

TPS6104x Low-Power, DC-DC Boost Converters in SOT-23 and WSON Packages

1 Features

- 1.8V to 6V input voltage range
- Adjustable output voltage range up to 28V
- 400mA (TPS61040) and 250mA (TPS61041) internal switch current
- Up to 1MHz switching frequency
- 28 μ A typical no-load quiescent current
- 1 μ A typical shutdown current
- Internal soft start
- Available in SOT23-5, TSOT23-5, and 2mm $\times$ 2mm $\times$ 0.8mm WSON packages

2 Applications

- LCD bias supply
- White-LED supply for LCD backlights
- Digital still camera
- PDAs, organizers, and handheld PCs
- Cellular phones
- Internet audio players
- Standard 3.3V or 5V to 12V conversion

3 Description

The TPS6104x is a high-frequency boost converter dedicated for small to medium LCD bias supply and white LED backlight supplies. The device is designed to generate output voltages up to 28V from a dual-cell NiMH/NiCd or a single-cell Li-Ion battery. The part can also be used to generate standard 3.3V or 5V to 12V power conversions.

The TPS6104x operates with a switching frequency up to 1MHz. This frequency allows the use of small external components using ceramic as well as tantalum output capacitors. Together with the thin WSON package, the TPS6104x gives a very small overall design size. The TPS61040 device has an internal 400mA switch current limit, while the TPS61041 device has a 250mA switch current limit, offering lower output voltage ripple and allows the use of a smaller form factor inductor for lower power applications. The low quiescent current (typically 28 μ A) together with an optimized control scheme, allows device operation at very high efficiencies over the entire load current range.

Device Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
TPS61040	DBV (SOT-23, 5)	2.9mm $\times$ 2.8mm
	DDC (SOT-23-THN, 5)	2.9mm $\times$ 2.8mm
	DRV (WSON, 6)	2mm $\times$ 2mm
TPS61041	DBV (SOT-23, 5)	2.9mm $\times$ 2.8mm
	DRV (WSON, 6)	2mm $\times$ 2mm

- (1) For more information, see [Section 10](#).
 (2) The package size (length $\times$ width) is a nominal value and includes pins, where applicable.

6 Detailed Description

6.1 Overview

The TPS6104x is a high-frequency boost converter dedicated for small to medium LCD bias supply and white LED backlight supplies. The device is designed to generate output voltages up to 28V from a dual-cell NiMH/ NiCd or a single cell device Li-Ion battery.

6.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

6.3 Feature Description

6.3.1 Peak Current Control

The internal switch turns on until the inductor current reaches the typical dc current limit (I_{LIM}) of 400mA (TPS61040) or 250mA (TPS61041). Due to the internal propagation delay of typical 100ns, the actual current exceeds the dc current limit threshold by a small amount. The typical peak current limit can be calculated:

$$I_{peak(typ)} = I_{LIM} + \frac{V_{IN}}{L} \times 100 \text{ ns}$$

$$I_{peak(typ)} = 400 \text{ mA} + \frac{V_{IN}}{L} \times 100 \text{ ns} \text{ for the TPS61040-Q1}$$

$$I_{peak(typ)} = 250 \text{ mA} + \frac{V_{IN}}{L} \times 100 \text{ ns} \text{ for the TPS61041-Q1} \quad (1)$$

The higher the input voltage and the lower the inductor value, the greater the peak.

By selecting the TPS6104x, tailoring the design to the specific application current limit requirements is possible. A lower current limit supports applications requiring lower output power and allows the use of an inductor with a lower current rating and a smaller form factor. A lower current limit typically has a lower output voltage ripple as well.

6.3.2 Soft Start

All inductive step-up converters exhibit high inrush current during start-up if no special precaution is made. This can cause voltage drops at the input rail during start up and must result in an unwanted or early system shut down.

The TPS6104x limits this inrush current by increasing the current limit in two steps starting from $\frac{I_{LIM}}{4}$ for 256 cycles to $\frac{I_{LIM}}{2}$ for the next 256 cycles, and then full current limit (see [Figure 7-4](#)).

6.3.3 Enable

Pulling the enable (EN) to ground shuts down the device reducing the shutdown current to 1µA (typical). Because there is a conductive path from the input to the output through the inductor and Schottky diode, the output voltage is equal to the input voltage during shutdown. The enable pin needs to be terminated and must not be left floating. Using a small external transistor disconnects the input from the output during shutdown as shown in [Figure 7-6](#).

6.3.4 Undervoltage Lockout

An undervoltage lockout prevents misoperation of the device at input voltages below typical 1.5V. When the input voltage is below the undervoltage threshold, the main switch is turned off.

6.3.5 Thermal Shutdown

An internal thermal shutdown is implemented and turns off the internal MOSFETs when the typical junction temperature of 168°C is exceeded. The thermal shutdown has a hysteresis of typically 25°C. This data is based on statistical means and is not tested during the regular mass production of the IC.

6.4 Device Functional Modes

6.4.1 Operation

The TPS6104x operates with an input voltage range of 1.8V to 6V and can generate output voltages up to 28V. The device operates in a pulse-frequency-modulation (PFM) scheme with constant peak current control. This control scheme maintains high efficiency over the entire load current range, and with a switching frequency up to 1MHz, the device enables the use of very small external components.

The converter monitors the output voltage, and as soon as the feedback voltage falls below the reference voltage of typically 1.233V, the internal switch turns on and the current ramps up. The switch turns off as soon as the inductor current reaches the internally set peak current of typically 400mA (TPS61040) or 250mA (TPS61041). See [Peak Current Control](#) for more information. The second criteria that turns off the switch is the maximum on-time of 6µs (typical). This is just to limit the maximum on-time of the converter to cover for extreme conditions. As the switch is turned off the external Schottky diode is forward biased delivering the current to the output. The switch remains off for a minimum of 400ns (typical), or until the feedback voltage drops below the reference voltage again. Using this PFM peak current control scheme the converter operates in discontinuous conduction mode (DCM) where the switching frequency depends on the output current, which results in very high efficiency over the entire load current range. This regulation scheme is inherently stable, allowing a wider selection range for the inductor and output capacitor.

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The TPS6104x is designed for output voltages up to 28V with an input voltage range of 1.8V to 6V and a switch peak current limit of 400mA (250mA for the TPS61041). The device operates in a pulse-frequency-modulation (PFM) scheme with constant peak current control. This control scheme maintains high efficiency over the entire load current range, and with a switching frequency up to 1MHz, the device enables the use of very small external components. The following section provides a step-by-step design approach for configuring the TPS61040 as a voltage regulating boost converter for LCD bias power supply, as shown in Figure 7-1.

7.2 Typical Application

The following section provides a step-by-step design approach for configuring the TPS611040 as a voltage regulating boost converter for LCD bias supply, as shown in Figure 7-1.

Figure 7-1. LCD Bias Supply

7.2.1 Design Requirements

Table 7-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage	1.8V to 6V
Output Voltage	18V
Output Current	10mA

7.2.2 Detailed Design Procedure

7.2.2.1 Inductor Selection, Maximum Load Current

Because the PFM peak current control scheme is inherently stable, the inductor value does not affect the stability of the regulator. The selection of the inductor together with the nominal load current, input and output voltage of the application determines the switching frequency of the converter. Depending on the application, inductor values from 2.2 μH to 47 μH are recommended. The maximum inductor value is determined by the maximum on time of the switch, typically 6 μs. The peak current limit of 400mA/250mA (typically) must be reached within this 6-μs period for proper operation.

The inductor value determines the maximum switching frequency of the converter. Therefore, select the inductor value that ensures the maximum switching frequency at the converter maximum load current is not exceeded. The maximum switching frequency is calculated by the following formula:

$$f_{S(max)} = \frac{V_{IN(min)} \times (V_{OUT} - V_{IN})}{I_P \times L \times V_{OUT}} \quad (2)$$

where

- I_P = Peak current as described in [Peak Current Control](#)
- L = Selected inductor value
- $V_{IN(min)}$ = The highest switching frequency occurs at the minimum input voltage

If the selected inductor value does not exceed the maximum switching frequency of the converter, the next step is to calculate the switching frequency at the nominal load current using the following formula:

$$f_S(I_{load}) = \frac{2 \times I_{load} \times (V_{OUT} - V_{IN} + V_d)}{I_P^2 \times L} \quad (3)$$

where

- I_P = Peak current as described in [Peak Current Control](#)
- L = Selected inductor value
- I_{load} = Nominal load current
- V_d = Rectifier diode forward voltage (typically 0.3V)

A smaller inductor value gives a higher converter switching frequency, but lowers the efficiency.

The inductor value has less effect on the maximum available load current and is only of secondary order. The best way to calculate the maximum available load current under certain operating conditions is to estimate the expected converter efficiency at the maximum load current. This number can be taken out of the efficiency graphs shown in [Figure 5-1](#) through [Figure 5-4](#). The maximum load current can then be estimated as follows:

$$I_{load(max)} = \eta \frac{I_P^2 \times L \times f_{S(max)}}{2 \times (V_{OUT} - V_{IN})} \quad (4)$$

where

- I_P = Peak current as described in [Peak Current Control](#)
- L = Selected inductor value
- $f_{S(max)}$ = Maximum switching frequency as calculated previously
- η = Expected converter efficiency. Typically 70% to 85%

The maximum load current of the converter is the current at the operation point where the converter starts to enter the continuous conduction mode. Usually the converter must always operate in discontinuous conduction mode.

Last, the selected inductor must have a saturation current that meets the maximum peak current of the converter (as calculated in [Peak Current Control](#)). Use the maximum value for I_{LIM} for this calculation.

Another important inductor parameter is the dc resistance. The lower the dc resistance, the higher the efficiency of the converter. See [Table 7-2](#) and the typical applications for the inductor selection.

Table 7-2. Recommended Inductor for Typical LCD Bias Supply (see Figure 10-1)

DEVICE	INDUCTOR VALUE	COMPONENT SUPPLIER ⁽¹⁾	COMMENTS

TPS61041	10µH	Murata LQH3C100K24	High efficiency Small design size

(1) See [Third-Party Products](#) disclaimer

7.2.2.2 Setting the Output Voltage

The output voltage is calculated as:

$$V_{OUT} = 1.233 \text{ V} \times \left(1 + \frac{R1}{R2}\right) \quad (5)$$

For battery-powered applications, a high-impedance voltage divider must be used with a typical value for R2 of ≤200kΩ and a maximum value for R1 of 2.2MΩ. Smaller values might be used to reduce the noise sensitivity of the feedback pin.

A feedforward capacitor across the upper feedback resistor R1 is required to provide sufficient overdrive for the error comparator. Without a feedforward capacitor, or one whose value is too small, the TPS6104x shows *double pulses* or a pulse burst instead of single pulses at the switch node (SW), causing higher output voltage ripple. If this higher output voltage ripple is acceptable, the feedforward capacitor can be left out.

The lower the switching frequency of the converter, the larger the feedforward capacitor value required. A good starting point is to use a 10pF feedforward capacitor. As a first estimation, the required value for the feedforward capacitor at the operation point can also be calculated using the following formula:

$$C_{FF} = \frac{1}{2 \times \pi \times \frac{f_S}{20} \times R1} \quad (6)$$

where

- R1 = Upper resistor of voltage divider
- f_S = Switching frequency of the converter at the nominal load current (See [Inductor Selection, Maximum Load Current](#) for calculating the switching frequency)
- C_{FF} = Choose a value that comes closest to the result of the calculation

The larger the feedforward capacitor the worse the line regulation of the device. Therefore, when concern for line regulation is paramount, the selected feedforward capacitor must be as small as possible. See the following section for more information about line and load regulation.

7.2.2.3 Line and Load Regulation

The line regulation of the TPS6104x depends on the voltage ripple on the feedback pin. Typically, a 50mV peak-to-peak voltage ripple on the feedback pin FB gives good results.

Some applications require a very tight line regulation and can only allow a small change in output voltage over a certain input voltage range. If no feedforward capacitor C_{FF} is used across the upper resistor of the voltage feedback divider, the device has the best line regulation. Without the feedforward capacitor the output voltage ripple is higher because the TPS6104x shows output voltage bursts instead of single pulses on the switch pin (SW), increasing the output voltage ripple. Increasing the output capacitor value reduces the output voltage ripple.

If a larger output capacitor value is not an option, a feed-forward capacitor C_{FF} can be used as described in the previous section. The use of a feedforward capacitor increases the amount of voltage ripple present on the feedback pin (FB). The greater the voltage ripple on the feedback pin ($\geq 50\text{mV}$), the worse the line regulation. There are two ways to improve the line regulation further:

1. Use a smaller inductor value to increase the switching frequency, which lowers the output voltage ripple, as well as the voltage ripple on the feedback pin.
2. Add a small capacitor from the feedback pin (FB) to ground to reduce the voltage ripple on the feedback pin down to 50mV again. As a starting point, the same capacitor value as selected for the feedforward capacitor C_{FF} can be used.

7.2.2.4 Output Capacitor Selection

For best output voltage filtering, a low ESR output capacitor is recommended. Ceramic capacitors have a low ESR value but tantalum capacitors can be used as well, depending on the application.

Assuming the converter does not show double pulses or pulse bursts on the switch node (SW), the output voltage ripple can be calculated as:

$$\Delta V_{\text{out}} = \frac{I_{\text{out}}}{C_{\text{out}}} \times \left(\frac{1}{f_S(I_{\text{out}})} - \frac{I_P \times L}{V_{\text{out}} + V_d - V_{\text{in}}} \right) + I_P \times \text{ESR} \quad (7)$$

where

- I_P = Peak current as described in [Peak Current Control](#)
- L = Selected inductor value
- I_{out} = Nominal load current
- $f_S(I_{\text{out}})$ = Switching frequency at the nominal load current as calculated previously
- V_d = Rectifier diode forward voltage (typically 0.3V)
- C_{out} = Selected output capacitor
- ESR = Output capacitor ESR value

See [Table 7-3](#) and the [Typical Application](#) for choosing the output capacitor.

Table 7-3. Recommended Input and Output Capacitors

DEVICE	CAPACITOR	VOLTAGE RATING	COMPONENT SUPPLIER ⁽¹⁾	COMMENTS
TPS6104x	4.7 μF /X5R/0805	6.3V	Tayo Yuden JMK212BY475MG	$C_{\text{IN}}/C_{\text{OUT}}$
	10 μF /X5R/0805	6.3V	Tayo Yuden JMK212BJ106MG	$C_{\text{IN}}/C_{\text{OUT}}$
	1 μF /X7R/1206	25V	Tayo Yuden TMK316BJ105KL	C_{OUT}
	1 μF /X5R/1206	35V	Tayo Yuden GMK316BJ105KL	C_{OUT}
	4.7 μF /X5R/1210	25V	Tayo Yuden TMK325BJ475MG	C_{OUT}

(1) See [Third-Party Products](#) disclaimer.

7.2.2.5 Input Capacitor Selection

For good input voltage filtering, low ESR ceramic capacitors are recommended. A $4.7\mu\text{F}$ ceramic input capacitor is sufficient for most of the applications. For better input voltage filtering this value can be increased. See [Table 7-3](#) and typical applications for input capacitor recommendations.

7.2.2.6 Diode Selection

To achieve high efficiency a Schottky diode must be used. The current rating of the diode must meet the peak current rating of the converter as it is calculated in [Peak Current Control](#). Use the maximum value for I_{LIM} for this calculation. See [Table 7-4](#) and the typical applications for the selection of the Schottky diode.

Figure 7-11. White LED Supply With Adjustable Brightness Control Using an Analog Signal on the Feedback Pin

7.4 Power Supply Recommendations

The device is designed to operate from an input voltage supply range between 1.8V and 6V. The output current of the input power supply must be rated according to the supply voltage, output voltage and output current of TPS6104x.

7.5 Layout

7.5.1 Layout Guidelines

Typical for all switching power supplies, the layout is an important step in the design; especially at high peak currents and switching frequencies. If the layout is not carefully done, the regulator might show noise problems and duty cycle jitter.

The input capacitor must be placed as close as possible to the input pin for good input voltage filtering. The inductor and diode must be placed as close as possible to the switch pin to minimize the noise coupling into other circuits. Because the feedback pin and network is a high-impedance circuit, the feedback network must be routed away from the inductor. The feedback pin and feedback network must be shielded with a ground plane or trace to minimize noise coupling into this circuit.

Wide traces must be used for connections in bold as shown in [Figure 7-12](#). A star ground connection or ground plane minimizes ground shifts and noise.

7.5.2 Layout Example

Figure 7-12. Layout Diagram

8 Device and Documentation Support

8.1 Device Support

8.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

8.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

8.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

8.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

8.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

9 Revision History

Changes from Revision K (July 2022) to Revision L (August 2026) Page

- Changed switch voltage on pin SW MIN value from 30 to –0.3..... 4

Changes from Revision J (December 2019) to Revision K (July 2022) Page

- Updated the numbering format for tables, figures, and cross-references throughout the document..... 1

Changes from Revision I (December 2016) to Revision J (December 2019) Page

- Changed DRV package pinout image to show thermal pad outline and transparent top view 3

Changes from Revision H (October 2015) to Revision I (December 2016) Page

- Changed C_{IN} from: 4.7mF To: 4.7μF and C_O From: 1mF To: 1μF in the *Typical Application Schematic* 1

Changes from Revision G (December 2014) to Revision H (October 2015)	Page
• Added 500µs/div label to X-axis of Figure 7-4 .	15

Changes from Revision F (December 2010) to Revision G (December 2014)	Page
• Added <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section.....	1

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
