

SN74CB3Q3257 4-Bit 1-of-2 FET Multiplexer and Demultiplexer 2.5V and 3.3V Low-Voltage High-Bandwidth Bus Switch

1 Features

- High-bandwidth data path (up to 500MHz)
- 5V Tolerant I/Os with device powered up or powered down
- Low and flat on-state resistance (r_{on}) characteristics over operating range ($r_{on} = 4\Omega$ typical)
- Rail-to-rail switching on data I/O ports
 - 0- to 5V Switching with 3.3V V_{CC}
 - 0- to 3.3V Switching with 2.5V V_{CC}
- Bidirectional data flow with near-zero propagation delay
- Low input and output capacitance minimizes loading and signal distortion ($C_{io(OFF)} = 3.5pF$ typical)
- Fast switching frequency ($f_{OE} = 20MHz$ maximum)
- Data and control inputs provide undershoot clamp diodes
- Low power consumption ($I_{CC} = 0.7mA$ typical)
- V_{CC} Operating range from 2.3V to 3.6V
- Data I/Os support 0- to 5V signaling levels (0.8V, 1.2V, 1.5V, 1.8V, 2.5V, 3.3V, 5V)
- Control inputs can be driven by TTL or 5V and 3.3V CMOS outputs
- I_{off} Supports partial-power-down mode operation
- Latch-up performance exceeds 100mA Per JESD 78, class II
- ESD Performance tested per JESD 22
 - 2000V Human body model (A114B, class II)
 - 1000V Charged-device model (C101)
- Supports both digital and analog applications: USB interface, differential signal interface, bus isolation, low-distortion signal gating ¹

2 Applications

- IP Phones: wired and wireless
- Optical modules
- Optical networking: video over fiber and EPON
- Private branch exchange (PBX)
- WiMAX and wireless infrastructure equipment

3 Description

The SN74CB3Q3257 device is a high-bandwidth FET bus switch using a charge pump to elevate the gate voltage of the pass transistor, providing a low and flat ON-state resistance (r_{on}).

Package Information

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltages are with respect to ground, unless otherwise specified.
- (3) The input and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
- (4) V_I and V_O are used to denote specific conditions for V_{I/O}.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

- (1) V_{IN} and I_{IN} refer to control inputs. V_I, V_O, I_I, and I_O refer to data terminals.
- (2) All typical values are at V_{CC} = 3.3V (unless otherwise noted), T_A = 25°C.
- (3) For I/O ports, the parameter I_{OZ} includes the input leakage current.
- (4) This is the increase in supply current for each input that is at the specified TTL voltage level, rather than V_{CC} or GND.
- (5) This parameter specifies the dynamic power-supply current associated with the operating frequency of a single control input (see [Figure 5-2](#)).
- (6) Measured by the voltage drop between the A and B terminals at the indicated current through the switch. ON-state resistance is determined by the lower of the voltages of the two (A or B) terminals.

7 Detailed Description

7.1 Overview

The SN74CB3Q3257 device is a high-bandwidth FET bus switch using a charge pump to elevate the gate voltage of the pass transistor, providing a low and flat ON-state resistance (r_{on}). The low and flat ON-state resistance allows for minimal propagation delay and supports rail-to-rail switching on the data input/output (I/O) ports. The device also features low data I/O capacitance to minimize capacitive loading and signal distortion on the data bus. Specifically designed to support high-bandwidth applications, the SN74CB3Q3257 device provides an optimized interface device designed for broadband communications, networking, and data-intensive computing systems.

The SN74CB3Q3257 device is organized as two 1-of-4 multiplexers/demultiplexers with separate output-enable ($1 \overline{OE}$, $2 \overline{OE}$) inputs. The select (S0, S1) inputs control the data path of each multiplexer/demultiplexer. When $\overline{OE}$ is low, the associated multiplexer/demultiplexer is enabled, and the A port is connected to the B port, allowing bidirectional data flow between ports. When $\overline{OE}$ is high, the associated multiplexer/demultiplexer is disabled, and a high-impedance state exists between the A and B ports.

This device is fully specified for partial-power-down applications using I_{off} . The I_{off} circuitry prevents damaging current backflow through the device when the device is powered down. The device has isolation during power off.

To provide the high-impedance state during power up or power down, $\overline{OE}$ must be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

(1) EN is the internal enable signal applied to the switch.

7.2 Functional Block Diagram

7.3 Feature Description

The SN74CB3Q3257 device has a high-bandwidth data path (up to 500MHz) and has 5V tolerant I/Os with the device powered up or powered down. The device also has low and flat ON-state resistance (r_{on}) characteristics over operating range ($r_{on} = 4\Omega$ Typical).

This device also has rail-to-rail switching on data I/O ports for 0- to 5V switching with 3.3V V_{CC} and 0- to 3.3V switching with 2.5V V_{CC} as well as bidirectional data flow with near-zero propagation delay and low input/output capacitance that minimizes loading and signal distortion ($C_{iO(OFF)} = 3.5pF$ Typical).

The SN74CB3Q3257 also provides a fast switching frequency ($f_{OE} = 20MHz$ Max) with data and control inputs that provide undershoot clamp diodes as well as low power consumption ($I_{CC} = 0.6mA$ Typical).

The V_{CC} operating range is from 2.3V to 3.6V and the data I/Os support 0 to 5V signal levels of (0.8V, 1.2V, 1.5V, 1.8V, 2.5V, 3.3V, 5V).

The control inputs can be driven by TTL or 5V / 3.3V CMOS outputs as well as I_{off} Supports Partial-Power-Down Mode Operation.

7.4 Device Functional Modes

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The SN74CB3Q3257 can be used to multiplex and demultiplex up to 4 channels simultaneously in a 2:1 configuration. The application shown here is a 4-bit bus being multiplexed between two devices. the $\overline{OE}$ and S pins are used to control the chip from the bus controller. This is a very generic example, and can apply to many situations. If an application requires less than 4 bits, be sure to tie the A side to either high or low on unused channels.

8.2 Typical Application

Figure 8-1. Typical Application of the SN74CB3Q3257

8.2.1 Design Requirements

- Recommended Input Conditions:
 - For specified high and low levels, see V_{IH} and V_{IL} in [Section 5.3](#).
 - Inputs and outputs are overvoltage tolerant allowing them to go as high as 4.6V at any valid V_{CC} .
- Recommended Output Conditions:
 - Load currents must not exceed $\pm 128\text{mA}$ per channel.
- Frequency Selection Criterion:
 - Maximum frequency tested is 500MHz.
 - Added trace resistance/capacitance can reduce maximum frequency capability; use layout practices as directed in [Section 8.4](#).

8.2.2 Detailed Design Procedure

The 0.1μF capacitor must be placed as close as possible to the device.

8.2.3 Application Curve

Figure 8-2. Propagation Delay (t_{pd}) Simulation Result at $V_{CC} = 2.5V$.

8.3 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating listed in the [Section 5.1](#) table.

Each V_{CC} terminal must have a good bypass capacitor to prevent power disturbance. For devices with a single supply, a $0.1\mu F$ bypass capacitor is recommended. If multiple pins are labeled V_{CC} , then a $0.01\mu F$ or $0.022\mu F$ capacitor is recommended for each V_{CC} because the V_{CC} pins are tied together internally. For devices with dual-supply pins operating at different voltages, for example V_{CC} and V_{DD} , a $0.1\mu F$ bypass capacitor is recommended for each supply pin. To reject different frequencies of noise, use multiple bypass capacitors in parallel. Capacitors with values of $0.1\mu F$ and $1\mu F$ are commonly used in parallel. The bypass capacitor must be installed as close to the power terminal as possible for best results.

8.4 Layout

8.4.1 Layout Guidelines

Reflections and matching are closely related to the loop antenna theory but are different enough to be discussed separately from the theory. When a PCB trace turns a corner at a 90° angle, a reflection can occur. A reflection occurs primarily because of the change of width of the trace. At the apex of the turn, the trace width increases to 1.414 times the width. This increase upsets the transmission-line characteristics, especially the distributed capacitance and self-inductance of the trace which results in the reflection. Not all PCB traces can be straight and therefore some traces must turn corners. [Figure 8-3](#) shows progressively better techniques of rounding corners. Only the last example (BEST) maintains constant trace width and minimizes reflections.

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (December 2024) to Revision F (August 2026)	Page
• Updated the number formatting for tables, figures, and cross-references throughout the document	1
• Updated the <i>Thermal Information</i> table values	5
• Updated the maximum value of the <i>Per input control</i> parameter in the <i>Electrical Characteristics - PKG = RGY, PW, DBQ, DGV</i> table from 0.35 to 0.45.....	5
• Updated new package information to the <i>Switching Characteristics</i> tables	7
• Updated the <i>Typical Characteristics</i> section.....	8

Changes from Revision D (July 2018) to Revision E (December 2024)	Page
• Changed the Device Information table to the <i>Package Information</i> table.....	1
• Changed the T _A MAX value from 85°C to 105°C in the <i>Recommended Operating Conditions</i>	4

Changes from Revision C (April 2017) to Revision D (July 2018)	Page
• Changed the pinout images appearance	3
• Added <i>Thermal Information</i> table values	5

Changes from Revision B (June 2015) to Revision C (April 2017)	Page
• Added MAX values for T _A = –40°C to 105°C to the <i>Electrical Characteristics</i> table.....	5
• Added MAX values for T _A = –40°C to 105°C to the <i>Switching Characteristics, V_{CC} = 2.5V</i> table.	5
• Added separate <i>Switching Characteristics, V_{CC} = 3.3V</i> for V _{CC} = 3.3V ± 0.3V. Added TYP values and MAX values for T _A = –40°C to 105°C.....	7

Changes from Revision A (November 2003) to Revision B (June 2015)	Page
• Removed <i>Ordering Information</i> table.....	1
• Added <i>Device Information</i> table, <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this datasheet, refer to the left-hand navigation.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
