# LOW POWER, SINGLE-SUPPLY, RAIL-TO-RAIL OPERATIONAL AMPLIFIERS MicroAmplifier ${ }^{\text {" }}$ Series 

## FEATURES

- RAIL-TO-RAIL INPUT
- RAIL-TO-RAIL OUTPUT (within 1mV)
- LOW QUIESCENT CURRENT: $150 \mu \mathrm{~A}$ typ
- MicroSIZE PACKAGES

SOT23-5
MSOP-8
TSSOP-14

- GAIN-BANDWIDTH

OPA344: $1 \mathrm{MHz}, \mathrm{G} \geq 1$
OPA345: 3MHz, G $\geq 5$

- SLEW RATE

OPA344: $0.8 \mathrm{~V} / \mu \mathrm{s}$
OPA345: $2 \mathrm{~V} / \mu \mathrm{s}$

- THD + NOISE: 0.006\%

## APPLICATIONS

## DESCRIPTION

The OPA344 and OPA345 series rail-to-rail CMOS operational amplifiers are designed for precision, low-power, miniature applications. The OPA344 is unity gain stable, while the OPA345 is optimized for gains greater than or equal to five, and has a gain-bandwidth product of 3 MHz .
The OPA344 and OPA345 are optimized to operate on a single supply from 2.5 V and up to 5.5 V with an input common-mode voltage range that extends 300 mV beyond the supplies. Quiescent current is only $250 \mu \mathrm{~A}$ (max).
Rail-to-rail input and output make them ideal for driving sampling analog-to-digital converters. They are also well suited for general purpose and audio applications and providing I/V conversion at the output of D/A converters. Single, dual and quad versions have identical specs for design flexibility.
A variety of packages are available. All are specified for operation from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$. A SPICE macromodel for design analysis is available for download from www.ti.com.

## SPECIFICATIONS: $\mathrm{V}_{\mathrm{S}}=2.7 \mathrm{~V}$ to 5.5 V

At $T_{A}=+25^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{L}}=10 \mathrm{k} \Omega$ connected to $\mathrm{V}_{\mathrm{S}} / 2$ and $\mathrm{V}_{\mathrm{OUT}}=\mathrm{V}_{\mathrm{S}} / 2$, unless otherwise noted.
Boldface limits apply over the temperature range, $\mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

NOTES: (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only. Functional operation of the device at these conditions, or beyond the specified operating conditions, is not implied. (2) Input terminals are diode-clamped to the power supply rails. Input signals that can swing more than 0.5 V beyond the supply rails should be current-limited to 10 mA or less. (3) Short-circuit to ground, one amplifier per package.

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

NOTES: (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
(2) Models with a slash (/) are available only in Tape and Reel in the quantities indicated (e.g., /2K5 indicates 2500 devices per reel). Ordering 2500 pieces of "OPA344UA/2K5" will get a single 2500-piece Tape and Reel.

## TYPICAL PERFORMANCE CURVES

At $T_{A}=+25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{S}}=+5 \mathrm{~V}$, and $\mathrm{R}_{\mathrm{L}}=10 \mathrm{k} \Omega$ connected to $\mathrm{V}_{\mathrm{S}} / 2$, unless otherwise noted.

## APPLICATIONS INFORMATION

OPA344 series op amps are unity gain stable and can operate on a single supply, making them highly versatile and easy to use. OPA345 series op amps are optimized for applications requiring higher speeds with gains of 5 or greater.

Rail-to-rail input and output swing significantly increases dynamic range, especially in low supply applications. Figure 1 shows the input and output waveforms for the OPA344 in unity-gain configuration. Operation is from $\mathrm{V}_{\mathrm{S}}=+5 \mathrm{~V}$ with a $10 \mathrm{k} \Omega$ load connected to $\mathrm{V}_{\mathrm{S}} / 2$. The input is a $5 \mathrm{Vp}-\mathrm{p}$ sinusoid. Output voltage is approximately $4.997 \mathrm{Vp}-\mathrm{p}$.
Power supply pins should be bypassed with $0.01 \mu \mathrm{~F}$ ceramic capacitors.

## OPERATING VOLTAGE

OPA344 and OPA345 series op amps are fully specified and ensured from +2.7 V to +5.5 V . In addition, many specifications apply from $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$. Parameters that vary significantly with operating voltages or temperature are shown in the Typical Performance Curves.

## RAIL-TO-RAIL INPUT

The input common-mode voltage range of the OPA344 and OPA345 series extends 300 mV beyond the supply rails. This is achieved with a complementary input stage-an N channel input differential pair in parallel with a P-channel differential pair (see Figure 2). The N-channel pair is active for input voltages close to the positive rail, typically ( $\mathrm{V}+$ ) 1.3 V to 300 mV above the positive supply, while the P channel pair is on for inputs from 300 mV below the negative supply to approximately $(\mathrm{V}+)-1.3 \mathrm{~V}$. There is a small transition region, typically $(\mathrm{V}+)-1.5 \mathrm{~V}$ to $(\mathrm{V}+)-1.1 \mathrm{~V}$, in which both pairs are on. This 400 mV transition region can vary 300 mV with process variation. Thus, the transition region (both stages on) can range from $(\mathrm{V}+)-1.8 \mathrm{~V}$ to $(\mathrm{V}+)$ -1.4 V on the low end, up to $(\mathrm{V}+)-1.2 \mathrm{~V}$ to $(\mathrm{V}+)-0.8 \mathrm{~V}$ on the high end. Within the 400 mV transition region PSRR, CMRR, offset voltage, offset drift, and THD may be degraded compared to operation outside this region. For more information on designing with rail-to-rail input op amps, see Figure 3 "Design Optimization with Rail-to-Rail Input Op Amps."

FIGURE 1. Rail-to-Rail Input and Output.

FIGURE 2. Simplified Schematic.

## DESIGN OPTIMIZATION WITH RAIL-TO-RAIL INPUT OP AMPS

Rail-to-rail op amps can be used in virtually any op amp configuration. To achieve optimum performance, however, applications using these special double-input-stage op amps may benefit from consideration of their special behavior.

In many applications, operation remains within the com-mon-mode range of only one differential input pair. However some applications exercise the amplifier through the transition region of both differential input stages. Although the two input stages are laser trimmed for excellent matching, a small discontinuity may occur in this transition. Careful selection of the circuit configuration, signal levels and biasing can often avoid this transi-

With a unity-gain buffer, for example, signals will traverse this transition at approximately 1.3 V below $\mathrm{V}+$ supply and may exhibit a small discontinuity at this point.
The common-mode voltage of the non-inverting amplifier is equal to the input voltage. If the input signal always remains less than the transition voltage, no discontinuity will be created. The closed-loop gain of this configuration can still produce a rail-to-rail output.
Inverting amplifiers have a constant common-mode voltage equal to $\mathrm{V}_{\mathrm{B}}$. If this bias voltage is constant, no discontinuity will be created. The bias voltage can generally be chosen to avoid the transition region.
tion region.

FIGURE 3. Design Optimization with Rail-to-Rail Input Op Amps.

## COMMON-MODE REJECTION

The CMRR for the OPA344 and OPA345 is specified in several ways so the best match for a given application may be used. First, the CMRR of the device in the common-mode range below the transition region $\left(\mathrm{V}_{\mathrm{CM}}<(\mathrm{V}+)-1.8 \mathrm{~V}\right)$ is given. This specification is the best indicator of the capability of the device when the application requires use of one of the differential input pairs. Second, the CMRR at $V_{S}=5.5 \mathrm{~V}$ over the entire common-mode range is specified. Third, the CMRR at $\mathrm{V}_{\mathrm{S}}=2.7 \mathrm{~V}$ over the entire common-mode range is provided. These last two values include the variations seen through the transition region.

## INPUT VOLTAGE BEYOND THE RAILS

If the input voltage can go more than 0.3 V below the negative power supply rail (single-supply ground), special precautions are required. If the input voltage goes sufficiently negative, the op amp output may lock up in an inoperative state. A Schottky diode clamp circuit will prevent this-see Figure 4. The series resistor prevents excessive current (greater than 10 mA ) in the Schottky diode and in the internal ESD protection diode, if the input voltage can exceed the positive supply voltage. If the signal source is limited to less than 10 mA , the input resistor is not required.

## RAIL-TO-RAIL OUTPUT

A class AB output stage with common-source transistors is used to achieve rail-to-rail output. This output stage is capable of driving $600 \Omega$ loads connected to any potential
between $\mathrm{V}+$ and ground. For light resistive loads (> $50 \mathrm{k} \Omega$ ), the output voltage can typically swing to within 1 mV from supply rail. With moderate resistive loads $(2 \mathrm{k} \Omega$ to $50 \mathrm{k} \Omega)$, the output can swing to within a few tens of millivolts from the supply rails while maintaining high open-loop gain. See the typical performance curve "Output Voltage Swing vs Output Current."

FIGURE 4. Input Current Protection for Voltages Exceeding the Supply Voltage.

## CAPACITIVE LOAD AND STABILITY

The OPA344 in a unity-gain configuration and the OPA345 in gains greater than 5 can directly drive up to 250 pF pure capacitive load. Increasing the gain enhances the amplifier's ability to drive greater capacitive loads. See the typical
performance curve "Small-Signal Overshoot vs Capacitive Load." In unity-gain configurations, capacitive load drive can be improved by inserting a small ( $10 \Omega$ to $20 \Omega$ ) resistor, $\mathrm{R}_{\mathrm{S}}$, in series with the output, as shown in Figure 5. This significantly reduces ringing while maintaining dc performance for purely capacitive loads. However, if there is a resistive load in parallel with the capacitive load, a voltage divider is created, introducing a dc error at the output and slightly reducing the output swing. The error introduced is proportional to the ratio $R_{S} / R_{L}$, and is generally negligible.

FIGURE 5. Series Resistor in Unity-Gain Configuration Improves Capacitive Load Drive.

## DRIVING A/D CONVERTERS

The OPA344 and OPA345 series op amps are optimized for driving medium-speed sampling A/D converters. The OPA344 and OPA345 op amps buffer the A/D's input capacitance and resulting charge injection while providing signal gain.
Figures 6 shows the OPA344 in a basic noninverting configuration driving the ADS7822. The ADS7822 is a 12-bit, micro-power sampling converter in the MSOP-8 package. When used with the low-power, miniature packages of the OPA344, the combination is ideal for space-limited, lowpower applications. In this configuration, an RC network at the A/D's input can be used to filter charge injection.
Figure 7 shows the OPA2344 driving an ADS7822 in a speech bandpass filtered data acquisition system. This small, low-cost solution provides the necessary amplification and signal conditioning to interface directly with an electret microphone. This circuit will operate with $\mathrm{V}_{\mathrm{S}}=+2.7 \mathrm{~V}$ to +5 V with less than $500 \mu \mathrm{~A}$ quiescent current.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but Tl does not recommend using this part in a new design
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free"
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width

$P(R-P D I P-T 8)$
PLASTIC DUAL-IN-LINE PACKAGE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. Falls within JEDEC MS-001 variation BA.

4214862/A 04/2023
NOTES:
PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 15X

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9 . Size of metal pad may vary due to creepage requirement.

SOLDER PASTE EXAMPLE
SCALE: 15X

NOTES: (continued)
11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.

ALTERNATIVE PACKAGE SINGULATION VIEW

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Refernce JEDEC MO-178.
4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
5. Support pin may differ or may not be present.

SOLDER MASK DETAILS

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

D (R-PDSO-G14)
PLASTIC SMALL OUTLINE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed $0.006(0,15)$ each side.
(D) Body width does not include interlead flash. Interlead flash shall not exceed $0.017(0,43)$ each side.
E. Reference JEDEC MS-012 variation AB.

D (R-PDSO-G14)

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.

Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
(D) Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
E. Falls within JEDEC MO-153

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed . 006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

SOLDER MASK DETAILS

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
