

SN65DP141 DisplayPort リニア・リドライバ

1 特長

- VESA DisplayPort 1.4a、2.0、eDP 1.4 をサポート
- DisplayPort RBR、HBR、HBR2、HBR3、UHBR10 など、最大 12Gbps のデータ・レートをサポートするクワッド・チャンネル・リニア・リドライバ
- プロトコルに依存しない
- DP リンク・トレーニングに対して透過的
- リンク上での位置の影響を受けないためソース、シンク、ケーブル・アプリケーションに好適
- 6GHz で 15dB のアナログ・イコライゼーション
- 出力リニア・ダイナミック・レンジ: 1200mV
- 帯域幅: > 20GHz
- 反射損失: 16dB 未満 (6GHz)
- 2.5V または 3.3V $\pm 5\%$ の単一電源
- 低消費電力: チャンネルあたり 80mW ($V_{CC} = 2.5V$)
- GPIO または I²C 制御

2 アプリケーション

- タブレット
- ノート PC
- デスクトップ PC
- ドッキング・ステーション

3 概要

SN65DP141 は、最大 12Gbps での使用に最適化された、プロトコルに依存しない低レイテンシ非同期 4 チャンネル・リニア・イコライザであり、基板配線とケーブルによる損失を補償します。

従来の補助スヌーピング・リドライバの短所を克服する効果的なリンク・トレーニングを DP ソースおよびシンクが実行できるように、本デバイスは DisplayPort (DP) リンク・トレーニングに対して透過的です。さらに、本デバイスは位置に依存せず動作します。ソース、ケーブル、シンクの中に配置でき、リンク・バジェット全体に対して実質的に負の損失を持つコンポーネントとして機能します。レシーバに実装した DFE (Decision Feedback Equalization) と組み合わせる場合、SN65DP141 によるリニア・イコライゼーションはリンク・マージンも増やします。

SN65DP141 を使用すると、I²C および GPIO 設定を使ってチャンネルのイコライゼーション、ゲイン、ダイナミック・レンジを個別に制御できます。

4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision B (September 2021) to Revision C (December 2021) Page

- Changed the I2C_EN pin Type from *internal pull-up* to *internal pull-down* **3**

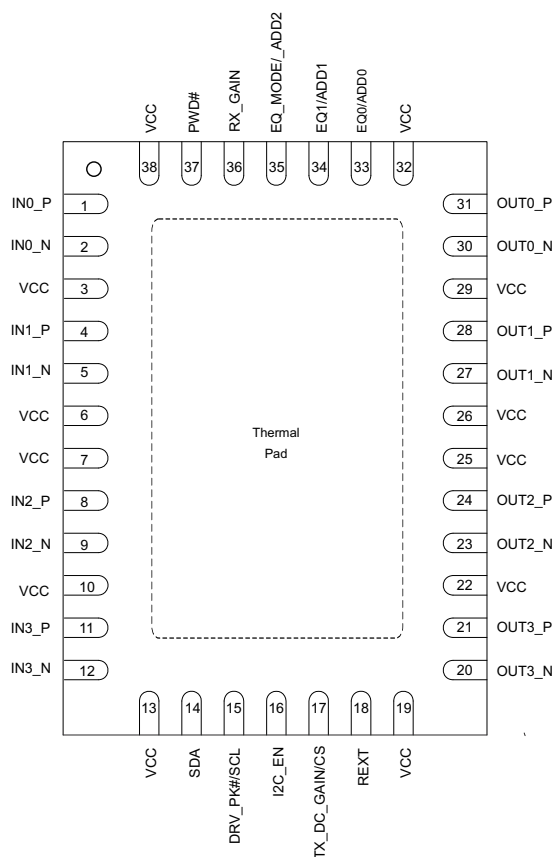

Changes from Revision A (October 2016) to Revision B (September 2021) Page

- 文書全体にわたって表、図、相互参照の採番方法を更新..... **1**
- 「特長」を「VESA DisplayPort 1.3 および eDP 1.4 をサポート」から「VESA DisplayPort 1.4a、2.0、eDP 1.4 をサポート」に更新..... **1**
- 特長を「DisplayPort RBR、HBR、HBR2、HBR3 など」から「DisplayPort RBR、HBR、HBR2、HBR3、UHBR10 など」に更新..... **1**
- Updated the DP bit rates from: RBR to HBR3 (1.6 Gbps, 2.7 Gbps, 5.4 Gbps and 8.1 Gbps ... to: RBR to UHBR10 (1.6 Gbps, 2.7 Gbps, 5.4 Gbps, 8.1 Gbps and 10.0 Gbps ... in the *Overview* section..... **14**
- Updated Operating data rate from HBR3 (8.1 Gbps) to UHBR10 (10 Gbps)..... **23**

Changes from Revision * (February 2016) to Revision A (October 2016) Page

- Replaced  9-2 **24**

5 Pin Configuration and Functions

It is required for the thermal pad to be soldered to ground for better thermal performance.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	MAX	UNIT
Supply voltage range	VCC	−0.3	4	V
Differential voltage between INx_P and INx_N	VIN, DIFF	−2.5	2.5	V
Voltage at INx_P and INx_N,	VIN+, IN−	−0.5	VCC + 0.5	V
Voltage on control IO pins, VIO		−0.5	VCC + 0.5	V
Continuous current at high speed differential data inputs(differential)	IN+, IN−	−25	25	mA
Continuous current at high speed differential data outputs	IOUT+, IOUT−	−25	25	mA

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values, except differential I/O bus voltages, are with respect to network ground terminal.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. .

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
DR	Operating data rate			12	Gbps
VCC	Supply voltage	2.375	2.5/3.3	3.465	V
T _C	Junction temperature	−10		125	°C
T _A	Operating free-air temperature	−40		85	°C
CMOS DC SPECIFICATIONS					
V _{IH}	Input high voltage	0.8 × VCC			V
V _(MID)	Input middle voltage	VCC × 0.4			V
V _{IL}	Input low voltage	−0.5			V

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		SN65DP141	UNIT
		RLJ (WQFN)	
		38 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	36.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	22.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	10.7	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	10.6	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	1.9	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER CONSUMPTION						
P_{DL}	Device Power dissipation	$V_{OD} = \text{Low}$, $V_{CC} = 3.3 \text{ V}$ and all 4 channels active		450	625	mW
		$V_{OD} = \text{Low}$, $V_{CC} = 2.5 \text{ V}$ and all 4 channels active		317	475	mW
P_{DH}	Device Power dissipation	$V_{OD} = \text{High}$, $V_{CC} = 3.3 \text{ V}$ and all 4 channels active		697	925	mW
		$V_{OD} = \text{High}$, $V_{CC} = 2.5 \text{ V}$ and all 4 channels active		485	675	mW
P_{DOFF}	Device power with all 4 channels switched off	Refer to I2C section for device configuration		10		mW
CMOS DC SPECIFICATIONS						
I_{IH}	High level input current	$V_{IN} = 0.9 \times V_{CC}$	-40	17	40	μA
I_{IL}	Low level input current	$V_{IN} = 0.1 \times V_{CC}$	-40	17	40	μA
CML INPUTS (IN[3:0]_P, IN[3:0]_N)						
R_{IN}	Differential input resistance	INx_P to INx_N		100		Ω
V_{IN}	Input linear dynamic range	Gain = 0.5		1200		mVpp
V_{ICM}	Input common mode voltage	Internally biased		$V_{CC} - 0.8$		V
SCD11	Input differential to common mode conversion	100 MHz to 6 GHz		-20		dB
SDD11	Differential input return loss	100 MHz to 6 GHz		-15		dB
CML OUTPUTS (OUT[3:0]_P, OUT[3:0]_N)						
V_{OD}	Output linear dynamic range	$R_L = 100 \text{ } \Omega$, $V_{OD} = \text{HIGH}$		1200		mVpp
		$R_L = 100 \text{ } \Omega$, $V_{OD} = \text{LOW}$		600		mVpp
V_{OS}	Output offset voltage	$R_L = 100 \text{ } \Omega$, 0 V applied at inputs		10		mVpp
V_{OCM}	Output common mode voltage			$V_{CC} - 0.4$		V
$V_{CM(RIP)}$	Common mode output ripple	K28.5 pattern at 12 Gbps on all 4 channels, No interconnect loss, $V_{OD} = \text{HIGH}$		10	20	mVRMS
$V_{OD(RIP)}$	Differential path output ripple	K28.5 pattern at 12 Gbps on all channels, No interconnect loss, $V_{IN} = 1200 \text{ mVpp}$.			20	mVpp
$V_{OC(SS)}$	Change in steady-state common mode output voltage between logic states			±10		mV

6.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

8 Detailed Description

8.1 Overview

The SN65DP141 is an asynchronous, protocol-agnostic, low latency, four-channel linear equalizer optimized for use up to 12 Gbps. The characteristics of this device make it transparent to DisplayPort (DP) link training. It supports all the available DP bit rates from RBR to UHBR10 (1.6 Gbps, 2.7 Gbps, 5.4 Gbps, 8.1 Gbps, and 10.0 Gbps respectively). Additionally, the SN65DP141 is configurable to a trace or cable mode, and hence improves its performance depending on the type of channel it is being used. Its transparency to the DP link training makes the SN65DP141 a position independent device, suitable for source/sink or cable applications, effectively providing a *negative loss* component to the overall link budget, in order to compensate the signal degradation over the channel.

The SN65DP141 is configurable by means of I²C and GPIOs, allowing independent channel control for activation, equalization, gain, and dynamic range.

8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 DC and AC Independent Gain Control

Besides the functional block diagram, the behavior of the SN65DP141 can be described as it is shown in [Figure 8-1](#); where the input stage first applies a DC gain (0 dB or –6 dB) and then equalizes the signal, which is driven to the output stage where the SN65DP141 applies an output DC gain (0 dB or 6 dB).

Figure 8-1. DP141 Signal Chain Gain Control

8.3.2 Two-Wire Serial Interface and Control Logic

The SN65DP141 uses a 2-wire serial interface for digital control. The two circuit inputs, SDA and SCL, are driven, respectively, by the serial data and serial clock from a microcontroller, for example. The SDA and SCK pins require external 10 kΩ pull-ups to VCC.

The 2-wire interface allows write access to the internal memory map to modify control registers and read access to read out control and status signals. The SN65DP141 is a slave device only which means that it cannot initiate a transmission itself; it always relies on the availability of the SCK signal for the duration of the transmission. The master device provides the clock signal as well as the START and STOP commands. The protocol for a data transmission is as follows:

1. START command
2. 7 bit slave address (0000ADD [2:0]) followed by an eighth bit which is the data direction bit (R/W). A zero indicates a WRITE and a 1 indicates a READ. The ADD [2:0] address bits change with the status of the ADD2, ADD1, and ADD0 device pins, respectively. If the pins are left floating or pulled down, the 7 bit slave address is 0000000.
3. 8-bit register address
4. 8-bit register data word
5. STOP command

Regarding timing, the SN65DP141 is I²C compatible. The typical timing is shown in [Figure 7-11](#) and a complete data transfer is shown in [Figure 7-10](#). Parameters for these figures are defined in the I²C Interface section of the [Switching Characteristics](#).

8.3.3 Bus Idle

Both SDA and SCL lines remain HIGH

8.3.4 Start Data Transfer

A change in the state of the SDA line, from HIGH to LOW, while the SCL line is HIGH, defines a START condition (S). Each data transfer is initiated with a START condition.

8.3.5 Stop Data Transfer

A change in the state of the SDA line from LOW to HIGH while the SCL line is HIGH defines a STOP condition (P). Each data transfer is terminated with a STOP condition; however, if the master still wishes to communicate on the bus, it can generate a repeated START condition and address another slave without first generating a STOP condition.

8.3.6 Data Transfer

The number of data bytes transferred between a START and a STOP condition is not limited and is determined by the master device. The receiver acknowledges the transfer of data.

8.3.7 Acknowledge

Each receiving device, when addressed, is obliged to generate an acknowledge bit. The transmitter releases the SDA line and a device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Setup and hold times must be taken into account. When a slave-receiver doesn't acknowledge the slave address, the data line must be left HIGH by the slave. The master can then generate a STOP condition to abort the transfer. If the slave-receiver does acknowledge the slave address but some time later in the transfer cannot receive any more data bytes, the master must abort the transfer. This is indicated by the slave generating the not acknowledge on the first byte to follow. The slave leaves the data line HIGH and the master generates the STOP condition.

8.4 Device Functional Modes

8.4.1 TRACE and CABLE Equalization Modes

The SN65DP141 is optimized for both trace and cable application at its input. The device pin EQ_MODE sets the EQ gain curve profile suitable for these two use cases.

8.4.2 Control Modes

The SN65DP141 features two control modes: GPIO and I2C, and the selection between these two modes is by means of the I2C_EN terminal, which activates the GPIO when tied to LOW; otherwise, the I2C mode is active due to its internal pull-up resistance.

8.4.3 GPIO MODE

Device Pins RX_GAIN, EQ1 and EQ0 determines receiver DC and AC gain as shown in [表 8-1](#) and [表 8-2](#).

表 8-1. EQ Pin Settings

EQ1	EQ0	EQ Setting
GND	GND	000
GND	HiZ	000
GND	VCC	001
HiZ	GND	010
HiZ	HiZ	011
HiZ	VCC	100
VCC	GND	101
VCC	HiZ	110
VCC	VCC	111

表 8-2. RX DC and AC GAIN Settings

EQ Configuration		EQ Gain	
EQ Setting	RX_GAIN	EQ_DC_GAIN (dB)	EQ_AC_GAIN (dB)
000 - 111	LOW	-6	1 - 9
000 - 111	HiZ	-6	7 - 17
000 - 111	HIGH	0	1 - 9

8.4.4 I²C Mode

表 8-3. I2C Control Settings Description for RX DC and AC GAIN

EQ_MODE	EQ_DC GAIN	RX_GAIN<1:0>	EQ_Setting<2:0>	DC GAIN (dB)	AC GAIN (dB)	APPLICATION
0	0	00	000 to 111	–6	1 to 9	Short Input Cable; Large Input Swing

9 Application and Implementation

Note

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

9.1 Application Information

The SN65DP141 can be used in Source, Sink, cable, and dongle applications, where the device is transparent to the DisplayPort link layer. For illustrating purposes, this section shows the implementation of a DisplayPort dongle, [図 9-1](#) shows an example of the SN65DP141 on a dongle board, where the AUX channel is directly connected from source to sink, meanwhile the power can be provided either way from the DP source or an external power source.

9.2 Typical Application

Copyright © 2016, Texas Instruments Incorporated

図 9-1. SN65DP141 Application Diagram

9.2.1 Design Requirements

The SN65DP141 can be designed into many types of applications. All applications have certain requirements for the system to work properly. The voltage rails are required to support the lowest possible power consumption. Configure the device by using I2C. The GPIO configuration is provided as I²C is not available in all cases. Because sources may have different naming conventions, confirm the link between source and sink is correctly mapped through the SN65DP141.

表 9-1. Design Parameters

PARAMETER	VALUE
Operating data rate	UHBR10 (10 Gbps)
Supply voltage	3.3 V
Main link input voltage	$V_{ID} = 75 \text{ mVpp}$ to 1.2 Vpp
Control pin Low	1 K Ω pulled to GND
Control pin Mid	No Connect
Control pin Low	1 K Ω pulled to High
Main link AC decoupling capacitor	75 to 200 nF, recommend 100 nF

First approach for GAIN configuration: It is highly recommend that DC GAIN be set to 1, this leads the output to preserve the input amplitude (GAIN = 1):

- For GPIO implementation: Use a pull-up resistor on the GAIN terminal (pin 36), refer to the schematic in [Figure 9-2](#).
- For I²C implementation: write a 1 to the bit 2 of the registers 0x02, 0x05, 0x08 and 0x0B. Refer to [Section 8.3.2](#) for a detailed description of the I²C interface

9.2.2 Detailed Design Procedure

Designing in the SN65DP141 requires the following:

- Determine the loss profile on the DP input and output channels and cables.
- Based upon the loss profile and signal swing, determine the optimal configuration for the SN65DP141, to pass electrical compliance (Equalization mode, EQ Gain, DC gain, and AC Gain).
- See [Figure 9-2](#) for information on using the AC coupling capacitors and control pin resistors, as well as for recommended decouple capacitors from VCC pins to ground.
- Configure the TheSN65DP141 using the GPIO terminals or the I²C interface:
 - GPIO – Using the terminals EQ_MODE, EQ1, EQ1, and gain.
 - I²C – Refer to the I2C [Register Maps](#) and the [Two-Wire Serial Interface and Control Logic](#) sections for a detailed configuration procedures.
- The thermal pad must be connected to ground.

Figure 9-2. SN65DP141 Application Schematic

9.2.3 Application Curves

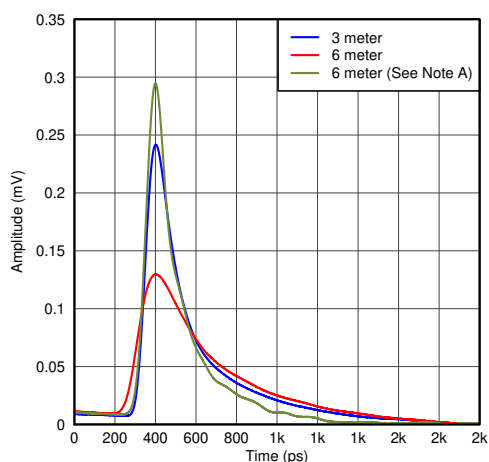

With SN65DP141 -> EQ = 4, VOD = High, ACGain = HiZ, DCGain = Low

9-3. Cable Mode – Symbol Response

With SN65DP141 -> EQ = 4, VOD = High, ACGain = HiZ, DCGain = Low

9-4. Cable Mode – Frequency Domain

With SN65DP141 -> EQ = 7, VOD = High, ACGain = High, DCGain = Low

9-5. Trace Mode – Symbol Response

With SN65DP141 -> EQ = 7, VOD = High, ACGain = High, DCGain = Low

9-6. Trace Mode – Frequency Domain

10 Power Supply Recommendations

To minimize the power supply noise floor, provide good decoupling near the SN65DP141 power pins. It is recommended to place one 0.01- μ F ceramic capacitor at each power pin, and two 0.1- μ F ceramic capacitors on each power node. The distance between the SN65DP141 and capacitors should be minimized to reduce loop inductance and provide optimal noise filtering. Placing the capacitor underneath the SN65DP141 on the bottom of the PCB is often a good choice. A 100-pF ceramic capacitor can be put at each power pin to optimize the EMI performance.

11 Layout

11.1 Layout Guidelines

- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.
- If an additional supply voltage plane or signal layer is needed, add a second power/ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high frequency bypass capacitance significantly.
- The control pin pull-up and pull-down resistors are shown in application section for reference. If a high level is needed then only uses the pull up. If a low level is needed only use the pull down.
- Place passive components within the signal path, such as source-matching resistors or ac-coupling capacitors, next to each other. Routing as in case a) creates wider trace spacing than in b); the resulting discontinuity, however, is limited to a far narrower area.
- When routing traces next to a via or between an array of vias, make sure that the via clearance section does not interrupt the path of the return current on the ground plane below.
- Avoid metal layers and traces underneath or between the pads off the DisplayPort connectors for better impedance matching. Otherwise they will cause the differential impedance to drop below 75 Ω and fail the board during TDR testing.
- Use solid power and ground planes for 100 Ω impedance control and minimum power noise.
- For a multi-layer PCB, it is recommended to keep one common GND layer underneath the device and connect all ground terminals directly to this plane. For 100 Ω differential impedance, use the smallest trace spacing possible, which is usually specified by the PCB vendor.
- Keep the trace length as short as possible to minimize attenuation.
- Place bulk capacitors (that is, 10 μ F) close to power sources, such as voltage regulators or where the power is supplied to the PCB.

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 サポート・リソース

[TI E2E™ サポート・フォーラム](#)は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の[使用条件](#)を参照してください。

12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
SN65DP141RLJRG4.A	NRND	Production	WQFN (RLJ) 38	3000 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	DP141

- (1) **Status:** For more details on status, see our [product life cycle](#).
- (2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.
- (3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.
- (4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- (6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
