

# SN74CBTLV3126 Low-Voltage Quadruple FET Bus Switch

## 1 Features

- Standard 126-type pinout
- 5Ω switch connection between two ports
- Rail-to-rail switching on data I/O ports
- $I_{off}$  supports partial-power-down mode operation
- Latch-up performance exceeds 100mA per JESD 78, Class II

## 2 Applications

- [Datacenter and enterprise computing](#)
- [Broadband fixed line access](#)
- [Building automation](#)
- [Wired networking](#)
- [Motor drives](#)

## 3 Description

The SN74CBTLV3126 quadruple FET bus switch features independent line switches. Each switch is disabled when the associated output-enable (OE) input is low.

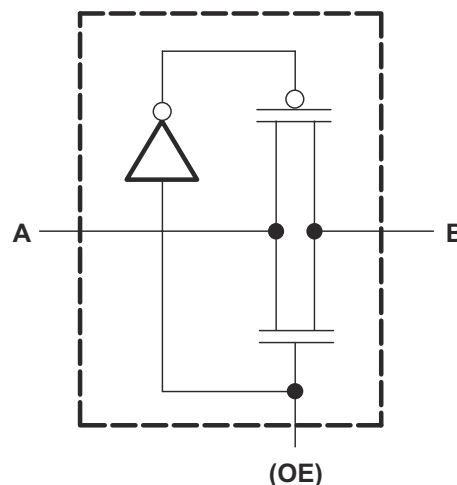

This device is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  feature verifies that damaging current does not backflow through the device when powered down. The SN74CBTLV3126 device has isolation during power off.

To verify the high-impedance state during power up or power down, tie OE to GND through a pull down resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

### Package Information

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

|                  |                                    |                      | MIN  | MAX | UNIT |
|------------------|------------------------------------|----------------------|------|-----|------|
| V <sub>CC</sub>  | Supply voltage range               |                      | −0.5 | 4.6 | V    |
| V <sub>I</sub>   | Input voltage range <sup>(2)</sup> |                      | −0.5 | 4.6 | V    |
| I <sub>I/O</sub> | Continuous channel current         |                      |      | 128 | mA   |
| I <sub>IK</sub>  | Input clamp current                | V <sub>I/O</sub> < 0 |      | −50 | mA   |
| T <sub>stg</sub> | Storage temperature range          |                      | −65  | 150 | °C   |

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

### 5.2 ESD Ratings

|                    |                         |  | VALUE | UNIT |
|--------------------|-------------------------|--|-------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±2000 | V    |
|                    |                         | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±250  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

<sup>(1)</sup>

|                 |                                  |                                | MIN | MAX             | UNIT |
|-----------------|----------------------------------|--------------------------------|-----|-----------------|------|
| V <sub>CC</sub> | Supply voltage                   |                                | 2.3 | 3.6             | V    |
| V <sub>IH</sub> | High-level control input voltage | V <sub>CC</sub> = 2.3V to 2.7V | 1.7 | V <sub>CC</sub> | V    |
|                 |                                  | V <sub>CC</sub> = 2.7V to 3.6V | 2   | V <sub>CC</sub> |      |
| V <sub>IL</sub> | Low-level control input voltage  | V <sub>CC</sub> = 2.3V to 2.7V |     | 0.7             | V    |
|                 |                                  | V <sub>CC</sub> = 2.7V to 3.6V |     | 0.8             |      |
| T <sub>A</sub>  | Operating free-air temperature   |                                | −40 | 85              | °C   |

- (1) All unused control inputs of the device must be held at V<sub>CC</sub> or GND to ensure proper device operation. Refer to the TI application note, [Implications of Slow or Floating CMOS Inputs](#).

## 7 Detailed Description

### 7.1 Overview

The SN74CBTLV3126 quadruple FET bus switch features independent line switches. Each switch is disabled when the associated output-enable (OE) input is low. This device is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  feature ensures that damaging current will not backflow through the device when it is powered down. The SN74CBTLV3126 device has isolation during power off. To ensure the high-impedance state during power up or power down, OE should be tied to GND through a pull down resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

The SN74CBTLV3126 features 5- $\Omega$  switch connection between ports, allowing for low signal loss across the switch. Rail-to-rail switching on data I/O allows for full voltage swing outputs.  $I_{off}$  supports partial-power-down mode operation, protecting the chip from voltages at output ports when it is not powered on. Latch-up performance exceeds 100 mA per JESD 78, Class II.

## 8 Application and Implementation

### Note

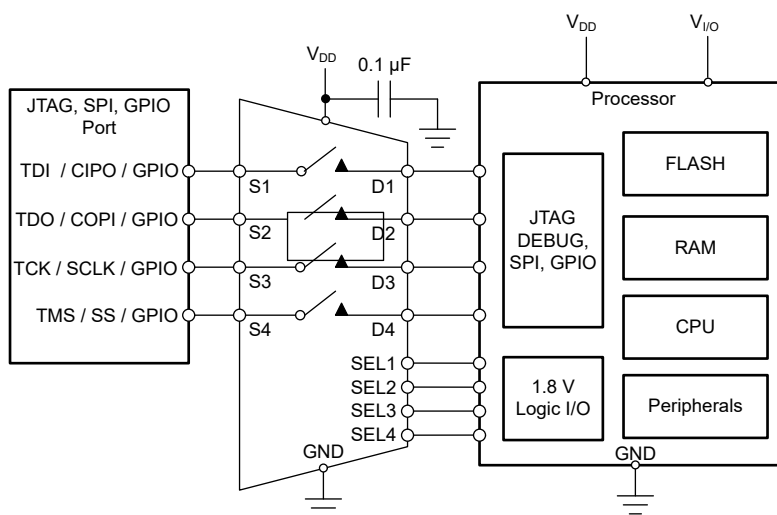

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

One useful application to take advantage of the SN74CBTLV3126 features is isolating various protocols from a processor or MCU such as JTAG, SPI, or standard GPIO signals. The device provides excellent isolation performance when the device is powered. The added benefit of powered-off protection allows a system to minimize complexity by eliminating the need for power sequencing in hot-swap and live insertion applications.

### 8.2 Typical Application

#### 8.2.1 Protocol and Signal Isolation

**Figure 8-1. Typical Application**

#### 8.2.1.1 Design Requirements

For this design example, use the parameters listed in [Table 8-1](#).

**Table 8-1. Design Parameters**

| PARAMETERS                   | VALUES          |
|------------------------------|-----------------|
| Supply (V <sub>DD</sub> )    | 3.3V            |
| Input or output signal range | 0V to 3.3V      |
| Control logic thresholds     | 1.8V compatible |

### 8.2.1.2 Detailed Design Procedure

The SN74CBTLV3126 can operate without any external components except for the supply decoupling capacitors. TI recommends that the digital control pins (OE) be pulled up to  $V_{CC}$  or down to GND to avoid an undesired switch state that could result from the floating pin. All input signals passing through the switch must fall within the [Recommend Operating Conditions](#) of the SN74CBTLV3126 including signal range and continuous current. For this design example, with a supply of 3.3V, the signals can range from 0V to 3.3V when the device is powered. This example can also utilize the Powered-off Protection feature, and the inputs can range from 0V to 3.3V when  $V_{DD} = 0V$ .

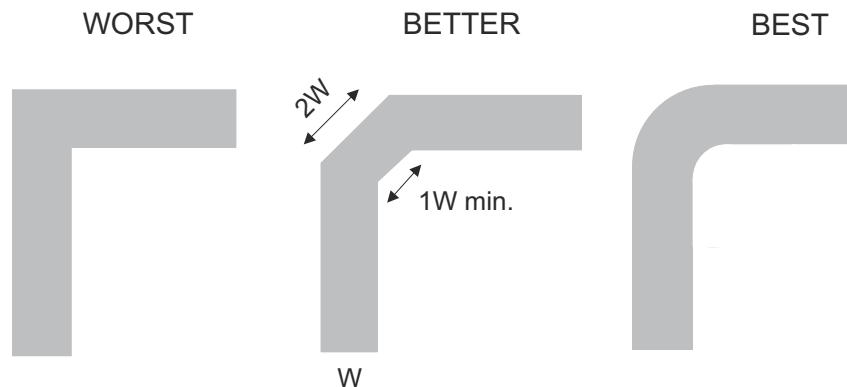

## 8.3 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating listed in the [Recommended Operating Conditions](#) table. Each  $V_{CC}$  terminal should have a good bypass capacitor to prevent power disturbance. For devices with a single supply, a 0.1 $\mu$ F bypass capacitor is recommended. If multiple pins are labeled  $V_{CC}$ , then a 0.01 $\mu$ F or 0.022 $\mu$ F capacitor is recommended for each  $V_{CC}$  because the  $V_{CC}$  pins are tied together internally. For devices with dual supply pins operating at different voltages, for example  $V_{CC}$  and  $V_{DD}$ , a 0.1 $\mu$ F bypass capacitor is recommended for each supply pin. To reject different frequencies of noise, use multiple bypass capacitors in parallel. Capacitors with values of 0.1 $\mu$ F and 1 $\mu$ F are commonly used in parallel. The bypass capacitor should be installed as close to the power terminal as possible for best results.

## 8.4 Layout

### 8.4.1 Layout Guidelines

When a PCB trace turns a corner at a 90° angle, a reflection can occur. A reflection occurs primarily because of the change of width of the trace. At the apex of the turn, the trace width increases to 1.414 times the width. This increase upsets the transmission-line characteristics, especially the distributed capacitance and self-inductance of the trace which results in the reflection. Not all PCB traces can be straight, and therefore; some traces must turn corners. [Figure 8-2](#) shows progressively better techniques of rounding corners. Only the last example (BEST) maintains constant trace width and minimizes reflections.

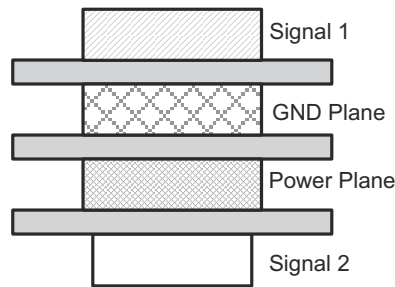

**Figure 8-2. Trace Example**

Route the high-speed signals using a minimum of vias and corners which reduces signal reflections and impedance changes. When a via must be used, increase the clearance size around it to minimize its capacitance. Each via introduces discontinuities in the signal's transmission line and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points, through-hole pins are not recommended at high frequencies.

Do not route high speed signal traces under or near crystals, oscillators, clock signal generators, switching regulators, mounting holes, magnetic devices or ICs that use or duplicate clock signals.

- Avoid stubs on the high-speed signals traces because the stubs cause signal reflections.
- Route all high-speed signal traces over continuous GND planes, with no interruptions.
- Avoid crossing over anti-etch, commonly found with plane splits.

- When working with high frequencies, a printed circuit board with at least four layers is recommended; two signal layers separated by a ground and power layer as shown in [Figure 8-3](#).

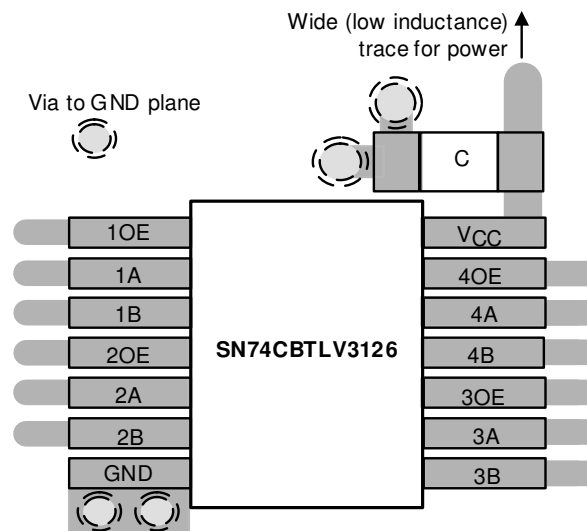

**Figure 8-3. Example Layout**

The majority of signal traces must run on a single layer, preferably Signal 1. Immediately next to this layer must be the GND plane, which is solid with no cuts. Avoid running signal traces across a split in the ground or power plane. When running across split planes is unavoidable, sufficient decoupling must be used. Minimizing the number of signal vias reduces EMI by reducing inductance at high frequencies.

[Figure 8-4](#) shows an example of a PCB layout with the SN74CBTLV3126. Some key considerations are:

- Decouple the  $V_{DD}$  pin with a 0.1  $\mu\text{F}$  capacitor, placed as close to the pin as possible. Make sure that the capacitor voltage rating is sufficient for the  $V_{DD}$  supply.
- High-speed switches require proper layout and design procedures for optimum performance.
- Keep the input lines as short as possible.
- Use a solid ground plane to help reduce electromagnetic interference (EMI) noise pickup.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when necessary.

### 9.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

**(2) Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

**(3) RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

**(4) Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**(5) MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

**(6) Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:

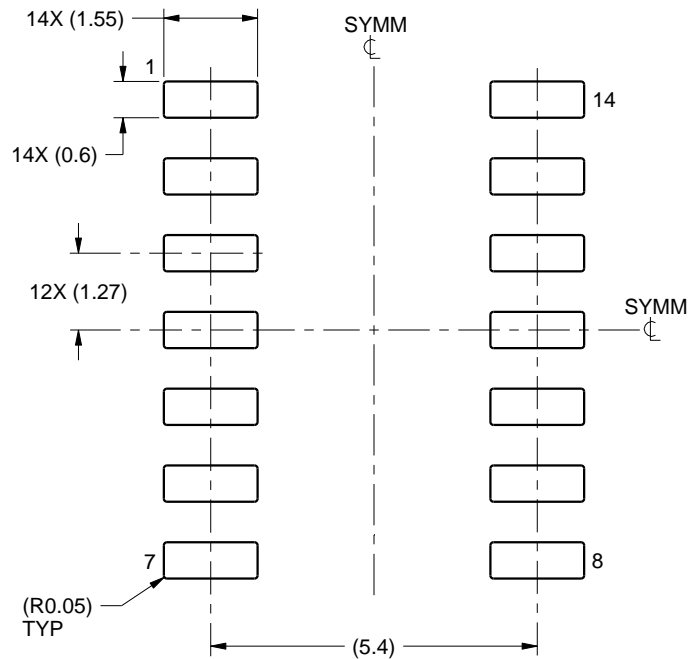

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.43 mm, per side.
5. Reference JEDEC registration MS-012, variation AB.
