These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

over operating free-air temperature range (unless otherwise noted)⁽²⁾

PARAMETERS		VALUE	UNIT
Input voltage range	RTN	–0.3 to 100	V
	FLTTIM, RAMP, SENSE, OV, UV	–0.3 to 15	
Output voltage range	$\overline{\text{FLT}}$, PG ⁽³⁾	–0.3 to 100	
Continuous output current	$\overline{\text{FLT}}$, PG	10	mA
Operating junction temperature range, T _J		–55 to 125	°C
ESD - Human body model (HBM)		2	kV
ESD - Charged device model (CDM)		1.5	

(1) All voltages are with respect to SOURCE (unless otherwise noted).

(2) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(3) With 10 k Ω minimum series resistance. Range limited to –0.3V to 80V from low impedance source.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Input supply, SOURCE to RTN	–80	–48	–12	V
Operating junction temperature range	–40		85	°C

DEVICE INFORMATION

PIN FUNCTIONS

PIN		I/O	DESCRIPTION
NAME	NO.		
$\overline{\text{FLT}}$	2	O	Open-drain, active-low indication that the part is in fault.
FLTTIM	5	I/O	Connection for user programming of the fault timeout period.
GAT	11	O	Gate drive for external N-channel MOSFET that ramps load current and disconnects in the event of a fault.
NC	9		Not connected, leave floating
NC	8		Not connected, leave floating
NC	14		Not connected, leave floating
NC	13		Not connected, leave floating
OV	4	I	Over voltage sense input.
PG	12	O	Open-drain, active-high indication that the power MOSFET is fully enhanced.
RAMP	6	I/O	Programming input for setting the inrush current slew rate.
RTN	1	I	Supply return (for positive grounded system).
SENSE	10	I	Positive current sense input.
SOURCE	7	I/O	Negative current sense input.
UV	3	I	Under voltage sense input.

PIN DESCRIPTIONS

$\overline{\text{FLT}}$: Open-drain, active-low indication that TPS2394 has shut down due to a faulted load. This happens if the load current stays limited by the linear current amplifier (LCA) for more than the fault time (time to charge the FLTTIM capacitor). $\overline{\text{FLT}}$ is cleared when input supply drops below the UV-comparator threshold or exceeds the OV-comparator threshold. The $\overline{\text{FLT}}$ output is pulled to SOURCE. The $\overline{\text{FLT}}$ output is able to sink 10 mA when in fault, withstand 80 V without leakage when not faulted, and withstand transients as high as 100 V when limited by a series resistor of at least 10 k Ω .

FLTTIM: Connection for user programming of the fault timeout period. An external capacitor connected from FLTTIM to SOURCE establishes the timeout period to declare a fault condition. This timeout protects against indefinite current sourcing into a faulted load, and also provides a filter against nuisance trips from momentary current spikes or surges. TPS2394 defines a fault condition as voltage at the SENSE pin at or greater than the 42-mV fault threshold. When a fault condition exists, the timer is active. The devices manage fault timing by charging the external capacitor to the 4-V fault threshold, then subsequently discharging it at approximately 1% the charge rate to establish the duty cycle for retrying the load. Whenever the fault latch is set (timer expired), GAT and $\overline{\text{FLT}}$ are pulled low.

GAT: Gate drive for an external N-channel protection power MOSFET. When input supply is above the UV threshold and below the OV threshold, gate drive is enabled and the device begins charging the external capacitor connected to RAMP. RAMP develops the reference voltage at the non-inverting input of the internal LCA. The inverting input is connected to the current sense node, SENSE. The LCA acts to slew the pass MOSFET gate to force the SENSE voltage to track the reference. The reference is internally clamped to 42 mV, so the maximum current that can be sourced to the load is determined by the sense resistor value as $I_{\text{MAX}} \leq 42 \text{ mV}/R_{\text{SENSE}}$. Once the load voltage has ramped up to the input dc potential and current demand drops off, the LCA drives GAT 14 V above SOURCE to fully enhance the pass MOSFET, completing the low-impedance supply return path for the load.

PG: Open-drain, active-high indication that load current is below the current limit and the power MOSFET is fully enhanced. When commanded load current is more than the actual load current, the linear current amplifier (LCA) will raise the power MOSFET gate voltage to fully enhance the power MOSFET. At this time, the PG output will go high. This output can be used to enable a down-stream dc-to-dc converter. The PG output is pulled to SOURCE and is able to sink 10 mA when in fault, withstand 80 V without leakage when power is not good, and withstand transients as high as 100 V when limited by a series resistor of at least 10 k Ω .

OV: Over voltage comparator input. This input is typically connected to a voltage divider between RTN and SOURCE to sense the magnitude of the input supply. If OV is less than 1.4 V above SOURCE, and UV is more than 1.4 V above SOURCE, and there is no fault, the linear current amp will be enabled. In the event of a fault, pulling OV high or UV low will reset the fault latch and allow the IC to restart. OV can also be used as an active-low logic enable input. The over-voltage comparator hysteresis is programmed by the equivalent resistance seen looking into the divider at the OV input.

RAMP: Programming input for setting inrush current and current slew rate. An external capacitor connected between RAMP and SOURCE establishes turn-on current slew rate. During turn-on, TPS2394 charges this capacitor to establish the reference input to the LCA at 1% of the voltage from RAMP to SOURCE. The closed-loop control of the LCA and the pass MOSFET maintains the $V(\text{SENSE} - \text{SOURCE})$ at the reference potential, so the load current slew rate is directly set by the voltage ramp rate at the RAMP pin. When fully charged, RAMP can exceed SOURCE by 6 V, but the reference is internally clamped to 42 mV, limiting load current to $42 \text{ mV}/R_{\text{SENSE}}$. When the output is disabled via OV, UV, or due to a load fault, the RAMP capacitor is discharged and held low to initialize for the next turn on.

The TPS2394 initiates ramp capacitor charging, and consequently load current slewing, at a reduced rate. This reduced rate applies until the voltage on the RAMP pin is about 0.5 V. The maximum di/dt rate, as set by [Equation 2](#), is effective once the device switches to a 10-mA charging source.

RTN: Positive supply input. For negative voltage systems, this pin connects directly to the return node of the input power bus.

SENSE: Current sense input. An external low-value resistor connected between SENSE and SOURCE is used to monitor current magnitude. There are two internal device thresholds associated with the voltage at the SENSE pin. During ramp-up of the load capacitance or during other periods of excessive demand, the linear current amp (LCA) will regulate this voltage to 42 mV. Whenever the LCA is in current regulation mode, the FLTTIM capacitor charges. If the LCA output is at its maximum, GAT is pulled 14 V above SOURCE. At this time, a fast fault such as a short circuit can cause the SENSE voltage to rapidly exceed 120 mV (the overload threshold). In this case, the GAT pin is pulled low rapidly, bypassing the fault timer.

SOURCE: Connection to the input supply negative rail.

UV: Under Voltage Comparator input. This input is typically connected to a voltage divider between RTN and SOURCE to sense the magnitude of the input supply. If UV is more than 1.4 V above SOURCE, OV is less than 1.4 V above SOURCE, and there is no fault, the LCA will be enabled. In the event of a fault, pulling UV low or OV high will reset the fault latch and allow restarting. UV can also be used as an active high logic enable input. The under-voltage comparator hysteresis is programmed by the equivalent resistance seen looking into the divider at the UV input.

APPLICATION INFORMATION**Figure 9. Typical Application**

APPLICATION INFORMATION

Setting the Sense Resistor Value

Due to the current-limiting action of the internal LCA, the maximum allowable load current for an implementation is easily programmed by selecting the appropriate sense resistor value. The LCA acts to limit the sense voltage $V(\text{SENSE-SOURCE})$ to its internal reference. Once the voltage at the RAMP pin exceeds approximately 4 V, this limit is the clamp voltage, $V_{\text{REF_K}}$. Therefore; a maximum sense resistor value can be determined from [Equation 1](#).

$$R_{\text{SENSE}} \leq \frac{34 \text{ mV}}{I_{\text{IMAX}}} \quad (1)$$

Where:

R_{SENSE} is the sensing resistor value

I_{IMAX} is the minimum desired current limit

When setting the sense resistor value, it is important to consider two factors, the minimum current limit that may be imposed by the TPS2394, and the maximum load under normal operation of the module. For the first factor, the specification minimum clamp value is used, as seen in [Equation 1](#). Second factor is to ensure the peak operating load current is less than I_{IMAX} . One example of this is a switching converter which draws higher input current, for a given power output, when the output is at the low end of its voltage range. To avoid current limit operation under normal loading, some margin should be designed in between this maximum anticipated load and the minimum current limit level, or $I_{\text{IMAX}} > I_{\text{LOAD(max)}}$, for [Equation 1](#).

For example, using a 10-m Ω sense resistor for a nominal 2-A load application provides a minimum of 1.4 A of overhead for load variance/margin. Typical bulk capacitor charging current during turn-on is 4.2 A (42 mV/10 m Ω).

Setting the Inrush Slew Rate

The TPS2394 device enables user-programming of the maximum current slew rate during load start-up events. A capacitor tied to the RAMP pin (C_{RAMP} in the typical application diagram) controls the di/dt rate. Once the sense resistor value has been established, a value for C_{RAMP} , in microfarads, can be determined from [Equation 2](#).

$$C_{\text{RAMP}} = \frac{11.3}{100 \times R_{\text{SENSE}} \times \left(\frac{di}{dt} \right)_{(\text{max})}} \quad (2)$$

Where:

R_{SENSE} is the sense resistor value in Ω

$(di/dt)_{(\text{max})}$ is the desired maximum slew rate in A/s

For example, if the desired slew rate for the typical application shown is 1500 mA/ms, the calculated value for C_{RAMP} is about 7500 pF. Selecting the next larger standard value of 8200 pF provides some margin for capacitor and sense resistor tolerances.

Setting the Fault Timing Capacitor

The fault timeout period is established by the value of the capacitor connected to the FLTTIM pin, C_{FLT} . The timeout period permits riding out spurious current glitches and surges that may occur during operation of the system, and prevents indefinite sourcing into faulted loads. However, to ensure smooth voltage ramping under all conditions of load capacitance and input supply potential, the minimum timeout should be set to accommodate these system variables. To do this, a rough estimate of the maximum voltage ramp time for a completely discharged plug-in card provides a good basis for setting the minimum timer delay. This section presents a quick procedure for calculating the timing capacitance requirement. However, for proper operation of the TPS2394, there is an absolute minimum value of 0.01- μF for C_{FLT} . This minimum requirement overrides any smaller results of [Equation 7](#) and [Equation 8](#).

Due to the three-phase nature of the load current at turn-on, the load voltage ramp has potentially three distinct phases. This profile depends on the relative values of load capacitance, input DC potential, maximum current limit and other factors. The first two phases are characterized by the two different slopes of the current ramp; the third phase, if required to complete load charging, is the constant-current charging at I_{MAX}. Considering the two current ramp phases to be one period at an average di/dt simplifies calculation of the required timing capacitor.

For the TPS2394, the typical duration of the soft-start period, t_{SS}, is given by [Equation 3](#).

$$t_{SS} = 1260 \times C_{RAMP} \quad (3)$$

Where:

t_{SS} is the soft-start period in ms

C_{RAMP} is given in μF

During this current ramp period, the load voltage magnitude which is attained is estimated by [Equation 4](#).

$$V_{LSS} = \frac{i_{AVG}}{2 \times C_{LOAD} \times C_{RAMP} \times 100 \times R_{SENSE}} \times (t_{SS})^2 \quad (4)$$

Where:

V_{LSS} is the load voltage reached during soft-start

i_{AVG} is 3.18 μA for the TPS2394

C_{LOAD} is the load capacitance in Farads

t_{SS} is the soft-start period in s

The quantity i_{AVG} in [Equation 4](#) is a weighted average of the two charge currents applied to C_{RAMP} during turn-on, considering the typical output values.

If the result of [Equation 4](#) is larger than the maximum input supply value, then the load can be expected to charge completely during the inrush slewing portion of the insertion event. However, if this voltage is less than the maximum supply input, V_{IN(MAX)}, the HSPM transitions to the constant-current charging of the load. The remaining amount of time required at I_{MAX} is determined from [Equation 5](#).

$$t_{CC} = \frac{C_{LOAD} \times (V_{IN(MAX)} - V_{LSS})}{\frac{V_{REF_K(MIN)}}{R_{SENSE}}} \quad (5)$$

Where:

t_{CC} is the constant-current voltage ramp time, in seconds

V_{REF_K(MIN)} is the minimum clamp voltage, 34 mV

With this information, the minimum recommended value timing capacitor C_{FLT} can be determined. The delay time needed will be either a time t_{SS2} or the sum of t_{SS2} and t_{CC}, according to the estimated time to charge the load. The quantity t_{SS2} is the duration of the normal rate current ramp period, and is given by [Equation 6](#).

$$t_{SS2} = 0.35 \times C_{RAMP} \quad (6)$$

Where:

C_{RAMP} is given in μF

Since fault timing is generated by the constant-current charging of C_{FLT}, the capacitor value is determined from either [Equation 7](#) or [Equation 8](#), as appropriate.

$$C_{FLT(MIN)} = \frac{54 \times t_{SS2}}{3.75} \quad (7)$$

$$C_{FLT(MIN)} = \frac{54 \times (t_{SS2} + t_{CC})}{3.75} \quad (8)$$

Where:

C_{FLT(MIN)} is the recommended capacitor value, in μ-Farads

t_{SS2} is the result of [Equation 6](#), in seconds

t_{CC} is the result of [Equation 5](#), in seconds

Continuing this calculation example, using a 220-μF input capacitor (C_{LOAD}), Equation 3 and Equation 4 estimate the load voltage ramping to approximately –45 V during the soft-start period. If the module should operate down to –72-V input supply, approximately another 1.4 ms of constant-current charging may be required. Therefore, Equation 6 and Equation 8 are used to determine $C_{FLT(MIN)}$, and the result is approximately 0.039-μF.

Setting the Undervoltage and Overvoltage Thresholds

The UV and OV pins can be used to set the undervoltage (V_{UV}) and overvoltage (V_{OV}) thresholds of the hot swap circuit. When the input supply is below V_{UV} or above V_{OV} , the GAT pin is held low, disconnecting power from the load, and the PG output is deasserted. When input voltage is within the UV/OV window, the GAT pin drive is enabled, assuming all other input conditions are valid for turn-on.

Threshold hysteresis is provided via two internal sources which are switched to either pin whenever the corresponding input level exceeds the internal 1.4-V reference. The additional bias shifts the pin voltage in proportion to the external resistance connected to it. This small voltage shift at the device pin is gained up by the external divider to input supply levels.

Figure 10. Programming the Undervoltage and Overvoltage Thresholds

The UV and OV thresholds can be individually programmed with a three-resistor divider connected to the TPS2394 as shown in the typical application diagram, and again in Figure 10a. When the desired trip voltages and undervoltage hysteresis have been established for the protected board, the resistor values needed can be determined from the following equations. First, select the top leg of the divider ($R1$ in the diagram) to obtain the threshold hysteresis. This value is calculated using Equation 9.

$$R1 = \frac{V_{HYS_UV}}{10 \mu A} \quad (9)$$

Where:

V_{HYS_UV} is the undervoltage hysteresis value

For example, assume the typical application design targets have been set to undervoltage turn-on at 33 V (input supply rising), turn-off at 31 V (input voltage falling), and overvoltage shutdown at 72 V. Then Equation 9 yields $R1 = 200 \text{ k}\Omega$ for the 2-V hysteresis. Once the value of $R1$ is selected, it is used to calculate resistors $R2$ and $R3$.

$$R2 = \frac{1.4 \times R1}{(V_{UV_L} - 1.4)} \times \left[1 - \frac{V_{UV_L}}{(V_{OV_L} + 10^{-5} \times R1)} \right] \quad (10)$$

$$R3 = \frac{1.4 \times R1 \times V_{UV_L}}{(V_{UV_L} - 1.4) \times (V_{OV_L} + 10^{-5} \times R1)} \quad (11)$$

Where:

V_{UV_L} is the UVLO threshold when the input supply is low; i.e., less than V_{UV} , and

V_{OV_L} is the OVLO threshold when the input supply is low; i.e., less than V_{OV}

Referring to [Figure 10a](#), [Equation 10](#) and [Equation 11](#) produce $R2 = 4.909 \text{ k}\Omega$ (4.99 k Ω selected) and $R3 = 3.951 \text{ k}\Omega$ (3.92 k Ω selected), as shown. For the selected values, the expected nominal supply thresholds are $V_{UV_L} = 32.8 \text{ V}$, $V_{UV_H} = 30.8 \text{ V}$, and $V_{OV_L} = 72.6 \text{ V}$. The hysteresis of the overvoltage threshold, as seen at the supply inputs, is given by the quantity $(10 \text{ }\mu\text{A}) \times (R1 + R2)$. For the majority of applications, this value is almost the same as the UV hysteresis, since typically $R1 \gg R2$.

If more independent control is needed for the OVLO hysteresis, there are several options. One option is to use separate dividers for both the UV and OV pins, as shown in [Figure 10b](#). In this case, once $R1$ and $R8$ have been selected for the required hysteresis per [Equation 9](#), and values for the bottom resistors in the divider ($R2$ and $R9$ in [Figure 10b](#)) can be calculated using [Equation 12](#).

$$R_{XVLO} = \frac{V_{REF}}{(V_{XV_L} - V_{REF})} \times R_{(TOP)} \quad (12)$$

Where:

R_{XVLO} is $R2$ or $R9$

$R_{(TOP)}$ is $R1$ or $R8$ as appropriate for the threshold being set

V_{XV_L} is the under (V_{UV_L}) or overvoltage (V_{OV_L}) threshold at the supply input, and

V_{REF} is either V_{THUV} or V_{THOV} from the specification table, as required for the resistor being calculated.

Reverse Voltage Protection

In some applications, it may be necessary to protect the TPS2394 against reverse polarity supply connections or input transients. If the potential at SOURCE pin rises above that of the RTN pin, device damage may result. If the application environment is such that these conditions are anticipated, a small-signal diode should be inserted between the supply return bus and the TPS2394 RTN pin, as shown in the Typical Application diagram. A 75-V to 100-V rated device (VRRM), such as MMBD4148 or BAV19, is recommended.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS2394PWR	TSSOP	PW	14	2000	330.0	12.4	6.9	5.6	1.6	8.0	12.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TPS2394PWR	TSSOP	PW	14	2000	353.0	353.0	32.0

TUBE

*All dimensions are nominal

Device	Package Name	Package Type	Pins	SPQ	L (mm)	W (mm)	T (μm)	B (mm)
TPS2394PW	PW	TSSOP	14	90	530	10.2	3600	3.5
TPS2394PW.A	PW	TSSOP	14	90	530	10.2	3600	3.5
TPS2394PW.B	PW	TSSOP	14	90	530	10.2	3600	3.5

EXAMPLE BOARD LAYOUT

PW0014A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 10X

SOLDER MASK DETAILS

4220202/B 12/2023

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

PW0014A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE: 10X

4220202/B 12/2023

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
