OSCCLK/32 during this phase.
- Boot ROM configures the SYSDIVSEL bits for /1 operation. XCLKOUT = OSCCLK/4 during this phase. XCLKOUT will not be visible at the pin until explicitly configured by user code.
- After reset, the boot ROM code samples Boot Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If boot ROM code executes after power-on conditions (in debugger environment), the boot code execution time is based on the current M3SSCLK speed. The M3SSCLK will be based on user environment and could be with or without PLL enabled.
- The XRS pin will be driven low by on-chip POR circuitry until the V_{DDIO} voltage crosses the POR threshold. (The POR threshold is lower than the operating voltage requirement.) To allow the external clock to stabilize, the XRS pin may also need to be driven low by the system for additional time.

Figure 5-1. Power-On Reset

Table 5-3. Reset ($\overline{\text{XRS}}$) Timing Requirements

| | | MIN | MAX | UNIT |
|---------------------------|---|-----|-----|--------|
| $t_{h(\text{boot-mode})}$ | Hold time for boot-mode pins | | | cycles |
| $t_{w(\text{RSL2})}$ | Pulse duration, $\overline{\text{XRS}}$ low | | | cycles |

Table 5-4. Reset ($\overline{\text{XRS}}$) Switching Characteristics

over recommended operating conditions (unless otherwise noted)

| PARAMETER | | MIN | TYP | MAX | UNIT |
|--------------------------|---|-----|-------------------------|-----|---------------|
| $t_{w(\text{RSL1})}$ | Pulse duration, $\overline{\text{XRS}}$ driven by device | | 600 | | μs |
| $t_{w(\text{WDRS})}$ | Pulse duration, reset pulse generated by watchdog | | $512t_{c(\text{OCLK})}$ | | cycles |
| $t_{d(\text{EX})}$ | Delay time, address/data valid after $\overline{\text{XRS}}$ high | | $32t_{c(\text{OCLK})}$ | | cycles |
| t_{INTOSCST} | Start-up time, internal zero-pin oscillator | | 3 | | μs |
| $t_{\text{OSCST}}^{(1)}$ | On-chip crystal-oscillator start-up time | | 2 | | ms |

(1) Dependent on crystal/resonator and board design.

A. After reset, the Boot ROM code samples BOOT Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If Boot ROM code executes after power-on conditions (in debugger environment), the Boot code execution time is based on the current M3SSCLK speed. The M3SSCLK will be based on user environment and could be with or without PLL enabled.

Figure 5-2. Warm Reset

5.9.1.1 Power Management and Supervisory Circuit Solutions

LDO selection depends on the total power consumed in the end application. Go to the [Power management](#) product folder to select a device and to access reference designs, technical documents, support and training. The [Power management guide](#) is also available for download.

5.9.2 Clock Specifications

This section provides the frequencies and timing requirements of the input clocks; PLL lock times; frequencies of the internal clocks; and the frequency and switching characteristics of the output clock.

5.9.2.1 Changing the Frequency of the Main PLL

When configuring the PLL, it should be locked *twice* in a row. The PLL will be ready to use in the system when the xPLLSTS[xPLLLOCKS] bit is set after the second lock. The SysCtlClockPllConfig () function in sysctl.c, found in controlSUITE™, may be referenced as an example of a proper PLL initialization sequence. For additional information, see the "Clock Control" section of the [Concerto F28M36x Technical Reference Manual](#).

5.9.2.2 Input Clock Frequency and Timing Requirements, PLL Lock Times

Table 5-5 shows the frequency requirements for the input clocks to the F28M36x devices. Table 5-6 shows the crystal equivalent series resistance requirements. Table 5-8, Table 5-9, Table 5-10, and Table 5-11 show the timing requirements for the input clocks to the F28M36x devices. Table 5-12 shows the PLL lock times for the Main PLL and the USB PLL. The Main PLL operates from the X1 or X1/X2 input clock pins, and the USB PLL operates from the XCLKIN input clock pin.

Table 5-5. Input Clock Frequency

| | | MIN | MAX | UNIT |
|--------------------|---|-----|-----|------|
| f _(OSC) | Frequency, X1/X2, from external crystal or resonator | 2 | 20 | MHz |
| f _(OCI) | Frequency, X1, from external oscillator (PLL enabled) | 2 | 30 | MHz |
| f _(OCI) | Frequency, X1, from external oscillator (PLL disabled) | 2 | 100 | MHz |
| f _(XCI) | Frequency, XCLKIN, from external oscillator | 2 | 60 | MHz |

Table 5-6. Crystal Equivalent Series Resistance (ESR) Requirements⁽¹⁾

| CRYSTAL FREQUENCY (MHz) | MAXIMUM ESR (Ω) (CL1/2 = 12 pF) | MAXIMUM ESR (Ω) (CL1/2 = 24 pF) |
|-------------------------|------------------------------------|------------------------------------|
| 2 | 175 | 375 |
| 4 | 100 | 195 |
| 6 | 75 | 145 |
| 8 | 65 | 120 |
| 10 | 55 | 110 |
| 12 | 50 | 95 |
| 14 | 50 | 90 |
| 16 | 45 | 75 |
| 18 | 45 | 65 |
| 20 | 45 | 50 |

(1) Crystal shunt capacitance (C0) should be less than or equal to 7 pF.

Table 5-7. Crystal Oscillator Electrical Characteristics

over recommended operating conditions (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------------|---|-----|-----|-----|------|
| Start-up time ⁽¹⁾ | f = 20 MHz; ESR MAX = 50 Ω; CL1 = CL2 = 24 pF, C0 = 7 pF | | 2 | | ms |

(1) Start-up time is dependent on the crystal and tank circuit components. It is recommended that the crystal vendor characterize the application with the chosen crystal.

Table 5-8. X1 Timing Requirements - PLL Enabled⁽¹⁾

| | | MIN | MAX | UNIT |
|--------------|---|-----|-----|------|
| $t_{f(OCI)}$ | Fall time, X1 | | 6 | ns |
| $t_{r(OCI)}$ | Rise time, X1 | | 6 | ns |
| $t_{w(OCL)}$ | Pulse duration, X1 low as a percentage of $t_{c(OCI)}$ | 45% | 55% | |
| $t_{w(OCH)}$ | Pulse duration, X1 high as a percentage of $t_{c(OCI)}$ | 45% | 55% | |

(1) The possible Main PLL configuration modes are shown in [Table 6-19](#) to [Table 6-22](#).

Table 5-9. X1 Timing Requirements - PLL Disabled

| | | | MIN | MAX | UNIT |
|--------------|---|-------------------|-----|-----|------|
| $t_{f(OCI)}$ | Fall time, X1 | Up to 20 MHz | | 6 | ns |
| | | 20 MHz to 100 MHz | | 2 | |
| $t_{r(OCI)}$ | Rise time, X1 | Up to 20 MHz | | 6 | ns |
| | | 20 MHz to 100 MHz | | 2 | |
| $t_{w(OCL)}$ | Pulse duration, X1 low as a percentage of $t_{c(OCI)}$ | | 45% | 55% | |
| $t_{w(OCH)}$ | Pulse duration, X1 high as a percentage of $t_{c(OCI)}$ | | 45% | 55% | |

Table 5-10. XCLKIN Timing Requirements - PLL Enabled⁽¹⁾

| | | MIN | MAX | UNIT |
|--------------|---|-----|-----|------|
| $t_{f(XCI)}$ | Fall time, XCLKIN | | 6 | ns |
| $t_{r(XCI)}$ | Rise time, XCLKIN | | 6 | ns |
| $t_{w(XCL)}$ | Pulse duration, XCLKIN low as a percentage of $t_{c(XCI)}$ | 45% | 55% | |
| $t_{w(XCH)}$ | Pulse duration, XCLKIN high as a percentage of $t_{c(XCI)}$ | 45% | 55% | |

(1) The possible USB PLL configuration modes are shown in [Table 6-23](#) and [Table 6-24](#).

Table 5-11. XCLKIN Timing Requirements - PLL Disabled

| | | | MIN | MAX | UNIT |
|--------------|---|-------------------|-----|-----|------|
| $t_{f(XCI)}$ | Fall time, XCLKIN | Up to 20 MHz | | 6 | ns |
| | | 20 MHz to 100 MHz | | 2 | |
| $t_{r(XCI)}$ | Rise time, XCLKIN | Up to 20 MHz | | 6 | ns |
| | | 20 MHz to 100 MHz | | 2 | |
| $t_{w(XCL)}$ | Pulse duration, XCLKIN low as a percentage of $t_{c(XCI)}$ | | 45% | 55% | |
| $t_{w(XCH)}$ | Pulse duration, XCLKIN high as a percentage of $t_{c(XCI)}$ | | 45% | 55% | |

Table 5-12. PLL Lock Times

| | | MIN | NOM | MAX | UNIT |
|-------------|---|-----|---------------------|-----|--------------------|
| $t_{(PLL)}$ | Lock time, Main PLL (X1, from external oscillator) | | 2000 ⁽¹⁾ | | input clock cycles |
| $t_{(USB)}$ | Lock time, USB PLL (XCLKIN, from external oscillator) | | 2000 ⁽¹⁾ | | input clock cycles |

(1) For example, if the input clock to the PLL is 10 MHz, then a single PLL lock time is 100 ns × 2000 = 200 μs. This defines the time of a single write to the PLL configuration registers until the xPLLSTS[xPLLLOCKS] bit is set. The PLL should be locked *twice* to ensure a good PLL output frequency is present.

5.9.2.3 Output Clock Frequency and Switching Characteristics

Table 5-13 provides the frequency of the output clock from the F28M36x devices. Table 5-14 shows the switching characteristics of the output clock from the F28M36x devices, XCLKOUT.

Table 5-13. Output Clock Frequency

| | | MIN | MAX | UNIT |
|-------------|--------------------|-----|------|------|
| $f_{(XCO)}$ | Frequency, XCLKOUT | 2 | 37.5 | MHz |

Table 5-14. XCLKOUT Switching Characteristics (PLL Bypassed or Enabled)⁽¹⁾⁽²⁾

over recommended operating conditions (unless otherwise noted)

| | PARAMETER | MIN | MAX | UNIT |
|---------------|------------------------------|-------|-------|------|
| $t_{f(XCO)}$ | Fall time, XCLKOUT | | 5 | ns |
| $t_{r(XCO)}$ | Rise time, XCLKOUT | | 5 | ns |
| $t_{w(XCOL)}$ | Pulse duration, XCLKOUT low | H – 2 | H + 2 | ns |
| $t_{w(XCOH)}$ | Pulse duration, XCLKOUT high | H – 2 | H + 2 | ns |

(1) A load of 40 pF is assumed for these parameters.

(2) $H = 0.5t_{c(XCO)}$

5.9.2.4 Internal Clock Frequencies

Table 5-15 provides the clock frequencies for the internal clocks of the F28M36x devices.

Table 5-15. Internal Clock Frequencies (150-MHz Devices)

| | | MIN | NOM | MAX | UNIT |
|-------------|-------------------------------------|-----|---------------------|--------------------|------|
| $f_{(USB)}$ | Frequency, USBPLLCLK | | 60 | | MHz |
| $f_{(PLL)}$ | Frequency, PLLSYSCLK | 2 | | 150 | MHz |
| $f_{(OCK)}$ | Frequency, OSCCLK | 2 | | 100 | MHz |
| $f_{(M3C)}$ | Frequency, M3SSCLK | 2 | | 100 ⁽¹⁾ | MHz |
| $f_{(ADC)}$ | Frequency, ASYSCLK | 2 | | 37.5 | MHz |
| $f_{(SYS)}$ | Frequency, C28SYSCLK | 2 | | 150 ⁽¹⁾ | MHz |
| $f_{(HSP)}$ | Frequency, C28HSPCLK | 2 | | 150 ⁽¹⁾ | MHz |
| $f_{(LSP)}$ | Frequency, C28LSPCLK ⁽²⁾ | 2 | 37.5 ⁽³⁾ | 150 ⁽¹⁾ | MHz |
| $f_{(10M)}$ | Frequency, 10MHZCLK | | 10 | | MHz |
| $f_{(32K)}$ | Frequency, 32KHZCLK | | 32 | | kHz |

(1) An integer divide ratio must be maintained between the C28x and Cortex-M3 clock frequencies. For example, when the C28x is configured to run at a maximum frequency of 150 MHz, the fastest allowable frequency for the Cortex-M3 will be 75 MHz. See Figure 6-10 and Figure 6-12 to see the internal clocks and clock divider options.

(2) Lower LSPCLK will reduce device power consumption.

(3) This is the default reset value if C28SYSCLK = 150 MHz.

5.9.3 Timing Parameter Symbology

Timing parameter symbols used are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

| Lowercase subscripts and their meanings: | | Letters and symbols and their meanings: | |
|--|------------------------|---|--|
| a | access time | H | High |
| c | cycle time (period) | L | Low |
| d | delay time | V | Valid |
| f | fall time | X | Unknown, changing, or don't care level |
| h | hold time | Z | High impedance |
| r | rise time | | |
| su | setup time | | |
| t | transition time | | |
| v | valid time | | |
| w | pulse duration (width) | | |

5.9.3.1 General Notes on Timing Parameters

All output signals from the 28x devices (including XCLKOUT) are derived from an internal clock such that all output transitions for a given half-cycle occur with a minimum of skewing relative to each other.

The signal combinations shown in the following timing diagrams may not necessarily represent actual cycles. For actual cycle examples, see the appropriate cycle description section of this document.

5.9.3.2 Test Load Circuit

This test load circuit is used to measure all switching characteristics provided in this document.

- Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.
- The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timing.

Figure 5-3. 3.3-V Test Load Circuit

5.9.4 Flash Timing – Master Subsystem

Table 5-16. Master Subsystem – Flash/OTP Endurance

| | | MIN | TYP | MAX | UNIT |
|-----------|--|-------|-------|-----|--------|
| N_f | Flash endurance for the array (write/erase cycles) | 20000 | 50000 | | cycles |
| N_{OTP} | OTP endurance for the array (write cycles) | | | 1 | write |

Table 5-17. Master Subsystem – Flash Parameters⁽¹⁾

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|-----------------|------|------|-----|---------|
| Program Time ⁽²⁾ | 128 data bits + 16 ECC bits | | 40 | 300 | | μ s |
| | 32K Sector | | 290 | 580 | | ms |
| | 128K Sector | | 1160 | 2320 | | ms |
| Erase Time ⁽³⁾ at < 25 cycles | 32K Sector | | 25 | 50 | | ms |
| | 128K Sector | | 40 | 70 | | |
| Erase Time ⁽³⁾ at 50k cycles | 32K Sector | | 115 | 4000 | | ms |
| | 128K Sector | | 140 | 4000 | | |
| I_{DDP} ⁽⁴⁾⁽⁵⁾ | V_{DD} current consumption during Erase/Program cycle | VREG disabled | 105 | | | mA |
| I_{DDIOP} ⁽⁴⁾⁽⁵⁾ | V_{DDIO} current consumption during Erase/Program cycle | | 55 | | | |
| I_{DDIOP} ⁽⁴⁾⁽⁵⁾ | V_{DDIO} current consumption during Erase/Program cycle | VREG enabled | 195 | | | mA |

- (1) The on-chip flash memory is in an erased state when the device is shipped from TI. As such, erasing the flash memory is not required before programming, when programming the device for the first time. However, the erase operation is needed on all subsequent programming operations.
- (2) Program time includes overhead of the Flash state machine but does not include the time to transfer the following into RAM:
- Code that uses Flash API to program the Flash
 - Flash API itself
 - Flash data to be programmed
- In other words, the time indicated in this table is applicable after all the required code/data is available in the device RAM, ready for programming. The transfer time will significantly vary depending on the speed of the JTAG debug probe used. Program time calculation is based on programming 144 bits at a time at the specified operating frequency. Program time includes Program verify by the CPU. The program time does not degrade with write/erase (W/E) cycling, but the erase time does. Erase time includes Erase verify by the CPU and does not involve any data transfer.
- (3) Erase time includes Erase verify by the CPU.
- (4) Typical parameters as seen at room temperature including function call overhead, with all peripherals off. It is important to maintain a stable power supply during the entire flash programming process. It is conceivable that device current consumption during flash programming could be higher than normal operating conditions. The power supply used should ensure V_{MIN} on the supply rails at all times, as specified in the Recommended Operating Conditions of the data sheet. Any brown-out or interruption to power during erasing/programming could potentially corrupt the password locations and lock the device permanently. Powering a target board (during flash programming) through the USB port is not recommended, as the port may be unable to respond to the power demands placed during the programming process.
- (5) This current is measured with Flash API executing from RAM. There is not any data transfer through JTAG or any peripheral.

Table 5-18. Master Subsystem – Flash/OTP Access Timing⁽¹⁾

| PARAMETER | | MIN | MAX | UNIT |
|--------------|-------------------|-----|-----|------|
| $t_{a(f)}$ | Flash access time | 25 | | ns |
| $t_{a(OTP)}$ | OTP access time | 50 | | ns |

- (1) Access time numbers shown in this table are prior to device characterization. Final numbers will be published in the data sheet for the fully qualified production device.

Table 5-19. Master Subsystem – Flash Data Retention Duration

| PARAMETER | TEST CONDITIONS | MIN | MAX | UNIT |
|-----------------|-------------------------|--------------------------|-----|-------|
| $t_{retention}$ | Data retention duration | $T_J = 85^\circ\text{C}$ | 20 | years |

Table 5-20. Master Subsystem – Minimum Required Flash/OTP Wait States at Different Frequencies

| SYSCCLKOUT (MHz) | SYSCCLKOUT (ns) | WAIT STATE |
|------------------|-----------------|------------|
| 125 | 8 | 3 |
| 120 | 8.33 | 2 |
| 110 | 9.1 | 2 |
| 100 | 10 | 2 |
| 90 | 11.11 | 2 |
| 80 | 12.5 | 1 |
| 70 | 14.29 | 1 |
| 60 | 16.67 | 1 |
| 50 | 20 | 1 |
| 40 | 25 | 0 |
| 30 | 33.33 | 0 |
| 20 | 50 | 0 |
| 10 | 100 | 0 |

The equation to compute the Flash wait state in [Table 5-20](#) is as follows:

$$R_{WAIT} = \left\lceil \frac{\text{SYSCCLK (MHz)}}{40 \text{ (MHz)}} \right\rceil - 1$$

round up to the next integer, or 1, whichever is larger.

5.9.5 Flash Timing – Control Subsystem

Table 5-21. Control Subsystem – Flash/OTP Endurance

| | | MIN | TYP | MAX | UNIT |
|-----------|--|-------|-------|-----|--------|
| N_f | Flash endurance for the array (write/erase cycles) | 20000 | 50000 | | cycles |
| N_{OTP} | OTP endurance for the array (write cycles) | | | 1 | write |

Table 5-22. Control Subsystem – Flash Parameters⁽¹⁾⁽²⁾

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|-----------------|-----|------|-----|---------|
| Program Time ⁽³⁾ | 128 data bits + 16 ECC bits | | 40 | 300 | | μ s |
| | 16K Sector | | 105 | 210 | | ms |
| | 64K Sector | | 420 | 840 | | ms |
| Erase Time ⁽⁴⁾ at < 25 cycles | 16K Sector | | 25 | 50 | | ms |
| | 64K Sector | | 30 | 55 | | |
| Erase Time ⁽⁴⁾ at 50k cycles | 16K Sector | | 105 | 4000 | | ms |
| | 64K Sector | | 115 | 4000 | | |
| I_{DDP} ⁽⁵⁾⁽⁶⁾ | V_{DD} current consumption during Erase/Program cycle | VREG disabled | | 90 | | mA |
| I_{DDIOP} ⁽⁵⁾⁽⁶⁾ | V_{DDIO} current consumption during Erase/Program cycle | | 55 | | | |
| I_{DDIOP} ⁽⁵⁾⁽⁶⁾ | V_{DDIO} current consumption during Erase/Program cycle | VREG enabled | | 150 | | mA |

- (1) The on-chip flash memory is in an erased state when the device is shipped from TI. As such, erasing the flash memory is not required before programming, when programming the device for the first time. However, the erase operation is needed on all subsequent programming operations.
- (2) Before trying to erase or program the C28x Flash, ensure that the Cortex-M3 core does not generate a reset while the C28x Flash is being erased or programmed.
- (3) Program time includes overhead of the Flash state machine but does not include the time to transfer the following into RAM:
 - Code that uses Flash API to program the Flash
 - Flash API itself
 - Flash data to be programmed

In other words, the time indicated in this table is applicable after all the required code/data is available in the device RAM, ready for programming. The transfer time will significantly vary depending on the speed of the JTAG debug probe used. Program time calculation is based on programming 144 bits at a time at the specified operating frequency. Program time includes Program verify by the CPU. The program time does not degrade with write/erase (W/E) cycling, but the erase time does. Erase time includes Erase verify by the CPU and does not involve any data transfer.
- (4) Erase time includes Erase verify by the CPU.
- (5) Typical parameters as seen at room temperature including function call overhead, with all peripherals off. It is important to maintain a stable power supply during the entire flash programming process. It is conceivable that device current consumption during flash programming could be higher than normal operating conditions. The power supply used should ensure V_{MIN} on the supply rails at all times, as specified in the Recommended Operating Conditions of the data sheet. Any brown-out or interruption to power during erasing/programming could potentially corrupt the password locations and lock the device permanently. Powering a target board (during flash programming) through the USB port is not recommended, as the port may be unable to respond to the power demands placed during the programming process.
- (6) This current is measured with Flash API executing from RAM. There is not any data transfer through JTAG or any peripheral.

Table 5-23. Control Subsystem – Flash/OTP Access Timing⁽¹⁾

| PARAMETER | | MIN | MAX | UNIT |
|--------------|-------------------|-----|-----|------|
| $t_{a(f)}$ | Flash access time | 25 | | ns |
| $t_{a(OTP)}$ | OTP access time | 50 | | ns |

- (1) Access time numbers shown in this table are prior to device characterization. Final numbers will be published in the data sheet for the fully qualified production device.

Table 5-24. Control Subsystem – Flash Data Retention Duration

| PARAMETER | | TEST CONDITIONS | MIN | MAX | UNIT |
|-----------------|-------------------------|--------------------------|-----|-----|-------|
| $t_{retention}$ | Data retention duration | $T_J = 85^\circ\text{C}$ | 20 | | years |

Table 5-25. Control Subsystem – Minimum Required Flash/OTP Wait States at Different Frequencies

| SYSCCLKOUT (MHz) | SYSCCLKOUT (ns) | WAIT STATE |
|------------------|-----------------|------------|
| 150 | 6.7 | 3 |
| 140 | 7.14 | 3 |
| 130 | 7.7 | 3 |
| 120 | 8.33 | 2 |
| 110 | 9.1 | 2 |
| 100 | 10 | 2 |
| 90 | 11.11 | 2 |
| 80 | 12.5 | 1 |
| 70 | 14.29 | 1 |
| 60 | 16.67 | 1 |
| 50 | 20 | 1 |
| 40 | 25 | 0 |
| 30 | 33.33 | 0 |
| 20 | 50 | 0 |
| 10 | 100 | 0 |

The equation to compute the Flash wait state in [Table 5-25](#) is as follows:

$$R_{WAIT} = \left[\frac{\text{SYSCCLK (MHz)}}{40 \text{ (MHz)}} \right] - 1$$

round up to the next integer, or 1, whichever is larger.

5.9.6 GPIO Electrical Data and Timing

5.9.6.1 GPIO - Output Timing

Table 5-26. General-Purpose Output Switching Characteristics

over recommended operating conditions (unless otherwise noted)

| PARAMETER | | | MIN | MAX | UNIT |
|--------------|---------------------------------------|-----------|-----|-----|------|
| $t_{r(GPO)}$ | Rise time, GPIO switching low to high | All GPIOs | | 8 | ns |
| $t_{f(GPO)}$ | Fall time, GPIO switching high to low | All GPIOs | | 8 | ns |
| t_{GPO} | Toggling frequency, GPIO pins | | | 25 | MHz |

Figure 5-4. General-Purpose Output Timing

5.9.6.2 GPIO - Input Timing

Table 5-27. General-Purpose Input Timing Requirements

| | | MIN | MAX | UNIT |
|--------------------|---------------------------------|----------------------|---|--------|
| $t_{w(SP)}$ | Sampling period | QUALPRD = 0 | $1t_{c(SCO)}$ | cycles |
| | | QUALPRD \neq 0 | $2t_{c(SCO)} * QUALPRD$ | cycles |
| $t_{w(IQSW)}$ | Input qualifier sampling window | | $t_{w(SP)} * (n^{(1)} - 1)$ | cycles |
| $t_{w(GPI)}^{(2)}$ | Pulse duration, GPIO low/high | Synchronous mode | $2t_{c(SCO)}$ | cycles |
| | | With input qualifier | $t_{w(IQSW)} + t_{w(SP)} + 1t_{c(SCO)}$ | cycles |

(1) "n" represents the number of qualification samples as defined by GPxQSELn register.

(2) For $t_{w(GPI)}$, pulse width is measured from V_{IL} to V_{IL} for an active low signal and V_{IH} to V_{IH} for an active high signal.

- A. This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is 1 SYSCLKOUT cycle. For any other value "n", the qualification sampling period is 2n SYSCLKOUT cycles (that is, at every 2n SYSCLKOUT cycles, the GPIO pin will be sampled).
- B. The qualification period selected through the GPxCTRL register applies to groups of 8 GPIO pins.
- C. The qualification block can take either three or six samples. The GPxQSELn Register selects which sample mode is used.
- D. In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for $(5 \times QUALPRD \times 2)$ SYSCLKOUT cycles. This would ensure 5 sampling periods for detection to occur. Because external signals are driven asynchronously, a 13-SYSCLKOUT-wide pulse ensures reliable recognition.

Figure 5-5. Sampling Mode

5.9.6.3 Sampling Window Width for Input Signals

The following section summarizes the sampling window width for input signals for various input qualifier configurations.

Sampling frequency denotes how often a signal is sampled with respect to SYSCLKOUT.

Sampling frequency = $\text{SYSCLKOUT} / (2 * \text{QUALPRD})$, if $\text{QUALPRD} \neq 0$

Sampling frequency = SYSCLKOUT , if $\text{QUALPRD} = 0$

Sampling period = $\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}$, if $\text{QUALPRD} \neq 0$

In the above equations, SYSCLKOUT cycle indicates the time period of SYSCLKOUT.

Sampling period = SYSCLKOUT cycle , if $\text{QUALPRD} = 0$

In a given sampling window, either 3 or 6 samples of the input signal are taken to determine the validity of the signal. This is determined by the value written to GPxQSELn register.

Case 1:

Qualification using 3 samples

Sampling window width = $(\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}) \times 2$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) \times 2$, if $\text{QUALPRD} = 0$

Case 2:

Qualification using 6 samples

Sampling window width = $(\text{SYSCLKOUT cycle} \times 2 \times \text{QUALPRD}) \times 5$, if $\text{QUALPRD} \neq 0$

Sampling window width = $(\text{SYSCLKOUT cycle}) \times 5$, if $\text{QUALPRD} = 0$

Figure 5-6. General-Purpose Input Timing

5.9.6.4 Low-Power Mode Wakeup Timing

Table 5-28 shows the timing requirements, Table 5-29 shows the switching characteristics, and Figure 5-7 shows the timing diagram for IDLE mode.

Table 5-28. IDLE Mode Timing Requirements⁽¹⁾

| | | | MIN | MAX | UNIT |
|-------------------|---|-------------------------|-----------------------------|-----|--------|
| $t_{w(WAKE-INT)}$ | Pulse duration, external wake-up signal | Without input qualifier | $2t_{c(SCO)}$ | | cycles |
| | | With input qualifier | $5t_{c(SCO)} + t_{w(IQSW)}$ | | |

(1) For an explanation of the input qualifier parameters, see Table 5-27.

Table 5-29. IDLE Mode Switching Characteristics⁽¹⁾

over recommended operating conditions (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | MAX | UNIT |
|----------------------|---|-------------------------|------------------------------|--------------------------------|--------|
| $t_{d(WAKE-IDLE)}$ | Delay time, external wake signal to program execution resume ⁽²⁾ | | | | |
| | Wake-up from Flash • Flash module in active state | Without input qualifier | | $20t_{c(SCO)}$ | cycles |
| | | With input qualifier | | $20t_{c(SCO)} + t_{w(IQSW)}$ | |
| | Wake-up from Flash • Flash module in sleep state | Without input qualifier | | $1050t_{c(SCO)}$ | cycles |
| | | With input qualifier | | $1050t_{c(SCO)} + t_{w(IQSW)}$ | |
| | • Wake-up from SARAM | Without input qualifier | | $20t_{c(SCO)}$ | cycles |
| With input qualifier | | | $20t_{c(SCO)} + t_{w(IQSW)}$ | | |

(1) For an explanation of the input qualifier parameters, see Table 5-27.

(2) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. execution of an ISR (triggered by the wake up) signal involves additional latency.

- A. WAKE INT can be any enabled interrupt, \overline{WDINT} , $XNMI$, or \overline{XRS} .
- B. From the time the IDLE instruction is executed to place the device into low-power mode (LPM), wakeup should not be initiated until at least 4 OSCCLK cycles have elapsed.

Figure 5-7. IDLE Entry and Exit Timing

Table 5-30. STANDBY Mode Timing Requirements

| | | | MIN | MAX | UNIT |
|-------------------|---|---|-----------------------------------|-----|--------|
| $t_{w(WAKE-INT)}$ | Pulse duration, external wake-up signal | Without input qualification | $3t_{c(OSCCLK)}$ | | cycles |
| | | With input qualification ⁽¹⁾ | $(2 + QUALSTDBY) * t_{c(OSCCLK)}$ | | |

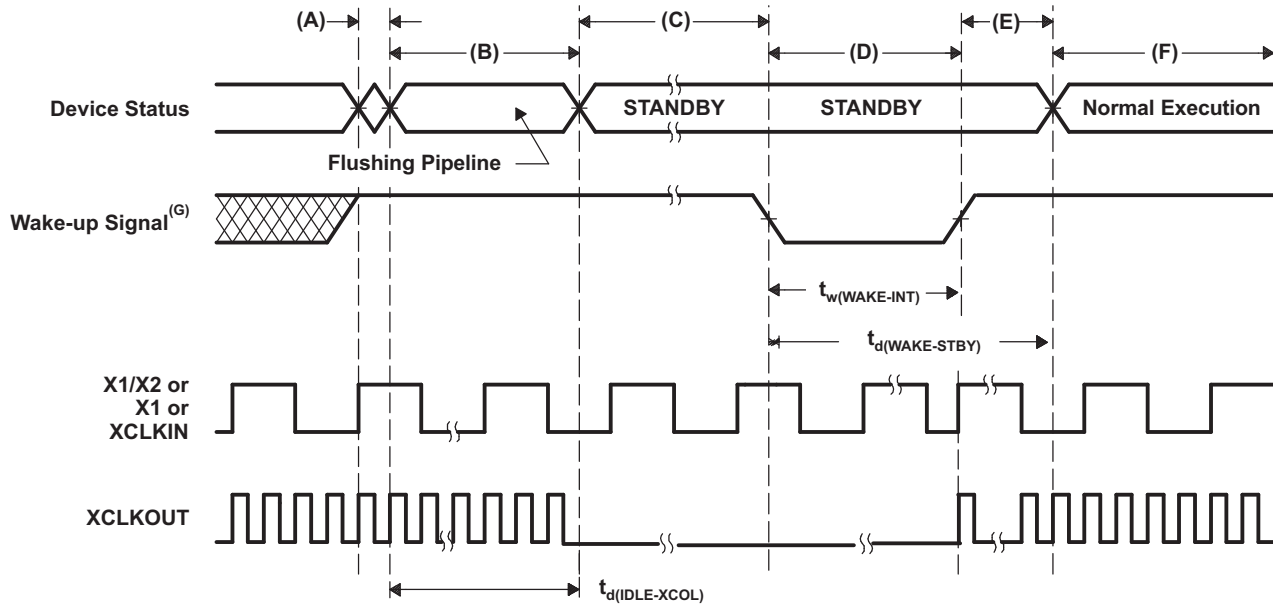

(1) QUALSTDBY is a 6-bit field in the LPMCR0 register.

Table 5-31. STANDBY Mode Switching Characteristics

over recommended operating conditions (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | MAX | UNIT |
|----------------------|--|-----------------------------------|------------------------------------|--------|
| $t_{d(IDLE-XCOL)}$ | Delay time, IDLE instruction executed to XCLKOUT low | $32t_{c(SCO)}$ | $45t_{c(SCO)}$ | cycles |
| $t_{d(WAKE-STBY)}$ | Delay time, external wake signal to program execution resume ⁽¹⁾ | | | cycles |
| | <ul style="list-style-type: none"> Wake up from flash <ul style="list-style-type: none"> Flash module in active state | Without input qualifier | $100t_{c(SCO)}$ | cycles |
| | | With input qualifier | $100t_{c(SCO)} + t_{w(WAKE-INT)}$ | |
| | <ul style="list-style-type: none"> Wake up from flash <ul style="list-style-type: none"> Flash module in sleep state | Without input qualifier | $1125t_{c(SCO)}$ | cycles |
| | | With input qualifier | $1125t_{c(SCO)} + t_{w(WAKE-INT)}$ | |
| | <ul style="list-style-type: none"> Wake up from SARAM | Without input qualifier | $100t_{c(SCO)}$ | cycles |
| With input qualifier | | $100t_{c(SCO)} + t_{w(WAKE-INT)}$ | | |

(1) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. execution of an ISR (triggered by the wake up signal) involves additional latency.

- A. IDLE instruction is executed to put the device into STANDBY mode.
- B. The PLL block responds to the STANDBY signal. SYSCLKOUT is held for the number of cycles indicated below before being turned off:
 - 16 cycles, when DIVSEL = 00 or 01
 - 32 cycles, when DIVSEL = 10
 - 64 cycles, when DIVSEL = 11

This delay enables the CPU pipeline and any other pending operations to flush properly. If an access to XINTF is in progress and its access time is longer than this number then it will fail. It is recommended to enter STANDBY mode from SARAM without an XINTF access in progress.
- C. Clock to the peripherals are turned off. However, the PLL and watchdog are not shut down. The device is now in STANDBY mode.
- D. The external wake-up signal is driven active.
- E. After a latency period, the STANDBY mode is exited.
- F. Normal execution resumes. The device will respond to the interrupt (if enabled).
- G. From the time the IDLE instruction is executed to place the device into low-power mode, wakeup should not be initiated until at least 4 OSCCLK cycles have elapsed.

Table 5-32. HALT Mode Timing Requirements

| | | MIN | MAX | UNIT |
|---------------------------|---|--|-----|--------|
| $t_{w(\text{WAKE-GPIO})}$ | Pulse duration, GPIO wake-up signal | $t_{\text{oscst}} + 2t_{c(\text{OSCCLK})}^{(1)}$ | | cycles |
| $t_{w(\text{WAKE-XRS})}$ | Pulse duration, $\overline{\text{XRS}}$ wakeup signal | $t_{\text{oscst}} + 8t_{c(\text{OSCCLK})}$ | | cycles |

(1) See [Table 5-4](#) for an explanation of t_{oscst} .

Table 5-33. HALT Mode Switching Characteristics

over recommended operating conditions (unless otherwise noted)

| PARAMETER | | MIN | MAX | UNIT |
|---------------------------|---|------------------------------|-----------------------|--------|
| $t_{d(\text{IDLE-XCOL})}$ | Delay time, IDLE instruction executed to XCLKOUT low | $32t_{c(\text{SCO})}$ | $45t_{c(\text{SCO})}$ | cycles |
| t_p | PLL lock-up time | $131072t_{c(\text{OSCCLK})}$ | | cycles |
| $t_{d(\text{WAKE-HALT})}$ | Delay time, PLL lock to program execution resume | | | |
| | <ul style="list-style-type: none"> • Wake up from flash <ul style="list-style-type: none"> – Flash module in sleep state | $1125t_{c(\text{SCO})}$ | | cycles |
| | <ul style="list-style-type: none"> • Wake up from SARAM | $35t_{c(\text{SCO})}$ | | cycles |

- A. IDLE instruction is executed to put the device into HALT mode.
- B. The PLL block responds to the HALT signal. SYSCLKOUT is held for the number of cycles indicated below before oscillator is turned off and the CLKIN to the core is stopped:
 - 16 cycles, when DIVSEL = 00 or 01
 - 32 cycles, when DIVSEL = 10
 - 64 cycles, when DIVSEL = 11
 This delay enables the CPU pipeline and any other pending operations to flush properly. If an access to XINTF is in progress and its access time is longer than this number then it will fail. It is recommended to enter HALT mode from SARAM without an XINTF access in progress.
- C. Clocks to the peripherals are turned off and the PLL is shut down. If a quartz crystal or ceramic resonator is used as the clock source, the internal oscillator is shut down as well. The device is now in HALT mode and consumes absolute minimum power.
- D. When the GPIO_n pin (used to bring the device out of HALT) is driven low, the oscillator is turned on and the oscillator wake-up sequence is initiated. The GPIO pin should be driven high only after the oscillator has stabilized. This enables the provision of a clean clock signal during the PLL lock sequence. Because the falling edge of the GPIO pin asynchronously begins the wakeup process, care should be taken to maintain a low noise environment before entering and during HALT mode.
- E. Once the oscillator has stabilized, the PLL lock sequence is initiated, which takes 131,072 OSCCLK (X1/X2 or X1 or XCLKIN) cycles. These 131,072 clock cycles are applicable even when the PLL is disabled (that is, code execution will be delayed by this duration even when the PLL is disabled).
- F. Clocks to the core and peripherals are enabled. The HALT mode is now exited. The device will respond to the interrupt (if enabled), after a latency.
- G. Normal operation resumes.
- H. From the time the IDLE instruction is executed to place the device into low-power mode, wakeup should not be initiated until at least 4 OSCCLK cycles have elapsed.

Figure 5-10. External Interrupt Timing

5.10 Analog and Shared Peripherals

Concerto Shared Peripherals are accessible from both the Master Subsystem and the Control Subsystem. The Analog Shared Peripherals include two 12-bit ADCs (Analog-to-Digital Converters), and six Comparator + DAC (10-bit) modules. The ADC Result Registers are accessible by CPUs and DMAs of the Master and Control Subsystems. All other analog registers, such as the ADC Configuration and Comparator Registers, are accessible by the C28x CPU only. The Digital Shared Peripherals include the IPC peripheral and the EPI. IPC is accessible by both CPUs; EPI is accessible by both CPUs and both DMAs.

IPC is used for sending and receiving synchronization events between Master and Control subsystems to coordinate execution of software running on both processors, or exchanging of data between the two processors. EPI is used by this device to communicate with external memory and other devices.

For detailed information on the processor peripherals, see the [Concerto F28M36x Technical Reference Manual](#).

5.10.1 Analog-to-Digital Converter

Figure 5-11 shows the internal structure of each of the two ADC peripherals that are present on Concerto. Each ADC has 16 channels that can be programmed to select analog inputs, select start-of-conversion trigger, set the sampling window, and select end-of-conversion interrupt to prompt a CPU or DMA to read 16 result registers. The 16 ADC channels can be used independently or in pairs, based on the assignments inside the SAMPLEMODE register. Pairing up the channels allows two analog inputs to be sampled simultaneously—thereby, increasing the overall conversion performance.

5.10.1.1 Sample Mode

Each ADC has 16 programmable channels that can be independently programmed for analog-to-digital conversion when corresponding bits in the SAMPLEMODE register are set to Sequential Mode. For example, if bit 2 in the SAMPLEMODE register is set to 0, ADC channels 4 and 5 are set to sequential mode. Both the SOC4CTL and SOC5CTL registers can then be programmed to configure channels 4 and 5 to independently perform analog-to-digital conversions with results being stored in the RESULT4 and RESULT5 registers. "Independently" means that channel 4 may use a different SOC trigger, different analog input, and different sampling window than the trigger, input, and window assigned to channel 5.

The 16 programmable channels for each ADC may also be grouped in 8 channel pairs when corresponding bits in the SAMPLEMODE register are set to Simultaneous Mode. For example, if bit 2 in the SAMPLEMODE register is set to 1, ADC channels 4 and 5 are set to Simultaneous Mode. The SOC4CTL register now contains configuration parameters for both channel 4 and channel 5, and the SOC5CTL register is ignored. While channel 4 and channel 5 are still using dedicated analog inputs (now selected as pairs in the CHSEL field of SOC4CTL), they both share the same SOC trigger and Sampling Window, with the results being stored in the RESULT4 and RESULT5 registers.

The Simultaneous mode is made possible by two sample-and-hold units present in each ADC. Each sample-and-hold unit has its own mux for selecting analog inputs (see Figure 5-11). By programming the SAMPLEMODE register, the 16 available channels can be configured as 16 independent channels, 8 channel pairs, or any combination thereof (for example, 10 sequential channels and 3 simultaneous pairs).

Figure 5-11. ADC

5.10.1.2 Start-of-Conversion Triggers

There are eight external SOC triggers that go to each of the two ADC modules (from the Control Subsystem). In addition to the eight external SOC triggers, there are also two internal SOC triggers derived from EOC interrupts inside each ADC module (ADCINT1 and ADCINT2). Registers INTSOCSEL1 and 2 are used to configure each of the 16 ADC channels for internal or external SOC sources. If internal SOC is chosen for a given channel, the INTSOCSEL1 and 2 registers also select whether the internal source is ADCINT1 or ADCINT2. If external SOC is chosen for a given ADC channel, the TRIGSEL field of the corresponding SOCxCTL register selects which of the eight external triggers is used for SOC in that channel. One analog-to-digital conversion can be performed at a time by the 12-bit ADC. The analog-to-digital conversion priority is managed according to the state of the PRICTL register.

5.10.1.3 Analog Inputs

Analog inputs to each of the two ADC modules are organized in two groups—A and B, with each group having a dedicated mux and sample-and-hold unit (see [Figure 5-11](#)). Mux A selects one of six possible analog inputs through AIO MUX. Mux B selects one of seven possible analog inputs—six external inputs through AIO MUX, and one from the internal VREFLO signal, which is currently tied to the Analog Ground. The Mux A and Mux B inputs can be simultaneously or sequentially sampled by the two sample-and-hold units according to the sampling window chosen in the SOCxCTL register for the corresponding channel.

5.10.1.4 ADC Result Registers and EOC Interrupts

Concerto analog-to-digital conversion results are stored in 32 Results Registers (16 for ADC1 and 16 for ADC2). The 16 ADCx channels can be programmed through the INTSELxNy registers to trigger up to eight ADCINT interrupts per ADC module, when their results are ready to be read. The eight ADCINT interrupts from ADC1 and the eight ADCINT interrupts from ADC2 are AND-ed together before propagating to both the Master Subsystem and the Control Subsystem, announcing that the Result Registers are ready to be read by a CPU or DMA (see [Figure 6-3](#)).

5.10.1.5 ADC Electrical Data and Timing

Table 5-36. ADC Electrical Characteristics

over recommended operating conditions (unless otherwise noted)

| PARAMETER | MIN | TYP | MAX | UNIT | |
|--|---------------------------------------|------|--------------------|------------|-----|

Figure 5-12. ADCSOCAO or ADCSOCBO Timing

5.10.2 Comparator + DAC Units

Figure 5-13 shows the internal structure of the six analog Comparator + DAC units present in Concerto devices. Each unit compares two analog inputs (A and B) and assigns a value of '1' when the voltage of the A input is greater than that of the B input, or a value of '0' when the opposite is true. The six A inputs and six B inputs come from AIO_MUX1 and AIO_MUX2. All six B inputs can also be provided by the 10-bit digital-to-analog units that are present in each comparator DAC. The 10-bit value for each DAC unit is programmed in the respective DACVAL register. Another comparator register, COMPCTL, can be programmed to select the source of the B input, to enable or disable the comparator circuit, to invert comparator output, to synchronize comparator output to C28x SYSCLK, and to select the qualification period (number of clock cycles). All six output signals from the six comparators can be routed out to the device pins through GPIO_MUX2 pin mux.

Figure 5-13. Comparator + DAC Units

5.10.2.1 On-Chip Comparator and DAC Electrical Data and Timing

Table 5-38. Electrical Characteristics of the Comparator/DAC

over recommended operating conditions (unless otherwise noted)

| PARAMETER | MIN | TYP | MAX | UNITS |
|----------------------------------|-----|---------------------|-----|-------|
| Comparator | | | | |
| Comparator Input Range | | $V_{SSA} - V_{DDA}$ | | V |
| Comparator response time to GPIO | | 30 | | ns |
| Input Offset | | ±5 | | mV |
| Input Hysteresis ⁽¹⁾ | | 35 | | mV |
| DAC | | | | |
| DAC Output Range | | $V_{SSA} - V_{DDA}$ | | V |
| DAC resolution | | 10 | | bits |
| DAC settling time | | See Figure 5-14 | | |
| DAC Gain | | -1.5 | | % |
| DAC Offset | | 10 | | mV |
| Monotonic | | Yes | | |
| INL | | ±3 | | LSB |

(1) Hysteresis on the comparator inputs is achieved with a Schmidt trigger configuration. This results in an effective 100-kΩ feedback resistance between the output of the comparator and the noninverting input of the comparator.

Figure 5-14. DAC Settling Time

5.10.3 Interprocessor Communications

Figure 5-15 shows the internal structure of the IPC peripheral used to synchronize program execution and exchange of data between the Cortex-M3 and the C28x CPU. IPC can be used by itself when synchronizing program execution or it can be used in conjunction with Message RAMs when coordinating data transfers between processors. In either case, the operation of the IPC is the same. There are two independent sides to the IPC peripheral—MTOC (Master to Control) and CTOM (Control to Master).

The MTOC IPC is used by the Master Subsystem to send events to the Control Subsystem. The MTOC IPC typically sends events to the Control Subsystem by using the following registers: MTOCIPCSET, MTOCIPCFLG/MTOCIPCSTS ⁽¹⁾, and MTOCIPCACK. Each of the 32 bits of these registers represents 32 independent channels through which the Cortex-M3 CPU can send up to 32 events to the C28x CPU through software handshaking. Additionally, the first 4 bits of the MTOCIPC registers are supplemented with interrupts. To send an event through channel 2 from Cortex-M3 to C28x, for example, the Cortex-M3 and C28x CPUs use bit 2 of the MTOCIPCSET, MTOCIPCFLG/MTOCIPCSTS, MTOCIPCACK registers. The handshake starts with the Cortex-M3 polling bit 2 of the MTOCIPCFLG register to make sure bit 2 is '0'. Next, the Cortex-M3 writes a '1' into bit 2 of the MTOCIPCSET register to start the handshake. In the mean time, the C28x is continually polling the MTOCIPCSTS register while waiting for the message. As soon as the Cortex-M3 writes '1' to bit 2 of the MTOCIPCSET register, bit 2 of MTOCIPCFLG/MTOCIPCSTS also turns '1', thus announcing the event to the C28x. As soon as the C28x CPU reads a '1' from the MTOCIPCSTS register, the C28x CPU should acknowledge by writing a '1' to bit 2 of the MTOCIPCACK register, which in turn, clears bit 2 of the MTOCIPCFLG/MTOCIPCSTS register, enabling the Cortex-M3 to send another message. Because the first four channels (bits 0, 1, 2, 3) are backed up by interrupts, both processors in the above example can use IPC interrupt 2 instead of polling to increase performance.

A similar handshake is also used when sending data (not just event) from the Master Subsystem to the Control Subsystem, but with two additional steps. Before setting a bit in the MTOCIPCSET register, the Cortex-M3 should first load the MTOC Message RAM with a block of data that is to be made available to the C28x. In the second additional step, the C28x should read the data before setting a bit in the MTOCIPCACK register. This way, no data gets lost during multiple data transfers through a given block of the message RAM.

The CTOM IPC is used by the Control Subsystem to send events to the Master Subsystem. The CTOM IPC typically sends events to the Master Subsystem by using the following three registers: CTOMIPCSET, CTOMIPCFLG/CTOMIPCSTS, and CTOMIPCACK. The process is exactly the same as that for the MTOC IPC communication above.

(1) Physically, MTOCIPCFLG/MTOCIPCSTS is one register, but it is referred to as the MTOCIPCFLG register when the Cortex-M3 CPU reads it, and as the MTOCIPCSTS register when the C28x CPU reads it.

Figure 5-15. IPC

5.10.4 External Peripheral Interface

The EPI provides a high-speed parallel bus for interfacing external peripherals and memory. EPI is accessible from both the Master Subsystem and the Control Subsystem. EPI has several modes of operation to enable glueless connectivity to most types of external devices. Some EPI modes of operation conform to standard microprocessor address/data bus protocols, while others are tailored to support a variety of fast custom interfaces, such as those communicating with field-programmable gate arrays (FPGAs) and complex programmable logic devices (CPLDs).

The EPI peripheral can be accessed by the Cortex-M3 CPU, the Cortex-M3 DMA, the C28x CPU, and the C28x DMA over the high-performance AHB bus. The Cortex-M3 CPU and the μ DMA drive AHB bus cycles directly through the Cortex-M3 Bus Matrix. The C28x CPU and DMA also connect to the Cortex-M3 Bus Matrix, but not directly. Before entering the Cortex-M3 Bus Matrix, the native C28x CPU and DMA bus cycles are first converted to AHB protocol inside the MEM32-to-AHB Bus Bridge. After that, they pass through the Frequency Gasket to reduce the bus frequency by a factor of 2 or 4. Inside the Cortex-M3 Bus Matrix, the Cortex-M3 bus cycles may have to compete with C28x bus cycles for access to the AHB bus on the way to the EPI peripheral. See [Figure 5-16](#) to see how EPI interfaces to the Concerto Master Subsystem, the Concerto Control Subsystem, Resets, Clocks, and Interrupts.

NOTE

The Control Subsystem has no direct access to EPI in silicon revision 0 devices.

Depending on how the Real-Time Window registers are configured inside the Bus Matrix, the arbitration between the Cortex-M3 and C28x bus cycles is fixed-priority with Cortex-M3 having higher priority than C28x, or the C28x having the option to own the Bus Matrix for a fixed period of time (window)—effectively stalling all Cortex-M3 accesses during that time. Another EPI register inside the Cortex-M3 Bus Matrix is the Memory Protection Register, which enables assignments of chip-select spaces to Cortex-M3 or C28x EPI accesses (or both). The assignments of chip-select spaces prevent a bus cycle (from any processor) that does not own a given chip-select space, from getting through to EPI. The Real-time Window registers are the only EPI-related registers that are configurable by the C28x. The Memory Protection Register is configurable only by the Cortex-M3 CPU, as are all configuration registers inside the EPI peripheral. [Figure 5-16](#) shows the EPI registers and how they relate to individual blocks within the EPI.

Once a bus cycle arrives at the AHB bus interface inside the EPI peripheral, the bus cycle is routed to the General-Purpose Block, SDRAM Block, or the Host Bus Module, depending on the operating mode chosen through the EPI Configuration Register. Write cycles are buffered in a 4-word-deep Write FIFO; therefore, in most cases, the write cycles do not stall the CPU or DMA unless the Write FIFO becomes full. Read cycles can be handled in two different ways: blocking read cycles and nonblocking read cycles. Blocking read cycles are implemented when the content of a Read Data Register is 0. Blocking reads stall the CPU or DMA until the bus transaction completes. Nonblocking read cycles are triggered when a non-zero value is written into a Read Data Register. A non-zero value being written into a Read Data register triggers EPI to autonomously perform multiple data reads in the background (without involving CPU or DMA) according to values stored inside the Read Address Register and the Read Size Register. The incoming data is then temporarily stored in the Non-Blocking Read (NBR) FIFO until an EPI interrupt is generated to prompt the CPU or DMA to read the FIFO without risk of stalling. Furthermore, EPI has actually two sets of Data/Address/Size registers (set 0 and set 1) to enable ping-pong operation of nonblocking reads. In a ping-pong operation, while the previously fetched data is being read by the CPU or DMA from one end of the NBR FIFO, the next set of data words is simultaneously being deposited into the other end of the NBR FIFO.

Figure 5-16. EPI

EPI can directly interrupt the Cortex-M3 CPU, the Cortex-M3 uDMA, and the C28x CPU (but not the C28x DMA) through the EPI interrupt. Typically, EPI interrupts are used to prompt the CPU or DMA to move data to and from EPI. There are four EPI Interrupt registers that control various facets of interrupt generation, clearing, and masking. The EPI Interrupt can trigger μ DMA to perform reads and writes through DMA Channels 20 and 22. If a CPU is the intended recipient, the Cortex-M3 CPU is interrupted by NVIC vector 69, and the C28x CPU is interrupted through the INT12/INTx6 vector to the PIE.

During EPI bus cycles, addresses entering the EPI module can propagate unchanged to the pins, or be remapped to different addresses according to values stored in the EPI Address Map Register in conjunction with the most significant bit of the incoming address.

The EPI's three primary operating modes are: the General-Purpose Mode, the SDRAM Mode, and the Host Bus Mode (including 8-bit and 16-bit versions).

5.10.4.1 EPI General-Purpose Mode

The EPI General-Purpose Mode is designed for high-speed clocked interfaces such as ones communicating with FPGAs and CPLDs. The high-speed clocked interfaces are different from the slower Host Bus interfaces, which have more relaxed timings that are compatible with established protocols like ones used to communicate with 8051 devices. Support of bus cycle framing and precisely controlled clocking are the additional features of the General-Purpose Mode that differentiate the General-Purpose Mode from the 8-bit and 16-bit Host Bus Modes.

Framing allows multiple bus transactions to be grouped together with an output signal called FRAME. The slave device responding to the bus cycles may use this signal to recognize related words of data and to speed up their transfers. The frame lengths are programmable and may vary from 1 to 30 clocks, depending on the clocking mode used.

Precise clocking is accomplished with a dedicated clock output pin (CLK). Devices responding the bus cycles can synchronize to CLK for faster transfers. The clock frequency can be precisely controlled through the Baud Rate Control block. This output clock can be gated or free-running. A gated approach uses a setup-time model in which the EPI clock controls when bus transactions are starting and stopping. A free-running EPI clock requires another method for determining when data is live, such as the frame pin or RD/WR strobes.

These and numerous other aspects of the General-Purpose Mode are controlled through the General-Purpose Configuration Register and the General-Purpose Configuration2 Register. The clocking for the General-Purpose Mode is configured through the EPI Baud Register of the EPI Baud Rate Control block.

See [Figure 5-17](#) for a snapshot of the General-Purpose Mode registers, modes, and features. For more detailed maps of the General-Purpose Mode, see [Table 5-39](#).

5.10.4.2 EPI SDRAM Mode

The EPI SDRAM Mode combines high performance, low cost, and low pin use to access up to 512 megabits (Mb) of external memory. Main features of the EPI SDRAM interface are:

- Supports x16 (single data rate) SDRAM
- Supports low-cost SDRAMs up to 64 megabytes (MB) [or 512Mb]
- Includes automatic refresh and access to all banks, rows
- Includes Sleep/STANDBY Mode to keep contents active with minimal power drain
- Multiplexed address/data interface for reduced pin count

See [Figure 5-18](#) for a snapshot of the SDRAM Mode registers and supported memory sizes. For more detailed maps of the SDRAM Mode, see [Table 5-40](#).

5.10.4.3 EPI Host Bus Mode

There are two versions of the EPI Host Bus Mode: an 8-bit version (HB-8) and a 16-bit version (HB-16). Section 5.10.4.3.1 discusses the EPI 8-Bit Host Bus Mode. Section 5.10.4.3.2 discusses the EPI 16-Bit Host Bus Mode.

5.10.4.3.1 EPI 8-Bit Host Bus (HB-8) Mode

The 8-Bit Host Bus (HB-8) Mode uses fewer data pins than the 16-Bit Host Bus (HB-16) Mode; hence, more pins are available for address. The HB-8 Mode is also slower than the General-Purpose Mode in order to accommodate older logic. The HB-8 Mode is selected with the MODE field of EPI Configuration Register. Within the HB-8 Mode, two additional registers are used to select address/data muxing, chip selects, and other options. These registers are the HB-8 Configuration Register and the HB-8 Configuration2 Register. See Figure 5-19 for a snapshot of HB-8 registers, modes, and features.

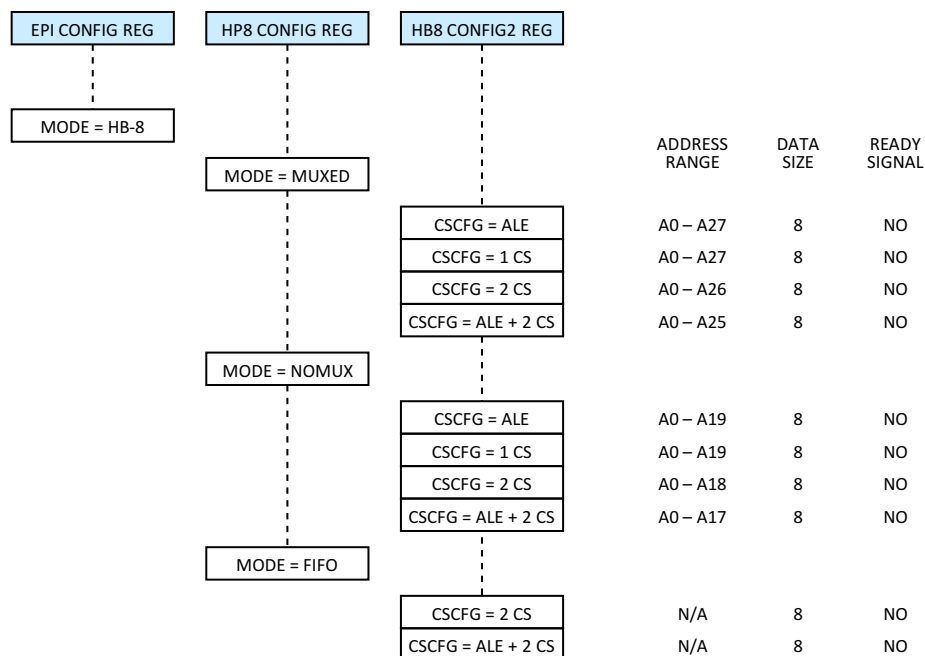

Figure 5-19. EPI 8-Bit Host Bus Mode

5.10.4.3.1.1 HB-8 Muxed Address/Data Mode

The HB-8 Muxed Mode multiplexes address signals with low-order data signals. For this reason, the Muxed Mode allows for a larger address space as compared to the Non-Muxed Mode. The HB-8 Muxed Mode is selected with the MODE field of the HB-8 Configuration Register. In addition to data and address signals, the HB-8 Muxed Mode also features the ALE signal (indicating to an external latch to capture address and hold the address until the data phase); RD and WR data strobes; and 1–4 CS (chip select) signals to enable one of four external peripherals. The ALE and CS options are chosen with the CSCFG field of the HB-8 Configuration2 Register. For more detailed maps of the HB-8 Muxed Mode, see Table 5-41.

5.10.4.3.1.2 HB-8 Non-Muxed Address/Data Mode

The HB-8 Non-Muxed Mode uses dedicated pins for address and data signals. For this reason, the Non-Muxed Mode has reduced address reach as compared to the Muxed Mode. The HB-8 Non-Muxed Mode is selected with the MODE field of the HB-8 Configuration Register. In addition to data and address signals, the HB-8 Non-Muxed Mode also features the ALE signal (indicating to an external latch to capture address and hold the address until the data phase); RD and WR data strobes; and 1–4 CS (chip select) signals to enable one of four external peripherals. The ALE and CS options are chosen with the CSCFG field of the HB-8 Configuration2 Register. For more detailed maps of the HB-8 Non-Muxed Mode, see [Table 5-42](#).

5.10.4.3.1.3 HB-8 FIFO Mode

The HB-8 FIFO Mode uses 8 bits of data, removes ALE and address pins, and optionally adds external FIFO Full/Empty flag inputs. This scheme is used by many devices, such as radios, communication devices (including USB2 devices), and some FPGA configuration (FIFO through block RAM). This FIFO Mode presents the data side of the normal Host-Bus interface, but is paced by FIFO control signals. It is important to consider that the FIFO Full/Empty control inputs may stall the EPI interface and can potentially block other CPU or DMA accesses. For more detailed maps of the HB-8 FIFO Mode, see [Table 5-43](#).

5.10.4.3.2 EPI 16-Bit Host Bus (HB-16) Mode

The 16-Bit Host Bus (HB-16) Mode uses fewer address pins than the 8-Bit Host Bus (HB-8) Mode; hence, more pins are available for data. The HB-16 Mode is also slower than the General-Purpose Mode in order to accommodate older logic. The HB-16 Mode is selected with the MODE field of EPI Configuration Register. Within the HB-16 Mode, two additional registers are used to select address/data muxing, byte selects, chip selects, and other options. These registers are the HB-16 Configuration Register and the HB-16 Configuration2 Register. See [Figure 5-20](#) for a snapshot of HB-16 registers, modes, and features.

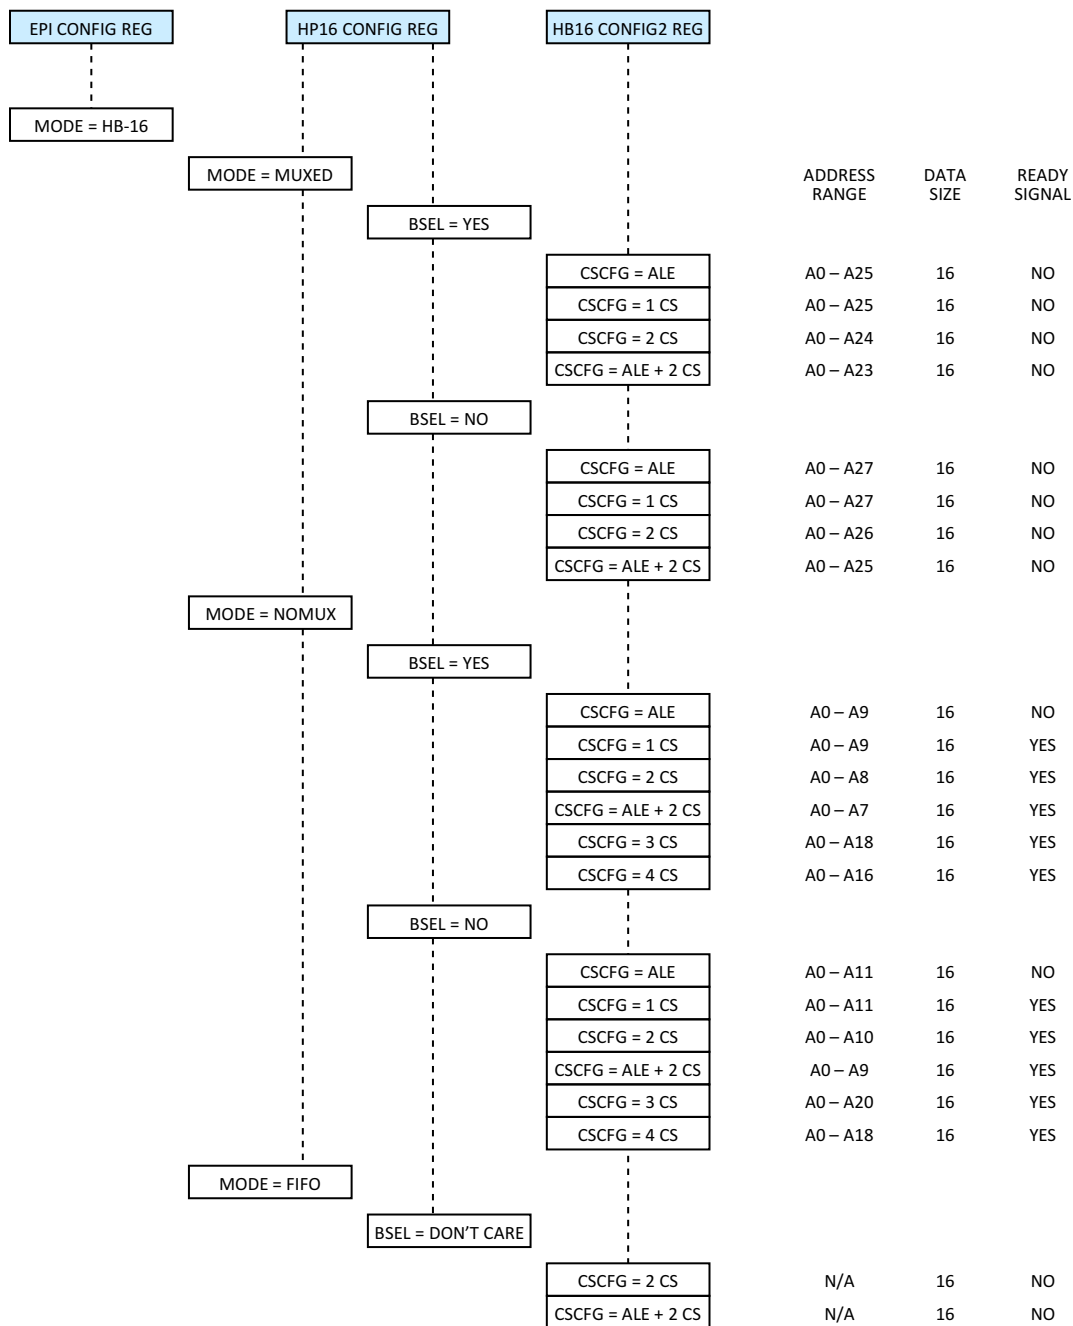

Figure 5-20. EPI 16-Bit Host Bus Mode

5.10.4.3.2.1 HB-16 Muxed Address/Data Mode

The HB-16 Muxed Mode multiplexes address signals with low-order data signals. For this reason, the Muxed Mode allows for a larger address space as compared to the Non-Muxed Mode. The HB-16 Muxed Mode is selected with the MODE field of the HB-16 Configuration Register. In addition to data and address signals, the HB-16 Muxed Mode also features the ALE signal (indicating to an external latch to capture address and hold the address until the data phase); RD and WR data strobes; 1–4 CS (chip select) signals to enable one of four external peripherals; and two BSEL (byte select) signals to accommodate byte accesses to lower or upper half of 16-bit data. The Byte Selects are chosen with the BSEL field of the HB-16 Configuration Register. The ALE and CS options are chosen with the CSCFG field of the HB-16 Configuration2 Register. For more detailed maps of the HB-16 Muxed Mode *without* Byte Selects, see [Table 5-44](#). For more detailed maps of the HB-16 Muxed Mode *with* Byte Selects, see [Table 5-45](#).

5.10.4.3.2.2 HB-16 Non-Muxed Address/Data Mode

The HB-16 Non-Muxed Mode uses dedicated pins for address and data signals. For this reason, the Non-Muxed Mode has reduced address reach as compared to the Muxed Mode. The HB-16 Non-Muxed Mode is selected with the MODE field of the HB-16 Configuration Register. In addition to data and address signals, the HB-16 Non-Muxed Mode also features the ALE signal (indicating to an external latch to capture address and hold the address until the data phase); RD and WR data strobes; 1–4 CS (chip select) signals to enable one of four external peripherals; and two BSEL (byte select) signals to accommodate byte accesses to lower or upper half of 16-bit data. The Byte Selects are chosen with the BSEL field of the HB-16 Configuration Register. The ALE and CS options are chosen with the CSCFG field of the HB-16 Configuration2 Register. For Non-Muxed bus cycles, most of the CSCFG modes also support a RDY signal. The RDY input to EPI is used by an external peripheral to extend bus cycles when the peripheral needs more time to complete reading or writing of data. While most EPI modes use up to 32 pins, the Non-Muxed CSCFG modes with 3 and 4 Chip Selects use 12 additional pins to extend the address reach and the number of CS signals. For detailed maps of HB-16 Non-Muxed Modes *without* Byte Selects, see [Table 5-46](#) and [Table 5-47](#). For detailed maps of HB-16 Non-Muxed Modes *with* Byte Selects, see [Table 5-48](#) and [Table 5-49](#).

5.10.4.3.2.3 HB-16 FIFO Mode

The HB-16 FIFO Mode uses 16 bits of data, removes ALE and address pins, and optionally adds external FIFO Full/Empty flag inputs. This scheme is used by many devices, such as radios, communication devices (including USB2 devices), and some FPGA configuration (FIFO through block RAM). This FIFO Mode presents the data side of the normal Host-Bus interface, but is paced by FIFO control signals. It is important to consider that the FIFO Full/Empty control inputs may stall the EPI interface and can potentially block other CPU or DMA accesses. For detailed maps of the HB-16 FIFO Mode, see [Table 5-50](#).

**Table 5-50. EPI MODES – 16-Bit Host-Bus Mode (EPICFG/MODE = 0x3),

5.10.4.4 EPI Electrical Data and Timing

The signal names in [Figure 5-21](#) through [Figure 5-29](#) are defined in [Table 5-51](#).

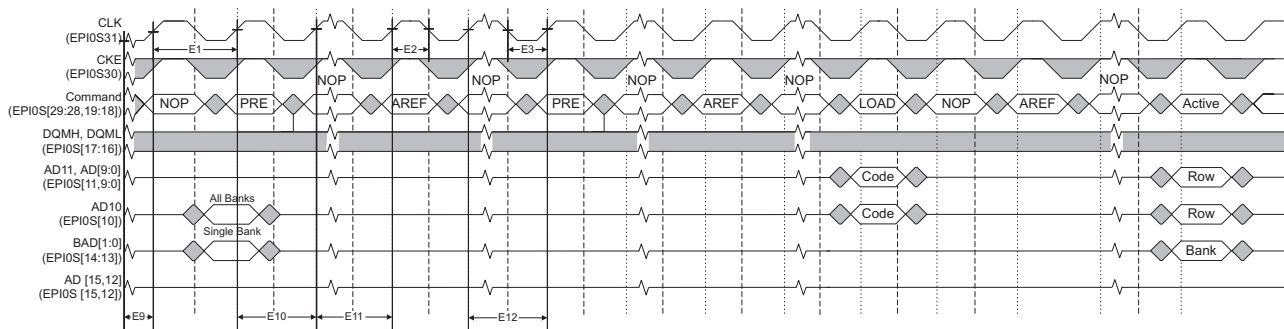

Table 5-51. Signals in [Figure 5-21](#) Through [Figure 5-29](#)

| SIGNAL | DESCRIPTION |
|---|---------------------------|
| AD | Address/Data |
| Address | Address output |
| ALE | Address latch enable |
| BAD | Bank Address/Data |
| $\overline{\text{BSEL0}}$, $\overline{\text{BSEL1}}$ | Byte select |
| $\overline{\text{CAS}}$ | Column address strobe |
| CKE | Clock enable |
| CLK, Clock | Clock |
| Command | Command signal |
| $\overline{\text{CS}}$ | Chip select |
| Data | Data signals |
| DQMH | Data mask high |
| DQML | Data mask low |
| Frame | Frame signal |
| iRDY | Ready input |
| Muxed Address/Data | Multiplexed Address/Data |
| $\overline{\text{RAS}}$ | Row address strobe |
| $\overline{\text{RD/OE}}$ | Read enable/Output enable |
| $\overline{\text{WE}}$, $\overline{\text{WR}}$ | Write enable |

Table 5-52. EPI SDRAM Interface Switching Characteristics
(see Figure 5-21, Figure 5-22, and Figure 5-23)

over recommended operating conditions (unless otherwise noted)

| NO. | PARAMETER | | MIN | MAX | UNIT |
|-----|-----------------|--|-----|-----|---------|
| E1 | $t_{c(CK)}$ | Cycle time, SDRAM clock | 20 | | ns |
| E2 | $t_{w(CKH)}$ | Pulse duration, SDRAM clock high | 10 | | ns |
| E3 | $t_{w(CKL)}$ | Pulse duration, SDRAM clock low | 10 | | ns |
| E4 | $t_{d(CK-OV)}$ | Delay time, clock to output valid | -5 | 5 | ns |
| E5 | $t_{d(CK-OIV)}$ | Delay time, clock to output invalid | -5 | 5 | ns |
| E6 | $t_{d(CK-OZ)}$ | Delay time, clock to output high-impedance | -5 | 5 | ns |
| E7 | $t_{su(AD-CK)}$ | Setup time, input before clock | 10 | | ns |
| E8 | $t_{h(CK-AD)}$ | Hold time, input after clock | 0 | | ns |
| E9 | t_{pU} | Power-up time | 100 | | μ s |
| E10 | t_{pc} | Precharge time, all banks | 20 | | ns |
| E11 | t_{rf} | Autorefresh | 66 | | ns |
| E12 | t_{MRD} | Program mode register | 40 | | ns |

- A. If CS is high at clock high time, all applied commands are NOP.
- B. The Mode register may be loaded before the autorefresh cycles if desired.
- C. JEDEC and PC100 specify three clocks.
- D. Outputs are ensured High-Z after command is issued.

Table 5-53. EPI Host-Bus 8 and Host-Bus 16 Interface Switching Characteristics
(see Figure 5-24, Figure 5-25, Figure 5-26, and Figure 5-27)

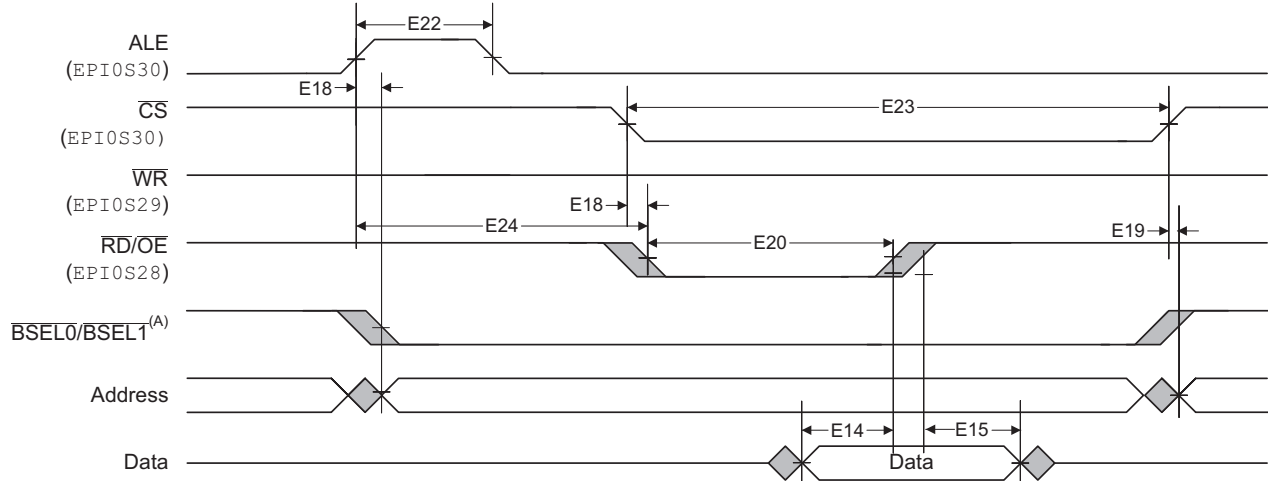

over recommended operating conditions (unless otherwise noted)

| NO. | PARAMETER | MIN | TYP | MAX | UNIT |
|-----|--|-----|-----|-----|------------|
| E16 | $t_{d(WR-WDATAV)}$ Delay time, \overline{WR} to write data valid | | | 5 | ns |
| E17 | $t_{d(WRIV-DATA)}$ Delay time, \overline{WR} invalid to data | 2 | | | EPI clocks |
| E18 | $t_{d(CS-OV)}$ Delay time, \overline{CS} to output valid | -5 | | 5 | ns |
| E19 | $t_{d(CS-OIV)}$ Delay time, \overline{CS} to output invalid | -5 | | 5 | ns |
| E20 | $t_{w(STL)}$ Pulse duration, $\overline{WR}/\overline{RD}$ strobe low | 2 | | | EPI clocks |
| E22 | $t_{w(ALEH)}$ Pulse duration, ALE high | | 1 | | EPI clocks |
| E23 | $t_{w(CSL)}$ Pulse duration, \overline{CS} low | 4 | | | EPI clocks |
| E24 | $t_{d(ALE-ST)}$ Delay time, ALE rising to $\overline{WR}/\overline{RD}$ strobe falling | 2 | | | EPI clocks |
| E25 | $t_{d(ALE-ADHZ)}$ Delay time, ALE falling to Address/Data high-impedance | 1 | | | EPI clocks |

Table 5-54. EPI Host-Bus 8 and Host-Bus 16 Interface Timing Requirements⁽¹⁾
(see Figure 5-24 and Figure 5-26)

| NO. | PARAMETER | MIN | MAX | UNIT |
|-----|---------------------------------------|-----|-----|------|
| E14 | $t_{su(RDATA)}$ Setup time, read data | 10 | | ns |
| E15 | $t_{h(RDATA)}$ Hold time, read data | 0 | | ns |

(1) Setup time for FEMPTY and FFULL signals from clock edge is 2 system clocks (MIN).

A. $\overline{BSEL0}$ and $\overline{BSEL1}$ are available in Host-Bus 16 mode only.

5.11 Master Subsystem Peripherals

Master Subsystem peripherals are located on the APB Bus and AHB Bus, and are accessible from the Cortex-M3 CPU/μDMA. The AHB peripherals include EPI, USB, and two CAN modules. The APB peripherals include EMAC, two I2Cs, five UARTs, four SSIs, four GPTIMERS, two WDOGs, NMI WDOG, and a μCRC module (Cyclic Redundancy Check). The Cortex-M3 CPU/μDMA also have access to Analog (Result Registers only) and Shared peripherals (see [Section 5.10](#)).

For detailed information on the processor peripherals, see the [Concerto F28M36x Technical Reference Manual](#).

5.11.1 Synchronous Serial Interface

This device has four SSI modules. Each SSI has a Master or Slave interface for synchronous serial communication with peripheral devices that have Texas Instruments™ SSIs, SPI, or Freescale™ serial format.

The SSI peripheral performs serial-to-parallel conversion on data received from a peripheral device. The CPU accesses data, control, and status information. The transmit and receive paths are buffered with internal FIFO memories, allowing up to eight 16-bit values to be stored independently in both transmit and receive modes. The SSI also supports μDMA transfers. The transmit and receive FIFOs can be programmed as destination/source addresses in the μDMA module. An μDMA operation is enabled by setting the appropriate bit or bits in the SSIDMACTL register.

[Figure 5-30](#) shows the SSI peripheral.

5.11.1.1 Bit Rate Generation

The SSI includes a programmable bit-rate clock divider and prescaler to generate the serial output clock. Bit rates are supported to 2 MHz and higher, although maximum bit rate is determined by peripheral devices. The serial bit rate is derived by dividing-down the input clock (SysClk). The clock is first divided by an even prescale value CPSDVSR from 2 to 254, which is programmed in the SSI Clock Prescale (SSICPSR) register. The clock is further divided by a value from 1 to 256, which is 1 + SCR, where SCR is the value programmed in the SSI Control 0 (SSICR0) register. The frequency of the output clock SSIClk is defined by:

$$\text{SSIClk} = \text{SysClk} / [\text{CPSDVSR} * (1 + \text{SCR})]$$

NOTE

For master mode, the system clock must be at least four times faster than SSIClk, with the restriction that SSIClk cannot be faster than 25 MHz. For slave mode, the system clock must be at least 12 times faster than SSIClk.

Figure 5-30. SSI

5.11.1.2 Transmit FIFO

The transmit FIFO is a 16-bit-wide, 8-location-deep, first-in, first-out memory buffer. The CPU writes data to the FIFO through the SSI Data (SSIDR) register, and data is stored in the FIFO until the data is read out by the transmission logic. When configured as a master or a slave, parallel data is written into the transmit FIFO before serial conversion and transmission to the attached slave or master, respectively, through the SSITx pin.

In slave mode, the SSI transmits data each time the master initiates a transaction. If the transmit FIFO is empty and the master initiates a transaction, the slave transmits the 8th most recent value in the transmit FIFO. If less than eight values have been written to the transmit FIFO since the SSI module clock was enabled using the SSI bit in the RGCG1 register, then "0" is transmitted. Care should be taken to ensure that valid data is in the FIFO as needed. The SSI can be configured to generate an interrupt or an μ DMA request when the FIFO is empty.

5.11.1.3 Receive FIFO

The receive FIFO is a 16-bit-wide, 8-location-deep, first-in, first-out memory buffer. Received data from the serial interface is stored in the buffer until read out by the CPU, which accesses the read FIFO by reading the SSIDR register. When configured as a master or slave, serial data received through the SSIRx pin is registered before parallel loading into the attached slave or master receive FIFO, respectively.

5.11.1.4 Interrupts

The SSI can generate interrupts when the following conditions are observed:

- Transmit FIFO service (when the transmit FIFO is half full or less)
- Receive FIFO service (when the receive FIFO is half full or more)
- Receive FIFO time-out
- Receive FIFO overrun
- End of transmission

All of the interrupt events are ORed together before being sent to the interrupt controller, so the SSI generates a single interrupt request to the controller regardless of the number of active interrupts. Each of the four individual maskable interrupts can be masked by clearing the appropriate bit in the SSI Interrupt Mask (SSIIM) register. Setting the appropriate mask bit enables the interrupt.

The individual outputs, along with a combined interrupt output, allow the use of either a global interrupt service routine or modular device drivers to handle interrupts. The transmit and receive dynamic data-flow interrupts have been separated from the status interrupts so that data can be read or written in response to the FIFO trigger levels. The status of the individual interrupt sources can be read from the SSI Raw Interrupt Status (SSIRIS) and SSI Masked Interrupt Status (SSIMIS) registers.

The receive FIFO has a time-out period that is 32 periods at the rate of SSIClk (whether or not SSIClk is currently active) and is started when the RX FIFO goes from EMPTY to not-EMPTY. If the RX FIFO is emptied before 32 clocks have passed, the time-out period is reset. As a result, the ISR should clear the Receive FIFO Time-out Interrupt just after reading out the RX FIFO by writing a "1" to the RTIC bit in the SSI Interrupt Clear (SSIICR) register. The interrupt should not be cleared so late that the ISR returns before the interrupt is actually cleared, or the ISR may be reactivated unnecessarily.

The End-of-Transmission (EOT) interrupt indicates that the data has been transmitted completely. This interrupt can be used to indicate when it is safe to turn off the SSI module clock or enter sleep mode. In addition, because transmitted data and received data complete at exactly the same time, the interrupt can also indicate that read data is ready immediately, without waiting for the receive FIFO time-out period to complete.

5.11.1.5 Frame Formats

Each data frame is between 4 bits and 16 bits long, depending on the size of data programmed, and is transmitted starting with the MSB. The following basic frame types can be selected:

- Texas Instruments Synchronous Serial
- Freescale SPI

For all three formats, the serial clock (SSIClk) is held inactive while the SSI is idle, and SSIClk transitions at the programmed frequency only during active transmission or reception of data. The idle state of SSIClk is used to provide a receive time-out indication that occurs when the receive FIFO still contains data after a time-out period.

5.11.2 Universal Asynchronous Receiver/Transmitter

This device has five UART modules. The CPU accesses data, control, and status information. The UART also supports μ DMA transfers. Each UART performs functions of parallel-to-serial and serial-to-parallel conversions. Each of the five UART modules is similar in functionality to a 16C550 UART, but is not register-compatible.

The UART is configured for transmit and receive through the TXE bit and the RXE bit, respectively, of the UART Control (UARTCTL) register. Transmit and receive are both enabled out of reset. Before any control registers are programmed, the UART must be disabled by clearing the URTEN bit in UARTCTL. If the UART is disabled during a TX or RX operation, the current transaction is completed before the UART stops.

The UART module also includes a serial IR (SIR) encoder/decoder block that can be connected to an infrared transceiver to implement an IrDA SIR physical layer. The SIR function is programmed using the UARTCTL register.

Figure 5-31 shows the UART peripheral.

5.11.2.1 Baud-Rate Generation

The baud-rate divisor is a 22-bit number consisting of a 16-bit integer and a 6-bit fractional part. The number formed by these two values is used by the baud-rate generator to determine the bit period. Having a fractional baud-rate divider allows the UART to generate all the standard baud rates.

The 16-bit integer is loaded through the UART Integer Baud-Rate Divisor (UARTIBRD) register, and the 6-bit fractional part is loaded with the UART Fractional Baud-Rate Divisor (UARTFBRD) register. The baud rate divisor (BRD) has the following relationship to the system clock (where BRDI is the integer part of the BRD, and BRDF is the fractional part, separated by a decimal place).

$$\text{BRD} = \text{BRDI} + \text{BRDF} = \text{UARTSysClk} / (\text{ClkDiv} * \text{Baud Rate})$$

where UARTSysClk is the system clock connected to the UART, and ClkDiv is either 16 (if HSE in UARTCTL is clear) or 8 (if HSE is set).

The 6-bit fractional number (that is to be loaded into the DIVFRAC bit field in the UARTFBRD register) can be calculated by taking the fractional part of the baud-rate divisor, multiplying this fractional part by 64, and adding 0.5 to account for rounding errors:

$$\text{UARTFBRD}[\text{DIVFRAC}] = \text{integer}(\text{BRDF} * 64 + 0.5)$$

The UART generates an internal baud-rate reference clock at 8x or 16x the baud rate [referred to as Baud8 and Baud16, depending on the setting of the HSE bit (bit 5 in UARTCTL)]. This reference clock is divided by 8 or 16 to generate the transmit clock, and is used for error detection during receive operations.

Along with the UART Line Control, High Byte (UARTLCRH) register, the UARTIBRD and UARTFBRD registers form an internal 30-bit register. This internal register is only updated when a write operation to UARTLCRH is performed, so any changes to the baud-rate divisor must be followed by a write to the UARTLCRH register for the changes to take effect.

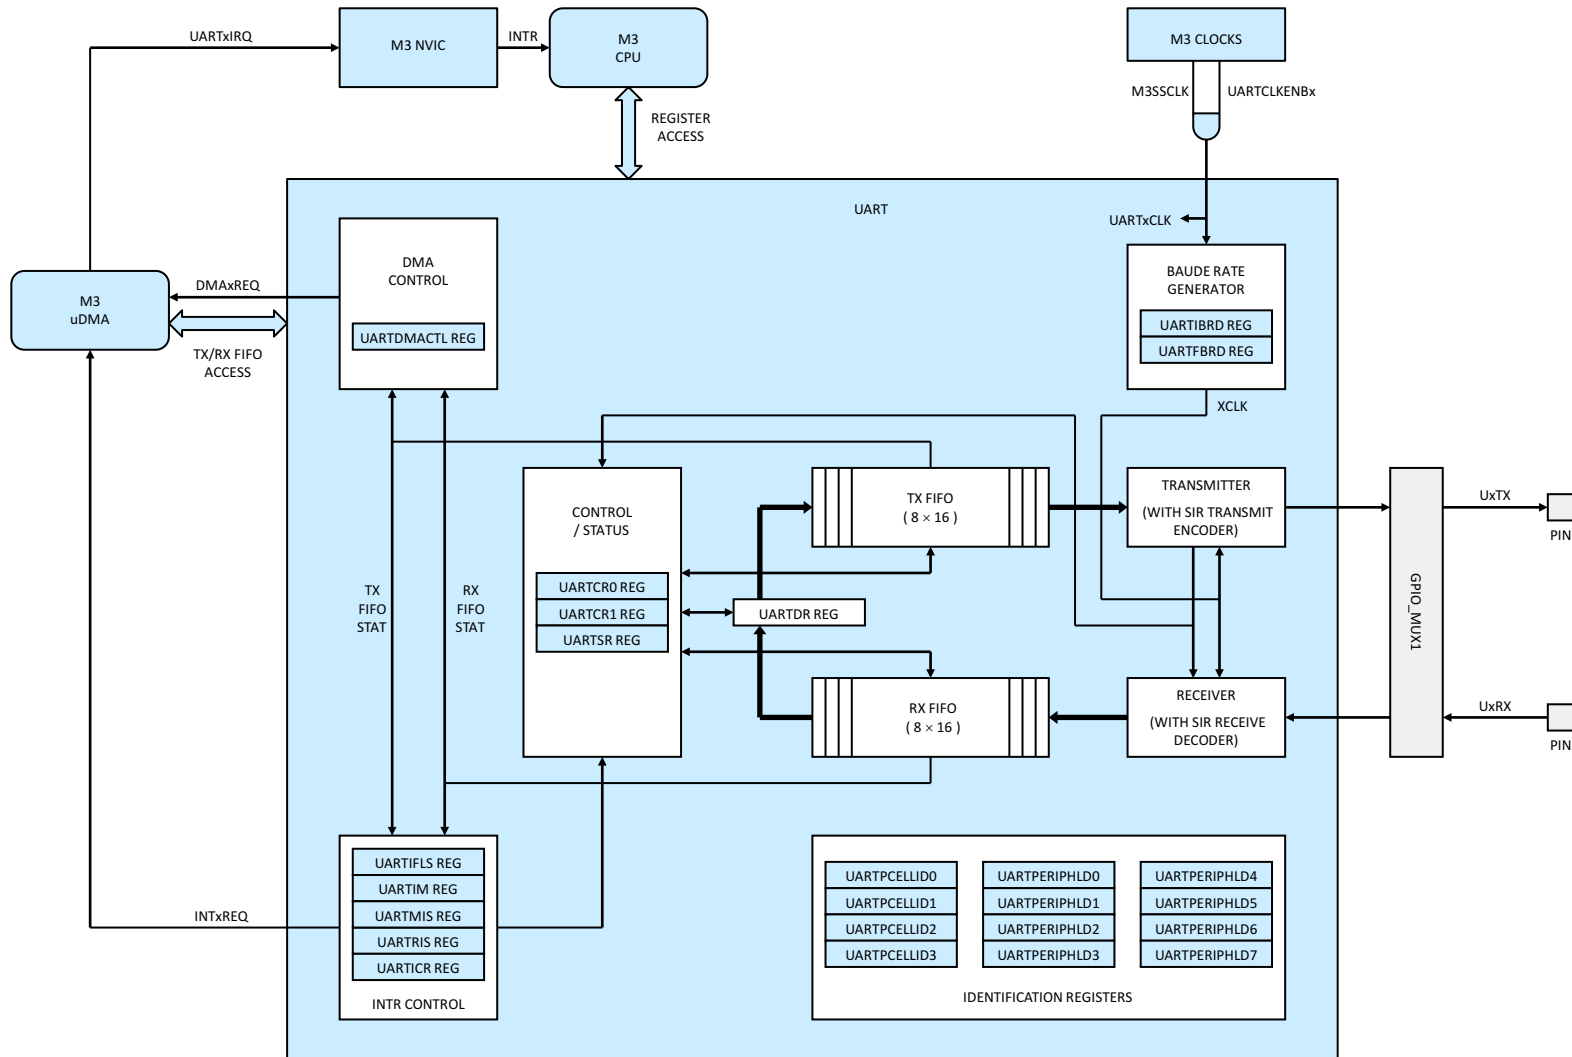

Figure 5-31. UART

5.11.2.2 Transmit and Receive Logic

The transmit logic performs parallel-to-serial conversion on the data read from the transmit FIFO. The control logic outputs the serial bit stream beginning with a start bit and followed by the data bits (LSB first), parity bit, and the stop bits according to the programmed configuration in the control registers.

The receive logic performs serial-to-parallel conversion on the received bit stream after a valid start pulse has been detected. Overrun, parity, frame error checking, and line-break detection are also performed, and their status accompanies the data that is written to the receive FIFO.

5.11.2.3 Data Transmission and Reception

Data received or transmitted is stored in two 16-byte FIFOs, though the receive FIFO has an extra 4 bits per character for status information. For transmission, data is written into the transmit FIFO. If the UART is enabled, a data frame starts transmitting with the parameters indicated in the UARTLCRH register. Data continues to be transmitted until there is no data left in the transmit FIFO. The BUSY bit in the UART Flag (UARTFR) register is asserted as soon as data is written to the transmit FIFO (that is, if the FIFO is nonempty) and remains asserted while data is being transmitted. The BUSY bit is negated only when the transmit FIFO is empty, and the last character has been transmitted from the shift register, including the stop bits. The UART can indicate that it is busy even though the UART may no longer be enabled.

When the receiver is idle (the UnRx signal is continuously "1"), and the data input goes Low (a start bit has been received), the receive counter begins running and data is sampled on the eighth cycle of Baud16 or the fourth cycle of Baud8, depending on the setting of the HSE bit (bit 5 in UARTCTL).

The start bit is valid and recognized if the UnRx signal is still low on the eighth cycle of Baud16 (HSE clear) or the fourth cycle of Baud 8 (HSE set), otherwise the start bit is ignored. After a valid start bit is detected, successive data bits are sampled on every 16th cycle of Baud16 or 8th cycle of Baud8 (that is, 1 bit period later), according to the programmed length of the data characters and value of the HSE bit in UARTCTL. The parity bit is then checked if parity mode is enabled. Data length and parity are defined in the UARTLCRH register.

Lastly, a valid stop bit is confirmed if the UnRx signal is High, otherwise a framing error has occurred. When a full word is received, the data is stored in the receive FIFO along with any error bits associated with that word.

5.11.2.4 Interrupts

The UART can generate interrupts when the following conditions are observed:

- Overrun Error
- Break Error
- Parity Error
- Framing Error
- Receive Time-out
- Transmit (when the condition defined in the TXIFLSEL bit in the UARTIFLS register is met, or if the EOT bit in UARTCTL is set, when the last bit of all transmitted data leaves the serializer)
- Receive (when the condition defined in the RXIFLSEL bit in the UARTIFLS register is met)

All of the interrupt events are ORed together before being sent to the interrupt controller, so the UART can only generate a single interrupt request to the controller at any given time. Software can service multiple interrupt events in a single interrupt service routine by reading the UART Masked Interrupt Status (UARTMIS) register.

The interrupt events that can trigger a controller-level interrupt are defined in the UART Interrupt Mask (UARTIM) register by setting the corresponding IM bits. If interrupts are not used, the raw interrupt status is always visible through the UART Raw Interrupt Status (UARTRIS) register.

Interrupts are always cleared (for both the UARTMIS and UARTRIS registers) by writing a "1" to the corresponding bit in the UART Interrupt Clear (UARTICR) register.

The receive time-out interrupt is asserted when the receive FIFO is not empty, and no further data is received over a 32-bit period. The receive time-out interrupt is cleared either when the FIFO becomes empty through reading all the data (or by reading the holding register), or when a "1" is written to the corresponding bit in the UARTICR register.

5.11.3 Cortex-M3 Inter-Integrated Circuit

This device has two Cortex-M3 I2C peripherals. The Cortex-M3 I2C bus provides bidirectional data transfer through a two-wire design (a serial data line SDA and a serial clock line SCL), and interfaces to external I2C devices such as serial memory (RAMs and ROMs), networking devices, LCDs, tone generators, and so on. The I2C bus may also be used for system testing and diagnostic purposes in product development and manufacture. The microcontroller includes two I2C modules, providing the ability to interact (both transmit and receive) with other I2C devices on the bus.

The two Cortex-M3 I2C modules include the following features:

- Devices on the I2C bus can be designated as either a master or a slave
 - Supports both transmitting and receiving data as either a master or a slave
 - Supports simultaneous master and slave operation
- Four I2C modes
 - Master transmit
 - Master receive
 - Slave transmit
 - Slave receive
- Two transmission speeds: Standard (100 Kbps) and Fast (400 Kbps)
- Master and slave interrupt generation
 - Master generates interrupts when a transmit or receive operation completes (or aborts due to an error)
 - Slave generates interrupts when data has been transferred or requested by a master or when a START or STOP condition is detected
- Master with arbitration and clock synchronization, multimaster support, and 7-bit addressing mode

Figure 5-32 shows the Cortex-M3 I2C peripheral.

5.11.3.1 Functional Overview

Each I2C module comprises both master and slave functions. For proper operation, the SDA and SCL pins must be configured as open-drain signals.

The I2C bus uses only two signals: SDA and SCL, named I2CSDA and I2CSCL. SDA is the bidirectional serial data line and SCL is the bidirectional serial clock line. The bus is considered idle when both lines are high.

Every transaction on the I2C bus is 9 bits long, consisting of eight data bits and a single acknowledge bit. The number of bytes per transfer (defined as the time between a valid START and STOP condition) is unrestricted, but each byte has to be followed by an acknowledge bit, and data must be transferred MSB first. When a receiver cannot receive another complete byte, the receiver can hold the clock line SCL Low and force the transmitter into a wait state. The data transfer continues when the receiver releases the clock SCL.

5.11.3.2 Available Speed Modes

The I2C bus can run in either standard mode (100 Kbps) or fast mode (400 Kbps). The selected mode should match the speed of the other I2C devices on the bus.

Figure 5-32. I2C (Cortex-M3)

5.11.3.3 I2C Electrical Data and Timing

Table 5-57. I2C Timing

| | | TEST CONDITIONS | MIN | MAX | UNIT |
|------------|---|---|-----------------|----------------|---------|
| f_{SCL} | SCL clock frequency | I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately | | 400 | kHz |
| V_{il} | Low level input voltage | | | $0.3 V_{DDIO}$ | V |
| V_{ih} | High level input voltage | | $0.7 V_{DDIO}$ | | V |
| V_{hys} | Input hysteresis | | $0.05 V_{DDIO}$ | | V |
| V_{ol} | Low level output voltage | 3 mA sink current | 0 | 0.4 | V |
| t_{LOW} | Low period of SCL clock | I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately | 1.3 | | μ s |
| t_{HIGH} | High period of SCL clock | I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately | 0.6 | | μ s |
| I_i | Input current with an input voltage between $0.1 V_{DDIO}$ and $0.9 V_{DDIO}$ MAX | | -10 | 10 | μ A |

5.11.4 Cortex-M3 Controller Area Network

NOTE

The CAN module uses the popular IP known as D_CAN. This document uses the names “CAN” and “D_CAN” interchangeably to reference this peripheral.

This device has two Cortex-M3 CAN peripherals. CAN is a serial communications protocol that efficiently supports distributed real-time control with a high level of security. The CAN module supports bit rates up to 1 Mbit/s and is compliant with the ISO11898-1 (CAN 2.0B) protocol specification.

CAN implements the following features:

- CAN protocol version 2.0 part A, B
- Bit rates up to 1 Mbit/s
- Multiple clock sources
- 32 message objects
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Suspend mode for debug support
- Software module reset
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Message RAM parity check mechanism
- Two interrupt lines
- Global power down and wakeup support

[Figure 5-33](#) shows the Cortex-M3 CAN peripheral.

5.11.4.1 Functional Overview

CAN performs CAN protocol communication according to ISO 11898-1 (identical to Bosch® CAN protocol specification 2.0 A, B). The bit rate can be programmed to values up to 1 Mbit/s. Additional transceiver hardware is required for the connection to the physical layer (CAN bus).

For communication on a CAN network, individual message objects can be configured. The message objects and identifier masks are stored in the Message RAM. All functions concerning the handling of messages are implemented in the message handler. Those functions are: acceptance filtering, the transfer of messages between the CAN Core and the Message RAM, and the handling of transmission requests.

The register set of the CAN is accessible directly by the CPU through the module interface. These registers are used to control/configure the CAN Core and the message handler, and to access the message RAM.

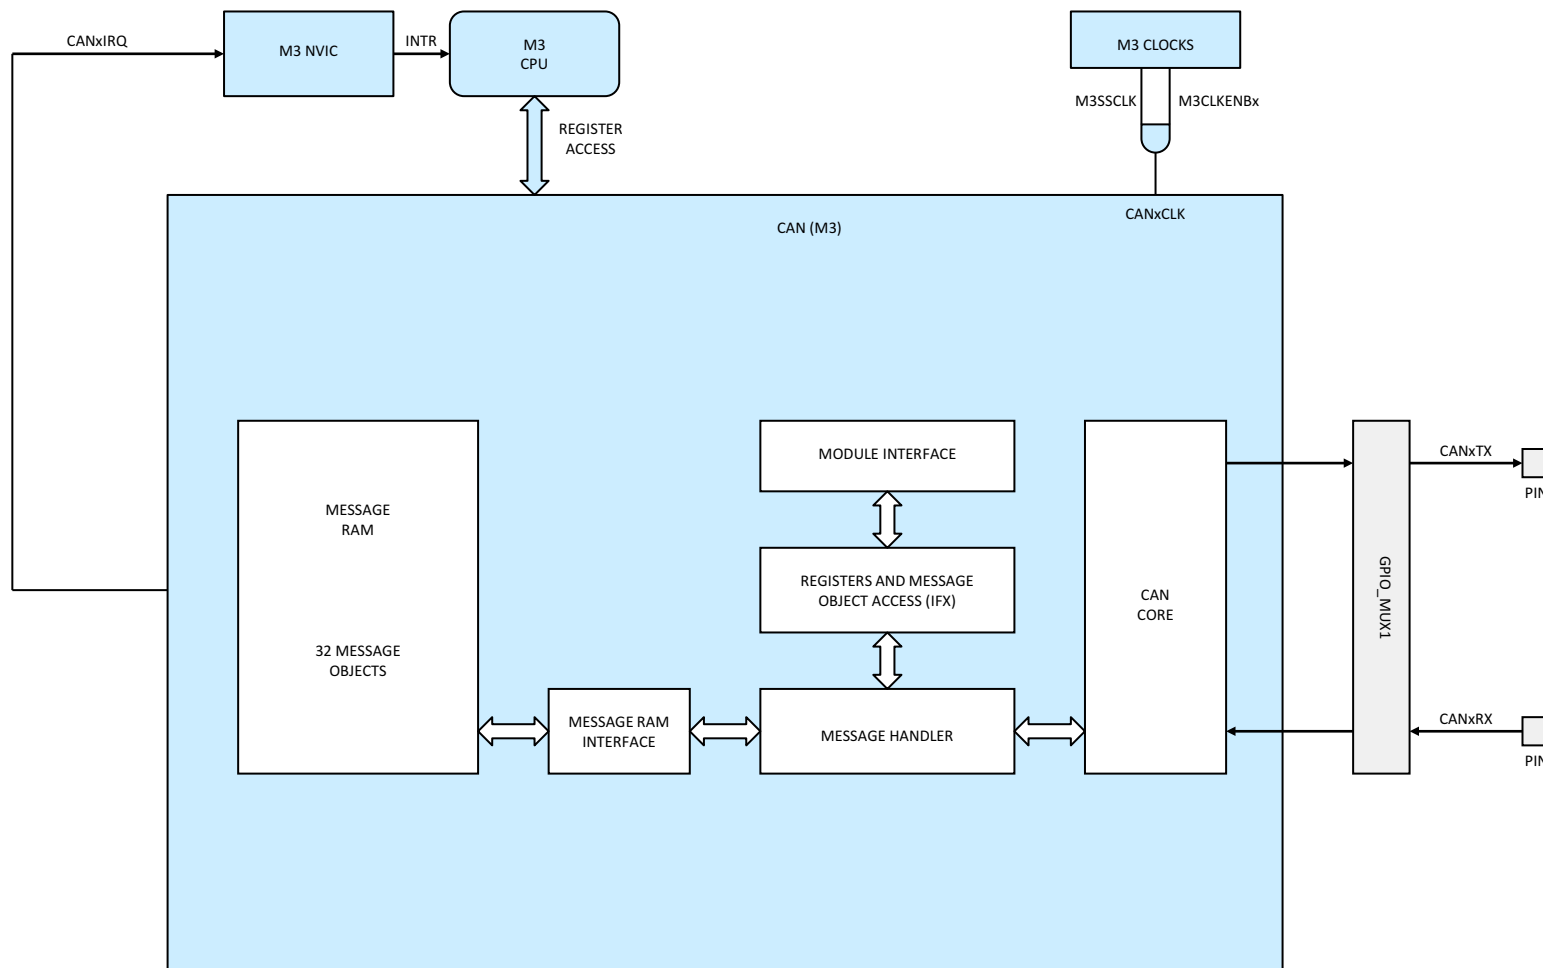

Figure 5-33. CAN (Cortex-M3)

5.11.5 Cortex-M3 Universal Serial Bus Controller

This device has one Cortex-M3 USB controller. The USB controller operates as a full-speed or low-speed function controller during point-to-point communications with the USB Host, Device, or OTG functions. The controller complies with the USB 2.0 standard, which includes SUSPEND and RESUME signaling. Thirty-two endpoints, which comprised of 2 hardwired endpoints for control transfers (one endpoint for IN and one endpoint for OUT) and 30 endpoints defined by firmware, along with a dynamic sizable FIFO, support multiple packet queuing. DMA access to the FIFO allows minimal interference from system software. Software-controlled connect and disconnect allow flexibility during USB device start-up. The controller complies with the Session Request Protocol (SRP) and Host Negotiation Protocol (HNP) of the OTG standard.

The USB controller includes the following features:

- Complies with USB-IF certification standards
- USB 2.0 full-speed (12-Mbps) and low-speed (1.5-Mbps) operation
- Integrated PHY
- Four transfer types: Control, Interrupt, Bulk, and Isochronous
- 32 endpoints:
 - One dedicated control IN endpoint and one dedicated control OUT endpoint
 - 15 configurable IN endpoints and 15 configurable OUT endpoints
- 4KB dedicated endpoint memory: one endpoint may be defined for double-buffered 1023-byte isochronous packet size
- VBUS droop and valid ID detection and interrupt
- Efficient transfers using DMA controller:
 - Separate channels for transmit and receive for up to three IN endpoints and three OUT endpoints
 - Channel requests asserted when FIFO contains required amount of data
- Electrical specifications are compliant with the USB Specification Rev. 2.0 (full-speed and low-speed support) and the On-The-Go Supplement to the USB 2.0 Specification Rev. 1.0. Some components of the USB system are integrated within the Concerto microcontroller and are specific to its design.

Figure 5-34 shows the USB peripheral.

5.11.5.1 Functional Description

The USB controller provides full OTG negotiation by supporting both the SRP and the HNP. The SRP allows devices on the B side of a cable to request the A-side devices' turn on VBUS. The HNP is used after the initial session request protocol has powered the bus and provides a method to determine which end of the cable will act as the Host controller. When the device is connected to non-OTG peripherals or devices, the controller can detect which cable end was used and provides a register to indicate if the controller should act as the Host controller or the Device controller. This indication and the mode of operation are handled automatically by the USB controller. This autodetection allows the system to use a single A/B connector instead of having both A and B connectors in the system, and supports full OTG negotiations with other OTG devices.

In addition, the USB controller provides support for connecting to non-OTG peripherals or Host controllers. The USB controller can be configured to act as either a dedicated Host or Device, in which case, the USB0VBUS and USB0ID signals can be used as GPIOs. However, when the USB controller is acting as a self-powered Device, a GPIO input must be connected to VBUS and configured to generate an interrupt when the VBUS level drops. This interrupt is used to disable the pullup resistor on the USB0DP signal.

NOTE

When the USB is used, the system clock frequency (SYSCLK) must be at least 20 MHz.

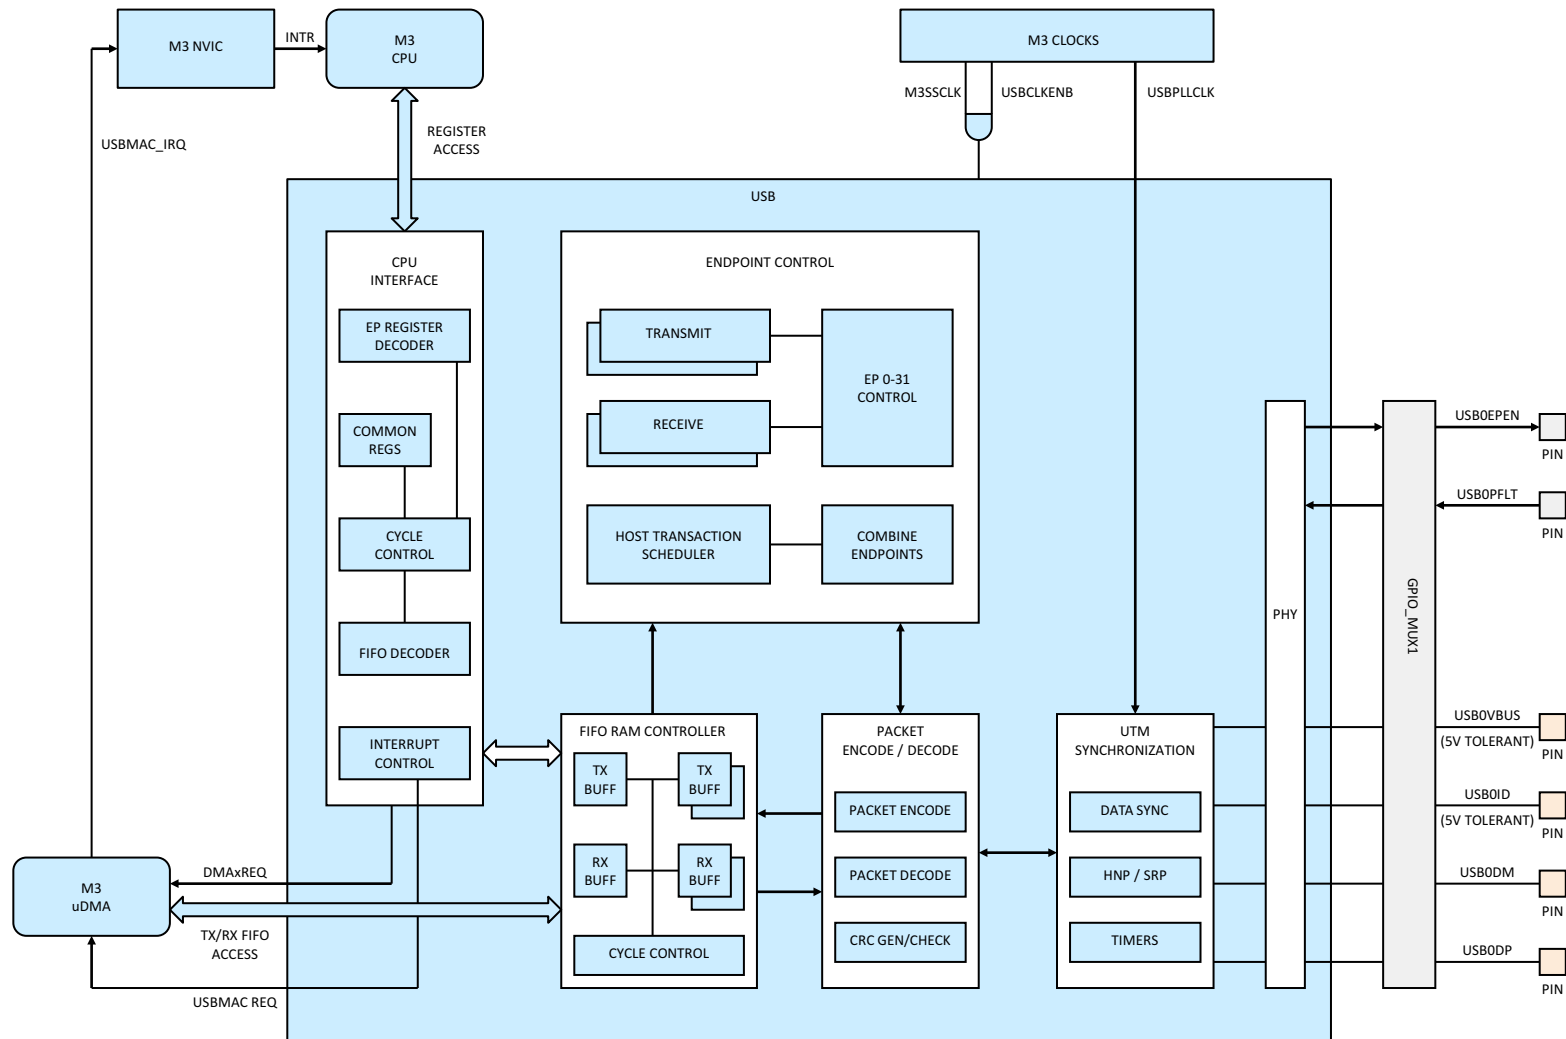

Figure 5-34. USB

5.11.6 Cortex-M3 Ethernet Media Access Controller

The Cortex-M3 EMAC conforms to IEEE 802.3 specifications and fully supports 10BASE-T and 100BASE-TX standards. This device has one Ethernet Media Access Controller.

The EMAC module has the following features:

- Conforms to the IEEE 802.3-2002 specification
 - 10BASE-T/100BASE-TX IEEE-802.3 compliant
- Multiple operational modes
 - Full- and half-duplex 100-Mbps
 - Full- and half-duplex 10-Mbps
 - Power-saving and power-down modes
- Highly configurable:
 - Programmable MAC address
 - Promiscuous mode support
 - CRC error-rejection control
 - User-configurable interrupts
- IEEE 1588 Precision Time Protocol: Provides highly accurate time stamps for individual packets
- Efficient transfers using the Micro Direct Memory Access Controller (μ DMA)
 - Separate channels for transmit and receive
 - Receive channel request asserted on packet receipt
 - Transmit channel request asserted on empty transmit FIFO

[Figure 5-35](#) shows the EMAC peripheral.

5.11.6.1 Functional Overview

The Ethernet Controller is functionally divided into two layers: the Media Access Controller (MAC) layer and the Network Physical (PHY) layer. The MAC resides inside the device, and the PHY outside of the device. These layers correspond to the OSI model layers 2 and 1, respectively. The CPU accesses the Ethernet Controller through the MAC layer. The MAC layer provides transmit and receive processing for Ethernet frames. The MAC layer also provides the interface to the external PHY layer through an internal Media Independent Interface (MII). The PHY layer communicates with the Ethernet bus.

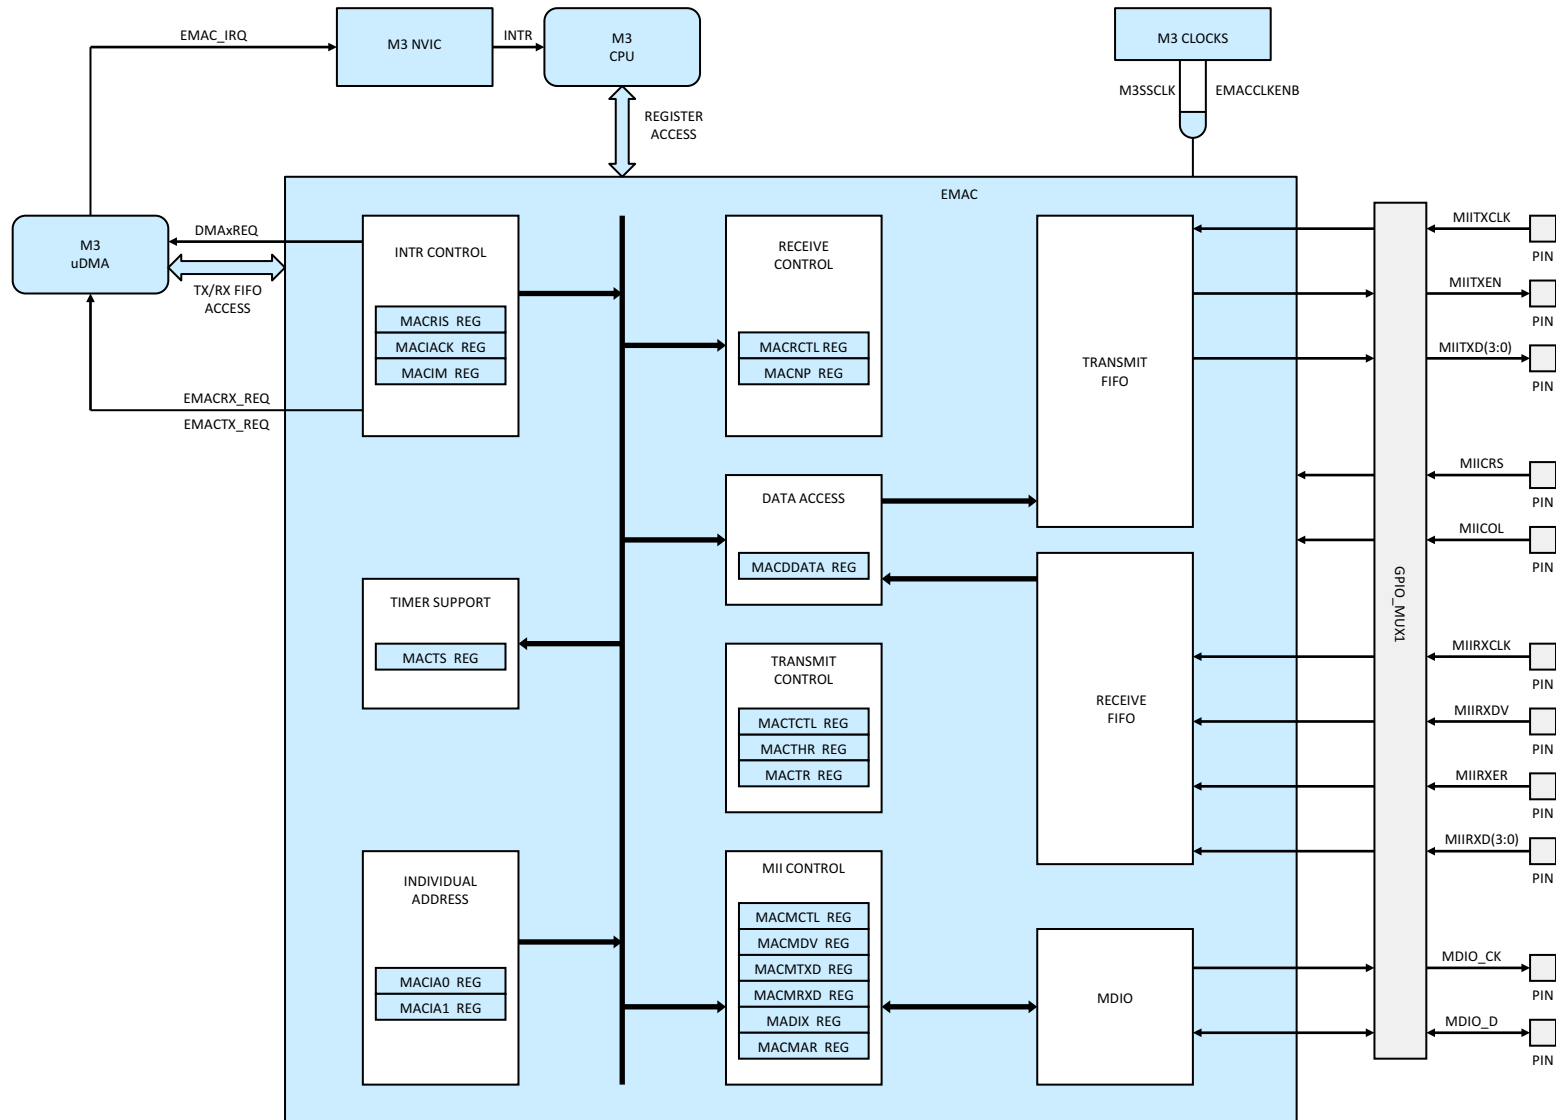

Figure 5-35. EMAC

5.11.6.2 MII Signals

The individual EMAC and Management Data Input/Output (MDIO) signals for the MII interface are summarized in [Table 5-58](#).

Table 5-58. EMAC and MDIO Signals for MII Interface

| SIGNAL | TYPE ⁽¹⁾ | DESCRIPTION |
|-------------|---------------------|---|
| MIITXCK | I | Transmit clock. The transmit clock is a continuous clock that provides the timing reference for transmit operations. The MIITXD and MIITXEN signals are tied to this clock. The clock is generated by the PHY and is 2.5 MHz at 10-Mbps operation and 25 MHz at 100-Mbps operation. |
| MIITXER | O | This pin is always driven low from the MAC controller on the device. |
| MIITXD[3-0] | O | Transmit data. The transmit data pins are a collection of four data signals comprising 4 bits of data. MTDX0 is the least-significant bit (LSB). The signals are synchronized by MIITXCLK and are valid only when MIITXEN is asserted. |
| MIITXEN | O | Transmit enable. The transmit enable signal indicates that the MIITXD pins are generating nibble data for use by the PHY. MIITXEN is driven synchronously to MIITXCLK. |
| MIICOL | I | Collision detected. In half-duplex operation, the MIICOL pin is asserted by the PHY when the PHY detects a collision on the network. The MIICOL pin remains asserted while the collision condition persists. This signal is not necessarily synchronous to MIITXCLK or MIIRXCLK. In full-duplex operation, the MIICOL pin is used for hardware transmit flow control. Asserting the MIICOL pin will stop packet transmissions; packets in the process of being transmitted when MIICOL is asserted will complete transmission. The MIICOL pin should be held low if hardware transmit flow control is not used. |
| MIICRS | I | Carrier sense. In half-duplex operation, the MIICRS pin is asserted by the PHY when the network is not idle in either transmit or receive. The pin is deasserted when both transmit and receive are idle. This signal is not necessarily synchronous to MIITXCLK or MIIRXCLK. In full-duplex operation, the MIICRS pin should be held low. |
| MIIRXCK | I | Receive clock. The receive clock is a continuous clock that provides the timing reference for receive operations. The MIIRXD, MIIRXDV, and MIIRXER signals are tied to this clock. The clock is generated by the PHY and is 2.5 MHz at 10-Mbps operation and 25 MHz at 100-Mbps operation. |
| MIIRXD[3-0] | I | Receive data. The receive data pins are a collection of four data signals comprising 4 bits of data. MRDX0 is the least-significant bit. The signals are synchronized by MIIRXCLK and are valid only when MIIRXDV is asserted. |
| MIIRXDV | I | Receive data valid. The receive data valid signal indicates that the MIIRXD pins are generating nibble data for use by the EMAC. MIIRXDV is driven synchronously to MIIRXCLK. |
| MIIRXER | I | Receive error. The receive error signal is asserted for one or more MIIRXCLK periods to indicate that an error was detected in the received frame. The MIIRXER signal being asserted is meaningful only during data reception when MIIRXDV is active. |
| MDIO_CK | O | Management data clock. The MDIO data clock is sourced by the MDIO module on the system. MDIO_CK is used to synchronize MDIO data access operations done on the MDIO pin. The frequency of this clock is controlled by the CLKDIV bits in the MDIO Control Register (CONTROL). |
| MDIO_D | I/O | Management data input output. The MDIO data pin drives PHY management data into and out of the PHY by way of an access frame that consists of start-of-frame, read/write indication, PHY address, register address, and data bit cycles. The MDIO_D pin acts as an output for all but the data bit cycles, at which time the pin is an input for read operations. |

(1) I = Input, O = Output, I/O = Input/Output

5.12 Control Subsystem Peripherals

Control Subsystem peripherals are accessible from the C28x CPU through the C28x Memory Bus, and from the C28x DMA through the C28x DMA Bus. They include one NMI Watchdog, three Timers, four Serial Port Peripherals (SCI, SPI, McBSP, I2C), and three types of Control Peripherals (ePWM, eQEP, eCAP). Additionally, the C28x CPU/DMA also have access to the EPI, and to Analog and Shared peripherals (see [Section 5.10](#)).

For detailed information on the processor peripherals, see the [Concerto F28M36x Technical Reference Manual](#).

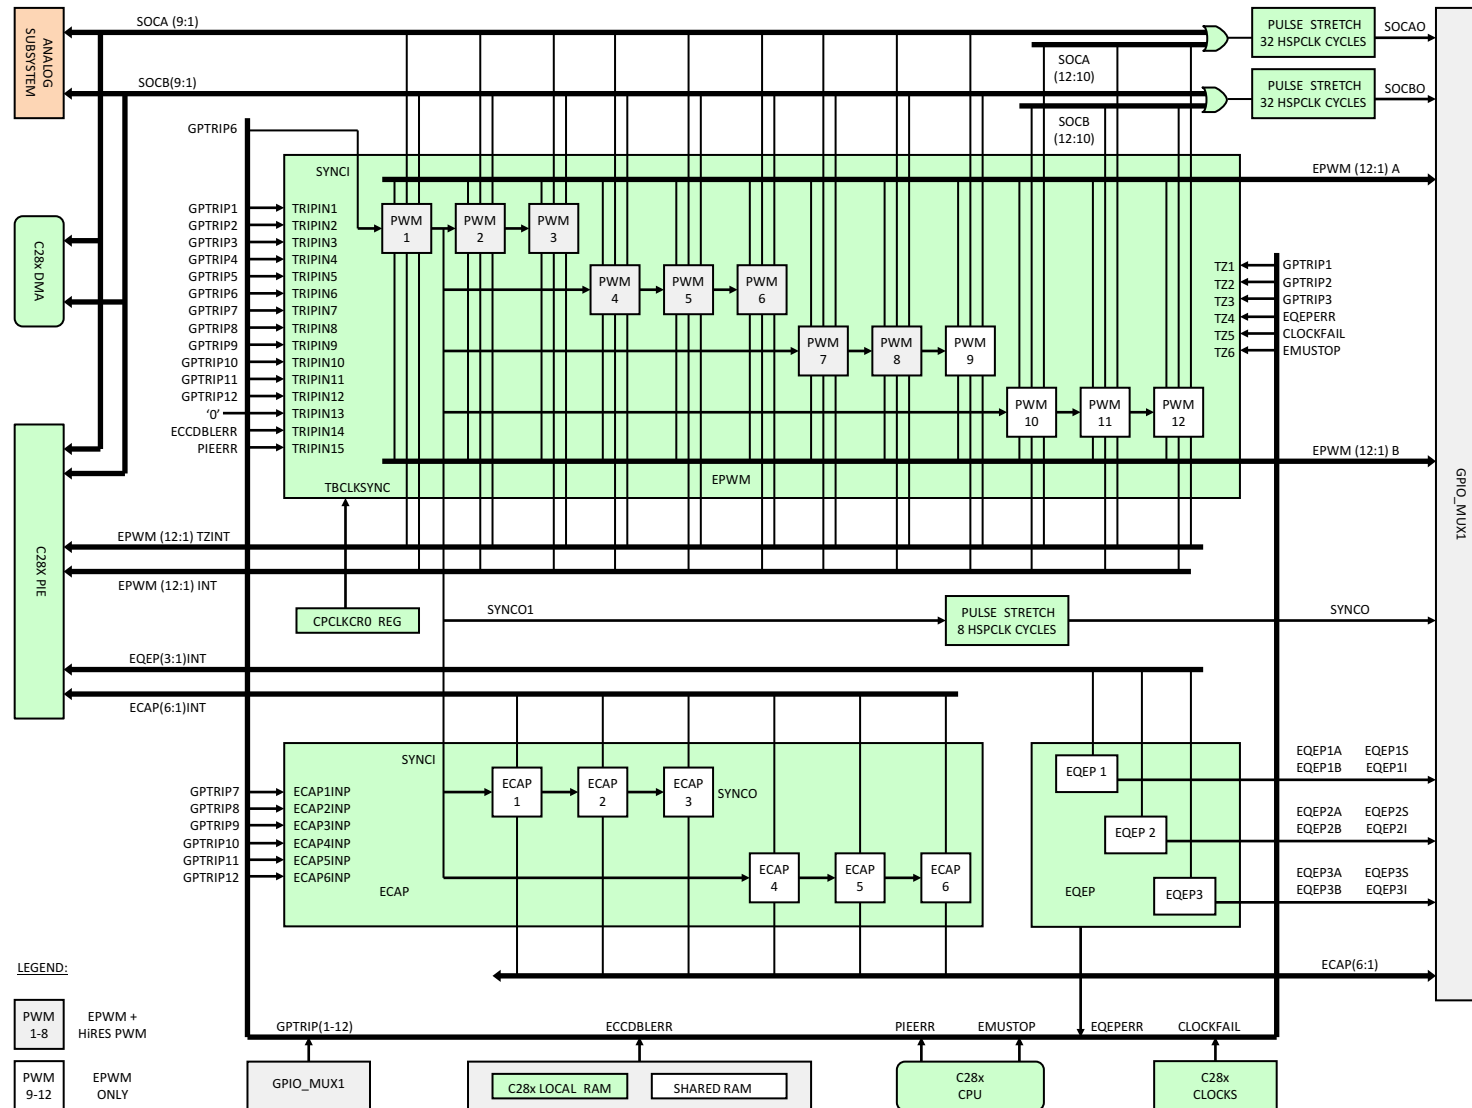

5.12.1 High-Resolution PWM and Enhanced PWM Modules

There are 12 PWM modules in the Concerto device. Eight of these are of the HRPWM type with high-resolution control on both A and B signal outputs, and four are of the ePWM type. The HRPWM modules have all the features of the ePWM plus they offer significantly higher PWM resolution (time granularity on the order of 150 ps). [Figure 5-43](#) shows the eight HRPWM modules (PWM 1–8) and four ePWM modules (PWM 9–PWM12).

The synchronization inputs to the PWM modules include the SYNCI signal from the GPTRIP1 output of GPIO_MUX1, and the TBCLKSYNC signal from the CPCLKCR0 register. Synchronization output SYNCO1 comes from the ePWM1 module and is stretched by 8 HSPCLK cycles before entering GPIO_MUX1. There are two groups of trip signal inputs to PWM modules. TRIP1–15 inputs come from GPTRIP1–12 (from GPIO_MUX1), ECCDBLERR signal (from C28x Local and Shared RAM), and PIEERR signal from the C28x CPU. TZ1–6 (Trip Zone) inputs come from GPTRIP 1–3 (from GPIO_MUX1), EQEPERR (from the eQEP peripheral), CLOCKFAIL (from M3 CLOCKS), and EMUSTOP (from the C28x CPU).

There are 12 SOCA PWM outputs and 12 SOCB PWM outputs—a pair from each PWM module. The 12 SOCA outputs are OR-ed together and stretched by 32 HSPCLK cycles before entering GPIO_MUX1 as a single SOCAO signal. The 12 SOCB outputs are OR-ed together and stretched by 32 HSPCLK cycles before entering GPIO_MUX1 as a single SOCBO signal. The 18 SOCA/B outputs from PWM1–PWM9 also go to the Analog Subsystem, where they can be selected to become conversion triggers to ADC modules.

The 12 PWM modules also drive two other sets of outputs which can interrupt the C28x CPU through the C28x PIE block. These are 12 EPWMINT interrupts and 12 EPWMTZINT trip-zone interrupts. See [Figure 5-44](#) for the internal structure of the HRPWM and ePWM modules. The green-colored blocks are common to both ePWM and HRPWM modules, but only the HRPWMs have the grey-colored hi-resolution blocks.

5.12.1.1 HRPWM Electrical Data and Timing

Table 5-66 shows the high-resolution PWM switching characteristics.

Table 5-66. High-Resolution PWM Characteristics at SYSCLKOUT = (60–150 MHz)

| PARAMETER | MIN | TYP | MAX | UNIT |
|---|-----|-----|-----|------|
| Micro Edge Positioning (MEP) step size ⁽¹⁾ | | 150 | 310 | ps |

- (1) The MEP step size will be largest at high temperature and minimum voltage on V_{DD}. MEP step size will increase with higher temperature and lower voltage and decrease with lower temperature and higher voltage. Applications that use the HRPWM feature should use MEP Scale Factor Optimizer (SFO) estimation software functions. See the TI software libraries for details of using SFO function in end applications. SFO functions help to estimate the number of MEP steps per SYSCLKOUT period dynamically while the HRPWM is in operation.

5.12.1.2 ePWM Electrical Data and Timing

Table 5-67 shows the PWM timing requirements and Table 5-68 shows the PWM switching characteristics.

Table 5-67. ePWM Timing Requirements⁽¹⁾

| | | MIN | MAX | UNIT |
|------------------------|----------------------|---|-----|--------|
| t _w (SYCIN) | Asynchronous | 2t _c (SCO) | | cycles |
| | Synchronous | 2t _c (SCO) | | cycles |
| | With input qualifier | 1t _c (SCO) + t _w (IQSW) | | cycles |

- (1) For an explanation of the input qualifier parameters, see Table 5-27.

Table 5-68. ePWM Switching Characteristics

over recommended operating conditions (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | MAX | UNIT |
|-------------------------------------|---|-----------------------|-----|--------|
| t _w (PWM) | Pulse duration, PWMx output high/low | 20 | | ns |
| t _w (SYNCOUT) | Sync output pulse width | 8t _c (SCO) | | cycles |
| t _d (PWM)t _{za} | Delay time, trip input active to PWM forced high Delay time, trip input active to PWM forced low | no pin load | 25 | ns |
| t _d (TZ-PWM)HZ | Delay time, trip input active to PWM Hi-Z | | 20 | ns |

5.12.1.2.1 Trip-Zone Input Timing

Table 5-69. Trip-Zone Input Timing Requirements⁽¹⁾

| | | MIN | MAX | UNIT |
|-------------|--|-----------------------------|-----|--------|
| $t_{w(TZ)}$ | Pulse duration, \overline{TZx} input low | | | |
| | Asynchronous | $1t_{c(SCO)}$ | | cycles |
| | Synchronous | $2t_{c(SCO)}$ | | cycles |
| | With input qualifier | $1t_{c(SCO)} + t_{w(IQSW)}$ | | cycles |

(1) For an explanation of the input qualifier parameters, see Table 5-27.

- A. \overline{TZ} - $\overline{TZ1}$, $\overline{TZ2}$, $\overline{TZ3}$, $\overline{TZ4}$, $\overline{TZ5}$, $\overline{TZ6}$
- B. PWM refers to all the PWM pins in the device. The state of the PWM pins after \overline{TZ} is taken high depends on the PWM recovery software.

Figure 5-45. PWM Hi-Z Characteristics

5.12.2 Enhanced Capture Module

There are six identical eCAP modules in Concerto devices: eCAP1, 2, 3, 4, 5, and 6. Each eCAP module represents one complete capture channel. Its main function is to accurately capture the timings of external events. One can also use eCAP modules for PWM, when they are not being used for input captures. This secondary function is selected by flipping the CAP/APWM bit of the ECCTL2 Register. For PWM function, the counter operates in count-up mode, providing a time base for asymmetrical pulse width (PWM) waveforms. The CAP1 and CAP2 registers become the period and compare registers, respectively; while the CAP3 and CAP4 registers become the shadow registers of the main period and capture registers, respectively.

The left side of [Figure 5-46](#) shows internal components associated with the capture block, and the right side depicts the PWM block. The two blocks share a set of four registers that are used in both Capture and PWM modes. Other components include the Counter block that uses the SYNCIN and SYNCOUT ports to synchronize with other modules; and the Interrupt Trigger and Flag Control block that sends Capture, PWM, and Counter events to the C28x PIE block through the ECAPxINT output. There are six ECAPxINT interrupts—one for each eCAP module.

The eCAP peripherals are clocked by C28SYSCLK, and its registers are accessible by the C28x CPU. This peripheral clock can be enabled or disabled by flipping a bit in one of the system control registers.

5.12.2.1 eCAP Electrical Data and Timing

[Table 5-70](#) shows the eCAP timing requirement and [Table 5-71](#) shows the eCAP switching characteristics.

Table 5-70. eCAP Timing Requirement⁽¹⁾

| | | MIN | MAX | UNIT |
|--------------|---------------------------|----------------------|-----------------------------|--------|

Figure 5-46. eCAP

5.12.3 Enhanced Quadrature Encoder Pulse Module

The eQEP module interfaces directly with linear or rotary incremental encoders to obtain position, direction, and speed information from rotating machines used in high-performance motion and position-control systems. There are three Type 0 eQEP modules in each Concerto device.

Each eQEP peripheral comprises five major functional blocks: Quadrature Capture Unit (QCAP), Position Counter/Control Unit (PCCU), Quadrature Decoder (QDU), Unit Time Base for speed and frequency measurement (UTIME), and Watchdog timer for detecting stalls (QWDOG). The C28x CPU controls and communicates with these modules through a set of associated registers (see [Figure 5-47](#)). The eQEP peripherals are clocked by C28SYSCLK, and its registers are accessible by the C28x CPU. This peripheral clock can be enabled or disabled by flipping a bit in one of the system control registers.

Each eQEP peripheral connects through the GPIO_MUX1 block to four device pins. Two of the four pins are always inputs, while the other two can be inputs or outputs, depending on the operating mode. The PCCU block of each eQEP also drives one interrupt to the C28x PIE. There is a total of three EQEPxINT interrupts—one from each of the three eQEP modules.

5.12.3.1 eQEP Electrical Data and Timing

[Table 5-72](#) shows the eQEP timing requirement and [Table 5-73](#) shows the eQEP switching characteristics.

Table 5-72. eQEP Timing Requirements⁽¹⁾

| | | | MIN | MAX | UNIT |
|------------------------|---------------------------|--|---|-----|--------|
| t _{w(QEPP)} | QEP input period | Asynchronous ⁽²⁾ /synchronous | 2t _{c(SCO)} | | cycles |
| | | With input qualifier | 2[1t _{c(SCO)} + t _{w(IQSW)}] | | cycles |
| t _{w(INDEXH)} | QEP Index Input High time | Asynchronous ⁽²⁾ /synchronous | 2t _{c(SCO)} | | cycles |
| | | With input qualifier | 2t _{c(SCO)} + t _{w(IQSW)} | | cycles |

5.12.4 C28x Inter-Integrated Circuit Module

This device has one C28x I2C peripheral. The I2C provides an interface between a Concerto device and devices compliant with the NXP® *I²C-bus specification and user manual* (UM10204) and connected by way of an I2C bus. External components attached to this 2-wire serial bus can transmit 1-bit to 8-bit data to and receive 1-bit to 8-bit data from the device through the I2C module.

NOTE

A unit of data transmitted or received by the I2C module can have fewer than 8 bits; however, for convenience, a unit of data is called a **data byte** in this section. The number of bits in a data byte is selectable through the BC bits of the mode register, I2CMR.

The I2C module has the following features:

- Compliance with the NXP *I²C-bus specification and user manual* (UM10204):
 - Support for 1-bit to 8-bit format transfers
 - 7-bit and 10-bit addressing modes
 - General call
 - START byte mode
 - Support for multiple master-transmitters and slave-receivers
 - Support for multiple slave-transmitters and master-receivers
 - Combined master transmit-and-receive and receive-and-transmit mode
 - Data transfer rate of from 10 Kbps up to 400 Kbps (I2C Fast-mode rate)
- One 4-word receive FIFO and one 4-word transmit FIFO
- One interrupt that can be used by the CPU. This interrupt can be generated as a result of one of the following conditions:
 - Transmit-data ready
 - Receive-data ready
 - Register-access ready
 - No-acknowledgment received
 - Arbitration lost
 - Stop condition detected
 - Addressed as slave
- An additional interrupt that can be used by the CPU when in FIFO mode
- Module enable or disable capability
- Free data format mode

The I2C module does not support:

- High-speed mode (Hs-mode)
- CBUS-compatibility mode

Figure 5-48 shows the C28x I2C peripheral.

Figure 5-48. I2C (C28x)

5.12.4.1 Functional Overview

Each device connected to an I2C Bus is recognized by a unique address. Each device can operate as either a transmitter or a receiver, depending on the function of the device. A device connected to the I2C Bus can also be considered as the master or the slave when performing data transfers. A master device is the device that initiates a data transfer on the bus and generates the clock signals to permit that transfer. During this transfer, any device addressed by this master is considered a slave. The I2C module supports the multi-master mode, in which one or more devices capable of controlling an I2C Bus can be connected to the same I2C Bus.

For data communication, the I2C module has a serial data pin (SDA) and a serial clock pin (SCL). These two pins carry information between the C28x device and other devices connected to the I2C Bus. The SDA and SCL pins both are bidirectional. They each must be connected to a positive supply voltage using a pullup resistor. When the bus is free, both pins are high. The driver of these two pins has an open-drain configuration to perform the required wired-AND function. There are two major transfer techniques:

1. Standard Mode: Send exactly n data values, where n is a value you program in an I2C module register.
2. Repeat Mode: Keep sending data values until you use software to initiate a STOP condition or a new START condition.

The I2C module consists of the following primary blocks:

- A serial interface: one data pin (SDA) and one clock pin (SCL)
- Data registers and FIFOs to temporarily hold receive data and transmit data traveling between the SDA pin and the CPU
- Control and status registers
- A peripheral bus interface to enable the CPU to access the I2C module registers and FIFOs.

5.12.4.2 Clock Generation

The device clock generator receives a signal from an external clock source and produces an I2C input clock with a programmed frequency. The I2C input clock is equivalent to the CPU clock and is then divided twice more inside the I2C module to produce the module clock and the master clock.

5.12.4.3 I2C Electrical Data and Timing

Table 5-74. I2C Timing

| | | TEST CONDITIONS | MIN | MAX | UNIT |
|-------------------|---|---|------------------------|-----------------------|------|
| f _{SCL} | SCL clock frequency | I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately | | 400 | kHz |
| V _{il} | Low level input voltage | | | 0.3 V _{DDIO} | V |
| V _{ih} | High level input voltage | | 0.7 V _{DDIO} | | V |
| V _{hys} | Input hysteresis | | 0.05 V _{DDIO} | | V |
| V _{ol} | Low level output voltage | 3 mA sink current | 0 | 0.4 | V |
| t _{LOW} | Low period of SCL clock | I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately | 1.3 | | μs |
| t _{HIGH} | High period of SCL clock | I2C clock module frequency is between 7 MHz and 12 MHz and I2C prescaler and clock divider registers are configured appropriately | 0.6 | | μs |
| I _i | Input current with an input voltage between 0.1 V _{DDIO} and 0.9 V _{DDIO} MAX | | -10 | 10 | μA |

5.12.5 C28x Serial Communications Interface

This device has one SCI peripheral. SCI is a two-wire asynchronous serial port, commonly known as a UART. The SCI module supports digital communications between the CPU and other asynchronous peripherals that use the standard non-return-to-zero (NRZ) format

The SCI receiver and transmitter each have a 16-level-deep FIFO for reducing servicing overhead, and each has its own separate enable and interrupt bits. Both can be operated independently for half-duplex communication, or simultaneously for full-duplex communication. To specify data integrity, the SCI checks received data for break detection, parity, overrun, and framing errors. The bit rate is programmable to different speeds through a 16-bit baud-select register.

Features of the SCI module include:

- Two external pins:
 - SCITXD: SCI transmit-output pin
 - SCIRXD: SCI receive-input pin
 - NOTE:** Both pins can be used as GPIO if not used for SCI.
 - Baud rate programmable to 64K different rates
- Data-word format
 - One start bit
 - Data-word length programmable from 1 to 8 bits
 - Optional even/odd/no parity bit
 - One or two stop bits
- Four error-detection flags: parity, overrun, framing, and break detection
- Two wake-up multiprocessor modes: idle-line and address bit
- Half- or full-duplex operation
- Double-buffered receive and transmit functions
- Transmitter and receiver operations can be accomplished through interrupt-driven or polled algorithms with status flags.
 - Transmitter: TXRDY flag (transmitter-buffer register is ready to receive another character) and TX EMPTY flag (transmitter-shift register is empty)
 - Receiver: RXRDY flag (receiver-buffer register is ready to receive another character), BRKDT flag (break condition occurred), and RX ERROR flag (monitoring four interrupt conditions)
- Separate enable bits for transmitter and receiver interrupts (except BRKDT)
- NRZ format

NOTE

All registers in this module are 8-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (bits 7–0), and the upper byte (bits 15–8) is read as zeros. Writing to the upper byte has no effect.

- Auto baud-detect hardware logic
- 16-level transmit and receive FIFO

Figure 5-49 shows the C28x SCI peripheral.

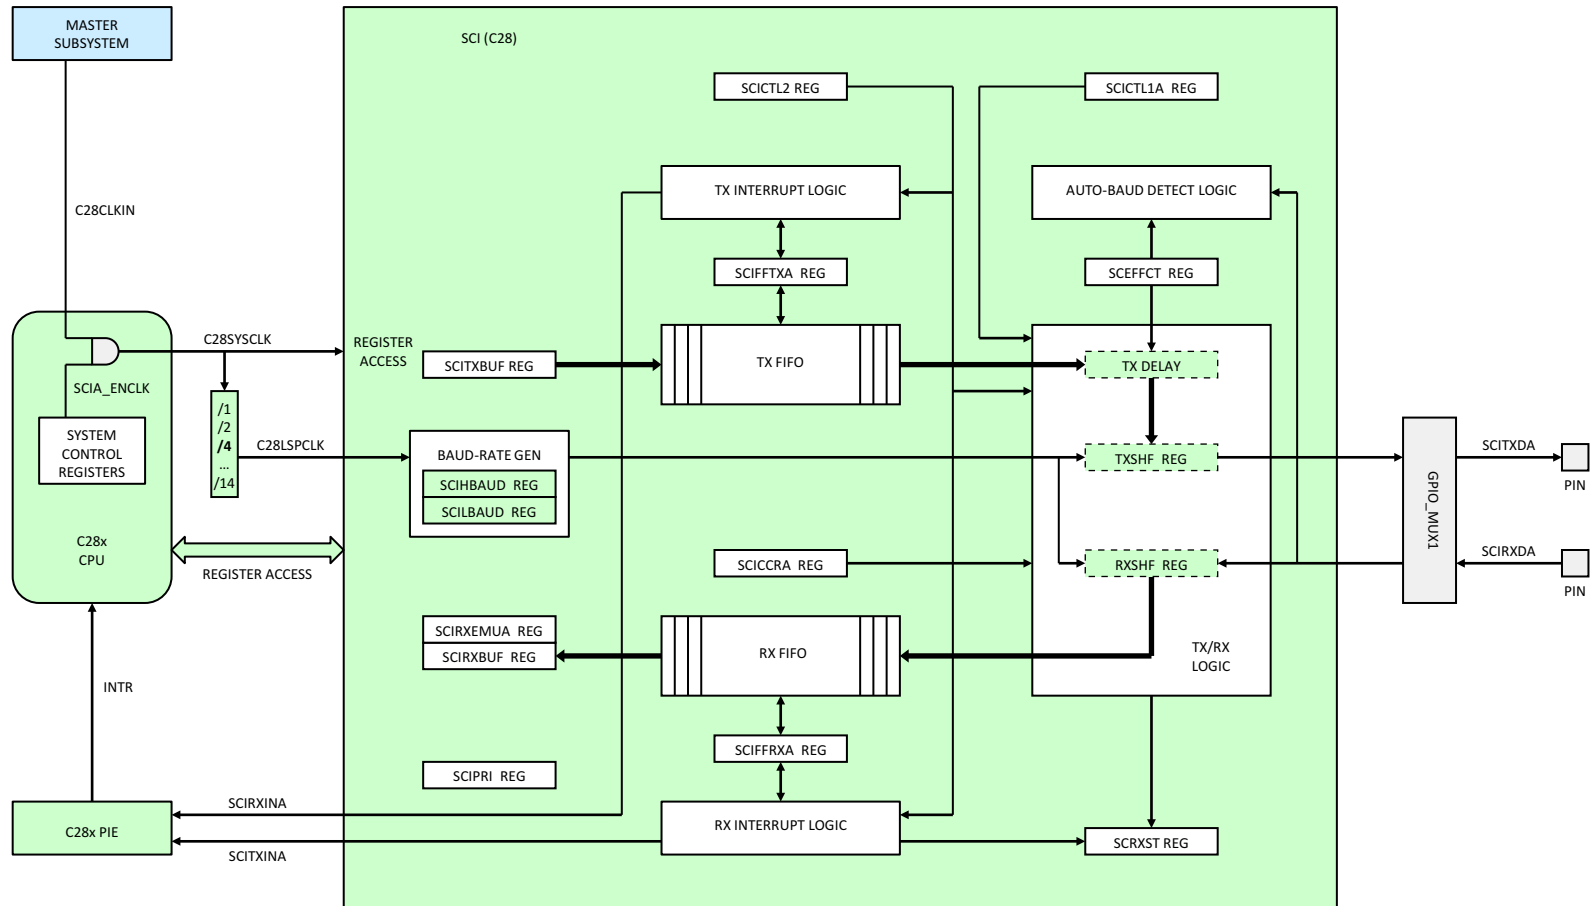

Figure 5-49. SCI (C28x)

5.12.5.1 Architecture

The major elements used in full-duplex operation include:

- A transmitter (TX) and its major registers:
 - SCITXBUF register – Transmitter Data Buffer register. Contains data (loaded by the CPU) to be transmitted
 - TXSHF register – Transmitter Shift register. Accepts data from the SCITXBUF register and shifts data onto the SCITXD pin, 1 bit at a time
- A receiver (RX) and its major registers:
 - RXSHF register – Receiver Shift register. Shifts data in from the SCIRXD pin, 1 bit at a time
 - SCIRXBUF register – Receiver Data Buffer register. Contains data to be read by the CPU. Data from a remote processor is loaded into the RXSHF register and then into the SCIRXBUF and SCIRXEMU registers
- A programmable baud generator
- Data-memory-mapped control and status registers enable the CPU to access the I2C module registers and FIFOs.

The SCI receiver and transmitter can operate either independently or simultaneously.

5.12.5.2 Multiprocessor and Asynchronous Communication Modes

The SCI has two multiprocessor protocols: the idle-line multiprocessor mode and the address-bit multiprocessor mode. These protocols allow efficient data transfer between multiple processors.

The SCI offers the UART communications mode for interfacing with many popular peripherals. The asynchronous mode requires two lines to interface with many standard devices such as terminals and printers that use RS-232-C formats.

Data transmission characteristics include:

- One start bit
- One to eight data bits
- An even/odd parity bit or no parity bit
- One or two stop bits with a programmed frequency

5.12.6 C28x Serial Peripheral Interface

This device has one C28x SPI. The SPI is a high-speed synchronous serial input/output (I/O) port that allows a serial bit stream of programmed length (1 to 16 bits) to be shifted into and out of the device at a programmed bit-transfer rate. The SPI is normally used for communications between the DSP controller and external peripherals or another controller. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multi-device communications are supported by the master/slave operation of the SPI. The port supports a 16-level, receive-and-transmit FIFO for reducing CPU servicing overhead.

The SPI module features include:

- SPISOMI: SPI slave-output/master-input pin
 - SPISIMO: SPI slave-input/master-output pin
 - SPISTE: SPI slave transmit-enable pin
 - SPICLK: SPI serial-clock pin
- NOTE:** All four pins can be used as GPIO, if the SPI module is not used.
- Two operational modes: master and slave
 - Baud rate: 125 different programmable rates. The maximum baud rate that can be employed is limited by the maximum speed of the I/O buffers used on the SPI pins.
 - Data word length: 1 to 16 data bits
 - Four clocking schemes (controlled by clock polarity and clock phase bits) include:
 - Falling edge without phase delay: SPICLK active-high. SPI transmits data on the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
 - Falling edge with phase delay: SPICLK active-high. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge without phase delay: SPICLK inactive-low. SPI transmits data on the rising edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
 - Rising edge with phase delay: SPICLK inactive-low. SPI transmits data one half-cycle ahead of the rising edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
 - Simultaneous receive-and-transmit operation (transmit function can be disabled in software)
 - Transmitter and receiver operations are accomplished through either interrupt-driven or polled algorithms.
 - Twelve SPI module control registers: Located in control register frame beginning at address 7040h.

NOTE

All registers in this module are 16-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (bits 7–0), and the upper byte (bits 15–8) is read as zeros. Writing to the upper byte has no effect.

- 16-level transmit and receive FIFO
- Delayed transmit control

Figure 5-50 shows the C28x SPI peripheral.

(1) RX FIFO AND TX FIFO CAN BE BYPASSED BY CONFIGURING BIT SPIFFENA OF THE SPIFFTX REGISTER

Figure 5-50. SPI (C28x)

5.12.6.1 Functional Overview

The SPI operates in master or slave mode. The master initiates data transfer by sending the SPICLK signal. For both the slave and the master, data is shifted out of the shift registers on one edge of the SPICLK and latched into the shift register on the opposite SPICLK clock edge. If the CLOCK PHASE bit (SPICLK.3) is high, data is transmitted and received a half-cycle before the SPICLK transition. As a result, both controllers send and receive data simultaneously. The application software determines whether the data is meaningful or dummy data. There are three possible methods for data transmission:

- Master sends data; slave sends dummy data
- Master sends data; slave sends data
- Master sends dummy data; slave sends data

The master can initiate a data transfer at any time because it controls the SPICLK signal. The software, however, determines how the master detects when the slave is ready to broadcast data.

5.12.6.2 SPI Electrical Data and Timing

This section contains both Master Mode and Slave Mode timing data.

5.12.6.2.1 Master Mode Timing

Table 5-75 lists the master mode timing (clock phase = 0) and Table 5-76 lists the master mode timing (clock phase = 1). Figure 5-51 and Figure 5-52 show the timing waveforms.

Table 5-75. SPI Master Mode External Timing (Clock Phase = 0)⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

over recommended operating conditions (unless otherwise noted)

| NO. | PARAMETER | BRR EVEN | | BRR ODD | | UNIT |
|-----|--|---|-----------------------|--|--|------|
| | | MIN | MAX | MIN | MAX | |
| 1 | $t_{c(SPC)M}$ Cycle time, SPICLK | $4t_{c(LSPCLK)}$ | $128t_{c(LSPCLK)}$ | $5t_{c(LSPCLK)}$ | $127t_{c(LSPCLK)}$ | ns |
| 2 | $t_{w(SPC1)M}$ Pulse duration, SPICLK first pulse | $0.5t_{c(SPC)M} - 10$ | $0.5t_{c(SPC)M} + 10$ | $0.5t_{c(SPC)M} + 0.5t_{c(LSPCLK)} - 10$ | $0.5t_{c(SPC)M} + 0.5t_{c(LSPCLK)} + 10$ | ns |
| 3 | $t_{w(SPC2)M}$ Pulse duration, SPICLK second pulse | $0.5t_{c(SPC)M} - 10$ | $0.5t_{c(SPC)M} + 10$ | $0.5t_{c(SPC)M} - 0.5t_{c(LSPCLK)} - 10$ | $0.5t_{c(SPC)M} - 0.5t_{c(LSPCLK)} + 10$ | ns |
| 4 | $t_{d(SIMO)M}$ Delay time, SPICLK to SPISIMO valid | | 10 | | 10 | ns |
| 5 | $t_{v(SIMO)M}$ Valid time, SPISIMO valid after SPICLK | $0.5t_{c(SPC)M} - 10$ | | $0.5t_{c(SPC)M} - 0.5t_{c(LSPCLK)} - 10$ | | ns |
| 8 | $t_{su(SOMI)M}$ Setup time, SPISOMI before SPICLK | 35 | | 35 | | ns |
| 9 | $t_{h(SOMI)M}$ Hold time, SPISOMI valid after SPICLK | 0 | | 0 | | ns |

- (1) The MASTER / SLAVE bit (SPICTL.2) is cleared and the CLOCK PHASE bit (SPICTL.3) is cleared.
- (2) $t_{c(SPC)} = \text{SPI clock cycle time} = \text{LSPCLK}/4$ or $\text{LSPCLK}/(\text{SPIBRR} + 1)$
- (3) Internal clock prescalers must be adjusted such that the SPI clock speed is limited to the following SPI clock rate:
Master mode transmit 25-MHz MAX, master mode receive 12.5-MHz MAX
Slave mode transmit 12.5-MHz MAX, slave mode receive 12.5-MHz MAX.
- (4) The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPICCR.6).

Figure 5-54. SPI Slave Mode External Timing (Clock Phase = 1)

5.12.7 C28x Multichannel Buffered Serial Port

This device provides one high-speed McBSP that allows direct interface to codecs and other devices. The CPU accesses data, control, and status information. The McBSP also supports μ DMA transfers.

The McBSP consists of a data-flow path and a control path connected to external devices by six pins. Data is communicated to devices interfaced with the McBSP through the data transmit (DX) pin for transmission and through the data receive (DR) pin for reception. Control information in the form of clocking and frame synchronization is communicated through the following pins: CLKX (transmit clock), CLKR (receive clock), FSX (transmit frame synchronization), and FSR (receive frame synchronization).

The CPU and the DMA controller communicate with the McBSP through 16-bit-wide registers accessible through the internal peripheral bus. The CPU or the DMA controller writes the data to be transmitted to the data transmit registers (DXR1, DXR2). Data written to the DXRs is shifted out to DX through the transmit shift registers (XSR1, XSR2). Similarly, receive data on the DR pin is shifted into the receive shift registers (RSR1, RSR2) and copied into the receive buffer registers (RBR1, RBR2). The contents of the RBRs is then copied to the DRRs, which can be read by the CPU or the DMA controller. This method allows simultaneous movement of internal and external data communications.

DRR2, RBR2, RSR2, DXR2, and XSR2 are not used (written, read, or shifted) if the serial word length is 8 bits, 12 bits, or 16 bits. For larger word lengths, these registers are needed to hold the most significant bits.

The frame and clock loop-back is implemented at chip level to enable CLKX and FSX to drive CLKR and FSR. If the loop-back is enabled, the CLKR and FSR get their signals from the CLKX and FSX pads instead of the CLKR and FSR pins.

McBSP features include:

- Full-duplex communication
- Double-buffered transmission and triple-buffered reception, allowing a continuous data stream
- Independent clocking and framing for reception and transmission
- The capability to send interrupts to the CPU and to send DMA events to the DMA controller
- 128 channels for transmission and reception
- Multichannel selection modes that enable or disable block transfers in each of the channels
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected A/D and D/A devices
- Support for external generation of clock signals and frame-synchronization signals
- A programmable sample rate generator for internal generation and control of clock signals and frame synchronization signals
- Programmable polarity for frame-synchronization pulses and clock signals
- Direct interface to:
 - T1/E1 framers
 - IOM-2 compliant devices
 - AC97-compliant devices (the necessary multi-phase frame capability is provided)
 - I2S compliant devices
 - SPI devices
- A wide selection of data sizes: 8, 12, 16, 20, 24, and 32 bits

NOTE

A value of the chosen data size is referred to as a **serial word** or **word** in this section. Elsewhere, **word** is used to describe a 16-bit value.

- μ -law and A-law companding
- The option of transmitting/receiving 8-bit data with the LSB first
- Status bits for flagging exception/error conditions
- ABIS mode is not supported

Figure 5-55 shows the C28x McBSP peripheral.

| | | | CLKX ext | 6 | | |

- (1) Polarity bits CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) $2P = 1/\text{CLKG}$ in ns. CLKG is the output of sample rate generator mux. $\text{CLKG} = \text{CLKSRG} / (1 + \text{CLKGDV})$. CLKSRG can be LSPCLK, CLKX, CLKR as source. $\text{CLKSRG} \leq (\text{SYSCLKOUT}/2)$. McBSP performance is limited by I/O buffer switching speed.
- (3) Internal clock prescalers must be adjusted such that the McBSP clock (CLKG, CLKX, CLKR) speeds are not greater than the I/O buffer speed limit (30 MHz).

6 Detailed Description

The Concerto MCU comprises three subsystems: the Master Subsystem, the Control Subsystem, and the Analog Subsystem. While the Master and Control Subsystem each have dedicated local memories and peripherals, they can also share data and events through shared memories and peripherals. The Analog Subsystem has two ADC converters and six Analog Comparators. Both the Master and Control Subsystems access the Analog Subsystem through the Analog Common Interface Bus (ACIB). The NMI Blocks force communication of critical events to the Master and Control Subsystem processors and their Watchdog Timers. The Reset Block responds to Watchdog Timer NMI Reset, External Reset, and other events to initialize subsystem processors and the rest of the chip to a known state. The Clocking Blocks support multiple low-power modes where clocks to the processors and peripherals can be slowed down or stopped in order to manage power consumption.

NOTE

Throughout this document, the Master Subsystem is denoted by the color blue; the Control Subsystem is denoted by the color green; and the Analog Subsystem is denoted by the color orange.

6.1 Memory Maps

Section 6.1.1 shows the Control Subsystem Memory Map. Section 6.1.2 shows the Master Subsystem Memory Map.

6.1.1 Control Subsystem Memory Map

- (1) The letter "C" refers to the Control Subsystem.
 (2) The letter "M" refers to the Master Subsystem.

6.3 Master Subsystem

The Master Subsystem includes the Cortex-M3 CPU, μ DMA, Nested Vectored Interrupt Controller (NVIC), Cortex-M3 Peripherals, and Local Memory. Additionally, the Cortex-M3 CPU and μ DMA can access the Control Subsystem through Shared Resources: IPC (CPU only), Message RAM, and Shared RAM; and read ADC Result Registers through the Analog Common Interface Bus. The Master Subsystem can also receive events from the NMI block and send events to the Resets block.

Figure 6-1 shows the Master Subsystem.

6.3.1 Cortex-M3 CPU

The 32-bit Cortex-M3 processor offers high performance, fast interrupt handling, and access to a variety of communication peripherals (including Ethernet and USB). The Cortex-M3 features a Memory Protection Unit (MPU) to provide a privileged mode for protected operating system functionality. A bus bridge adjacent to the MPU can route program instructions and data on the I-CODE and D-CODE buses that connect to the Boot ROM and Flash. Other data is typically routed through the Cortex-M3 System Bus connected to the local RAMs. The System Bus also goes to the Shared Resources block (also accessible by the Control Subsystem) and to the Analog Subsystem through the ACIB. Another bus bridge allows bus cycles from both the Cortex-M3 System Bus and those of the μ DMA bus to access the Master Subsystem peripherals (through the APB bus or the AHP bus).

Most of the interrupts to the Cortex-M3 CPU come from the NVIC, which manages the interrupt requests from peripherals and assigns handling priorities. There are also several exceptions generated by Cortex-M3 CPU that can return to the Cortex-M3 as interrupts after being prioritized with other requests inside the NVIC. In addition to programmable priority interrupts, there are also three levels of fixed-priority interrupts of which the highest priority, level-3, is given to M3PORRST and M3SYSRST resets from the Resets block. The next highest priority, level-2, is assigned to the M3NMIINT, which originates from the NMI block. The M3HRDFLT (Hard Fault) interrupt is assigned to level-1 priority, and this interrupt is caused by one of the error condition exceptions (Memory Management, Bus Fault, Usage Fault) escalating to Hard Fault because they are not enabled or not properly serviced.

The Cortex-M3 CPU has two low-power modes: Sleep and Deep Sleep.

Figure 6-1. Master Subsystem

6.3.2 Cortex-M3 DMA and NVIC

The Cortex-M3 direct memory access (μ DMA) module provides a hardware method of transferring data between peripherals, between memory, and between peripherals and memory without intervention from the Cortex-M3 CPU. The NVIC manages and prioritizes interrupt handling for the Cortex-M3 CPU.

The Cortex-M3 peripherals use REQ/DONE handshaking to coordinate data transfer requests with the μ DMA. If a DMA channel is enabled for a given peripheral, REQ/DONE from the peripheral will trigger the data transfer, following which an IRQ request may be sent from the μ DMA to the NVIC to announce to the Cortex-M3 that the transfer has completed. If a DMA channel is not enabled for a given peripheral, REQ/DONE will directly drive IRQ to the NVIC so that the Cortex-M3 CPU can transfer the data. For those peripherals that are not supported by the μ DMA, IRQs are supplied directly to the NVIC, bypassing the DMA. This case is true for both Watchdogs, CANs, I2Cs, and the Analog-to-Digital Converters sending ADCINT[8:1] interrupts from the Analog Subsystem. The NMI Watchdog does not send any events to the μ DMA or the NVIC (only to the Resets block).

6.3.3 Cortex-M3 Interrupts

Table 6-14 shows all interrupt assignments for the Cortex-M3 processor. Most interrupts (16–107) are associated with interrupt requests from Cortex-M3 peripherals. The first 15 interrupts (1–15) are processor exceptions generated by the Cortex-M3 core itself. These processor exceptions are detailed in Table 6-15.

Table 6-14. Interrupts from NVIC to Cortex-M3

| INTERRUPT NUMBER (BIT IN INTERRUPT REGISTERS) | VECTOR NUMBER | VECTOR ADDRESS OR OFFSET | DESCRIPTION |
|---|---------------|-----------------------------|-------------------------|
| – | 0–15 | 0x0000.0000–0x0000.003C | Processor exceptions |

| Interrupts | programmable | 16 and above | 0x0000.0040 and above | Asynchronous |

(1) 0 is the default priority for all the programmable priorities

6.3.4 Cortex-M3 Vector Table

Each peripheral interrupt of [Table 6-14](#) is assigned an address offset containing the location of the peripheral interrupt handler (relative to the vector table base) for that particular interrupt (vector numbers 16–107).

Similarly, each exception interrupt of [Table 6-15](#) (including Reset) is also assigned an address offset containing the location of the exception interrupt handler (relative to the vector table base) for that particular interrupt (vector numbers 1–15).

In addition to interrupt vectors, the vector table also contains the initial stack pointer value at table location 0.

Following system reset, the vector table base is fixed at address 0x0000.0000. Privileged software can write to the Vector Table Offset (VTABLE) register to relocate the vector table start address to a different memory location, in the range 0x0000 0200 to 0x3FFF FE00. When configuring the VTABLE register, the offset must be aligned on a 512-byte boundary.

6.3.5 Cortex-M3 Local Peripherals

The Cortex-M3 local peripherals include two Watchdogs, an NMI Watchdog, four General-Purpose Timers, four SSI peripherals, two CAN peripherals, five UARTs, two I2C peripherals, Ethernet, USB + PHY, EPI, and μ CRC (Cyclic Redundancy Check). The USB and EPI are accessible through the AHB Bus (Advanced High-Performance Bus). The EPI peripheral is also accessible from the Control Subsystem. The remaining peripherals are accessible through the APB Bus (Advanced Peripheral Bus). The APB and AHB bus cycles originate from the CPU System Bus or the μ DMA Bus through a bus bridge.

While the Cortex-M3 CPU has access to all the peripherals, the μ DMA has access to most, with the exception of the μ CRC, Watchdogs, NMI Watchdog, CAN peripherals, and the I2C peripheral. The Cortex-M3 peripherals connect to the Concerto device pins through GPIO_MUX1. Most of the peripherals also generate event signals for the μ DMA and the NVIC. The Watchdogs receive M3SWRST from the NVIC (triggered by software) and send M3WDRST[1:0] reset requests to the Reset block. The NMI Watchdog receives the M3NMI event from the NMI block and sends the M3NMIRST request to the Resets block.

See [Section 5.11](#) for more information on the Cortex-M3 peripherals.

6.3.6 Cortex-M3 Local Memory

The Local Memory includes Boot ROM; Secure Flash with ECC; Secure C0/C1 RAM with ECC; and C2/C3 RAM with Parity Error Checking. The Boot ROM and Flash are both accessible through the I-CODE and D-CODE Buses. Flash registers can also be accessed by the Cortex-M3 CPU through the APB Bus. All Local Memory is accessible from the Cortex-M3 CPU; the C2/C3 RAM is also accessible by the μ DMA.

Two types of error correction events can be generated during access of the Local Memory: uncorrectable errors and single errors. The uncorrectable errors (including one from the Shared Memories) generate a Bus Fault Exception to the Cortex-M3 CPU. The less critical single errors go to the NVIC where they can result in maskable interrupts to the Cortex-M3 CPU.

6.3.7 Cortex-M3 Accessing Shared Resources and Analog Peripherals

There are several memories, digital peripherals, and analog peripherals that can be accessed by both the Master and Control Subsystems. They are grouped into Shared Resources and the Analog Subsystem.

The Shared Resources include the EPI, IPC registers, MTOC Message RAM, CTOM Message RAM, and eight individually configurable Shared RAM blocks. The RAMs of the Shared Resources block have Parity Error Checking.

The Message RAMs and the Shared RAMs can be accessed by the Cortex-M3 CPU and μ DMA. The MTOC Message RAM is intended for sending data from the Master Subsystem to the Control Subsystem, having R/W access for the Cortex-M3/ μ DMA and read-only access for the C28x/DMA. The CTOM Message RAM is intended for sending data from the Control Subsystem to the Master Subsystem, having R/W access for the C28x/DMA and read-only access for the Cortex-M3/ μ DMA.

The IPC registers provide up to 32 handshaking channels to coordinate the transfer of data through the Message RAMs by polling. Four of these channels are also backed up by four interrupts to PIE on the Control Subsystem side, and four interrupts to the NVIC on the Master Subsystem side (to reduce delays associated with polling).

The eight Shared RAM blocks are similar to the Message RAMs, in that the data flow is only one way; however, the direction of the data flow can be individually set for each block to be from Master to Control Subsystem or from Control to Master Subsystem.

The Analog Subsystem has ADC1, ADC2, and Analog Comparator peripherals that can be accessed through the Analog Common Interface Bus. The ADC Result Registers are accessible by CPUs and DMAs of the Master and Control Subsystems. All other Analog Peripheral Registers are accessible by the C28x CPU only. The Cortex-M3 CPU accesses the ACIB through the System Bus, and the μ DMA through the μ DMA Bus. The ACIB arbitrates for access to the ADC and Analog Comparator registers between CPU/DMA bus cycles of the Master Subsystem with those of the Control Subsystem. In addition to managing bus cycles, the ACIB also transfers End-of-Conversion ADC interrupts to the Master Subsystem (as well as to the Control Subsystem). The eight EOC sources from ADC1 and the eight EOC sources from ADC2 are AND-ed together by the ACIB, with the resulting eight ADC interrupts going to destinations in both the Master Subsystem and the Control Subsystem.

See [Section 5.10](#) for more information on shared resources and analog peripherals.

6.4 Control Subsystem

The Control Subsystem includes the C28x CPU/FPU/VCU, Peripheral Interrupt Expansion (PIE) block, DMA, C28x Peripherals, and Local Memory. Additionally, the C28x CPU and DMA have access to Shared Resources: IPC (CPU only), Message RAM, and Shared RAM; and to Analog Peripherals through the Analog Common Interface Bus.

[Figure 6-2](#) shows the Control Subsystem.

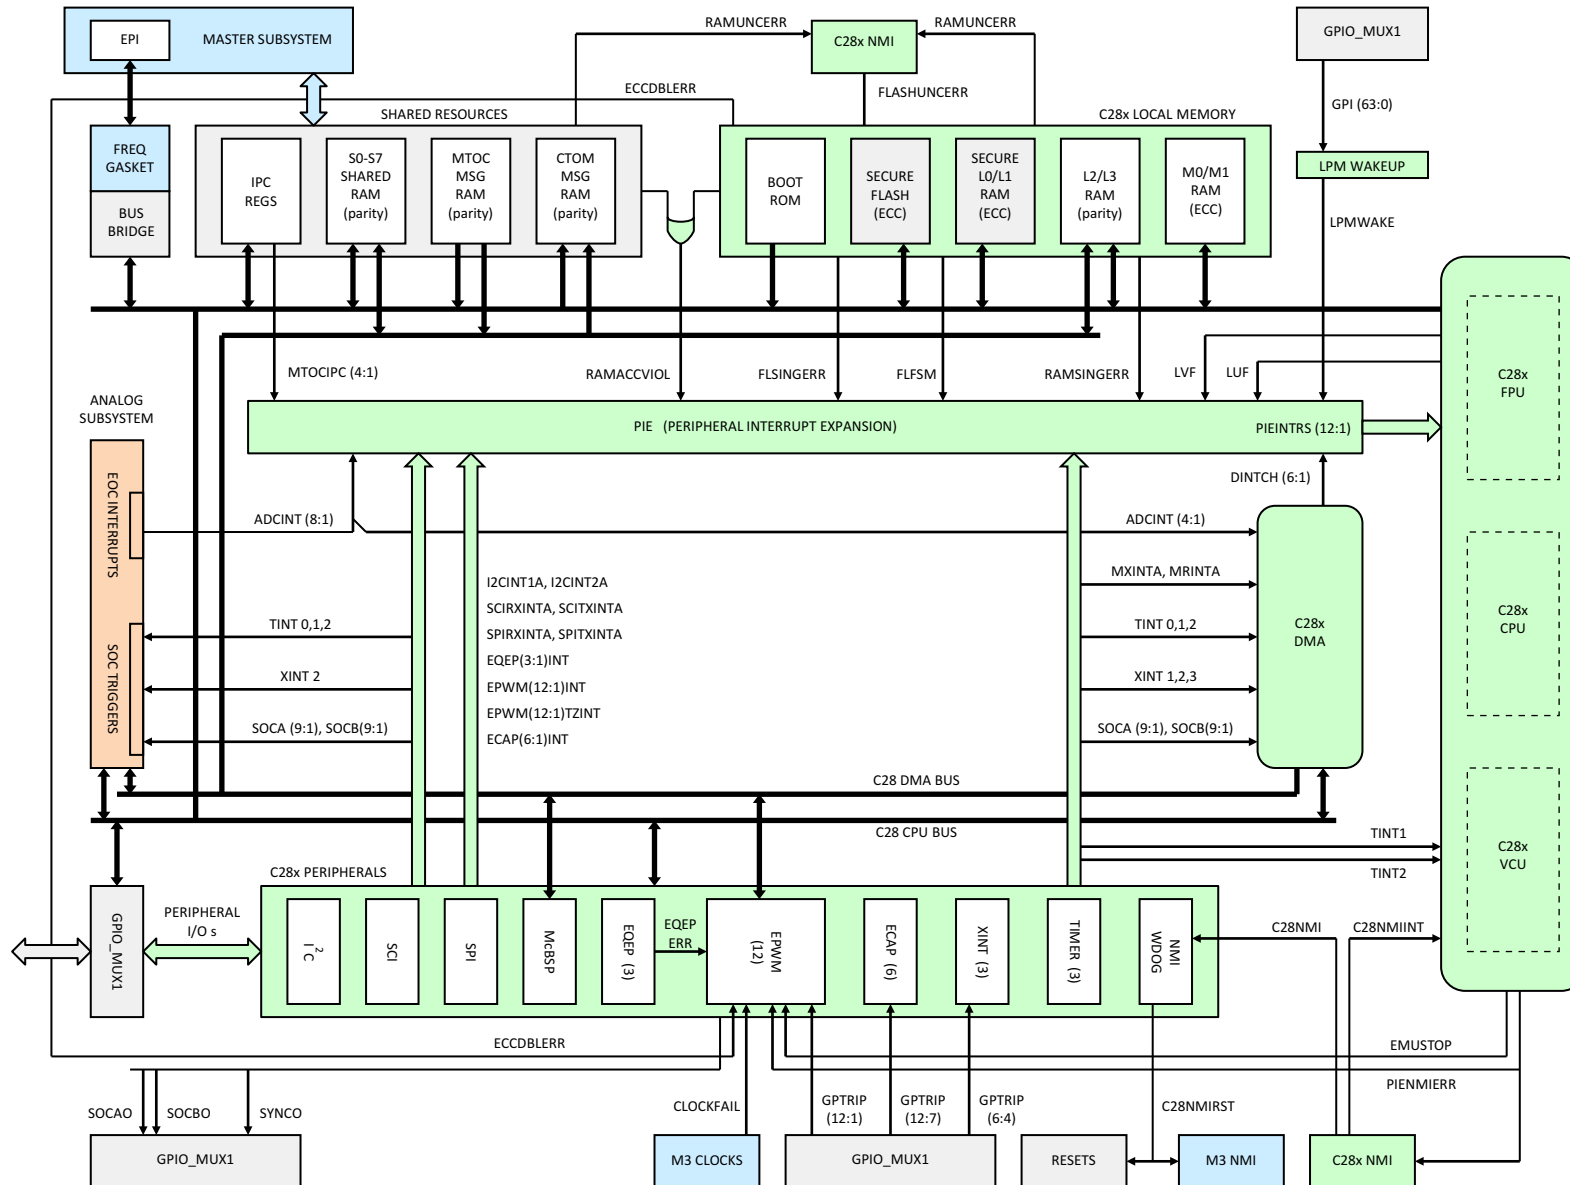

Figure 6-2. Control Subsystem

6.4.1 C28x CPU/FPU/VCU

The F28M36x Concerto MCU family is a member of the TMS320C2000 MCU platform. The Concerto C28x CPU/FPU has the same 32-bit fixed-point architecture as TI's existing [Entry performance MCUs](#), combined with a single-precision (32-bit) IEEE 754 FPU of TI's existing [Premium performance MCUs](#). Each F28M36x device is a very efficient C/C++ engine, enabling users to develop their system control software in a high-level language. Each F28M36x device also enables math algorithms to be developed using C/C++. The device is equally efficient at DSP math tasks and at system control tasks. The 32 × 32-bit MAC 64-bit processing capabilities enable the controller to handle higher numerical resolution problems efficiently. With the addition of the fast interrupt response with automatic context save of critical registers, the device is capable of servicing many asynchronous events with minimal latency. The device has an 8-level-deep protected pipeline with pipelined memory accesses. This pipelining enables the device to execute at high speeds without resorting to expensive high-speed memories. Special branch-look-ahead hardware minimizes the latency for conditional discontinuities. Special conditional store operations further improve performance. The VCU extends the capabilities of the C28x CPU and C28x+FPU processors by adding additional instructions to accelerate Viterbi, Complex Arithmetic, 16-bit FFTs, and CRC algorithms. No changes have been made to existing instructions, pipeline, or memory bus architecture. Therefore, programs written for the C28x are completely compatible with the C28x+VCU.

There are two events generated by the FPU block that go to the C28x PIE: LVF and LUV. Inside PIE, these and other events from C28x peripherals and memories result in 12 PIE interrupts PIEINTS[12:1] into the C28x CPU. The C28x CPU also receives three additional interrupts directly (instead of through PIE) from Timer 1 (TINT1), from Timer 2 (TINT2), and from the NMI block (C28uNMIINT).

The C28x has two low-power modes: IDLE and STANDBY.

6.4.2 C28x Core Hardware Built-In Self-Test

The Concerto microcontroller C28x CPU core includes a HWBIST feature for testing the CPU core logic for errors. Tests using HWBIST can be initiated through a software library provided by TI.

6.4.3 C28x Peripheral Interrupt Expansion

The PIE block serves to multiplex numerous interrupt sources into a smaller set of interrupt inputs. The PIE block can support up to 96 peripheral interrupts. On the F28M36x, 72 of the possible 96 interrupts are used. The 96 interrupts are grouped into blocks of 8 and each group is fed into 1 of 12 CPU interrupt lines (INT1 to INT12). Each of 12 interrupt lines supports up to 8 simultaneously active interrupts. Each of the 96 interrupts has its own vector stored in a dedicated RAM block that can be overwritten by the user. The vector is automatically fetched by the CPU on servicing the interrupt. Eight CPU clock cycles are needed to fetch the vector and save critical CPU registers. Hence, the CPU can quickly respond to interrupt events. Prioritization of interrupts is controlled in hardware and software. Each individual interrupt can be enabled or disabled within the PIE block.

See [Table 6-16](#) for PIE interrupt assignments.

Table 6-16. PIE Peripheral Interrupts⁽¹⁾

| CPU INTERRUPTS | PIE INTERRUPTS | | | | | | | |

(1) Out of the 96 possible interrupts, 72 interrupts are currently used. The remaining interrupts are reserved for future devices. These interrupts can be used as software interrupts if they are enabled at the PIEIFRx level, provided none of the interrupts within the group is being used by a peripheral. Otherwise, interrupts coming in from peripherals may be lost by accidentally clearing their flag while modifying the PIEIFR. To summarize, there are two safe cases when the reserved interrupts could be used as software interrupts:

- 1) No peripheral within the group is asserting interrupts.
- 2) No peripheral interrupts are assigned to the group (example PIE group 11).

6.4.4 C28x Direct Memory Access

The C28x DMA module provides a hardware method of transferring data between peripherals, between memory, and between peripherals and memory without intervention from the CPU, thereby freeing up bandwidth for other system functions. Additionally, the DMA has the capability to orthogonally rearrange the data as the data is transferred as well as “ping-pong” data between buffers. These features are useful for structuring data into blocks for optimal CPU processing. The interrupt trigger source for each of the six DMA channels can be configured separately and each channel contains its own independent PIE interrupt to notify the CPU when a DMA transfer has either started or completed. Five of the six channels are exactly the same, while Channel 1 has one additional feature: the ability to be configured at a higher priority than the others.

6.4.5 C28x Local Peripherals

The C28x local peripherals include an NMI Watchdog, three Timers, four Serial Port Peripherals (SCI, SPI, McBSP, I2C), an EPI, and three types of Control Peripherals (ePWM, eQEP, eCAP). All peripherals are accessible by the C28x CPU through the C28x Memory Bus. Additionally, the McBSP and ePWM are accessible by the C28x DMA Bus. The EPI peripheral is also accessible from the Master Subsystem. The Serial Port Peripherals and the Control Peripherals connect to the pins in Concerto through the GPIO_MUX1 block. Internally, the C28x peripherals generate events to the PIE block, C28x DMA, and the Analog Subsystem. The C28x NMI Watchdog receives a C28NMI event from the NMI block and sends a counter time-out event to the Cortex-M3 NMI block and the Resets block to flag a potentially critical condition.

The ePWM peripheral receives events that can be used to trip the ePWM outputs EPWMxA and EPWMxB. These events include ECCDBLERR event from the C28x Local Memory, PIENMIERR and EMUSTOP events from the C28x CPU, and up to 12 trips from GPIO_MUX1.

See [Section 5.12](#) for more information on C28x peripherals.

6.4.6 C28x Local Memory

The C28x Local Memory includes Boot ROM; Secure Flash with ECC; Secure L0/L1 RAM with ECC; L2/L3 RAM with Parity Error Checking; and M0/M1 with ECC. All local memories are accessible from the C28x CPU; the L2/L3 RAM is also accessible by the C28x DMA. Two types of error correction events can be generated during access of the C28x Local Memory: uncorrectable errors and single errors. The uncorrectable errors propagate to the NMI block where they can become the C28NMI to the C28x NMI Watchdog and the C28NMIINT nonmaskable interrupt to the C28x CPU. The less critical single errors go to the PIE block where they can become maskable interrupts to the C28x CPU.

6.4.7 C28x Accessing Shared Resources and Analog Peripherals

There are several memories, digital peripherals, and analog peripherals that can be accessed by both the Master and Control Subsystems. They are grouped into the Shared Resources and the Analog Subsystem.

The Shared Resources include the EPI, IPC registers, MTOC Message RAM, CTOM Message RAM, and eight individually configurable Shared RAM blocks.

The Message RAMs and the Shared RAMs can be accessed by the C28x CPU and DMA and have Parity-Error Checking. The MTOC Message RAM is intended for sending data from the Master Subsystem to the Control Subsystem, having R/W access for the Cortex-M3/μDMA and read-only access for the C28x/DMA. The CTOM Message RAM is intended for sending data from the Control Subsystem to the Master Subsystem, having R/W access for the C28x/DMA and read-only access for the Cortex-M3/μDMA.

The IPC registers provide up to 32 handshaking channels to coordinate transfer of data through the Message RAMs by polling. Four of these channels are also backed up by four interrupts to PIE on the Control Subsystem side, and four interrupts to the NVIC on the Master Subsystem side (to reduce delays associated with polling).

The eight Shared RAM blocks are similar to the Message RAMs, in that the data flow is only one way; however, the direction of the data flow can be individually set for each block to be from Master to Control Subsystem or from Control to Master Subsystem.

See [Section 5.10](#) for more information on shared resources and analog peripherals.

6.5 Analog Subsystem

The Analog Subsystem has ADC1, ADC2, and six Analog Comparator + DAC units that can be accessed through the Analog Common Interface Bus. The ADC Result Registers are accessible by CPUs and DMAs of the Master and Control Subsystems. All other Analog Peripheral Registers are accessible by the C28x CPU only. The C28x CPU accesses the ACIB through the C28x Memory Bus, and the C28x DMA through the C28x DMA Bus. The ACIB arbitrates for access to ADC and Analog Comparator registers between CPU/DMA bus cycles of the C28x Subsystem with those of the Cortex-M3 Subsystem. In addition to managing bus cycles, the ACIB also transfers Start-Of-Conversion triggers to the Analog Subsystem and returns End-Of-Conversion ADC interrupts to both the Master Subsystem and the Control Subsystem.

There are 22 possible Start-Of-Conversion (SOC) sources from the C28x Subsystem that are mapped to a total of 8 possible SOC triggers inside the Analog Subsystem (to ADC1 and ADC2).

Going the other way, eight End-Of-Conversion (EOC) sources from ADC1 and eight EOC sources from ADC2 are AND-ed together to form eight interrupts going to destinations in both the Master and Control Subsystems. Inside the C28x Subsystem, all eight EOC interrupts go to the PIE, but only four of the same eight go to the C28x DMA.

The Concerto MCU Analog Subsystem has two independent Analog-to-Digital Converters (ADC1, ADC2); six Analog Comparators + DAC units; and an ACIB to facilitate analog data communications with the two digital subsystems of Concerto (Cortex-M3 and C28x).

Figure 6-3 shows the Analog Subsystem.

6.5.1 ADC1

The ADC1 consists of a 12-bit Analog-to-Digital converter with up to 16 analog input channels of which 12 are currently pinned out. The analog channels are internally preassigned to two Sample-and-Hold (S/H) units A and B, both feeding an Analog Mux whose output is converted to a 12-bit digital value and stored in ADC1 result registers. The two S/H units enable simultaneous sampling of two analog signals at a time. Additional channels or channel pairs are converted sequentially. SOC triggers from the Control Subsystem initiate analog-to-digital conversions. EOC interrupts from ADCs notify the Master and Control Subsystems that the conversion results are ready to be read from ADC1 result registers.

See [Section 5.10.1](#) for more information on ADC peripherals.

6.5.2 ADC2

The ADC2 consists of a 12-bit Analog-to-Digital converter with up to 16 analog input channels of which 12 are currently pinned out. The analog channels are internally preassigned to two S/H units A and B, both feeding an Analog Mux whose output is converted to a 12-bit digital value and stored in the ADC2 result registers. The two S/H units enable simultaneous sampling of two analog signals at a time. Additional channels or channel pairs are converted sequentially. SOC triggers from the Control Subsystem initiate analog-to-digital conversions. EOC interrupts from ADCs notify the Master and Control Subsystems that the conversion results are ready to be read from ADC2 result registers.

See [Section 5.10.1](#) for more information on ADC peripherals.

Figure 6-3. Analog Subsystem

6.5.3 Analog Comparator + DAC

There are six Comparator blocks enabling simultaneous comparison of multiple pairs of analog inputs, resulting in six digital comparison outputs. The external analog inputs that are being compared in the comparators come from AIO_MUX1 and AIO_MUX2 blocks. These analog inputs can be compared against each other or the outputs of 10-bit DACs (Digital-to-Analog Converters) inside individual Comparator modules. The six comparator outputs go to the GPIO_MUX2 block where they can be mapped to six out of eight available pins.

To use these comparator outputs to trip the C28x EPWMA/B outputs, they must be first routed externally from pins of the GPIO_MUX2 block to selected pins of the GPIO_MUX1 block before they can be assigned to selected 12 ePWM Trip Inputs.

See [Section 5.10.2](#) for more information on the analog comparator + DAC.

6.5.4 Analog Common Interface Bus

The ACIB links the Master and Control Subsystems with the Analog Subsystem. The ACIB enables the Cortex-M3 CPU/ μ DMA and C28x CPU/DMA to access Analog Subsystem registers, to send SOC Triggers to the Analog Subsystem, and to receive EOC Interrupts from the Analog Subsystem. The Cortex-M3 uses its System Bus and the μ DMA Bus to read from ADC Result registers. The C28x uses its Memory Bus and the DMA bus to access ADC Result registers and other registers of the Analog Subsystem. The ACIB arbitrates between up to four possibly simultaneously occurring bus cycles on the Master/Control Subsystem side of ACIB to access the ADC and Analog Comparator registers on the Analog Subsystem side.

Additionally, ACIB maps up to 22 SOC trigger sources from the Control Subsystem to 8 SOC trigger destinations inside the Analog Subsystem (shared between ADC1 and ADC2), and up to 16 ADC EOC interrupt sources from the Analog Subsystem to 8 destinations inside the Master and Control Subsystems. The eight ADC interrupts are the result of AND-ing of eight EOC interrupts from ADC1 with 8 EOC interrupts from ADC2. The total of 16 possible ADC1 and ADC2 interrupts are sharing the 8 interrupt lines because it is unlikely that any application would need all 16 interrupts at the same time.

Eight registers (TRIG1SEL–TRIG8SEL) configure eight corresponding SOC triggers to assign 1 of 22 possible trigger sources to each SOC trigger.

There are two registers that provide status of ACIB to the Master Subsystem and to the Control Subsystem.

The Cortex-M3 can read the MCIBSTATUS register to verify that the Analog Subsystem is properly powered up; the Analog System Clock (ASYSCLK) is present; and that the bus cycles, triggers, and interrupts are correctly propagating between the Master, Control, and Analog subsystems.

The C28x can read the CCIBSTATUS register to verify that the Analog Subsystem is properly powered up; the Analog System Clock (ASYSCLK) is present; and that the bus cycles, triggers, and interrupts are correctly propagating between the Master, Control, and Analog subsystems.

6.6 Master Subsystem NMIs

The Cortex-M3 NMI Block generates an M3NMIINT nonmaskable interrupt to the Cortex-M3 CPU and an M3NMI event to the NMI Watchdog in response to potentially critical conditions existing inside or outside the Concerto MCU. When able to respond to the M3NMIINT interrupt, the Cortex-M3 CPU may address the NMI condition and disable the NMI Watchdog. Otherwise, the NMI Watchdog counts out and an M3NMIRST reset signal is sent to the Resets block.

The inputs to the Cortex-M3 NMI block include the C28NMIRST, PIENMIERR, CLOCKFAIL, ACIBERR, EXTGPIO, MLBISTERR, and CLBISTERR signals. The C28NMIRST comes from the C28x NMI Watchdog; C28NMIRST indicates that the C28x was not able to prevent the C28x NMI Watchdog counter from counting out. PIENMIERR indicates that an error condition was generated during the NMI vector fetch from the C28x PIE block. The CLOCKFAIL input comes from the Master Clocks Block, announcing a missing clock source to the Main Oscillator. ACIBERR indicates an abnormal condition inside the Analog Common Interface Bus. EXTGPIO comes from the GPIO_MUX1 to announce an external emergency. MLBISTERR is generated by the Cortex-M3 core to signal that a BIST time-out or signature mismatch error has been detected. CLBISTERR is generated by the C28x core to signal that a BIST time-out or signature mismatch error has been detected.

The Cortex-M3 NMI block can be accessed through the Cortex-M3 NMI configuration registers—including the MNMIFLG, MNMIFLGCLR, and MNMIFLGFRC registers—to examine flag bits for the NMI sources, clear the flags, and force the flags to active state, respectively.

[Figure 6-4](#) shows the Cortex-M3 NMI and C28x NMI.

6.7 Control Subsystem NMIs

The C28x NMI Block generates a C28NMIINT nonmaskable interrupt to the C28x CPU and a C28NMI event to the C28x NMI Watchdog in response to potentially critical conditions existing inside the Concerto MCU. When able to respond to the C28NMIINT interrupt, the C28x CPU may address the NMI condition and disable the C28x NMI Watchdog. Otherwise, the C28x NMI Watchdog counts out and the C28NMIRST reset signal is sent to the Resets block and the Cortex-M3 NMI Block, where the Cortex-M3 NMI Block can generate an NMI to the Cortex-M3 processor.

The inputs to the C28x NMI block include the CLOCKFAIL, ACIBERR, RAMUNCERR, FLASHUNCERR, PIENMIERR, CLBISTERR, and MLBISTERR signals. The CLOCKFAIL input comes from the Clocks Block, announcing a missing clock source to the Main Oscillator. ACIBERR indicates an abnormal condition inside the Analog Common Interface Bus. The RAMUNCERR and FLASHUNCERR announce the occurrence of uncorrectable error conditions during access to the Flash or RAM (local or shared). PIENMIERR indicates that an error condition was generated during NMI vector fetch from the C28x PIE block. MLBISTERR is generated by the Cortex-M3 core to signal that a BIST time-out or signature mismatch error has been detected. CLBISTERR is generated by the C28x core to signal that a BIST time-out or signature mismatch error has been detected.

The C28x NMI block can be accessed through the C28x NMI configuration registers—including the CNMIFLG, CNMIFLGCLR, and CNMIFLGFRC registers—to examine flag bits for the NMI sources, clear the flags, and force the flags to active state, respectively.

[Figure 6-4](#) shows the Cortex-M3 NMI and C28x NMI.

6.8 Resets

The Concerto MCU has two external reset pins: \overline{XRS} for the Master and Control Subsystems and \overline{ARS} for the Analog Subsystem. Texas Instruments (TI) recommends that these two pins be externally tied together with a board signal trace.

The \overline{XRS} pin can receive an external reset signal from outside into the chip, and the pin can drive a reset signal out from inside of the chip. A reset pulse driven into the \overline{XRS} pin resets the Master and Control Subsystems. A reset pulse can also be driven out of the \overline{XRS} pin by the Power-On Reset (POR) block of the Master and Control Subsystems (see [Section 6.9](#)). A reset pulse can be driven out of the \overline{XRS} pin when the two Cortex-M3 Watchdogs or the Cortex-M3 NMI Watchdog time-out.

There are some requirements on the \overline{XRS} pin:

1. During power up, the \overline{XRS} pin must be held low for at least eight X1 cycles after the input clock is stable. This requirement is to enable the entire device to start from a known condition.
2. TI recommends that no voltage larger than 0.7 V be applied to any pin before powering up the device. Voltages applied to pins on an unpowered device can lead to unpredictable results.

The \overline{ARS} pin can receive an external reset signal from outside into the chip, and the pin can drive a reset signal out from inside of the chip. A reset pulse driven into the \overline{ARS} pin resets the Analog Subsystem. A reset pulse can be driven out of the \overline{ARS} pin by the POR block of the Analog Subsystem.

[Figure 6-5](#) shows the resets.

6.8.1 Cortex-M3 Resets

The Cortex-M3 CPU and NVIC (Nested Vectored Interrupt Controller) are both reset by the POR or the M3SYSRST reset signal. In both cases, the Cortex-M3 CPU restarts program execution from the address provided by the reset entry in the vector table. A register can later be referenced to determine the source of the reset. The M3SYSRST signal also propagates to the Cortex-M3 peripherals and the rest of the Cortex-M3 Subsystem.

The $\overline{M3SYSRST}$ has four possible sources: \overline{XRS} , $\overline{M3WDOGS}$, $\overline{M3SWRST}$, and $\overline{M3DBGRST}$. The $\overline{M3WDOGS}$ is set in response to time-out conditions of the two Cortex-M3 Watchdogs or the Cortex-M3 NMI Watchdog. The $\overline{M3SWRST}$ is a software-generated reset output by the NVIC. The $\overline{M3DBGRST}$ is a debugger-generated reset that is also output by the NVIC. In addition to driving M3SYSRST, these two resets also propagate to the C28x Subsystem and the Analog Subsystem.

The M3RSNIN bit can be set inside the CRESCNF register to selectively reset the C28x Subsystem from the Cortex-M3, and ACIBRST bit of the same register selectively resets the Analog Common Interface Bus. In addition to driving reset signals to other parts of the chip, the Cortex-M3 can also detect a $\overline{C28SYSRST}$ reset being set inside the C28x Subsystem by reading the CRES bit of the CRESSTS register.

Cortex-M3 software can also set bits in the SRCR register to selectively reset individual Cortex-M3 peripherals, provided they are enabled inside the DC (Device Configuration) register. The Reset Cause register (MRESC) can be read to find out if the latest reset was caused by External Reset, POR, Watchdog Timer 0, Watchdog Timer 1, or Software Reset from NVIC.

6.8.2 C28x Resets

The C28x CPU is reset by the $\overline{\text{C28RSTIN}}$ signal, and the C28x CPU in turn resets the rest of the C28x Subsystem with the $\overline{\text{C28SYSRST}}$ signal. When reset, the C28x restarts program execution from the address provided at the top of the Boot ROM Vector Table.

The $\overline{\text{C28RSTIN}}$ has five possible sources: $\overline{\text{XRS}}$, $\overline{\text{C28NMIWD}}$, $\overline{\text{M3SWRST}}$, $\overline{\text{M3DBGSRST}}$, and the $\overline{\text{M3RSNIN}}$. The $\overline{\text{C28NMIWD}}$ is set in response to time-out conditions of the C28x NMI Watchdog. The $\overline{\text{M3SWRST}}$ is a software-generated reset output by the NVIC. The $\overline{\text{M3DBGSRST}}$ is a debugger-generated reset that is also output by the NVIC. These two resets must be first enabled by the Cortex-M3 processor in order to propagate to the C28x Subsystem. $\overline{\text{M3RSNIN}}$ reset comes from the Cortex-M3 Subsystem to selectively reset the C28x Subsystem from Cortex-M3 software.

The C28x processor can learn the status of the internal $\overline{\text{ACIBRST}}$ reset signal and the external $\overline{\text{XRS}}$ pin by reading the DEVICECNF register.

6.8.3 Analog Subsystem and Shared Resources Resets

Both the Analog Subsystem and the resources shared between the C28x and Cortex-M3 subsystems (IPC, MSG RAM, Shared RAM) are reset by the SRXRST reset signal. Additionally, the Analog Subsystem is also reset by the internal ACIBRST signal from the Cortex-M3 Subsystem and the external $\overline{\text{ARS}}$ pin, (should be externally tied to the $\overline{\text{XRS}}$ pin), which can be reset by the POR circuitry.

The SRXRST has three possible sources: $\overline{\text{XRS}}$, $\overline{\text{M3SWRST}}$, and $\overline{\text{M3DBGSRST}}$. The $\overline{\text{M3SWRST}}$ is a software-generated reset output by the NVIC. The $\overline{\text{M3DBGSRST}}$ is a debugger-generated reset that is also output by the NVIC. These two resets must be first enabled by the Cortex-M3 processor in order to propagate to the Analog Subsystem and the Shared Resources.

Although EPI is a shared peripheral, it is physically located inside the Cortex-M3 Subsystem; therefore, EPI is reset by $\overline{\text{M3SYSRST}}$.

6.8.4 Device Boot Sequence

The boot sequence of Concerto is used to configure the Master Subsystem and the Control Subsystem for execution of application code. The boot sequence involves both internal resources, and resources external to the device. These resources include: Master Subsystem Bootloader code (M-Bootloader) factory-programmed inside the Master Subsystem Boot ROM (M-Boot ROM); Control Subsystem Bootloader code (C-Bootloader) factory-programmed inside the Control Subsystem Boot ROM (C-Boot ROM); four GPIO_MUX pins for Master boot mode selection; internal Flash and RAM memories; and selected Cortex-M3 and C28x peripherals for loading the application code into the Master and Control Subsystems.

The boot sequence starts when the Master Subsystem comes out of reset, which can be caused by device power up, external reset, debugger reset, software reset, Cortex-M3 watchdog reset, or Cortex-M3 NMI watchdog reset. While the M-Bootloader starts executing first, the C-Bootloader starts soon after, and then both bootloaders work in tandem to configure the device, load application code for both processors (if not already in the Flash), and branch the execution of each processor to a selected location in the application code.

Execution of the M-Bootloader commences when an internal reset signal goes from active to inactive state. At that time, the Control Subsystem and the Analog Subsystem continue to be in reset state until the Master Subsystem takes them out of reset. The M-Bootloader first initializes some device-level functions, then the M-Bootloader initializes the Master Subsystem. Next, the M-Bootloader takes the Control Subsystem and the Analog Subsystem/ACIB out of reset. When the Control Subsystem comes out of reset, its own C-Bootloader starts executing in parallel with the M-Bootloader. After initializing the Control Subsystem, the C-Bootloader enters the C28x processor into the IDLE mode (to wait for the M-Bootloader to wake up the C28x processor later through the MTOCIPC1 interrupt). Next, the M-Bootloader reads four GPIO pins (see [Table 6-17](#)) to determine the boot mode for the rest of the M-Bootloader operation.

Table 6-17. Master Subsystem Boot Mode Selection

| BOOT MODE # | MASTER SUBSYSTEM BOOT MODES | PF2_GPIO34 (Bmode_pin4) ⁽¹⁾ | PF3_GPIO35 (Bmode_pin3) ⁽¹⁾ | PG7_GPIO47 (Bmode_pin2) ⁽¹⁾ | PG3_GPIO43 (Bmode_pin1) ⁽¹⁾ |
|------------------------|--|---|---|---|---|
| 0 ⁽²⁾ | Boot from Parallel GPIO | 0 | 0 | 0 | 0 |
| 1 ⁽²⁾ | Boot to Master Subsystem RAM | 0 | 0 | 0 | 1 |
| 2 ⁽²⁾ | Boot from Master Subsystem serial peripherals (UART0/SSIO/I2C0) | 0 | 0 | 1 | 0 |
| 3 ⁽²⁾ | Boot from Master Subsystem CAN interface | 0 | 0 | 1 | 1 |
| 4 ⁽²⁾ | Boot from Master Subsystem Ethernet interface | 0 | 1 | 0 | 0 |
| 5 ⁽²⁾⁽⁴⁾ | Not supported (Defaults to Boot-to-Flash), future boot from Cortex-M3 USB | 0 | 1 | 0 | 1 |
| 6 ⁽²⁾⁽⁴⁾⁽⁵⁾ | Boot-to-OTP | 0 | 1 | 1 | 0 |
| 7 ⁽²⁾⁽⁴⁾ | Boot to Master Subsystem Flash memory | 0 | 1 | 1 | 1 |
| 8 | Not supported (Defaults to Boot-to-Flash) | 1 | 0 | 0 | 0 |
| 9 ⁽⁴⁾ | Boot from Master Subsystem serial peripheral – SSIO Master | 1 | 0 | 0 | 1 |
| 10 ⁽⁴⁾ | Boot from Master Subsystem serial peripheral – I2C0 Master | 1 | 0 | 1 | 0 |
| 11 ⁽⁴⁾ | Not supported (Defaults to Boot-to-Flash) | 1 | 0 | 1 | 1 |
| 12 ⁽³⁾ | Boot from Master Subsystem Ethernet interface | 1 | 1 | 0 | 0 |
| 13 ⁽⁴⁾ | Not supported (Defaults to Boot-to-Flash) | 1 | 1 | 0 | 1 |
| 14 ⁽⁴⁾ | Not supported (Defaults to Boot-to-Flash) | 1 | 1 | 1 | 0 |
| 15 ⁽⁴⁾ | Boot to Master Subsystem Flash memory | 1 | 1 | 1 | 1 |

(1) By default, GPIO terminals are not pulled up (they are floating).

(2) Boot Modes 0–7 are pin-compatible with the F28M35x members of the Concerto family (they use same GPIO terminals).

(3) Boot Mode 12 is the same as Boot Mode 4, except it uses a different set of GPIO terminals.

(4) This Boot Mode uses a faster Flash power-up sequence. The maximum supported OSCCLK frequency for this mode is 30 MHz.

(5) Supported only in TMS version. On all other versions, this mode defaults to Boot-to-Flash.

Boot Mode 7 and Boot Mode 15 cause the Master program to branch execution to the application in the Master Flash memory. This branching requires that the Master Flash be already programmed with valid code; otherwise, a hard fault exception is generated and the Cortex-M3 goes back to the above reset sequence. (Therefore, for a factory-fresh device, the M-Bootloader will be in a continuous reset loop until the JTAG debug probe is connected and a debug session started.) If the Master Subsystem Flash has already been programmed, the application code will start execution. Typically, the Master Subsystem application code will then establish data communication with the C28x [through the IPC (Interprocessor Communications peripheral)] to coordinate the rest of the boot process with the Control Subsystem. Boot Mode 15 (Fast Boot to Flash Mode) supported on this device is a special boot to Flash mode, which configures Flash for a faster power up, thus saving some boot time. Boot Mode 7 and other modes which default to Flash do not configure Flash for a faster power up like Boot Mode 15 does. Following reset, the internal pullup resistors on GPIOs are disabled. Therefore, Boot Mode 15, for example, will typically require four external pullups.

Boot Mode 1 causes the Master boot program to branch to Cortex-M3 RAM, where the Cortex-M3 processor starts executing code that has been preloaded earlier. Typically, this mode is used during development of application code meant for Flash, but which has to be first tested running out of RAM. In this case, the user would typically load the application code into RAM using the debugger, and then issue a debugger reset, while setting the four boot pins to 0001b. From that point on, the rest of the boot process on the Master Subsystem side is controlled by the application code.

Boot Modes 0, 2, 3, 4, 9, 10, and 12 are used to load the Master application code from an external peripheral before branching to the application code. This process is different from the process in Boot Modes 1, 7, and 15, where the application code was either already programmed in Flash or loaded into RAM by the JTAG debug probe. If the boot mode selection pins are set to 0000b, the M-Bootloader (running out of M-Boot ROM) will start uploading the Master application code from preselected Parallel GPIO_MUX pins. If the boot pins are set to 0010b, the application code will be loaded from the Master

Subsystem UART0, SSI0, or I2C0 peripheral. (SSI0 and I2C0 are configured to work in Slave mode in this Boot Mode.) If the boot pins are set to 0011b, the application code will be loaded from the Master Subsystem CAN interface. Furthermore, if the boot pins are set to 0100b, the application code will be loaded through the Master Subsystem Ethernet interface; the IOs used in this Boot Mode are compatible with the F28M35x device. If the boot pins are set to 1001b or 1010b, then the application code will be loaded through the SSI0 or I2C0 interface, respectively. SSI0 and I2C0 loaders work in Master Mode in this boot mode. If the boot pins are set to 1100b, then the application code will be loaded through the Master Subsystem Ethernet interface; the IOs used in this Boot Mode are F28M36x IOs, which are available only in a BGA package.

Regardless of the type of boot mode selected, once the Master application code is resident in Master Flash or RAM, the next step for the M-Bootloader is to branch to Master Flash or RAM. At that point, the application code takes over control from the M-Bootloader, and the boot process continues as prescribed by the application code. At this stage, the Master application program typically establishes communication with the C-Bootloader, which by now, would have already initialized the Control Subsystem and forced the C28x to go into IDLE mode. To wake the Control Subsystem out of IDLE mode, the Master application issues the Master-to-Control-IPC-interrupt 1 (MTOCIPCINT1) . Once the data communication has been established through the IPC, the boot process can now also continue on the Control Subsystem side.

The rest of the Control Subsystem boot process is controlled by the Master Subsystem application issuing IPC instructions to the Control Subsystem, with the C-Bootloader interpreting the IPC commands and acting on them to continue the boot process. At this stage, a boot mode for the Control Subsystem can be established. The Control Subsystem boot modes are similar to the Master Subsystem boot modes, except for the mechanism by which they are selected. The Control Subsystem boot modes are chosen through the IPC commands from the Master application code to the C-Bootloader, which interprets them and acts accordingly. The choices are, as above, to branch to already existing Control application code in Flash, to branch to preloaded code in RAM (development mode), or to upload the Control application code from one of several available peripherals (see [Table 6-18](#)). As before, once the Control application code is in place (in Flash or RAM), the C-Bootloader branches to Flash or RAM, and from that point on, the application code takes over.

Table 6-18. Control Subsystem Boot Mode Selection

| CONTROL SUBSYSTEM BOOT MODES | MTOCIPCBOOTMODE REGISTER VALUE | DESCRIPTION |
|------------------------------|--------------------------------|--|
| BOOT_FROM_RAM | 0x0000 0001 | Upon receiving this command from the Master Subsystem, C-Boot ROM will branch to the Control Subsystem RAM entry point location and start executing code from there. |
| BOOT_FROM_FLASH | 0x0000 0002 | Upon receiving this command, C-Boot ROM will branch to the Control Subsystem FLASH entry point and start executing code from there. |
| BOOT_FROM_SCI | 0x0000 0003 | Upon receiving this command, C-Boot ROM will boot from the Control Subsystem SCI peripheral. |
| BOOT_FROM_SPI | 0x0000 0004 | Upon receiving this command, C-Boot ROM will boot from the Control Subsystem SPI interface. |
| BOOT_FROM_I2C | 0x0000 0005 | Upon receiving this command, C-Boot ROM will boot from the Control Subsystem I2C interface. |
| BOOT_FROM_PARALLEL | 0x0000 0006 | Upon receiving this command, C-Boot ROM will boot from the Control Subsystem GPIO. |
| BOOT_FROM_SPI ⁽¹⁾ | 0x0000 0007 | Upon receiving this command, C-Boot ROM will boot from the Control Subsystem SPI interface. |

(1) MTOCBOOTMODE 0x0000 0001–MTOCBOOTMODE 0x0000 0006 are compatible with the F28M35x members of the Concerto family, but MTOCBOOTMODE 0x0000 0007 uses GPIO terminals that are not available on the F28M35x.

The boot process can be considered completed once the Cortex-M3 and C28x are both running out of their respective application programs. Following the boot sequence, the C-Bootloader is still available to interpret and act upon an assortment of IPC commands that can be issued from the Master Subsystem to perform a variety of configuration, housekeeping, and other functions.

6.9 Internal Voltage Regulation and Power-On-Reset Functionality

While the analog functions of Concerto draw power from a single dedicated external power source— V_{DDA} , its digital circuits are powered by three separate rails: 3.3-V V_{DDIO} , 1.8-V V_{DD18} , and 1.2-V V_{DD12} . This section describes the sourcing, regulation, and POR functionality for these three digital power rails.

Concerto devices can be internally divided into an Analog Subsystem and a Digital Subsystem (having the Cortex-M3-based Master Subsystem and the C28x-based Control Subsystem). The Digital Subsystem uses V_{DD12} to power the two processors, internal memory, and peripherals. The Analog Subsystem uses V_{DD18} to power the digital logic associated with the analog functions. Both Digital and Analog Subsystems share a common V_{DDIO} rail to power their 3.3-V I/O buffers through which the Concerto digital signals communicate with the outside world.

The Analog and Digital Subsystems each have their own POR circuits that operate independently. With the \overline{ARS} and \overline{XRS} reset pins externally tied together, both systems can come out of reset together, and can also be put in reset together by driving both reset pins low. See [Figure 6-6](#) for a snapshot of the voltage regulation and POR functions provided within the Analog and Digital Subsystems of Concerto.

6.9.1 Analog Subsystem: Internal 1.8-V VREG

The internal 1.8-V Voltage Regulator (VREG) generates V_{DD18} power from V_{DDIO} . The 1.8-V VREG is enabled by pulling the $\overline{VREG18EN}$ pin to a low state. When enabled, the 1.8-V VREG provides 1.8 V to digital logic associated with the analog functions of the Analog Subsystem.

When the internal 1.8-V VREG function is enabled, the 1.8 V power no longer has to be provided externally; however, a 1.2- μ F (10% tolerance) capacitor is required for each V_{DD18} pin to stabilize the internally generated voltages. These load capacitors are not required if the internal 1.8-V VREG is disabled, and the 1.8 V is provided from an external supply.

While removing the need for an external power supply, enabling the internal VREG might affect the V_{DDIO} power consumption.

Figure 6-6. Voltage Regulation and Monitoring

6.9.2 Digital Subsystem: Internal 1.2-V VREG

The internal 1.2-V VREG generates V_{DD12} power from V_{DDIO} . The 1.2-V VREG is enabled by pulling the $\overline{VREG12EN}$ pin to a low state. When enabled, the 1.2-V VREG internally provides 1.2 V to digital logic associated with the processors, memory, and peripherals of the Digital Subsystem.

When the internal 1.2-V VREG function is enabled, the 1.2 V power no longer has to be provided externally; however, the minimum and maximum capacitance required for each V_{DD12} pin to stabilize the internally generated voltages are 250 nF and 750 nF, respectively. These load capacitors are not required if the internal 1.2-V VREG is disabled and the 1.2 V is provided from an external supply.

While removing the need for an external power supply, enabling the internal VREG might affect the V_{DDIO} power consumption.

6.9.3 Analog and Digital Subsystems: Power-On-Reset Functionality

The Analog and Digital Subsystems' each have a POR circuit that creates a clean reset throughout the device enabling glitchless GPIOs during the power-on procedure. The POR function keeps both \overline{ARS} and \overline{XRS} driven low during device power up. This functionality is always enabled, even when VREG is disabled.

While in most applications, the POR generated reset has a long enough duration to also reset other system ICs, some applications may require a longer lasting pulse. In these cases, the \overline{ARS} and \overline{XRS} reset pins (which are open-drain) can also be driven low to match the time the device is held in a reset state with the rest of the system.

When POR drives the \overline{ARS} and \overline{XRS} pins low, the POR also resets the digital logic associated with both subsystems and puts the GPIO pins in a high impedance state.

In addition to the POR reset, the Resets block of the Digital Subsystem also receives reset inputs from the NVIC, the Cortex-M3 Watchdogs (0, 1), and from the Cortex-M3 NMI Watchdog. The resulting reset output signal is then fed back to the \overline{XRS} pin after being AND-ed with the POR reset (see [Figure 6-6](#)).

On a related note, only the Master Subsystem comes out of reset immediately following a device power up. The Control and Analog Subsystems continue to be held in reset until the Master Processor (Cortex-M3) brings them out of reset by writing a "1" to the M3RSNIN and ACIBRST bits of the CRESCNF Register (see [Figure 6-6](#)).

6.9.4 Connecting \overline{ARS} and \overline{XRS} Pins

In most Concerto applications, TI recommends that the \overline{ARS} and \overline{XRS} pins be tied together by external means such as through a signal trace on a PCB board. Tying the \overline{ARS} and \overline{XRS} pins together ensures that all reset sources will cause both the Analog and Digital Subsystems to enter the reset state together, regardless of where the reset condition occurs.

6.10 Input Clocks and PLLs

Concerto devices have multiple input clock pins from which all internal clocks and the output clock are derived. Figure 6-7 shows the recommended methods of connecting crystals, resonators, and oscillators to pins X1/X2 and XCLKIN.

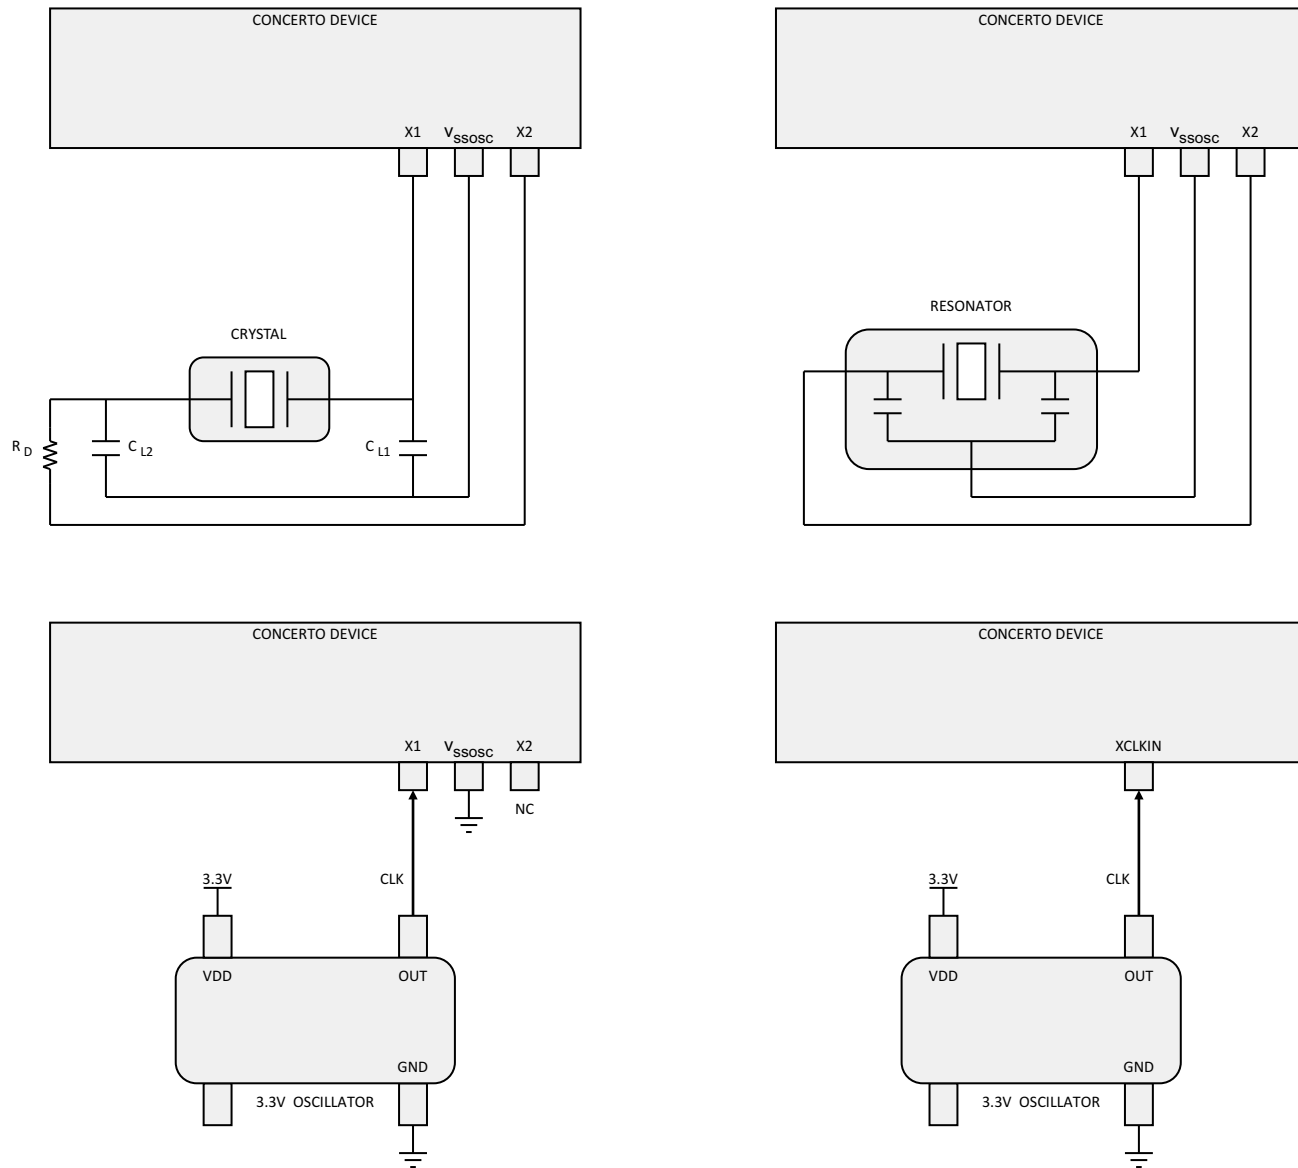

Figure 6-7. Connecting Input Clocks to a Concerto™ Device

6.10.1 Internal Oscillator (Zero-Pin)

Each Concerto device contains a zero-pin internal oscillator. This oscillator outputs two fixed-frequency clocks: 10MHZCLK and 32KHZCLK. These clocks are not configurable by the user and should not be used to clock the device during normal operation. They are used inside the Master Subsystem to implement low-power modes. The 10MHZCLK is also used by the Missing Clock Detect circuit.

6.10.2 Crystal Oscillator/Resonator (Pins X1/X2 and V_{SSOSC})

The main oscillator circuit connects to an external crystal through pins X1 and X2. If a resonator is used (version of a crystal with built-in load capacitors), its ground terminal should be connected to the pin V_{SSOSC} (not board ground). The V_{SSOSC} pin should also be used to ground the external load capacitors connected to the two crystal terminals as shown in [Figure 6-7](#).

6.10.3 External Oscillators (Pins X1, V_{SSOSC} , XCLKIN)

Concerto has two pins (X1 and XCLKIN) into which a single-ended clock can be driven from external oscillators or other clock sources. When connecting an external clock source through the X1 terminal, the X2 terminal should be left unconnected. Most internal clocks of this device are derived from the X1 clock input (or X1/X2 crystal). The XCLKIN clock is only used by the USB PLL and CAN peripherals. [Figure 6-7](#) shows how to connect external oscillators to the X1 and XCLKIN terminals.

Locate the external oscillator as close to the MCU as practical. Ideally, the return ground trace should be an isolated trace directly underneath the forward trace or run adjacent to the trace on the same layer. Spacing should be kept minimal, with any other nearby traces double-spaced away, so that the electromagnetic fields created by the two opposite currents cancel each other out as much as possible, thus reducing parasitic inductances that radiate EMI.

6.10.4 Main PLL

The Main PLL uses the reference clock from pins X1 (external oscillator) or X1/X2 (external crystal/resonator). The input clock is multiplied by an integer multiplier and a fractional multiplier as selected by the SPLLIMULT and SPLLFMULT fields of the SYSPLLMULT register. For example, to achieve PLL multiply of 28.5, the integer multiplier should be set to 28, and the fractional multiplier to 0.5. The output clock from the Main PLL must be between 150 MHz and 300 MHz. The PLL output clock is then divided by 2 before entering a mux that selects between this clock and the PLL input clock – OSCCLK (used in PLL bypass mode). The PLL bypass mode is selected by setting the SPLLIMULT field of the SYSPLLMULT register to 0. The output clock from the mux next enters a divider controlled by the SYSDIVSEL register, after which the output clock becomes the PLLSYCLK. [Figure 6-8](#) shows the Main PLL function and configuration examples. [Table 6-19](#) to [Table 6-22](#) list the integer multiplier configuration values.

- (1) OUTPUT OF THE MAIN PLL MUST RANGE BETWEEN 150–300 MHz.
- (2) WHEN SPLEN BIT = 0, THE MAIN PLL IS POWERED OFF.

| | | | | |
|------------|--------------|-----------------------------------|----------------------------|---|
| EXAMPLE 1: | X1 = 100 MHz | SPLLIMULT = 0000000 (BYPASS PLL) | N/A | PLLSYSCLK = 100 MHz |
| EXAMPLE 2: | X1 = 10 MHz | SPLLIMULT = 0010100 (× 20) | SPLLFMULT = 00 (NOT USED) | PLLSYSCLK = [(10 × 20) / 2] / 1 = 100 MHz |
| EXAMPLE 3: | X1 = 10 MHz | SPLLIMULT = 0010100 (× 20) | SPLLFMULT = 10 (× 0.50) | PLLSYSCLK = [(10 × 20.5) / 2] / 1 = 102.5 MHz |

6.10.5 USB PLL

The USB PLL uses the reference clock selectable between the input clock arriving at the XCLKIN pin, or the internal OSCCLK (originating from the external crystal or oscillator through the X1/X2 pins). An input mux selects the source of the USB PLL reference based on the UPLLCLKSRC bit of the UPLLCTL Register (see [Figure 6-9](#)). The input clock is multiplied by an integer multiplier and a fractional multiplier as selected by the UPLLIMULT and UPLLFMULT fields of the UPLLMULT register. For example, to achieve PLL multiply of 28.5, the integer multiplier should be set to 28, and the fractional multiplier to 0.5. The output clock from the USB PLL must always be 240 MHz. The PLL output clock is then divided by 4—resulting in 60 MHz that the USB needs—before entering a mux that selects between this clock and the PLL input clock (used in the PLL bypass mode). The PLL bypass mode is selected by setting the UPLLIMULT field of the UPLLMULT register to 0. The output clock from the mux becomes the USBPLLCLK (there is not another clock divider). [Figure 6-9](#) shows the USB PLL function and configuration examples. [Table 6-23](#) and [Table 6-24](#) list the integer multiplier configuration values.

(1) OUTPUT OF THE USB PLL MUST BE ALWAYS 240MHz (SO THAT USBPLLCLK IS 60MHZ)

(2) WHEN UPLEN BIT = 0, THE USB PLL IS POWERED OFF

| | | | | | |
|------------|-----------------------|----------------------------------|-----------------------------|---------------------------|--------------|
| EXAMPLE 1: | X1 OR XCLKIN = 60 MHZ | UPLLMULT = 000000 (BYPASS PLL) | N/A | PLLSYSCLK = 60 MHz | |
| EXAMPLE 2: | X1 OR XCLKIN = 10 MHZ | UPLLMULT = 011000 (× 24) | UPLLFMULT = 00 (NOT USED) | PLLSYSCLK = (10 × 24) | / 4 = 60 MHz |
| EXAMPLE 3: | X1 OR XCLKIN = 64 MHZ | UPLLMULT = 000011 (× 3) | UPLLFMULT = 11 (× 0.75) | PLLSYSCLK = (64 × 3.75) | / 4 = 60 MHz |

6.11 Master Subsystem Clocking

The internal PLLSYSCLK clock, normally used as a source for all Master Subsystem clocks, is a divided-down output of the Main PLL or X1 external clock input, as defined by the SPLLCKEN bit of the SYSPLLCTL register.

There is also a second oscillator that internally generates two clocks: 32KHZCLK and 10MHZCLK. The 10MHZCLK is used by the Missing Clock Circuit to detect a possible absence of an external clock source to the Main Oscillator that drives the Main PLL. Detection of a missing clock results in a substitution of the 10MHZCLK for the PLLSYSCLK. The CLKFAIL signal is also sent to the NMI Block and the Control Subsystem where this signal can trip the ePWM peripherals.

The 32KHZCLK and 10MMHZCLK clocks are also used by the Cortex-M3 Subsystem as possible sources for the Deep Sleep Clock.

There are four registers associated with the Main PLL: SYSPLLCTL, SYSPLLMULT, SYSPLLSTAT and SYSDIVSEL. Typically, the Cortex-M3 processor writes to these registers, while the C28x processor has read access. The C28x can request write access to the above registers through the CLKREQUEST register. Cortex-M3 can regain write ownership of these registers through the MCLKREQUEST register.

The Master Subsystem operates in one of three modes: Run Mode, Sleep Mode, or Deep Sleep Mode. [Table 6-25](#) shows the Master Subsystem low-power modes and their effect on both CPUs, clocks, and peripherals. [Figure 6-10](#) shows the Cortex-M3 clocks and the Master Subsystem low-power modes.

Table 6-25. Master Subsystem Low-Power Modes

| Cortex-M3 LOW-POWER MODE | STATE OF Cortex-M3 CPU | CLOCK TO Cortex-M3 PERIPHERALS | REGISTER USED TO GATE CLOCKS TO Cortex-M3 PERIPHERALS | MAIN PLL | USB PLL | CLOCK TO C28x | CLOCK TO SHARED RESOURCES | CLOCK TO ANALOG SUBSYSTEM |
|--------------------------|------------------------|--------------------------------|---|----------|---------|--------------------------|---------------------------|---------------------------|
| Run | Active | M3SSCLK ⁽¹⁾ | RCGC | On | On | PLLSYSCLK ⁽²⁾ | PLLSYSCLK ⁽²⁾ | ASYSCLK ⁽³⁾ |
| Sleep | Stopped | M3SSCLK ⁽¹⁾ | RCGC or SCGC ⁽⁴⁾ | On | On | PLLSYSCLK ⁽²⁾ | PLLSYSCLK ⁽²⁾ | ASYSCLK ⁽³⁾ |
| Deep Sleep | Stopped | M3DSDIVCLK ⁽⁵⁾ | RCGC or DCGC ⁽⁴⁾ | Off | Off | Off | Off | Off |

- (1) PLLSYSCLK or OSCCLK divided-down per the M3SSDIVSEL register. In case of a missing source clock, M3SSCLK becomes 10MHZCLK divided-down per the M3SSDIVSEL register.
- (2) PLLSYSCLK normally refers to the output of the Main PLL divided-down per the SYSDIVSEL register. In case the PLL is bypassed, the PLLSYSCLK becomes the OSCCLK divided-down per the SYSDIVSEL register. In case of a missing source clock, the 10MHZCLK is substituted for the PLLSYSCLK.
- (3) PLLSYSCLK or OSCCLK divided-down per the CCLKCTL register. In case of a missing source clock, ASYSCLK becomes 10MHZCLK.
- (4) Depends on the ACG bit of the RCC register.
- (5) 32KHZCLK or 10MHZCLK or OSCCLK chosen/divided-down per the DSLPCLKCFG register, then again divided by the M3SSDIVSEL register (source determined inside the DSLPCLKCFG register).

[Figure 6-11](#) shows the system clock/PLL.

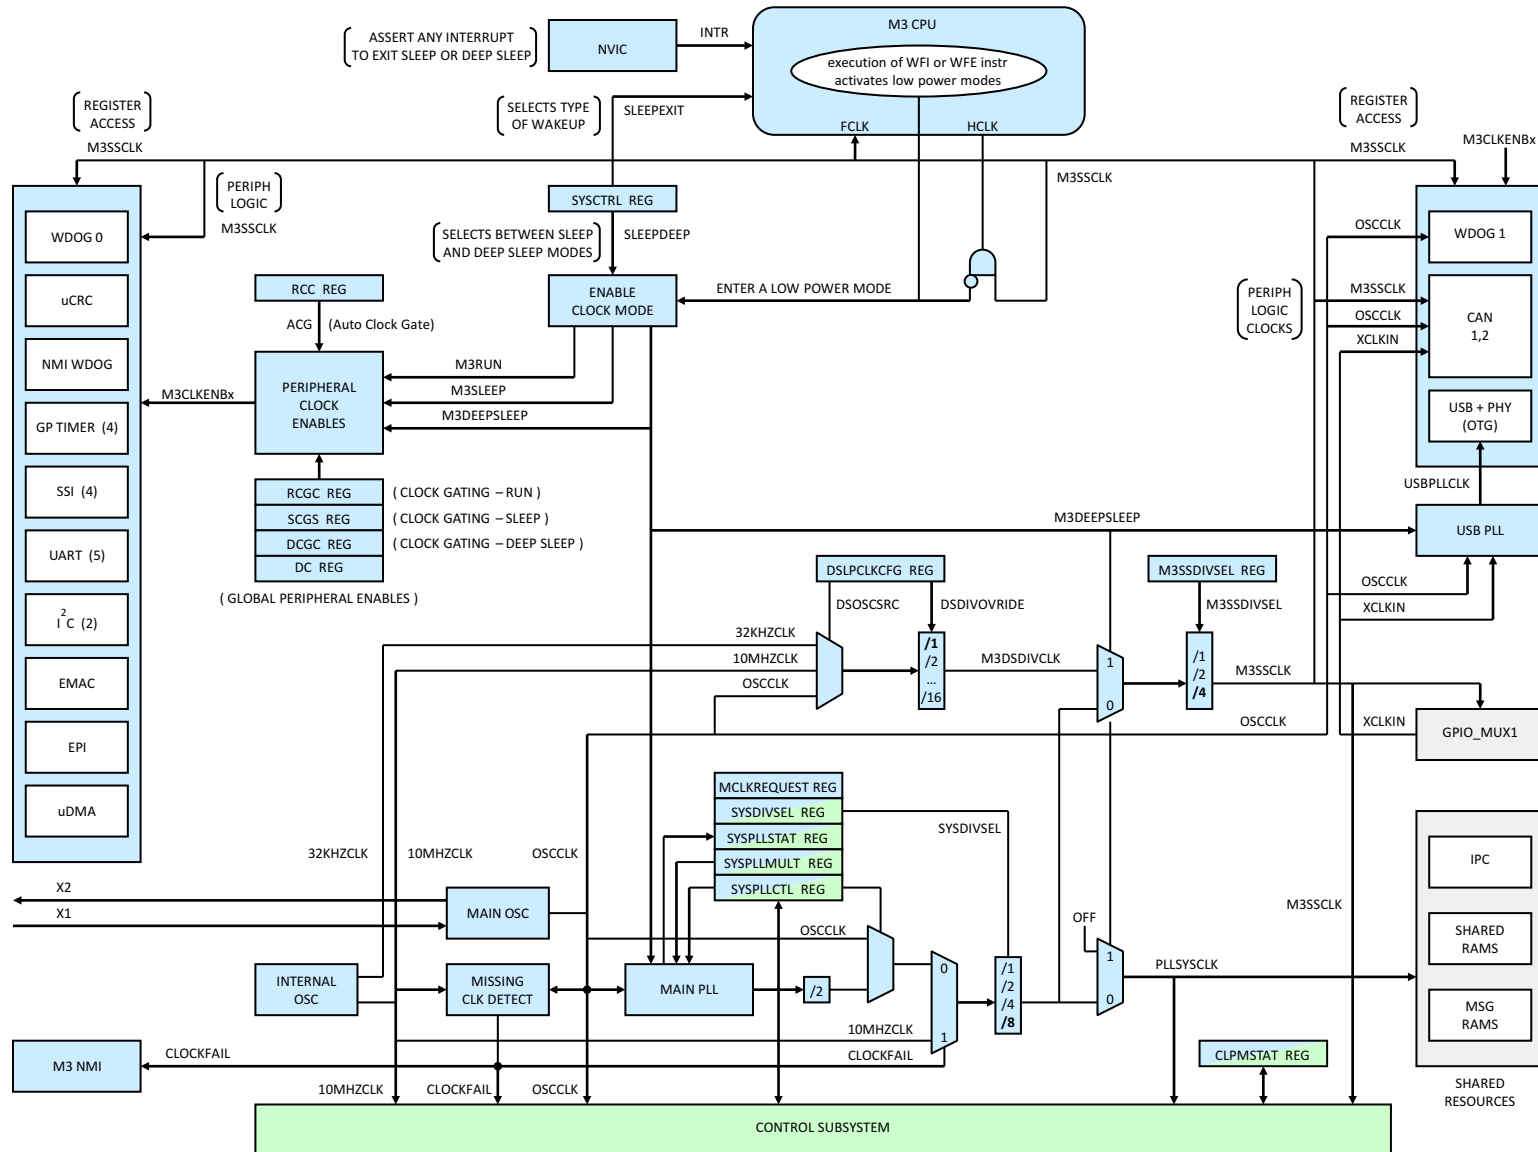

Figure 6-10. Cortex-M3 Clocks and Low-Power Modes

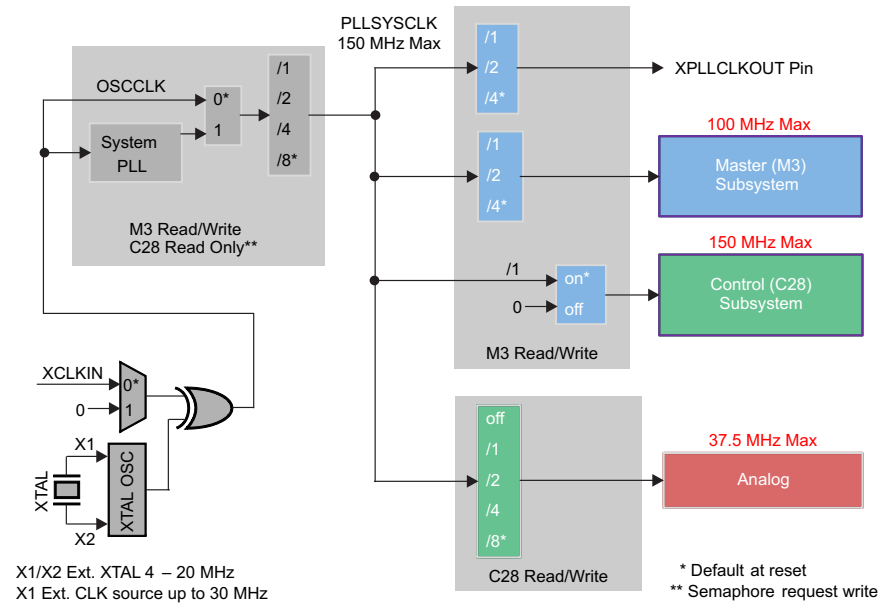

Figure 6-11. System Clock/PLL

6.11.1 Cortex-M3 Run Mode

In Run Mode, the Cortex-M3 processor, memory, and most of the peripherals are clocked by the M3SSCLK, which is a divide-down version of the PLLSYSCLK (from Main PLL). The USB is clocked from a dedicated USB PLL, the CAN peripherals are clocked by M3SSCLK, OSCCLK, or XCLKIN, and one of two watchdogs (WDOG1) is also clocked by the OSCCLK. Clock selection for these peripherals is accomplished through corresponding peripheral configuration registers. Clock gating for individual peripherals is defined inside the RCGS register. RCGS, SCGS, and DCGS clock-gating settings only apply to peripherals that are enabled in a corresponding DC (Device Configuration) register.

Execution of the WFI instruction (Wait-for-Interrupt) shuts down the HCLK to the Cortex-M3 CPU and forces the Cortex-M3 Subsystem into Sleep or Deep Sleep low-power mode, depending on the state of the SLEEPDEEP bit of the Cortex-M3 SYSCTRL register. To come out of a low-power mode, any properly configured interrupt event terminates the Sleep or Deep Sleep Mode and returns the Cortex-M3 processor/subsystem to Run Mode.

6.11.2 Cortex-M3 Sleep Mode

In Sleep Mode, the Cortex-M3 processor and memory are prevented from clocking, and thus the code is no longer executing. The gating for the peripheral clocks may change based on the ACG bit of the RCC register. When ACG = 0, the peripheral clock gating is used as defined by the RCGS registers (same as in Run Mode); and when ACG = 1, the clock gating comes from the SCGS register. RCGS and SCGS clock-gating settings only apply to peripherals that are enabled in a corresponding DC register. Peripheral clock frequency for the enabled peripherals in Sleep Mode is the same as during the Run Mode.

Sleep Mode is terminated by any properly configured interrupt event. Exiting from the Sleep Mode depends on the SLEEPEXIT bit of the SYSCTRL register. When the SLEEPEXIT bit is 1, the processor will temporarily wake up only for the duration of the ISR of the interrupt causing the wake-up. After that, the processor goes back to Sleep Mode. When the SLEEPEXIT bit is 0, the processor wakes up permanently (for the ISR and thereafter).

6.11.3 Cortex-M3 Deep Sleep Mode

In Deep Sleep Mode, the Cortex-M3 processor and memory are prevented from clocking and thus the code is no longer executing. The Main PLL, USB PLL, ASYSCLK to the Analog Subsystem, and input clock to the C28x CPU and Shared Resources are turned off. The gating for the peripheral clocks may change based on the ACG bit of the RCC register. When ACG = 0, the peripheral clock gating is used as defined by the RCGS registers (same as in Run Mode); and when ASC = 1, the clock gating comes from the DCGS register. RCGS and DCGS clock gating settings only apply to peripherals that are enabled in a corresponding DC register.

Peripheral clock frequency for the enabled peripherals in Deep Sleep Mode is different from the Run Mode. One of three sources for the Deep Sleep clocks (32KHZCLK, 10MHZCLK, or OSCCLK) is selected with the DSOSCSRC bits of the DSLPCLKCFG register. This clock is divided-down according to DSDIVOVERRIDE bits of the DSLPCLKCFG register. The output of this Deep Sleep Divider is further divided-down per the M3SSDIVSEL bits of the D3SSDIVSEL register to become the Deep Sleep Clock. If 32KHXCLK or 10MHZCLK is selected in Deep Sleep mode, the internal oscillator circuit (that generates OSCCLK) is turned off.

The Cortex-M3 processor should enter the Deep Sleep mode only after first confirming that the C28x is already in the STANDBY mode. Typically, just before entering the STANDBY mode, the C28x will record in the CLPMSTAT that it is about to do so. The Cortex-M3 processor can read the CLPMSTAT register to check if the C28x is in STANDBY mode, and only then should the Cortex-M3 processor go into Deep Sleep. The reason for the Cortex-M3 processor to confirm that the C28x is in STANDBY mode before the Cortex-M3 processor enters the Deep Sleep mode is that the Deep Sleep mode shuts down the clock to C28x and its peripherals, and if this clock shutdown is not expected by the C28x, unintended consequences could result for some of the C28x control peripherals.

Deep Sleep Mode is terminated by any properly configured interrupt event. Exiting from the Deep Sleep Mode depends on the SLEEPEXIT bit of the SYSCTRL register. When the SLEEPEXIT bit is 1, the processor will temporarily wake up only for the duration of the ISR of the interrupt causing the wake-up. After that, the processor goes back to Deep Sleep Mode. When the SLEEPEXIT bit is 0, the processor wakes up permanently (for the ISR and thereafter).

6.12 Control Subsystem Clocking

The CLKIN input clock to the C28x processor is normally a divided-down output of the Main PLL or X1 external clock input. There are four registers associated with the Main PLL: SYSPLLCTL, SYSPLLMULT, SYSPLLSTAT and SYSDIVSEL. Typically, the Cortex-M3 processor writes to these registers, while the C28x processor has read access. The C28x can request write access to the above registers through the CLKREQUEST register. The Cortex-M3 can regain write ownership of these registers through the MCLKREQUEST register.

Individual C28x peripherals can be turned on or off by gating C28SYSCLK to those peripherals, which is done through the CPCLKCR0,2,3 registers.

The C28x processor outputs two clocks: C28CPUCLK and C28SYSCLK. The C28SYSCLK is used by C28x peripherals, C28x Timer 0, C28x Timer 1, and C28x Timer 2. C28x Timer 2 can also be clocked by OSCCLK or 10MHZCLK (see [Figure 6-12](#)). The C28CPUCLK is used by the C28x CPU, FPU, VCU, and PIE.

The Control Subsystem operates in one of three modes: Normal Mode, IDLE Mode, or STANDBY Mode. [Table 6-26](#) shows the Control Subsystem low-power modes and their effect on the C28x CPU, clocks, and peripherals. [Figure 6-12](#) shows the Control Subsystem clocks and low-power modes.

Table 6-26. Control Subsystem Low-Power Modes⁽¹⁾

| C28x LOW-POWER MODE | STATE OF C28x CPU | C28CPUCLK ⁽²⁾ | C28SYSCLK ⁽³⁾ | REGISTERS USED TO GATE CLOCKS TO C28x PERIPHERALS |
|---------------------|-------------------|--------------------------|--------------------------|---|
| Normal | Active | On | On | CPCLKCR0,1,3 |
| IDLE | Stopped | Off | On | CPCLKCR0,1,3 |
| STANDBY | Stopped | Off | Off | N/A |

(1) The input clock to the C28x CPU is PLLSYSCLK from the Master Subsystem. This clock is turned off when the Master Subsystem enters the Deep Sleep mode.

(2) C28CPUCLK is an output from the C28x CPU. C28CPUCLK clocks the C28x FPU, VCU, and PIE.

(3) C28SYSCLK is an output from the C28x CPU. C28SYSCLK clocks C28x peripherals.

6.12.1 C28x Normal Mode

In Normal Mode, the C28x processor, Local Memory, and C28x peripherals are clocked by the C28SYSCLK, which is derived from the C28CLKIN input clock to the C28x processor. The FPU, VCU, and PIE are clocked by the C28CPUCLK, which is also derived from the C28CLKIN. Timer 2 can also be clocked by the TMR2CLK, which is a divided-down version of one of three source clocks—C28SYSCLK, OSCCLK, and 10MHZCLK—as selected by the CLKCTL register. Additionally, the LOSPCP register can be programmed to provide a dedicated clock (C28LSPCLK) to the SCI, SPI, and McBSP peripherals.

Clock gating for individual peripherals is defined inside the CPCLKCR0,1,3 registers. Execution of the IDLE instruction stops the C28x processor from clocking and activates the IDLES signal. The IDLES signal is gated with two LPM bits of the CPCLKCR0 register to enter the C28x Subsystem into IDLE mode or STANDBY Mode.

6.12.2 C28x IDLE Mode

In IDLE Mode, the C28x processor stops executing instructions and the C28CPUCLK is turned off. The C28SYSCLK continues to run. Exit from IDLE Mode is accomplished by any enabled interrupt or the C28NMIINT (C28x nonmaskable interrupt).

Upon exit from IDLE Mode, the C28CPUCLK is restored. If LPMWAKE interrupt is enabled, the LPMWAKE ISR is executed. Next, the C28x processor starts fetching instructions from a location immediately following the IDLE instruction that originally triggered the IDLE Mode.

Figure 6-12. C28x Clocks and Low-Power Modes

6.12.3 C28x STANDBY Mode

In STANDBY Mode, the C28x processor stops executing instructions and the C28CLKIN, C28CPUCLK, and C28SYSCLK are turned off. Exit from STANDBY Mode is accomplished by one of 64 GPIOs from the GPIO_MUX1 block, or MTOCIPCINT2 (interrupt from MTOC IPC peripheral). The wakeup GPIO selected inside the GPIO_MUX block enters the Qualification Block as the LPMWAKE signal. Inside the Qualification Block, the LPMWAKE signal is sampled per the QUALSTDBY bits (bits [7:2] of the CPCLKCR0 register) before propagating into the wake request logic.

Cortex-M3 should use CLPMSTAT register bits to tell the C28x to go into STANDBY mode before going into Deep Sleep mode. Otherwise, the clock to the C28x will be turned off suddenly when the control software is not expecting this clock to shut off. When the device is in Deep Sleep/STANDBY mode, wake-up should happen only from the Master Subsystem, because all C28x clocks are off (C28CLKIN, C28CPUCLK, C28SYSCLK), thus preventing the C28x from waking up first.

Upon exit from STANDBY Mode, the C28CLKIN, C28SYSCLK, and C28CPUCLK are restored. If the LPMWAKE interrupt is enabled, the LPMWAKE ISR is executed. Next, the C28x processor starts fetching instructions from a location immediately following the IDLE instruction that originally triggered the STANDBY Mode.

NOTE

For GPIO_MUX1 pins PF6_GPIO38 and PG6_GPIO46, only the corresponding USB function is available on silicon revision 0 devices (GPIO and other functions listed in [Table 4-1](#) are not available).

6.13 Analog Subsystem Clocking

The Analog Subsystem is clocked by ASYSCLK, which is a divided-down version of the PLLSYSCLK as defined by CLKDIV bits of the CCLKCTL register. The CCLKCTL register is exclusively accessible by the C28x processor. The CCLKCTL register is reset by $\overline{\text{ASYSRST}}$, which is derived from two Analog Subsystem resets— $\overline{\text{ACIBRST}}$ and $\overline{\text{SRXRST}}$. Therefore, while normally the C28x controls the frequency of ASYSCLK, it is possible for the Cortex-M3 software to restore the ASYSCLK to its default value by resetting the Analog Subsystem.

The ASYSCLK is shut down when the Cortex-M3 processor enters the Deep Sleep mode.

6.14 Shared Resources Clocking

The IPC, Shared RAMs, and Message RAMs are clocked by PLLSYSCLK. EPI is clocked by M3SSCLK. The PLLSYSCLK normally refers to the output of the Main PLL divided-down per the SYSDIVSEL register. In case the PLL is bypassed, the PLLSYSCLK becomes the OSCCLK divided-down per the SYSDIVSEL register. In case of a missing source clock, the 10MHZCLK is substituted for the PLLSYSCLK.

Although EPI is a shared peripheral, it is physically located inside the Cortex-M3 Subsystem; therefore, EPI is clocked by M3SSCLK.

6.15 Loss of Input Clock (NMI Watchdog Function)

The Concerto devices use two type of input clocks. The main clock, for clocking most of the digital logic of the Master, Control, and Analog subsystems, enters the chip through pins X1 and X2 when using external crystal or just pin X1 when using an external oscillator. The second clock enters the chip through the XCLKIN pin and this second clock can be used to clock the USB PLL and CAN peripherals. Only the main clock has a built-in Missing Clock Detection circuit to recognize when the clock source vanishes and to enable other chip components to take corrective or recovery action from such event (see [Figure 6-13](#)).

The Missing Clock Detection circuit itself is clocked by the 10MHZCLK (from an internal zero-pin oscillator) so that, if the main clock disappears, the circuit is still working. Immediately after detecting a missing source clock, the Missing Clock Detection circuit outputs the CLOCKFAIL signal to the Cortex-M3 NMI circuit, the C28x NMI, ePWM peripherals, and the PLLSYSCLK mux. When the PLLSYSCLK mux senses an active CLOCKFAIL signal, the PLLSYSCLK mux revives the PLLSYSCLK using the 10MHZCLK. Simultaneously, the ePWM peripherals can use the CLOCKFAIL signal to stop down driving motor control outputs. The NMI blocks respond to the CLOCKFAIL signal by sending an NMI interrupt to a corresponding CPU, while starting the associated NMI watchdog counter.

If the software does not respond to the clock-fail condition, the watchdog timers will overflow, resulting in the device reset. If the software does react to the NMI, the software can prevent the impending reset by disabling the watchdog timers, and then the software can initiate necessary corrective action such as switching over to an alternative clock source (if available) or the software can initiate a shut-down procedure for the system.

Figure 6-13. Missing Clock Detection

6.16 GPIOs and Other Pins

Most Concerto external pins are shared among many internal peripherals. This sharing of pins is accomplished through several I/O muxes where a specific physical pin can be assigned to selected signals of internal peripherals.

Most of the I/O pins of the Concerto MCU can also be configured as programmable GPIOs. Exceptions include the X1 and X2 oscillator inputs; the \overline{XRS} digital reset and \overline{ARS} analog reset; the $\overline{VREG12EN}$ and $\overline{VREG18EN}$ internal voltage regulator enables; and five JTAG pins. The 144 primary GPIOs are grouped in 2 programmable blocks: GPIO_MUX1 block (136 pins) and GPIO_MUX2 block (8 pins). Additionally, eight secondary GPIOs are available through the AIO_MUX1 block (four pins) and AIO_MUX2 block (four pins). [Figure 6-14](#) shows the GPIOs and other pins.

6.16.1 GPIO_MUX1

One-hundred and thirty-six pins of the GPIO_MUX1 block can be selectively mapped through corresponding sets of registers to all Cortex-M3 peripherals, to all C28x peripherals, to 136 General-Purpose Inputs, to 136 General-Purpose Outputs, or a mixture of all of the above. The first 64 pins of GPIO_MUX1 (GPIO0–GPIO63) can also be mapped to 12 ePWM Trip Inputs, 6 eCAP inputs, 3 External Interrupts to the C28x PIE, and the C28x STANDBY Mode Wakeup signal (LMPWAKE). Additionally, each GPIO_MUX1 pin can have a pullup enabled or disabled. By default, all pullups and outputs are disabled on reset, and all pins of the GPIO_MUX1 block are mapped to Cortex-M3 peripherals (and not to C28x peripherals).

[Figure 6-15](#) shows the internal structure of GPIO_MUX1. The blue blocks represent the Master Subsystem side of GPIO_MUX1, and the green blocks are the Control Subsystem side. The grey block in the center, Pin-Level Mux, is where the GPIO_MUX1 pins are individually assigned between the two subsystems, based on how the configuration registers are programmed in the blue and green blocks (see [Figure 6-16](#) for the configuration registers).

Pin-Level Mux assigns Master Subsystem peripheral signals, Control Subsystem peripheral signals, or GPIOs to the 136 GPIO_MUX1 pins. In addition to connecting peripheral I/Os of the two subsystems to pins, the Pin-Level Mux also provides other signals to the subsystems: XCLKIN and GPIO[S:A] IRQ signals to the Master Subsystem, plus GPTRIP[12:1] and GPI[63:0] signals to the Control Subsystem. XCLKIN carries a clock from an external pin to USB PLL and CAN modules. The 17 GPIO[S:A] IRQ signals are interrupt requests from selected external pins to the NVIC interrupt controller. The 12 GPTRIP[12:1] signals carry trip events from selected external pins to C28x control peripherals—ePWM, eCAP, and eQEP. Sixty-four GPI signals go to the C28x LPM GPIO Select block where one of them can be selected to wake up the C28x CPU from Low-Power Mode. One-hundred and thirty-six (136) GPI signals go to the C28x QUAL block where they can be configured with a qualification sampling period (see [Figure 6-16](#)).

The configuration registers for the muxing of Master Subsystem peripherals are organized in 17 sets (A–S), with each set being responsible for eight pins. The first nine sets of these registers (A–J) are programmable by the Cortex-M3 CPU through the AHB bus or the APB bus. The remaining sets of registers (K–S) are programmable by the AHB bus only. The configuration register for the muxing of Control Subsystem peripherals are organized in five sets (A–E), with each set being responsible for up to 32 pins. These registers are programmable by the C28x CPU through the C28x CPU bus. [Figure 6-16](#) shows set A of the Master Subsystem GPIO configuration registers, set A of the Control Subsystem registers, and the muxing logic for one GPIO pin as driven by these registers.

Figure 6-15. GPIO_MUX1 Block

For each of the 8 pins in set A of the Cortex-M3 GPIO registers, register GPIOCTL selects between 1 of 11 possible primary Cortex-M3 peripheral signals, or 1 of 4 possible alternate peripheral signals. Register GPIOAPSEL then picks one output to propagate further along the muxing chain towards a given pin. The input takes the reverse path. See [Table 6-27](#) and [Table 6-28](#) for the mapping of Cortex-M3 peripheral signals to GPIO_MUX1 pins.

Similarly, on the C28x side, GPAMUX1 and GPAMUX2 registers select 1 of 4 possible C28x peripheral signals for each of 32 pins of set A. The selected C28x peripheral output then propagates further along the muxing chain towards a given pin. The input takes the reverse path. See [Table 6-29](#) for the mapping of C28x peripheral signals to GPIO_MUX1 pins.

In addition to passing mostly digital signals, four GPIO_MUX1 pins can also be assigned to analog signals. The GPIO Analog Mode Select (GPIOAMSEL) Register is used to assign four pins to analog USB signals. PF6_GPIO38 becomes USB0VBUS, PG2_GPIO42 becomes USB0DM, PG5_GPIO45 becomes USB0DP, and PG6_GPIO46 becomes USB0ID. When analog mode is selected, these four pins are not available for digital GPIO_MUX1 options as described above.

Another special case is the External Oscillator Input signal (XCLKIN). This signal, available through pin PJ7_GPIO63, is directly tied to USBPLLCLK (clock input to USB PLL) and two CAN modules. XCLKIN is always available at these modules where it can be selected through local registers.

NOTE

For GPIO_MUX1 pins PF6_GPIO38 and PG6_GPIO46, only the corresponding USB function is available on silicon revision 0 devices (GPIO and other functions listed in [Table 4-1](#) are not available).

6.16.2 GPIO_MUX2

The eight pins of the GPIO_MUX2 block can be selectively mapped to eight General-Purpose Inputs, eight General-Purpose Outputs, or six COMPOUT outputs from the Analog Comparator peripheral. Each GPIO_MUX2 pin can have a pullup enabled or disabled. On reset, all pins of the GPIO_MUX2 block are configured as analog inputs, and the GPIO function is disabled. The GPIO_MUX2 block is programmed through a separate set of registers from those used to program GPIO_MUX1.

The multiple registers responsible for configuring the GPIO_MUX2 pins are organized in register set G. They are accessible by the C28x CPU only. The middle portion of [Figure 6-17](#) shows set G of Control Subsystem registers, plus muxing logic for the associated eight GPIO pins. The GPGMUX1 register selects one of six possible digital output signals from analog comparators, or one of eight general-purpose GPIO digital outputs. The GPGPUD register disables pullups for the GPIO_MUX2 pins when a corresponding bit of that register is set to “1”. Other registers of set G allow reading and writing of the eight GPIO bits, as well as setting the direction for each of the bits (read or write). See [Table 6-30](#) for the mapping of comparator outputs and GPIO to the eight pins of GPIO_MUX2.

Peripheral Modes 0, 1, 2, and 3 are chosen by setting selected bit pairs of GPGMUX1 register to “00”, “01”, “10”, and “11”, respectively. For example, setting bits 5–4 of the GPGMUX1 register to “00” (Peripheral Mode 0) assigns pin GPIO194 to internal signal GPIO194 (digital GPIO). Setting bits 5–4 of the GPGMUX1 register to “11” (Peripheral Mode 3) assigns pin GPIO194 to internal signal COMP6OUT coming from Analog Comparator 6. Peripheral Modes 1 and 2 are reserved and are not currently available.

Table 6-30. GPIO_MUX2 Pin Assignments (C28x Peripheral Modes)⁽¹⁾

| DEVICE PIN NAME | C28x PERIPHERAL MODE 0 | C28x PERIPHERAL MODE 1 | C28x PERIPHERAL MODE 2 | C28x PERIPHERAL MODE 3 |
|-----------------|------------------------------|------------------------------|------------------------------|------------------------------|
| GPIO192 | GPIO192 | – | – | – |
| GPIO193 | GPIO193 | – | – | COMP1OUT |
| GPIO194 | GPIO194 | – | – | COMP6OUT |
| GPIO195 | GPIO195 | – | – | COMP2OUT |
| GPIO196 | GPIO196 | – | – | COMP3OUT |
| GPIO197 | GPIO197 | – | – | COMP4OUT |
| GPIO198 | GPIO198 | – | – | – |
| GPIO199 | GPIO199 | – | – | COMP5OUT |

(1) Blank fields represent Reserved functions.

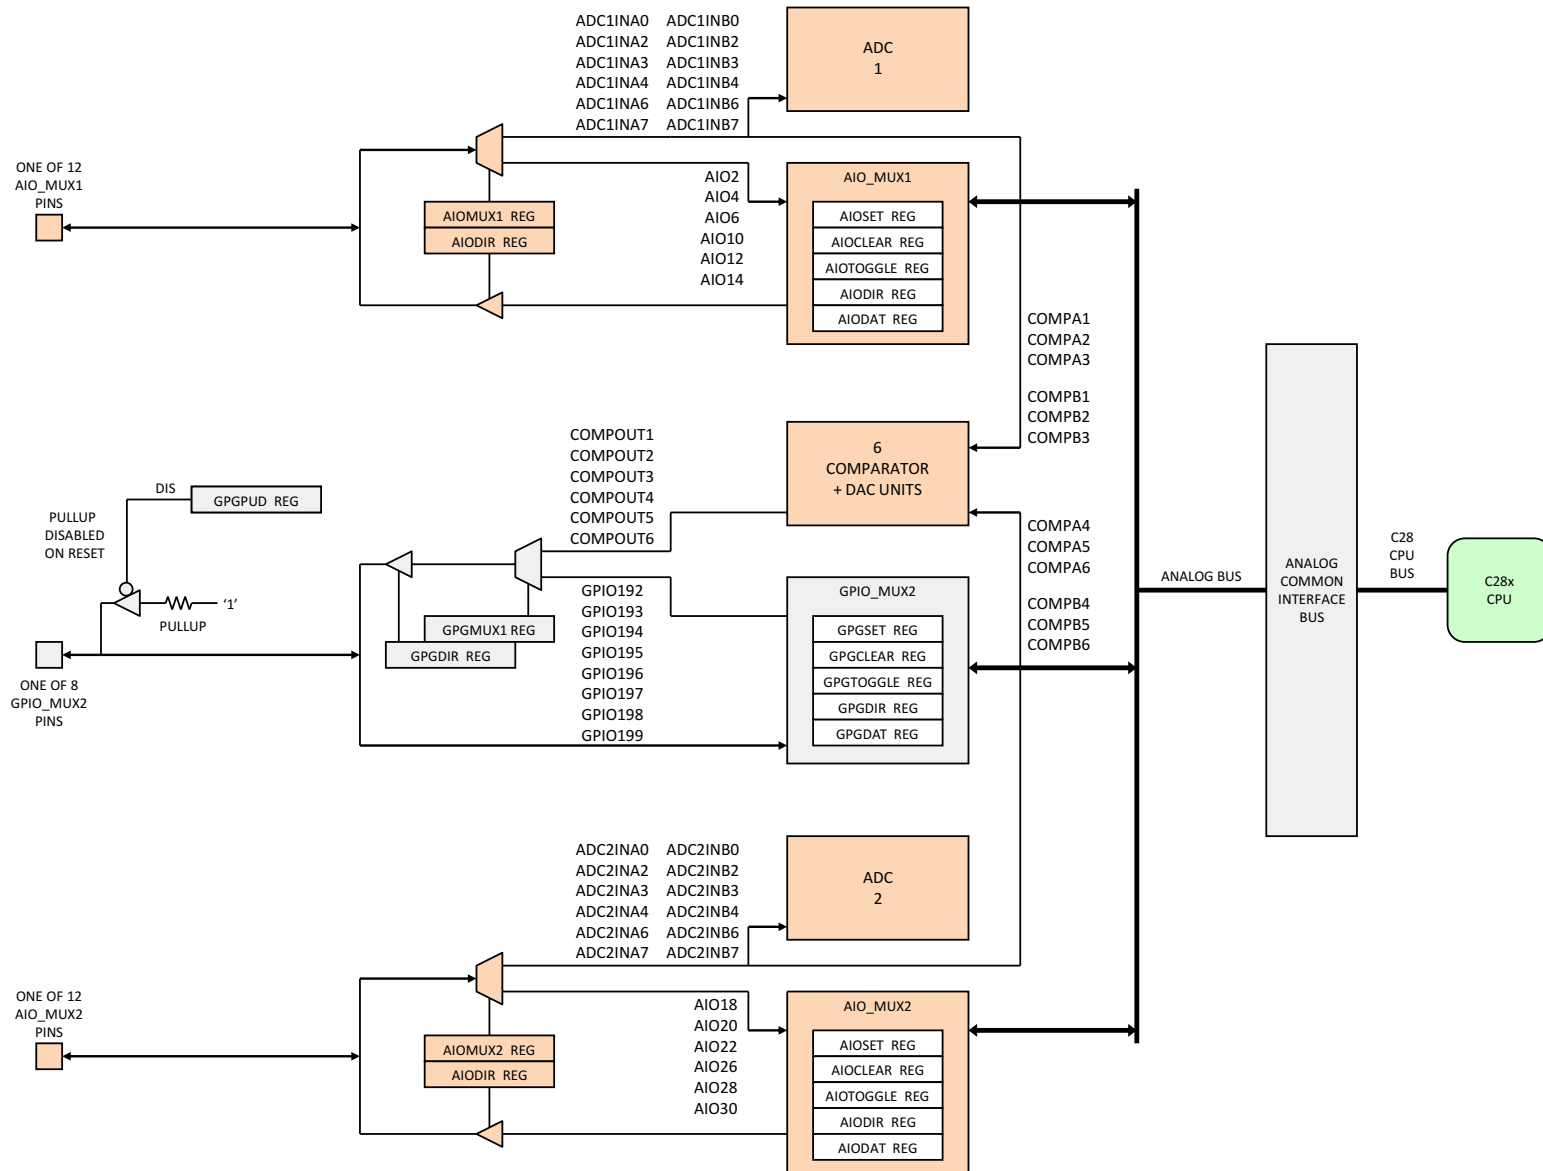

Figure 6-17. Pin Muxing on AIO_MUX1, AIO_MUX2, and GPIO_MUX2

6.16.3 AIO_MUX1

The 12 pins of AIO_MUX1 can be selectively mapped through a dedicated set of registers to 12 analog inputs for ADC1 peripheral, six analog inputs for Comparator peripherals, four General-Purpose Inputs, or four General-Purpose Outputs. While AIO_MUX1 has been named after the analog signals passing through it, the GPIOs (here called AIOs) are still digital, although with fewer features than those in the GPIO_MUX1 and GPIO_MUX2 blocks—for example, they do not offer pullups. On reset, all pins of the AIO_MUX1 block are configured as analog inputs and the GPIO function is disabled. The AIO_MUX1 block is programmed through a separate set of registers from those used to program AIO_MUX2.

The multiple registers responsible for configuring the AIO_MUX1 pins are accessible by the C28x CPU only. The top portion of [Figure 6-17](#) shows Control Subsystem registers and muxing logic for the associated 12 AIO pins. The AIOMUX1 register selects 1 of 12 possible analog input signals or 1 of 6 general-purpose AIO inputs. Other registers allow reading and writing of the 6 AIO bits, as well as setting the direction for each of the bits (read or write). See [Table 6-31](#) for the mapping of analog inputs and AIOs to the 12 pins of AIO_MUX1.

AIO Mode 0 is chosen by setting selected odd bits of the AIOMUX1 register to '0'. AIO Mode 1 is chosen by setting selected odd bits of the AIOMUX1 register to '1'. For example, setting bit 5 of the AIOMUX1 register to '0' assigns pin ADC1INA2 to internal signal AIO2 (digital GPIO). Setting bit 5 of the AIOMUX1 register to '1' assigns pin ADC1INA2 to analog inputs ADC1INA2 or COMPA1 (only one should be enabled at a time in the respective analog module). Currently, all even bits of the AIOMUX1 register are “don't cares”.

Table 6-31. AIO_MUX1 Pin Assignments (C28x AIO Modes)⁽¹⁾⁽²⁾

| DEVICE PIN NAME | C28x AIO MODE 0 ⁽³⁾ | C28x AIO MODE 1 ⁽⁴⁾ |
|-----------------|--------------------------------|--------------------------------|
| ADC1INA0 | – | ADC1INA0 |
| ADC1INA2 | AIO2 | ADC1INA2, COMPA1 |
| ADC1INA3 | – | ADC1INA3 |
| ADC1INA4 | AIO4 | ADC1INA4, COMPA2 |
| ADC1INA6 | AIO6 | ADC1INA6, COMPA3 |
| ADC1INA7 | – | ADC1INA7 |
| ADC1INB0 | – | ADC1INB0 |
| ADC1INB2 | AIO10 | ADC1INB2, COMPB1 |
| ADC1INB3 | – | ADC1INB3 |
| ADC1INB4 | AIO12 | ADC1INB4, COMPB2 |
| ADC1INB6 | AIO14 | ADC1INB6, COMPB3 |
| ADC1INB7 | – | ADC1INB7 |

(1) Blank fields represent Reserved functions.

(2) For each field with two pins (for example, ADC1INA2, COMPA1), only one pin should be enabled at a time; the other pin should be disabled. Use registers inside the respective destination analog peripherals to enable or disable these inputs.

(3) AIO Mode 0 represents digital general-purpose inputs or outputs.

(4) AIO Mode 1 represents analog inputs for ADC1 or the Comparator module.

6.16.4 AIO_MUX2

The 12 pins of AIO_MUX2 can be selectively mapped through a dedicated set of registers to 12 analog inputs for ADC2 peripheral, six analog inputs for Comparator peripherals, four General-Purpose Inputs, or four General-Purpose Outputs. While AIO_MUX2 has been named after the analog signals passing through it, the GPIOs (here called AIOs) are still digital, although with fewer features than those in the GPIO_MUX1 and GPIO_MUX2 blocks—for example, they do not offer pullups. On reset, all pins of the AIO_MUX2 block are configured as analog inputs and the GPIO function is disabled. The AIO_MUX2 block is programmed through a separate set of registers from those used to program AIO_MUX1.

The multiple registers responsible for configuring the AIO_MUX2 pins are accessible by the C28x CPU only. The bottom portion of Figure 6-17 shows Control Subsystem registers and muxing logic for the associated 12 AIO pins. The AIOMUX2 register selects 1 of 12 possible analog input signals or 1 of 6 general-purpose AIO inputs. Other registers allow reading and writing of the 6 AIO bits, as well as setting the direction for each of the bits (read or write). See Table 6-32 for the mapping of analog inputs and AIOs to the 12 pins of AIO_MUX2. Peripheral Modes 1 and 2 are currently not available.

AIO Mode 0 is chosen by setting selected odd bits of the AIOMUX2 register to '0'. AIO Mode 1 is chosen by setting selected odd bits of the AIOMUX2 register to '1'. For example, setting bit 9 of the AIOMUX2 register to '0' assigns pin ADC2INA4 to internal signal AIO20 (digital GPIO). Setting bit 9 of the AIOMUX2 register to '1' assigns pin ADC2INA4 to analog inputs ADC2INA4 or COMPA5 (only one should be enabled at a time in the respective analog module). Currently, all even bits of the AIOMUX2 register are "don't cares".

Table 6-32. AIO_MUX2 Pin Assignments (C28x AIO Modes)⁽¹⁾⁽²⁾

| DEVICE PIN NAME | C28x AIO MODE 0 ⁽³⁾ | C28x AIO MODE 1 ⁽⁴⁾ |
|-----------------|--------------------------------|--------------------------------|
| ADC2INA0 | – | ADC2INA0 |
| ADC2INA2 | AIO18 | ADC2INA2, COMPA4 |
| ADC2INA3 | – | ADC2INA3 |
| ADC2INA4 | AIO20 | ADC2INA4, COMPA5 |
| ADC2INA6 | AIO22 | ADC2INA6, COMPA6 |
| ADC2INA7 | – | ADC2INA7 |
| ADC2INB0 | – | ADC2INB0 |
| ADC2INB2 | AIO26 | ADC2INB2, COMPB4 |
| ADC2INB3 | – | ADC2INB3 |
| ADC2INB4 | AIO28 | ADC2INB4, COMPB5 |
| ADC2INB6 | AIO30 | ADC2INB6, COMPB6 |
| ADC2INB7 | – | ADC2INB7 |

- (1) Blank fields represent Reserved functions.
- (2) For each field with two pins (for example, ADC2INA6, COMPA6), only one pin should be enabled at a time; the other pin should be disabled. Use registers inside the respective destination analog peripherals to enable or disable these inputs.
- (3) AIO Mode 0 represents digital general-purpose inputs or outputs.
- (4) AIO Mode 1 represents analog inputs for ADC2 or the Comparator module.

6.17 Emulation/JTAG

Concerto devices have two types of emulation ports to support debug operations: the 7-pin TI JTAG port and the 5-pin Cortex-M3 Instrumentation Trace Macrocell (ITM) port. The 7-pin TI JTAG port can be used to connect to debug tools through the TI 14-pin JTAG header or the TI 20-pin JTAG header. The 5-pin Cortex-M3 ITM port can only be accessed through the TI 20-pin JTAG header.

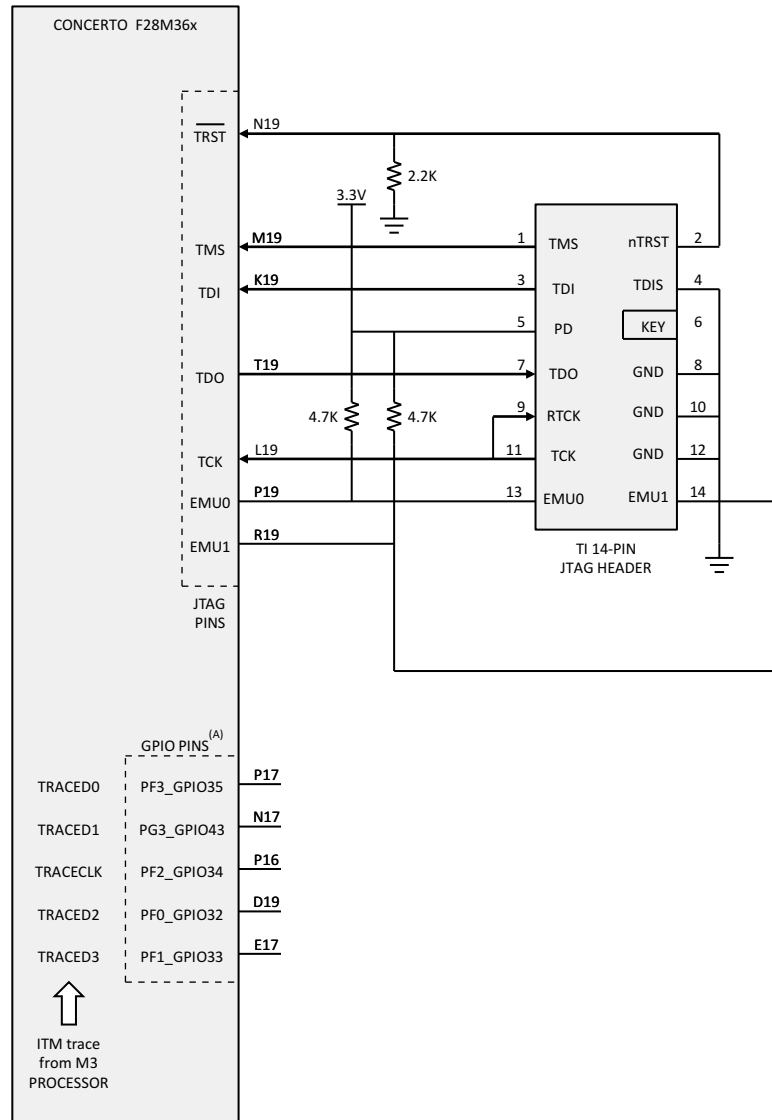

The JTAG port has seven dedicated pins: $\overline{\text{TRST}}$, TMS, TDI, TDO, TCK, EMU0, and EMU1. The $\overline{\text{TRST}}$ signal should always be pulled down through a 2.2-k Ω pulldown resistor on the board. EMU0 and EMU1 signals should be pulled up through a pair of pullups ranging from 2.2 k Ω to 4.7 k Ω (depending on the drive strength of the debugger ports). The JTAG port is TI's standard debug port.

The ITM port uses five GPIO pins that can be mapped to internal Cortex-M3 ITM trace signals: TRACE0, TRACE1, TRACE2, TRACE3, and TRACECLK. This port is typically used for advanced software debug.

TI JTAG debug probes, and those from other manufacturers, can connect to Concerto devices through TI's 14-pin JTAG header or 20-pin JTAG header. See [Figure 6-18](#) to see how the 14-pin JTAG header connects to the JTAG port signals in Concerto. The 14-pin header does not support the ITM debug mode.

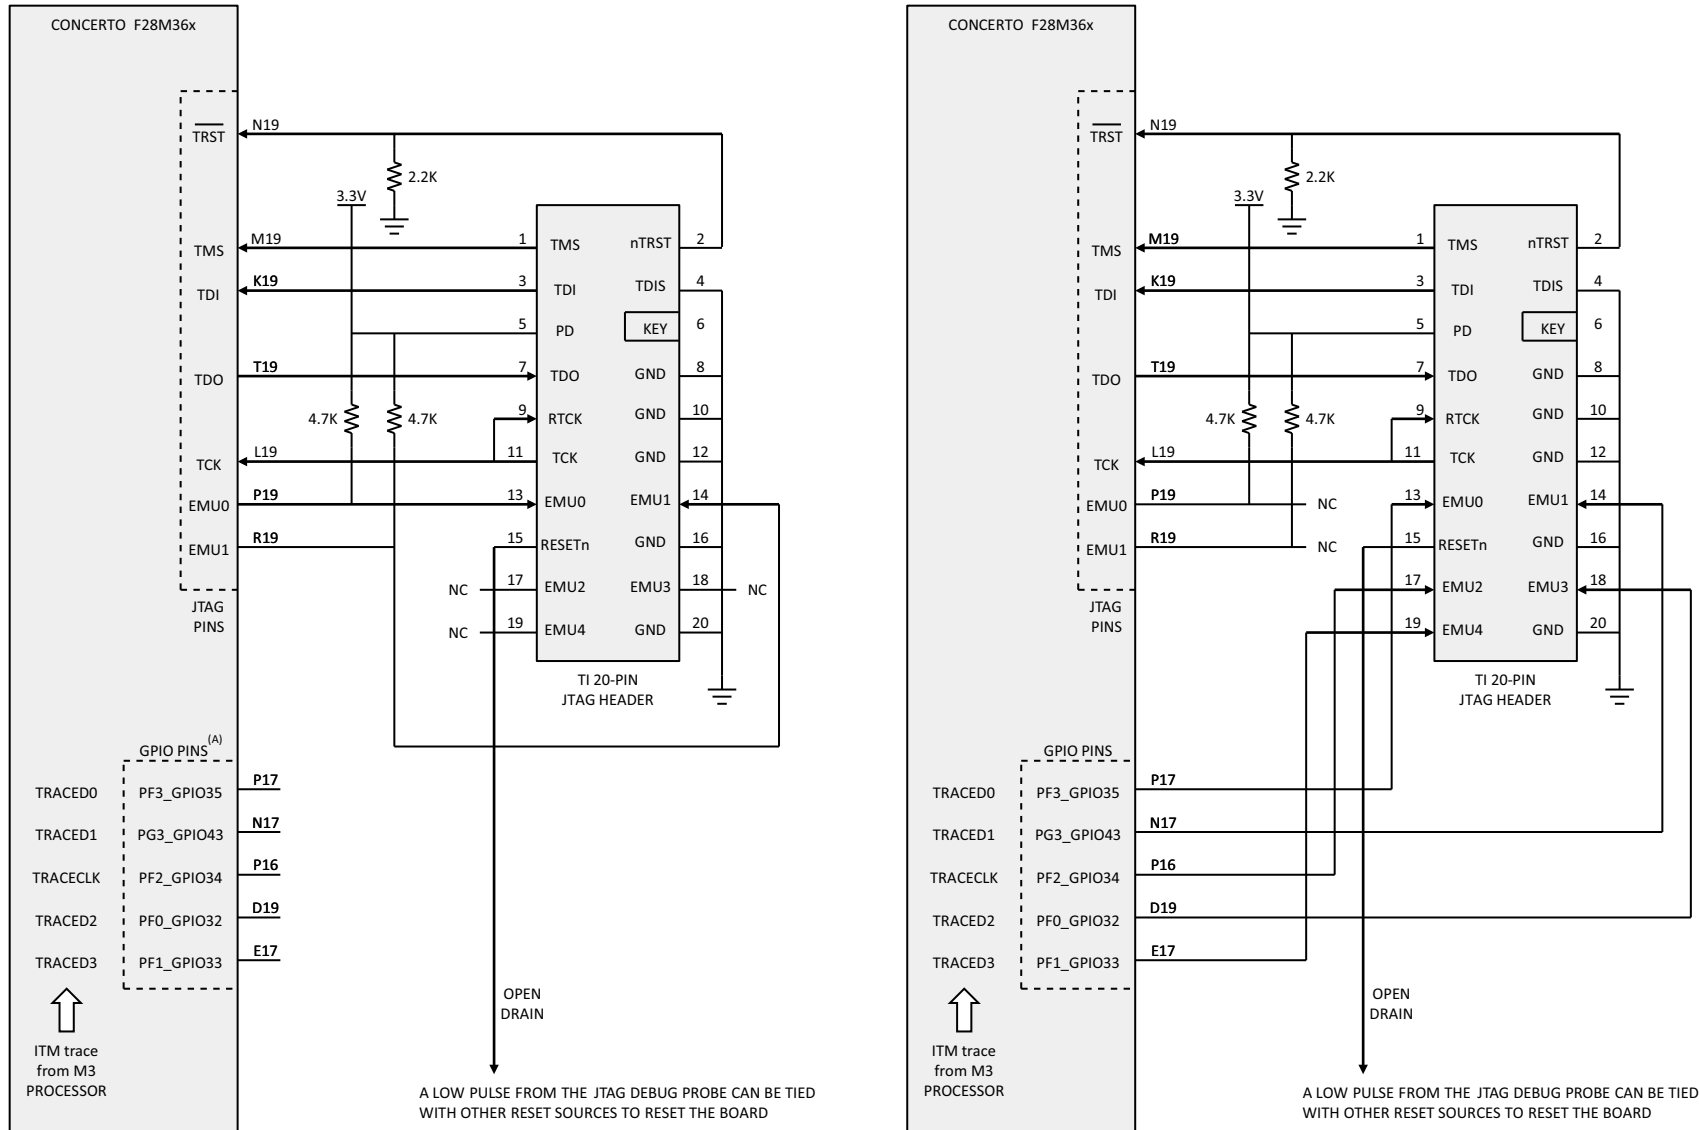

[Figure 6-19](#) shows two possible ways to connect the 20-pin header to the emulation pins in Concerto. The left side of the drawing shows all seven JTAG signals connecting to the 20-pin header similar to the way the 14-pin header was connected. The JTAG EMU0 and EMU1 signals are mapped to the corresponding terminals on the 20-pin header. In this mode, header terminals EMU2, EMU3, and EMU4 are left unconnected and the ITM trace mode is not available.

The right side of the drawing shows the same 20-pin header now connected to five ITM signals and five of seven JTAG signals. The EMU0 and EMU1 signals in Concerto are left unconnected in this mode; thus, the emulation functions associated with these two signals are not available when debugging with ITM trace.

A. The GPIO pins (GPIO32–GPIO35 and GPIO43) may be used in the application if ITM trace is not used.

Figure 6-18. Connecting to TI 14-Pin JTAG Debug Probe Header

A. The GPIO pins (GPIO32–GPIO35 and GPIO43) may be used in the application if ITM trace is not used.

Figure 6-19. Connecting to TI 20-Pin JTAG Debug Probe Header

6.18 Code Security Module

The Code Security Module (CSM) is a security feature incorporated in Concerto devices. The CSM prevents access and visibility to on-chip secure memories by unauthorized persons—that is, the CSM prevents duplication and reverse-engineering of proprietary code. The word "secure" means that access to on-chip secure memories is protected. The word "unsecure" means that access to on-chip secure memory is not protected—that is, the contents of the memory could be read by any means [for example, by using a debugging tool such as Code Composer Studio™ Integrated Development Environment (IDE)].

Code Security Module Disclaimer

THE CODE SECURITY MODULE (CSM) INCLUDED ON THIS DEVICE WAS DESIGNED TO PASSWORD PROTECT THE DATA STORED IN THE ASSOCIATED MEMORY AND IS WARRANTED BY TEXAS INSTRUMENTS (TI), IN ACCORDANCE WITH ITS STANDARD TERMS AND CONDITIONS, TO CONFORM TO TI'S PUBLISHED SPECIFICATIONS FOR THE WARRANTY PERIOD APPLICABLE FOR THIS DEVICE.

TI DOES NOT, HOWEVER, WARRANT OR REPRESENT THAT THE CSM CANNOT BE COMPROMISED OR BREACHED OR THAT THE DATA STORED IN THE ASSOCIATED MEMORY CANNOT BE ACCESSED THROUGH OTHER MEANS. MOREOVER, EXCEPT AS SET FORTH ABOVE, TI MAKES NO WARRANTIES OR REPRESENTATIONS CONCERNING THE CSM OR OPERATION OF THIS DEVICE, INCLUDING ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

IN NO EVENT SHALL TI BE LIABLE FOR ANY CONSEQUENTIAL, SPECIAL, INDIRECT, INCIDENTAL, OR PUNITIVE DAMAGES, HOWEVER CAUSED, ARISING IN ANY WAY OUT OF YOUR USE OF THE CSM OR THIS DEVICE, WHETHER OR NOT TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. EXCLUDED DAMAGES INCLUDE, BUT ARE NOT LIMITED TO LOSS OF DATA, LOSS OF GOODWILL, LOSS OF USE OR INTERRUPTION OF BUSINESS OR OTHER ECONOMIC LOSS.

6.18.1 Functional Description

The security module restricts the CPU access to on-chip secure memory without interrupting or stalling CPU execution. When a read occurs to a protected memory location, the read returns a zero value and CPU execution continues with the next instruction. This process, in effect, blocks read and write access to various memories through the JTAG port or external peripherals. Security is defined with respect to the access of on-chip secure memories and prevents unauthorized copying of proprietary code or data.

The zone is secure when CPU access to the on-chip secure memories associated with that zone is restricted. When secure, two levels of protection are possible, depending on where the program counter is currently pointing. If code is currently running from inside secure memory, only an access through JTAG is blocked (that is, through the JTAG debug probe). This process allows secure code to access secure data. Conversely, if code is running from unsecure memory, all accesses to secure memories are blocked. User code can dynamically jump in and out of secure memory, thereby allowing secure function calls from unsecure memory. Similarly, interrupt service routines can be placed in secure memory, even if the main program loop is run from unsecure memory.

The code security mechanism present in this device offers dual-zone security for the Cortex-M3 code and single-zone security for the C28x code. In case of dual-zone security on the master subsystem, the different secure memories (RAMs and flash sectors) can be assigned to different security zones by configuring the GRABRAM and GRABSECT registers associated with each zone. Flash Sector N and Flash Sector A are dedicated to Zone1 and Zone2, respectively, and cannot be allocated to any other zone by configuration. Similarly, flash sectors get assigned to different zones based on the setting in the GRABSECT registers.

Security is provided by a CSM password of 128 bits of data (four 32-bit words) that is used to secure or unsecure the zones. Each zone has its own 128-bit CSM password. The zone can be unsecured by executing the password match flow (PMF).

The CSM password for each zone is stored in its dedicated flash sector. The password storage locations in the flash sector store the CSM password. The password is selected by the system designer. If the password locations of a zone have all 128 bits as ones, the zone is considered "unsecure". Because new flash devices have erased flash (all ones), only a read of the password locations is required to bring any zone into unsecure mode. If the password locations of a zone have all 128 bits as zeros, the zone is considered "secure", regardless of the contents of the CSMKEY registers. The user should not use all zeros as a password or reset the device during an erase of the flash. Resetting the device during an erase routine can result in either an all-zero or unknown password. If a device is reset when the password locations are all zeros, the device cannot be unlocked by the password match flow. Using a password of all zeros will seriously limit the user's ability to debug secure code or reprogram the flash.

NOTE

If a device is reset while the password locations of a zone contain all zeros or an unknown value, that zone will be permanently locked unless a method to run the flash erase routine from secure SARAM is embedded into the flash or OTP. Care must be taken when implementing this procedure to avoid introducing a security hole.

6.19 μ CRC Module

The μ CRC module is part of the master subsystem. This module can be used by Cortex-M3 software to compute CRC on data and program, which are stored at memory locations that are addressable by Cortex-M3. On this device, the Cortex-M3 Flash Bank and ROM are mapped to the code space that is only accessed by the ICODE/DCODE bus of Cortex-M3; and RAMs are mapped on the SRAM space that is accessible by the SYSTEM bus. Hence, the μ CRC module snoops both the DCODE and SYSTEM buses to support CRC calculation for data and program.

6.19.1 Functional Description

The μ CRC module snoops both the DCODE and SYSTEM buses to support CRC calculation for data and program. To allow interrupts execution in between CRC calculations for a block of data and to discard the Cortex-M3 literal pool accesses in between executions of the program (which reads data for CRC calculation), the Cortex-M3 ROM, Flash, and RAMs are mapped to a mirrored memory location. The μ CRC module grabs data from the bus to calculate CRC only if the address of the read data belongs to mirrored memory space. After grabbing, the μ CRC module performs the CRC calculation on the grabbed data and updates the μ CRC Result Register (μ CRCRES). This register can be read at any time to get the calculated CRC for all the previous read data. The μ CRC module only supports CRC calculation for byte accesses. So, in order to calculate the CRC on a block of data, software must perform byte accesses to all the data. For half-word and word accesses, the μ CRC module discards the data and does not update the μ CRCRES register.

NOTE

If a read to a mirrored address space is thrown from the debugger (Code Composer Studio or any other debug platform), the μ CRC module ignores the read data and does not update the CRC result for that particular read.

6.19.2 CRC Polynomials

The following are the CRC polynomials that are supported by the μ CRC module:

- CRC8 Polynomial = 0x07
- CRC16 Polynomial-1 = 0x8005
- CRC16 Polynomial-2 = 0x1021
- CRC32 Polynomial = 0x04C11DB7

6.19.3 CRC Calculation Procedure

The software procedure for calculating CRC for a set of data that is stored in Cortex-M3 addressable memory space is as follows:

1. Save the current value of the μ CRC Result Register (μ CRCRES) into the stack to allow calculation of CRC in nested interrupt
2. Clear the μ CRC Result Register (μ CRCRES) by setting the CLEAR field of the μ CRC Control Register (μ CRCCONTROL) to "1"
3. Configure the μ CRC polynomials (CRC8, CRC16-P1, CRC16-P2, or CRC32) in the μ CRC Configuration Register (μ CRCCONFIG)
4. Read the data from memory locations for which CRC needs to be calculated using mirrored address
5. Read the μ CRCRES register to get the calculated CRC value. Pop the last saved value of the CRC from the stack and store this value into the μ CRC Result Register (μ CRCRES)

6.19.4 CRC Calculation for Data Stored In Secure Memory

This device has dual-zone security for the Cortex-M3 subsystem. Because ZoneX ($X \rightarrow 1/2$) software does not have access to program/data in ZoneY ($Y \rightarrow 2/1$), code running from ZoneX cannot calculate CRC on data stored in ZoneY memory. Similarly, in the case of Exe-Only flash sectors, even though software is running from same secure zone, the software cannot read the data stored in Exe-Only sectors. However, hardware does allow CRC computation on data stored in Exe-Only flash sectors as long as the read access for this data is initiated by code running from same secure zone. These reads are just dummy reads and, in this case, read data only goes to the μ CRC module, not to the CPU.

7 Applications, Implementation, and Layout

NOTE

Information in the following sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 TI Reference Design

The TI Reference Design Library is a robust reference design library spanning analog, embedded processor, and connectivity. Created by TI experts to help you jump start your system design, all reference designs include schematic or block diagrams, BOMs, and design files to speed your time to market. Search and download designs at the [Select TI reference designs](#) page.

8 Device and Documentation Support

8.1 Device and Development Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all Concerto MCU devices and support tools. Each Concerto MCU commercial family member has one of three prefixes: x, p, or no prefix (for example, xF28M36P63C2ZWTT). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (with prefix **x** for devices and TMDX for tools) through fully qualified production devices/tools (with no prefix for devices and TMDS, instead of TMDX, for tools).

| | |
|-------------------|--|
| xF28M36... | Experimental device that is not necessarily representative of the final device's electrical specifications |
| pF28M36... | Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification |
| F28M36... | Fully qualified production device |

Support tool development evolutionary flow:

| | |
|-------------|---|
| TMDX | Development-support product that has not yet completed Texas Instruments internal qualification testing |
| TMDS | Fully qualified development-support product |

Devices with prefix **x** or **p** and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

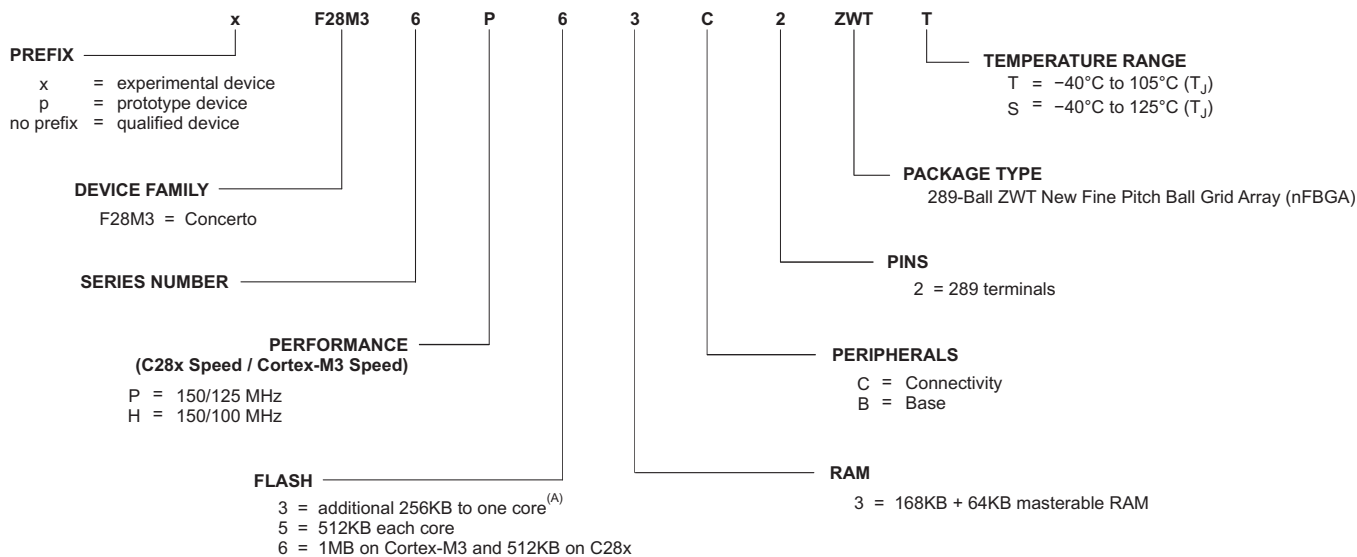

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices with prefix of **x** or **p** have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ZWT) and temperature range (for example, T).

For device part numbers and further ordering information of F28M36x devices in the ZWT package type, see the TI website (www.ti.com) or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the [F28M36x Concerto™ MCUs Silicon Errata](#).

A. The additional 256KB is added to the Cortex-M3 core (connectivity devices) or to the C28x core (base devices).

Figure 8-1. Device Nomenclature

8.2 Tools and Software

TI offers an extensive line of development tools. Some of the tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below. To view all available tools and software for C2000™ real-time control MCUs, visit the [C2000 MCU Tools and Software](#) page.

Development Tools

[H63C2 Concerto Experimenter Kit](#)

The C2000 Experimenter Kits from Texas Instruments are ideal products for initial device exploration and testing. The Concerto H63C2 Experimenter Kit has a docking station that features access to all controlCARD signals, breadboard areas and RS-232 and JTAG connectors. Each kit contains a H63C2 controlCARD. The controlCARD is a complete board level module that utilizes an industry-standard DIMM form factor to provide a low-profile single-board controller solution. Kit is complete with Code Composer Studio™ IDE v5 and USB cable.

[F28M36 Concerto Control Card](#)

The C2000 controlCARDS from Texas Instruments are ideal products for initial software development and short run builds for system prototypes, test stands, and many other projects that require easy access to high-performance controllers. The controlCARDS are complete board-level modules that utilize an industry-standard DIMM form factor to provide a low-profile single-board controller solution. The host system needs to provide only a single 5V power rail to the controlCARD for it to be fully functional.

[UniFlash Standalone Flash Tool](#)

UniFlash is a standalone tool used to program on-chip flash memory through a GUI, command line, or scripting interface.

Software Tools

[controlSUITE™ Software Suite: Essential Software and Development Tools for C2000™ Microcontrollers](#)
controlSUITE™ for C2000™ microcontrollers is a cohesive set of software infrastructure and software tools designed to minimize software development time.

[Code Composer Studio™ \(CCS\) Integrated Development Environment \(IDE\) for C2000 Microcontrollers](#)
Code Composer Studio is an integrated development environment (IDE) that supports TI's Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a suite of tools used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking the user through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

[F021 Flash API](#)

The F021 Flash Application Programming Interface (API) provides a software library of functions to program, erase, and verify F021 on-chip Flash memory.

Models

Various models are available for download from the product Tools & Software pages. These include I/O Buffer Information Specification (IBIS) Models and Boundary-Scan Description Language (BSDL) Models. To view all available models, visit the Models section of the Tools & Software page for each device, which can be found in [Table 8-1](#).

Training

To help assist design engineers in taking full advantage of the C2000 microcontroller features and performance, TI has developed a variety of training resources. Utilizing the online training materials and downloadable hands-on workshops provides an easy means for gaining a complete working knowledge of the C2000 microcontroller family. These training resources have been designed to decrease the learning curve, while reducing development time, and accelerating product time to market. For more information on the various training resources, visit the [C2000™ real-time control MCUs – Support & training](#) site.

8.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The current documentation that describes the processor, related peripherals, and other technical collateral is listed below.

Errata

[F28M36x Concerto™ MCUs Silicon Errata](#) describes known advisories on silicon and provides workarounds.

Technical Reference Manual

[Concerto F28M36x Technical Reference Manual](#) details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the F28M36x Microcontroller Processors.

CPU User's Guides

[TMS320C28x CPU and Instruction Set Reference Guide](#) describes the central processing unit (CPU) and the assembly language instructions of the TMS320C28x fixed-point digital signal processors (DSPs). This Reference Guide also describes emulation features available on these DSPs.

[TMS320C28x Extended Instruction Sets Technical Reference Manual](#) describes the architecture, pipeline, and instruction set of the TMU, VCU-II, and FPU accelerators.

Peripheral Guides

[C2000 Real-Time Control Peripherals Reference Guide](#) describes the peripheral reference guides of the 28x DSPs.

Tools Guides

[TMS320C28x Assembly Language Tools v20.2.0.LTS User's Guide](#) describes the assembly language tools (assembler and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C28x device.

[TMS320C28x Optimizing C/C++ Compiler v20.2.0.LTS User's Guide](#) describes the TMS320C28x C/C++ compiler. This compiler accepts ANSI standard C/C++ source code and produces TMS320 DSP assembly language source code for the TMS320C28x device.

Application Reports

[Semiconductor and IC Package Thermal Metrics](#) describes traditional and new thermal metrics and puts their application in perspective with respect to system-level junction temperature estimation.

[Semiconductor Packing Methodology](#) describes the packing methodologies employed to prepare semiconductor devices for shipment to end users.

[Calculating Useful Lifetimes of Embedded Processors](#) provides a methodology for calculating the useful lifetime of TI embedded processors (EPs) under power when used in electronic systems. It is aimed at general engineers who wish to determine if the reliability of the TI EP meets the end system reliability requirement.

[An Introduction to IBIS \(I/O Buffer Information Specification\) Modeling](#) discusses various aspects of IBIS including its history, advantages, compatibility, model generation flow, data requirements in modeling the input/output structures and future trends.

[Serial Flash Programming of C2000™ Microcontrollers](#) discusses using a flash kernel and ROM loaders for serial programming a device.

8.5 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

8.6 Trademarks

Concerto, TMS320C2000, controlSUITE, Texas Instruments, Code Composer Studio, C2000, TI E2E are trademarks of Texas Instruments.

Arm, Cortex are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

Freescale is a trademark of Freescale Semiconductor, Inc.

NXP is a registered trademark of NXP Semiconductors.

Bosch is a registered trademark of Robert Bosch GmbH Corporation.

All other trademarks are the property of their respective owners.

8.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.8 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

9 Mechanical, Packaging, and Orderable Information

9.1 Packaging Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TRAY

Chamfer on Tray corner indicates Pin 1 orientation of packed units.

*All dimensions are nominal

ZWT (S-PBGA-N289)

PLASTIC BALL GRID ARRAY

4206421-2/F 09/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. This is a Pb-free solder ball design.
 - D. Falls within JEDEC MO-275.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on [ti.com](#) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
