

DP83TC812x-Q1 TC-10 Compliant 100BASE-T1 Automotive Ethernet PHY

1 Features

- Open Alliance and IEEE 802.3bw 100BASE-T1 compliant
 - Passes Level IV emissions with Integrated LPF
 - TC-10 compliant with < 20µA sleep current
- SAE J2962-3 EMC compliant
- Configurable I/O voltages: 3.3V, 2.5V, and 1.8V
- MAC interfaces: MII, RMII, RGMII and SGMII
- Optional separate voltage rail for MAC interface pins (3.3V, 2.5V, 1.8V)
- AEC-Q100 qualified for automotive applications:
 - Temperature grade 1: –40°C to +125°C ambient operating temperature
 - ±8kV HBM ESD for pins 12 and 13
 - IEC61000-4-2 ESD classification level 4 for pins 12 and 13: ±8kV contact discharge
- IEEE 1588 SFD support
- TSN compliant with 802.3br frame pre-emption support
- Low active power operation: < 230mW
- Diagnostic toolkit
 - Signal quality indication (SQI)
 - Time domain reflectometry (TDR)
 - Electrostatic discharge sensor
 - Voltage sensor
 - PRBS Built-in Self-Test
 - Loopbacks
- VQFN, wettable flank packaging
- [Functional Safety-Capable](#)
 - [Documentation available to aid in functional safety system design](#)

2 Applications

- [ADAS](#)
- [Gateway and body control](#)
- [Telematics](#)

3 Description

The DP83TC812-Q1 device is an IEEE 802.3bw-compliant automotive PHYTER™ ethernet physical layer transceiver which work with the unshielded twisted pair cable. The PHY supports TC10 sleep and wake features. The PHY provides all physical layer functions needed to transmit and receive data over unshielded single twisted-pair cables. The device provides xMII flexibility with support for standard MII, RMII, RGMII, and SGMII MAC interfaces. The PHY also integrates a low-pass filter on the MDI side to reduce emissions.

This device includes the Diagnostic Tool Kit, providing an extensive list of real-time monitoring tools, debug tools, and test modes. Within the toolkit is the first integrated electrostatic discharge (ESD) monitoring tool. The device can count ESD events on MDI as well as providing real-time monitoring through the use of a programmable interrupt. Additionally, the DP83TC812-Q1 includes a pseudo-random binary sequence (PRBS) frame generation tool, which is fully compatible with internal loopbacks, to transmit and receive data without the use of a MAC. The device is housed in a 6.00mm × 6.00mm, 36 pin VQFN wettable flank package. This device is pin-2-pin compatible with DP83TG720 (1000BASE-T1) and is also form factor compatible with DP83TC811. This means a PCB layout is useable for DP83TC811, DP83TC812, DP83TC814, and DP83TG720.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
DP83TC812S-Q1	VQFN (36)	6.00mm × 6.00mm
DP83TC812R-Q1	VQFN (36)	6.00mm × 6.00mm

(1) For more information, see [Section 12](#).

(2) The package size (length × width) is a nominal value and includes pins, where applicable.

Simplified Schematic

Table 5-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME ⁽²⁾	NO.		
MAC INTERFACE			

Table 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME ⁽²⁾	NO.		
RX_D3 RX_M	23	S, PD, O	Receive Data: Symbols received on the cable are decoded and transmitted out of these pins synchronous to the rising edge of RX_CLK. Data is considered valid when RX_DV is asserted. A data nibble, RX_D[3:0], is transmitted in MII and RGMII modes. 2 bits; RX_D[1:0], are transmitted in RMII mode. RX_D[3:2] are not used when in RMII Follower mode. If the PHY is bootstrapped to RMII Leader mode, a 50MHz clock reference is automatically outputted on RX_D3. This clock must be fed to the MAC. RX_M / RX_P: Differential SGMII Data Output. These pins transmit data from the PHY to the MAC. Use the strap resistors in RX_D3 pin in SGMII mode.
RX_D2 RX_P	24		
RX_D1	25		
RX_D0	26		
RX_CLK	27	PD, O	Receive Clock: In MII and RGMII modes, the receive clock provides a 25MHz reference clock. Unused in RMII and SGMII modes
RX_ER	14	S, PD, O	Receive Error: In MII and RMII modes, this pin indicates a receive error symbol has been detected within a received packet. In MII mode, RX_ER is asserted high synchronously to the rising edge of RX_CLK. In RMII mode, RX_ER is asserted high synchronously to the rising edge of the reference clock. This pin is not required to be used by the MAC in MII or RMII because the PHY automatically corrupts data on a receive error. Unused in RGMII and SGMII modes
RX_DV CRS_DV RX_CTRL	15	S, PD, O	Receive Data Valid: This pin indicates when valid data is presented on RX_D[3:0] for MII mode. Carrier Sense Data Valid: This pin combines carrier sense and data valid into an asynchronous signal. When CRS_DV is asserted, data is presented on RX_D[1:0] in RMII mode. To set Pin 15 as CRS_DV, set 0x0551=0x0010 (Default). RGMII Receive Control: Receive control combines receive data valid indication and receive error indication into one signal. RX_DV is presented on the rising edge of RX_CLK and RX_ER is presented on the falling edge of RX_CLK. To set Pin 15 as RX_DV, set 0x0551=0x0000. Unused in SGMII mode
TX_CLK	28	PD, I, O	Transmit Clock: In MII mode, the transmit clock is a 25MHz output (50Ω Driver) and has constant phase referenced to the reference clock. In RGMII mode, this clock is sourced from the MAC layer to the PHY. A 25MHz clock must be provided (not required to have constant phase to the reference clock unless synchronous RGMII is enabled) Unused in RMII and SGMII modes
TX_EN TX_CTRL	29	PD, I	Transmit Enable: In MII mode, transmit enable is presented before the rising edge of the transmit clock. TX_EN indicates the presence of valid data inputs on TX_D[3:0]. In RMII mode, transmit enable is presented before the rising edge of the reference clock. TX_EN indicates the presence of valid data inputs on TX_D[1:0]. RGMII Transmit Control: Transmit control combines transmit enable and transmit error indication into one signal. TX_EN is presented before the rising edge of TX_CLK; TX_ER is presented before the falling edge of TX_CLK. Unused in SGMII mode
TX_D3	30	PD, I	Transmit Data: In MII and RGMII modes, the transmit data nibble, TX_D[3:0], is received from the MAC before the rising edge of TX_CLK. In RMII mode, TX_D[1:0] is received from the MAC before the rising edge of the reference clock. TX_D[3:2] are not used in RMII mode. TX_M / TX_P: Differential SGMII Data Input. These pins receive data that is transmitted from the MAC to the PHY.
TX_D2	31		
TX_D1 TX_P	32		
TX_D0 TX_M	33		
SERIAL MANAGEMENT INTERFACE			
MDC	1	I	Management Data Clock: Synchronous clock to the MDIO serial management input and output data. This clock can be asynchronous to the MAC transmit and receive clocks. The maximum clock rate is 20MHz. There is no minimum clock rate.

Table 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME ⁽²⁾	NO.		
MDIO	36	OD, IO	Management Data Input/Output: Bidirectional management data signal that can be sourced by the management station or the PHY. This pin requires a pullup resistor. In systems with multiple PHYs using same MDIO-MDC bus, a pull-up resistor to VDDIO must be used on MDIO line. Recommended to use a resistor from 2.2kΩ to 9kΩ. MDIO/MDC Access is required to pass Open Alliance Compliance. See Section 7.3.2
CONTROL INTERFACE			
INT	2	PU, OD, IO	Interrupt: Active-LOW output, which is asserted LOW when an interrupt condition occurs. This pin has a weak internal pullup. Register access is necessary to enable various interrupt triggers. Once an interrupt event flag is set, register access is required to clear the interrupt event. This pin can be configured as an Active-HIGH output using register 0x0011. Interrupt status from Reg 12-13 is recommended to be read only when INT_N is LOW. This pin can also operate as Power-Down control where asserting this pin low puts the PHY in power down mode and asserting high puts the PHY in normal mode. This feature can also be enabled using the register 0x0011.
RESET	3	PU, I	Reset: Active-LOW input, which initializes or reinitializes the PHY. Asserting this pin LOW for at least 1μs forces a reset process to occur. All internal registers reinitializes to the default states as specified for each bit in the Register Maps section. All bootstrap pins are resampled upon deassertion of reset.
WAKE	8	PD, I/O	WAKE: Input/Output pin which is Active-HIGH input by default. As input this pin wakes the PHY from TC-10 SLEEP. Asserting this pin HIGH at power-up brings the PHY out of SLEEP. External 10kΩ pulldown resistor can be used when implementing TC-10 circuit to prevent accidental wake-up. This pin can be directly tied to VSLEEP or the pin can be pulled to VSLEEP using a resistor to wake the device. This pin also supports wake forwarding feature where a WAKE pulse is generated by the PHY which can be used for waking up other PHYs on the same system.
INH	10	O, OD	INH: Active-HIGH output. This pin is Hi-Z when the PHY is in TC-10 SLEEP. This pin is HIGH for all other PHY states. External pull down resistor in the range of 2kΩ - 10kΩ must be used when implementing TC-10 circuit. If multiple devices are sharing INH pin, then a pull down resistor must be used.
CLOCK INTERFACE			
XI	5	I	Reference Clock Input (RMII): Reference clock 50MHz CMOS-level oscillator in RMII Follower mode. Reference clock 25MHz crystal or oscillator in RMII Leader mode. Reference Clock Input (Other MAC Interfaces): Reference clock 25MHz crystal or oscillator input. The device supports either an external crystal resonator connected across pins XI and XO, or an external CMOS-level oscillator connected to pin XI only and XO left floating. This pin can also accept clock input from other devices like Ethernet MAC or another Ethernet PHY in daisy-chain operations. If using a crystal, connect a 100Ω resistor in series with the XI pin
XO	4	O	Reference Clock Output: XO pin is used for crystal only. This pin must be left floating when a CMOS-level oscillator is connected to XI.
LED/GPIO INTERFACE			
LED_0 / GPIO_0	35	S, PD, IO	LED_0: Link Status LED. This pin can also be used as LED or clock output with Register selection.
LED_1 / GPIO_1	6	S, PD, IO	LED_1: Link Status and BLINK for TX/RX Activity. This pin can also be used as LED or clock output with Strap/Register selection.
CLKOUT / GPIO_2	16	IO	Clock Output: 25MHz reference clock in all modes except RMII Follower, which is 50MHz instead. This pin can also be used as LED or GPIO with Strap/Register selection. Program register<0x045F>=0x000F and register<0x0453>=0x0003 to disable switching on CLKOUT pin
MEDIUM DEPENDENT INTERFACE			

Table 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME ⁽²⁾	NO.		
TRD_M	13	IO	Differential Transmit and Receive: Bidirectional differential signaling configured for 100BASE-T1 operation, IEEE 802.3bw compliant.
TRD_P	12		
GROUND ESCAPE			
GND_ESC	17		Ground Escape: Optional ground escape pins. These pins can be connected to ground to optimize PCB layout. These pins are not substitute for power ground connection to DAP. DAP must always be connected to power ground. This pin can be left unconnected if not used.
GND_ESC	18		Ground Escape: Optional ground escape pins. These pins can be connected to ground to optimize PCB layout. These pins are not substitute for power ground connection to DAP. DAP must always be connected to power ground. This pin can be left unconnected if not used.
POWER CONNECTIONS			
VDDA	11	SUPPLY	Core Supply: 3.3V Recommend using 0.47µF and 0.01µF ceramic decoupling capacitors; optional ferrite bead can be used.
VDDIO	34	SUPPLY	IO Supply: 1.8V, 2.5V, or 3.3V Recommend using ferrite bead, 0.47µF and 0.01µF ceramic decoupling capacitors.
VDDMAC	22	SUPPLY	Optional MAC Interface Supply: 1.8V, 2.5V, or 3.3V Optional separate supply for MAC interface pins. This pin supplies power to the MAC interface pins and can be kept at a different voltage level as compared to other IO pins. Recommend using 0.47µF, and 0.01µF ceramic decoupling capacitors and ferrite bead. When separate VDDMAC is not required in the system then the pin must be connected to VDDIO. When connecting to VDDIO, 0.47µF on the VDDIO can be removed. 0.47µF must still be connected close to VDDMAC. In this case, one common ferrite bead can be used between VDDIO and VDDMAC.
VSLEEP	7	SUPPLY	VSLEEP Supply: 3.3V Recommend using 0.1µF ceramic decoupling capacitors.
GROUND	DAP	GROUND	Ground: This must always be connected to power ground.
DO NOT CONNECT			
DNC	19		DNC: Do not connect (leave floating)
DNC	20		DNC: Do not connect (leave floating)
RECOMMENDED TO ACCOMODATE FOR DP83TC815			
Pin 9	9		Connect to Pin 21
Pin 21	21		Connect 2.2µF and 0.1µF ceramic capacitors from Pin 21 to GND

- (1) Pin Type:
I = Input
O = Output
IO = Input/Output
OD = Open Drain
PD = Internal pulldown
PU = Internal pullup
S = Bootstrap configuration pin (all configuration pins have weak internal pullups or pulldowns)
- (2) When pins are unused, follow the recommended connection requirements provided in the table above. If pins do not have required termination, the pins can be left floating.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	TYP	MAX	UNIT
Input Voltage	VDDA	−0.3		4	V
Input Voltage	VDDIO/VDDMAC (3.3V)	−0.3		4	V
Input Voltage	VDDIO/VDDMAC (2.5V)	−0.3		4	V
Input Voltage	VDDIO/VDDMAC (1.8V)	−0.3		4	V
Input Voltage	VSLEEP	−0.3		4	V
Pins	MDI	−0.3		4	V
Pins	MAC interface	−0.3	VDDMAC + 0.3		V
Pins	MDIO, MDC, GPIO, XI, XO, INT, RESET, CLKOUT	−0.3	VDDIO + 0.3		V
Pins	WAKE, INH	−0.3	VSLEEP + 0.3		V
DC Output Voltage	All Pins	−0.3		4	V
T _J	Junction Temperature			150	°C
T _{stg}	Storage temperature	−65		150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

				VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾	All pins	±2000	V
			TRD_N, TRD_P pins	±8000	
		Charged device model (CDM), per AEC Q100-011	Corner pins	±750	
			Other pins	±750	
		IEC 61000-4-2 contact discharge	TRD_N, TRD_P pins	±8000	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDDIO / VDDMAC	IO Supply Voltage, 1.8V operation	1.62	1.8	1.98	V
	IO Supply Voltage, 2.5V operation	2.25	2.5	2.75	
	IO Supply Voltage, 3.3V operation	2.97	3.3	3.63	
VDDA	Core Supply Voltage, 3.3V	2.97	3.3	3.63	V
VSLEEP	Sleep Supply Voltage, 3.3V	2.97	3.3	3.63	V
T _A	Ambient temperature	−40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DP83TC812	UNIT
		RHA (VQFN)	
		36 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	36.7	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	27.0	°C/W
R _{θJB}	Junction-to-board thermal resistance	17.5	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.7	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	17.5	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	6.7	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
100BASE-T1 PMA CONFORMANCE						
V _{OD-MDI}	Output Differential Voltage	R _{L(diff)} = 100Ω			2.2	V
R _{MDI-Diff}	Integrated Differential Output Termination	TRD_P and TRD_M		100		Ω
BOOTSTRAP DC CHARACTERISTICS (2 Level)						
V _{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 3.3V ±10%, 2-level strap	0		0.8	V
V _{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 3.3V ±10%, 2-level strap	2		VDDIO	V
V _{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 2.5V ±10%, 2-level strap	0		0.7	V
V _{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 2.5V ±10%, 2-level strap	1.5		VDDIO	V
V _{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 1.8V ±10%, 2-level strap	0		0.35 x VDDIO	V
V _{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 1.8V ±10%, 2-level strap	0.65 x VDDIO		VDDIO	V
BOOTSTRAP DC CHARACTERISTICS (3 Level)						
V _{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 3.3V ±10%, 3-level strap	0		0.18 x VDDIO	V
V _{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 3.3V ±10%, 3-level strap	0.22 x VDDIO		0.42 x VDDIO	V
V _{MODE3}	Mode 3 Strap Voltage Range	VDDIO = 3.3V ±10%, 3-level strap	0.46 x VDDIO		VDDIO	V
V _{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 2.5V ±10%, 3-level strap	0		0.19 x VDDIO	V
V _{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 2.5V ±10%, 3-level strap	0.27 x VDDIO		0.41 x VDDIO	V
V _{MODE3}	Mode 3 Strap Voltage Range	VDDIO = 2.5V ±10%, 3-level strap	0.58 x VDDIO		VDDIO	V
V _{MODE1}	Mode 1 Strap Voltage Range	VDDIO = 1.8V ±10%, 3-level strap	0		0.35 x VDDIO	V
V _{MODE2}	Mode 2 Strap Voltage Range	VDDIO = 1.8V ±10%, 3-level strap	0.40 x VDDIO		0.75 x VDDIO	V

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{MODE3}	Mode 3 Strap Voltage Range	VDDIO = 1.8V ±10%, 3-level strap	0.84 x VDDIO		VDDIO	V
IO CHARACTERISTICS						
V _{IH}	High Level Input Voltage	VDDIO = 3.3V ±10%	2			V
V _{IL}	Low Level Input Voltage	VDDIO = 3.3V ±10%			0.8	V
V _{OH}	High Level Output Voltage	I _{OH} = -2mA, VDDIO = 3.3V ±10%	2.4			V
V _{OL}	Low Level Output Voltage	I _{OL} = 2mA, VDDIO = 3.3V ±10%			0.4	V
V _{IH}	High Level Input Voltage	VDDIO = 2.5V ±10%	1.7			V
V _{IL}	Low Level Input Voltage	VDDIO = 2.5V ±10%			0.7	V
V _{OH}	High Level Output Voltage	I _{OH} = -2mA, VDDIO = 2.5V ±10%	2			V
V _{OL}	Low Level Output Voltage	I _{OL} = 2mA, VDDIO = 2.5V ±10%			0.4	V
V _{IH}	High Level Input Voltage	VDDIO = 1.8V ±10%	0.65*VDDIO			V
V _{IL}	Low Level Input Voltage	VDDIO = 1.8V ±10%			0.35*VDDIO	V
V _{OH}	High Level Output Voltage	I _{OH} = -2mA, VDDIO = 1.8V ±10%	VDDIO-0.45			V
V _{OL}	Low Level Output Voltage	I _{OL} = 2mA, VDDIO = 1.8V ±10%			0.45	V
I _{IH}	Input High Current ⁽¹⁾	T _A = -40°C to 125°C, VIN=VDDIO, All pins except XI and WAKE	-10		10	µA
I _{IH-XI}	Input High Current ⁽¹⁾	T _A = -40°C to 125°C, VIN=VDDIO, XI pin	-15		15	µA
I _{IL-XI}	Input Low Current ⁽¹⁾	T _A = -40°C to 125°C, VIN=GND, XI pin	-15		15	µA
I _{IL}	Input Low Current ⁽¹⁾	T _A = -40°C to 125°C, VIN=GND, All pins except XI pin	-10		10	µA
I _{ozh}	Tri-state Output High Current	T _A = -40°C to 125°C, VIN=VDDIO, For pins RX_D[3:0], RX_CLK, MDIO, INT_N and XO	-10		10	µA
I _{ozh}	Tri-state Output High Current	T _A = -40°C to 125°C, VIN=VDDIO, For pins RX_CTRL and RX_ER	-52		52	µA
I _{ozl}	Tri-state Output Low Current ⁽²⁾	T _A = -40°C to 125°C, VOUT=GND	-10		10	µA
R _{pulldn}	Internal Pull Down Resistor	RX_D[3:0], RX_CLK, LED_0, LED_1	6.2	8.4	10.7	kΩ
R _{pulldn}	Internal Pull Down Resistor	RX_CTRL, RX_ER	4.725	5.8	7.2	kΩ
R _{pulldn}	Internal Pull Down Resistor	WAKE		455		kΩ
R _{pullup}	Internal Pull Up Resistor	INT, RESET	6.3	9	11.2	kΩ
XI V _{IH}	High Level Input Voltage		1.3		VDDIO	V
XI V _{IL}	Low Level Input Voltage				0.5	V
C _{IN}	Input Capacitance XI			1		pF

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
C _{IN}	Input Capacitance INPUT PINS			5		pF
C _{OUT}	Output Capacitance XO			1		pF
C _{OUT}	Output Capacitance OUTPUT PINS			5		pF
R _{series}	Integrated MAC Series Termination Resistor	RX_D[3:0], RX_ER, RX_DV, RX_CLK	35	50	65	Ω
POWER CONSUMPTION						
I(3V3)	MII	-40°C to 125°C		57	63	mA

SGMII Input						
V _{IDTH}	Input differential voltage tolerance	SI_P and SI_N, AC coupled	0.1			V
R _{IN-DIFF}	Receiver differential input impedance (DC)		80		120	ohm
SGMII Output						
	Clock signal duty cycle	SO_P and SO_N, AC coupled, 0101010101 pattern	48		52	%
	Output Differential Voltage	SO_P and SO_N, AC coupled	150		400	mV
Voltage Sensor						
VDDA	VDDA Sensor Range	-40°C to +125°C	2.7	3.3	4	V
	VDDA Sensor Resolution (LSB)	-40°C to +125°C		8.8		mV
	VDDA Sensor Accuracy (voltage and temperature variation on single part)	-40°C to +125°C	-120		120	mV
	VDDA Sensor Accuracy (part-part variation)	-40°C to +125°C	-50		50	mV

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
VDDIO / VDDMAC	VDDIO / VDDMAC Sensor Range	-40°C to +125°C	1.44		3.9	V
	VDDIO / VDDMAC Sensor Resolution (LSB)	-40°C to +125°C		16		mV
	VDDIO / VDDMAC Sensor Accuracy (voltage and temperature variation on single part)	-40°C to +125°C	-144		144	mV
	VDDIO / VDDMAC Sensor Accuracy (part-part variation)	-40°C to +125°C	-85		85	mV
VSLEEP	VSLEEP Sensor Range	-40°C to +125°C	2.7	3.3	4	V
	VSLEEP Sensor Resolution (LSB)	-40°C to +125°C		8.8		mV
	VSLEEP Sensor Accuracy (voltage and temperature variation on single part)	-40°C to +125°C	-120		120	mV
	VSLEEP Sensor Accuracy (part-part variation)	-40°C to +125°C	-50		50	mV

- (1) For pins: MDC, TX_CLK, TX_CTRL, TX_D[3:0], and RESET_N
(2) For pins: RX_D[3:0], RX_CLK, RX_CTRL, MDIO, INT_N, and XO.

6.6 Timing Requirements

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
MII TIMING						
T1.1	TX_CLK High / Low Time		16	20	24	ns
T1.2	TX_D[3:0], TX_ER, TX_EN Setup to TX_CLK		10			ns
T1.3	TX_D[3:0], TX_ER, TX_EN Hold from TX_CLK		0			ns
T2.1	RX_CLK High / Low Time		16	20	24	ns
T2.2	RX_D[3:0], RX_ER, RX_DV Delay from RX_CLK rising		10		30	ns
RMII LEADER TIMING						
T3.1	RMII Leader Clock Period			20		ns
	RMII Leader Clock Duty Cycle		35		65	%
T3.2	TX_D[1:0], TX_ER, TX_EN Setup to RMII Leader Clock		4			ns
T3.3	TX_D[1:0], TX_ER, TX_EN Hold from RMII Leader Clock		2			ns
T3.4	RX_D[1:0], RX_ER, CRS_DV Delay from RMII Leader Clock rising edge		4	10	14	ns
RMII FOLLOWER TIMING						
T3.1	Input Reference Clock Period			20		ns
	Reference Clock Duty Cycle		35		65	%
T3.2	TX_D[1:0], TX_ER, TX_EN Setup to XI Clock rising		4			ns
T3.3	TX_D[1:0], TX_ER, TX_EN Hold from XI Clock rising		2			ns
T3.4	RX_D[1:0], RX_ER, CRS_DV Delay from XI Clock rising		4		14	ns
RGMII INPUT TIMING						
T _{cyc}	Clock Cycle Duration	TX_CLK	36	40	44	ns
T _{setup(alig n)}	TX_D[3:0], TX_CTRL Setup to TX_CLK (Align Mode)		1	2		ns
T _{hold(alig n)}	TX_D[3:0], TX_CTRL Hold from TX_CLK (Align Mode)		1	2		ns
RGMII OUTPUT TIMING						
T _{skew(alig n)}	RX_D[3:0], RX_CTRL Delay from RX_CLK (Align Mode Enabled)	On PHY Pins	-750		750	ps
T _{skew(shift)}	RX_D[3:0], RX_CTRL Delay from RX_CLK (Shift Mode Enabled, default)	On PHY Pins	2			ns
T _{cyc}	Clock Cycle Duration	RX_CLK	36	40	44	ns
Duty_G	Duty Cycle	RX_CLK	45	50	55	%
Tr/Tf	Rise / Fall Time (20% to 80%)	C _{LOAD} = 5pF			1.2	ns
SMI TIMING						
T4.1	MDC to MDIO (Output) Delay Time	25pF load capacitance	0		40	ns
T4.2	MDIO (Input) to MDC Setup Time		10			ns
T4.3	MDIO (Input) to MDC Hold Time		10			ns
	MDC Frequency			2.5	20	MHz
POWER-UP TIMING						
T5.1	Supply ramp time: For all supplies ⁽¹⁾		0.2		8	ms
T5.3	XTAL Startup / Settling: Powerup to XI good/stabilized			0.35		ms
T5.4	Oscillator stabilization time from power up				10	ms
T5.5	Post power-up to SMI ready: Post Power-up wait time required before MDC preamble can be sent for register access		10			ms
T5.6	Power-up to Strap latch-in				10	ms

7 Detailed Description

7.1 Overview

The DP83TC812S-Q1 is a 100BASE-T1 automotive Ethernet Physical Layer transceiver. The device is IEEE 802.3bw compliant and AEC-Q100 qualified for automotive applications. The DP83TC812S-Q1 is interoperable with both BroadR-Reach PHYs and 100BASE-T1 PHYs.

The DP83TC812S-Q1 also supports Open Alliance TC-10 low-power mode for additional power savings. The PHY supports WAKE and INH pins for implementing TC-10 functionality in the system.

This device is specifically designed to operate at 100Mbps speed while meeting stringent automotive EMC limits. The DP83TC812S-Q1 transmits PAM3 ternary symbols at 66.667MHz over unshielded single twisted-pair cable. The device is application flexible; supporting MII, RMII, RGMII, and SGMII in a 36-pin VQFN wettable flank package.

There is an extensive Diagnostic Tool Kit within the DP83TC812S-Q1 for both in-system use as well as debug, compliance and system prototyping for bring-up. The DP83TC812S-Q1 can meet IEC61000-4-2 Level 4 electrostatic discharge limits and the device also includes an on-chip ESD sensor for detecting ESD events in real time.

7.2 Functional Block Diagram

Figure 7-1. DP83TC812S-Q1

7.3 Feature Description

Note

See also the [DP83TC812, DP83TC813, and DP83TC814: Configuring for Open Alliance Specification Compliance](#) application note for more information about the register settings used for compliance testing. Use these register settings to achieve the same performance as observed during compliance testing.

7.3.1 Diagnostic Tool Kit

The DP83TC812 diagnostic tool kit provides mechanisms for monitoring normal operation, device-level debugging, system-level debugging, fault detection, and compliance testing. This tool kit includes a built-in self-test with PRBS data, various loopback modes, Signal Quality Indicator (SQI), Time Domain Reflectometry (TDR), undervoltage monitor, electrostatic discharge monitor, and IEEE 802.3bw test modes.

7.3.1.1 Signal Quality Indicator

When the DP83TC812-Q1 is active, use the Signal Quality Indicator to determine the quality of link based on the devices SNR readings. SQI is presented as a 8-level indication. Signal quality indication is accessible through register 0x871. The PHY continuously monitors the SQI PHY to allow for real-time link signal quality status.

Bits[3:1] in register 0x871 provide SQI value while bits [7:5] provide the worst SQI value since the last read. The SQI value reported in register 0x871[3:1] map directly to the SQI levels required by Open Alliance.

To get the most accurate SQI reporting, use the initialization routine explained in the TI [DP83TC812, DP83TC813, and DP83TC814: Configuring for Open Alliance Specification Compliance](#) application note.

Table 7-1. Signal Quality Indicator

REG 0x871[3:1]	OPEN ALLIANCE SQI LEVEL	LINK QUALITY
0x0	0 (Worst)	Poor/ No Link
0x1	1	
0x2	2	
0x3	3	
0x4	4	Good / Excellent Link
0x5	5	
0x6	6	
0x7	7 (Best)	

7.3.1.2 Electrostatic Discharge Sensing

Electrostatic discharge is a serious issue for electronic circuits and if not properly mitigated can create short-term issues (signal integrity, link drops, packet loss) as well as long-term reliability faults. The DP83TC812 has robust integrated ESD circuitry and offers an ESD sensing architecture. Independently detect ESD events on MDI pins for further analysis and debug.

Additionally, the DP83TC812 provides an interrupt status flag; *Register 0x12[11]* is set when an ESD event is logged. Route this interrupt to the INT_N pin using bit[3] of the same register. *Register 0x442[14:9]* store the number of ESD events that have occurred since power-up. The ESDS register ignores hardware and software resets to prevent unwarranted clearing.

7.3.1.3 Time Domain Reflectometry

Time domain reflectometry helps determine the quality of the cable, connectors and terminations in addition to estimating OPEN and SHORT faults along a cable. The DP83TC812-Q1 transmits a test pulse down the attached twisted-pair cable. Transmitted pulses continue down the cable and reflect from each imperfection and fault, allowing the device to measure the time to return and strength (amplitude) of all reflections. This technique enables the DP83TC812-Q1 to identify cable OPENs and SHORTs.

Setting bit[15] in register 0x1E activates TDR. The procedure is as follows.

- Configure the DP83TC812-Q1 as per the initialization settings from the TI [DP83TC812, DP83TC813, and DP83TC814: Configuring for Open Alliance Specification Compliance](#) application note
- Verify that the Link Partner connected to the PHY is silent. Link is down during TDR execution.
- Run the Pre-TDR configuration settings as listed in the TI [DP83TC812, DP83TC813, and DP83TC814: Configuring for Open Alliance Specification Compliance](#) application note.
- Start TDR by setting register 0x1E[15] to '1'.
- Wait 100ms, read register 0x1E[1:0]
 - If the register reads 0b10 then TDR has executed successfully.
- If TDR executed successfully then read register 0x310 to get TDR results.
 - 0x310[7]: 0 = Cable fault not detected or 1 = Cable fault detected
 - 0x310[6]: 0 = Cable fault is SHORT or 1 = Cable fault is OPEN
 - If valid cable fault is detected then 0x310[5:0] stores the location value in meters.

7.3.1.4 Voltage Sensing

The DP83TC812 offers sensors for monitoring voltage at the supply pins. Undervoltage monitoring are always active in the DP83TC812 by default. If an undervoltage condition is detected, interrupt status flag is set in register 0x0013. These interrupts can also be optionally routed to the INT pin using the same register.

Use the following steps to read each sensor.

1. Program register 0x0467 = 0x6004; Initial configuration of monitors
2. Program register 0x046A = 0x00A3; Enable Monitors
3. Configure register 0x0468 with the corresponding setting to select the required sensor.
 - VDDA Sensor: Use 0x0468 = 0x0920
 - VSLEEP Sensor: Use 0x0468 = 0x1920
 - VDDMAC Sensor: Use 0x0468 = 0x2920
 - VDDIO Sensor: Use 0x0468 = 0x3920
4. Read register 0x047B[14:7] and convert this output code to decimal.
5. Use the output code in the following equations to get the absolute value of the sensor. See the [Table 7-2](#) table for constant values for corresponding sensors.
 - $vdda_value = 3.3 + (vdda_output_code - vdda_output_mean_code) \times slope_vdda_sensor$
 - $vsleep_value = 3.3 + (vsleep_output_code - vsleep_output_mean_code) \times slope_vsleep_sensor$
 - $vddmac_value = 3.3 + (vddmac_output_code - vddmac_output_mean_code) \times slope_vddmac_sensor$
 - $vddio_value = 3.3 + (vddio_output_code - vddio_output_mean_code) \times slope_vddio_sensor$

Table 7-2. Sensors Constant Values

SENSOR	CONSTANT	VALUE
VDDA	vdda_output_mean_code	126
	slope_vdda_sensor	0.0088
VSLEEP	vsleep_output_mean_code	134
	slope_vsleep_sensor	0.0088
VDDMAC	vddmac_output_mean_code	205
	slope_vddmac_sensor	0.016
VDDIO	vddio_output_mean_code	205
	slope_vddio_sensor	0.016

7.3.1.5 BIST and Loopback Modes

DP83TC812 incorporates a data path Built-In-Self-Test (BIST) to check the PHY level and system-level data-paths. BIST has following integrated features which make the system-level data transfer tests (throughput, and so forth) and diagnostics possible without relying on MAC or external data generator hardware/software.

For easy evaluation, use the following features are available in the DP83TC812:

1. Loopback modes
2. Data generator
 - a. Customizable MAC packets generator
 - b. Transmitted packet counter
 - c. PRBS stream generator
3. Data checker
 - a. Received MAC packets error checker
 - b. Received packet counter: counts total packets received and packets received with errors
 - c. PRBS lock and PRBS error checker

7.3.1.5.1 Data Generator and Checker

DP83TC812 supports inbuilt pseudo-random data generator and checker which are useable in conjunction with Loopback modes to check the data path. Program the data generator to generate either user defined MAC packets or PRBS stream.

Following parameters of generated MAC packets are configurable (see the registers<0x061B>,register<0x061A> and register<0x0624> for required configuration):

- Packet length
- Inter-packet gap
- Defined number of packets to be sent or continuous transmission
- Packet data-type: incremental/fixed/PRBS
- Number of valid bytes per packet

7.3.1.5.2 xMII Loopback

Figure 7-2. xMII Loopback Without Data Generator

xMII Loopback is the shallowest loop through the PHY. xMII Loopback is a useful test mode to validate communications between the MAC and the PHY. When in xMII Loopback, data transmitted from a connected MAC on the TX path is internally looped back in the DP83TC812 to the RX pins where the device can be checked by the MAC. There is no link indication when in xMII loopback.

Enable Loopback

Write register 0x0000 = 0x6100

Enable Data Generator/checker for MAC Side

Data is generated externally on the MAC TX pins.

Use the following register settings to enable checker depending on the MAC interface mode.

- For RGMII, write register 0x0619 = 0x1004
- For SGMII, write register 0x0619 = 0x1114
- For RMII, write register 0x0619 = 0x1224
- For MII, write register 0x0619 = 0x1334

Check Incoming Data From MAC Side

Data can be verified at MAC interface RX pins.

Data can also be checked internally by reading registers 0x063C, 0x063D, 0x063E. The registers must be read together and in this order.

Enable Data Generator/checker for Cable Side

Not applicable as data is generated externally on the MAC interface TX pins.

Check Data for Cable Side

Not applicable as PRBS stream checker works with only internal PRBS generator.

Other System Requirements

Generated data is going to cable side.

7.3.1.5.3 PCS Loopback

Figure 7-3. PCS Loopback With Data Generator

Figure 7-4. PCS Loopback Without Data Generator

PCS Loopback loops back data before exiting the PCS and entering the PMA. Data received from the MAC on the transmit path is brought through the digital block within the PHY where the data is then routed back to the MAC through the receive path. The DP83TC812 receive PMA circuitry is configured for isolation to prevent contention.

Enable Loopback

Write register 0x0016 = 0x0102

Enable Data Generator/Checker For MAC Side

Write register 0x0624 = 0x55BF

Write register 0x0619 = 0x1555

Check Incoming Data From MAC Side

Internally check the data by reading registers 0x063C, 0x063D, 0x063E. The registers must be read together and in this order.

Enable Data Generator/Checker For Cable Side

Write register 0x0624 = 0x55BF

Write register 0x0619 = 0x0557

Check Data For Cable Side

1. Write register 0x0620[1] = 1'b1
2. Read register 0x620
 - a. Bit [7:0] = Number of errors bytes received
 - b. Bit [8] = PRBS checker lock status on incoming data (1'b1 indicates lock)

Repeat steps 1 and 2 to continuously check error status of incoming data stream.

Other System Requirements

Data generate by the internal PRBS is transmitted over the MDI and the MAC interface.

7.3.1.5.4 Digital Loopback

Figure 7-5. Digital Loopback With Data Generator

Figure 7-6. Digital Loopback Without Data Generator

Digital Loopback loops back data before exiting the Digital and entering the AFE. Data received from the MAC on the transmit path is brought through the digital block within the PHY where data is then routed back to the MAC through the receive path. The DP83TC812 receive Analog circuitry is configured for isolation to prevent contention.

Enable Loopback

Write register 0x0016 = 0x0104

Enable Data Generator/Checker for MAC Side

Write register 0x0624 = 0x55BF

Write register 0x0619 = 0x1555

Check Incoming Data From MAC Side

Data can also be checked internally by reading registers 0x063C, 0x063D, 0x063E. The registers must be read together and in this order.

Enable Data Generator/Checker for Cable Side

Write register 0x0624 = 0x55BF

Write register 0x0619 = 0x0557

Check Data for Cable Side

1. Write register 0x0620[1] = 1'b1
2. Read register 0x620
 - a. Bit [7:0] = Number of errors bytes received
 - b. Bit [8] = PRBS checker lock status on incoming data (1'b1 indicates lock)

Repeat steps 1 and 2 to continuously check error status of incoming data stream.

Other System Requirements

Data generated by the internal PRBS is transmitted over the MDI and the MAC interface.

7.3.1.5.5 Analog Loopback

Figure 7-7. Analog Loopback With Data Generator

Figure 7-8. Analog Loopback Without Data Generator

Analog Loopback uses the echoed signals from the unterminated MDI and decodes these signals in the Hybrid to return the data to the MAC.

Enable Loopback

Write register 0x0016 = 0x0108

Enable Data Generator/checker For MAC Side

Write register 0x0624 = 0x55BF

Write register 0x0619 = 0x1555

Check Incoming Data From MAC Side

Data can also be checked internally by reading registers 0x063C, 0x063D, 0x063E. The registers must be read together and in this order.

Enable Data Generator/checker For Cable Side

Write register 0x0624 = 0x55BF

Write register 0x0619 = 0x0557

Check Data For Cable Side

1. Write register 0x0620[1] = 1'b1
2. Read register 0x620
 - a. Bit [7:0] = Number of errors bytes received
 - b. Bit [8] = PRBS checker lock status on incoming data (1'b1 indicates lock)

Repeat steps 1 and 2 to continuously check error status of incoming data stream.

Other System Requirements

Data generated by the internal PRBS is transmitted over the MDI and the MAC interface.

7.3.1.5.6 Reverse Loopback

Figure 7-9. Reverse Loopback With Data Generator

Figure 7-10. Reverse Loopback Without Data Generator

Reverse Loopback receives data on the MDI and passes data through the entire receive block where the data is then looped back within the PCS layer to the transmit block. The data is transmitted back out on the MDI to the attached Link Partner. To avoid contention, MAC transmit path is isolated.

Enable Loopback

Write register 0x0016 = 0x0110

Enable Data Generator/Checker For MAC Side

Write register 0x0624 = 0x55BF

Use the following register settings to enable checker depending on the MAC interface mode.

- For RGMII, write register 0x0619 = 0x1004
- For SGMII, write register 0x0619 = 0x1114
- For RMII, write register 0x0619 = 0x1224
- For MII, write register 0x0619 = 0x1334

Check Incoming Data From MAC Side

Data can also be checked internally by reading registers 0x063C, 0x063D, 0x063E. The registers must be read together and in this order.

Enable Data Generator/Checker For Cable Side

Write register 0x0624 = 0x55BF

Write register 0x0619 = 0x0557

Check Data For Cable Side

1. Write register 0x0620[1] = 1'b1
2. Read register 0x620
 - a. Bit [7:0] = Number of errors bytes received
 - b. Bit [8] = PRBS checker lock status on incoming data (1'b1 indicates lock)

Repeat steps 1 and 2 to continuously check error status of incoming data stream.

Other System Requirements

Data generate by the internal PRBS is transmitted over the MDI and the MAC interface.

7.3.2 Compliance Test Modes

Note

See also the [DP83TC812](#), [DP83TC813](#), and [DP83TC814: Configuring for Open Alliance Specification Compliance](#) application note for more information about the register settings used for compliance testing. Use these register settings to achieve the same performance as observed during compliance testing.

the DP83TC812-Q1 supports all four PMA compliance test modes required in IEEE 802.3bw, sub-clause 96.5.2. These compliance test modes include:

- Transmitter waveform power spectral density (PSD) mask
- Amplitude
- Distortion
- 100BASE-T1 Leader jitter
- 100BASE-T1 Follower jitter
- Droop
- Transmitter frequency
- Frequency tolerance
- Return loss
- Mode conversion

Use any of the three GPIOs to output TX_TCLK for the 100BASE-T1 Follower jitter measurement. For routing TX_TCLK to CLKOUT pin for 100BASE-T1 Follower Jitter measurement, write to register 0x045F = 0x000D. Configure the device in Follower mode.

7.3.2.1 Test Mode 1

Test mode 1 evaluates transmitter droop. In test mode 1, the DP83TC812-Q1 transmits '+1' symbols for a minimum of 600ns followed by '-1' symbols for a minimum of 600ns. This pattern is repeated continuously until the test mode is disabled.

Test mode 1 is enabled by setting bits[15:13] = 0b001 in the MMD1_PMA_TEST_MODE_CTRL Register (0x1836).

7.3.2.2 Test Mode 2

Test mode 2 evaluates the transmitter 100BASE-T1 Leader mode jitter. In test mode 2, the DP83TC812-Q1 transmits a {+1,-1} data symbol sequence. The transmitter synchronizes the transmitted symbols from the local reference clock.

Test mode 2 is enabled by setting bits[15:13] = 0b010 in MMD1_PMA_TEST_MODE_CTRL Register (0x1836).

7.3.2.3 Test Mode 4

Test mode 4 evaluates the transmitter distortion. In test mode 4, the DP83TC812-Q1 transmits the sequence of symbols generated by [Equation 1](#):

$$g(x) = 1 + x^9 + x^{11} \quad (1)$$

The bit sequences, $x0_n$ and $x1_n$, are generated from combinations of the scrambler in accordance to [Equation 2](#) and [Equation 3](#):

$$x0_n = \text{Scr}_n[0] \quad (2)$$

$$x1_n = \text{Scr}_n[1]^{\text{Scr}_n[4]} \quad (3)$$

[Table 7-3](#) shows example streams of the 3-bit nibbles.

Table 7-3. Transmitter Test Mode 4 Symbol Mapping

$x1_n$	$x0_n$	PAM3 SYMBOL
0	0	0
0	1	+1
1	0	0
1	1	-1

Test mode 4 is enabled by setting bits[15:13] = 0b100 in MMD1_PMA_TEST_MODE_CTRL Register (0x1836).

7.3.2.4 Test Mode 5

Test mode 5 evaluates the transmitter PSD mask. In test mode 5, the DP83TC812-Q1 transmits a pseudo-random sequence of PAM3 symbols.

Test mode 5 is enabled by setting bits[15:13] = 0b101 in MMD1_PMA_TEST_MODE_CTRL Register (0x1836).

7.4 Device Functional Modes

Figure 7-11. Power State Diagram

7.4.1 Power Down

When any of the supply rails are below the POR threshold ($\approx 0.6V$), the PHY is in a power-down state. All digital IOs remains in high impedance states and analog blocks are disabled. PMA termination is not present when powered down.

7.4.2 Reset

Reset is activated upon power-up, when $\overline{RESET}$ is pulled LOW (for the minimum reset pulse time) or if hardware reset is initiated by setting bit[15] in register 0x1F. All digital circuitry is cleared along with register settings during reset. Once reset completes, device bootstraps are re-sampled and associated bootstrap registers are set accordingly. PMA termination is not present in reset.

7.4.3 Standby

The device (100BASE-T1 Leader mode only) automatically enters into standby post power-up and reset so long that all supplies including VSLEEP are available and the device is bootstrapped for managed operation.

In standby, all PHY functions are operational except for PCS and PMA blocks. The PMA termination is also not present. Link establishment is not possible in standby and data cannot be transmitted or received. SMI functions are operational and register configurations are maintained.

If the device is configured for autonomous operation through bootstrap setting, the PHY automatically switches to normal operation once POR is complete.

7.4.4 Normal

Enter normal mode from either autonomous or managed operation. When in autonomous operation, the PHY automatically tries to establish a link with a valid Link Partner once POR is complete.

In managed operation, SMI access is required to allow the device to exit standby (100BASE-T1 Leader mode only); commands issued through the SMI allow the device to exit standby and enables both the PCS and PMA blocks. All device features are operational in normal mode.

Enable autonomous operation through SMI access by setting register 0x18B[6] = '1'. Note that this bit is auto-cleared after link up.

7.4.5 Sleep Ack

When the PHY receives low power sleep requests from the link partner, the PHY enters Sleep Ack mode. In this mode, the PHY allows 8ms for the MAC to decide if TC-10 sleep mode must be enabled or not. If the MAC decides to allow TC-10, the PHY proceeds to the next step in TC-10 state machine. However, the MAC can decide to abort TC-10 and the PHY returns to Normal mode. TC10 can be aborted using the register setting by disabling TC10 or using GPIO. If TC10 is aborted by disabling TC10 feature, then re-enable TC10 feature once the sleep request has been aborted.

7.4.6 Sleep Request

Sleep request is entered when switching from normal mode to sleep mode. This is an intermediate state and is used to for a smooth transition into sleep mode. In sleep request mode, the PHY transmits LPS code-groups, informing the Link Partner that sleep is requested.

PHY sleep_rqst_timer (default = 16ms) begins once the PHY enters into sleep request mode. LPS decoding at the Link Partner triggers the LPS RECEIVED interrupt. In sleep request state device waits for Link Partner to send LPS symbols. Once LPS symbols are received by the device, the device transitions to the SLEEP_SILENT state. If the sleep_rqst_timer expires before device receives LPS codes, the device enters SLEEP FAIL state. .

7.4.7 Sleep Fail

The PHY enters sleep fail mode if the Sleep_rqst_timer expires when in sleep_request state or sleep_silent state.. This indicates that the link partner has not entered sleep mode. After entering sleep fail mode, the PHY transitions to Normal mode.

7.4.8 Sleep

If sleep enable is set, the PHY transitions to sleep mode after the MDI line goes silent when in sleep_silent state; however, if sleep enable is not set, the device transitions to standby after the MDI line goes silent. By default, sleep enable is set. Once in sleep mode, all PHY blocks are disabled except for energy detection on the MDI. All register configurations are lost in sleep mode. No link can be established, data cannot be transmitted or received and SMI access is not available when in sleep mode.

Note

When the PHY is in Sleep mode, the MAC interface must not be driven by the Ethernet MAC.

7.4.9 Wake-Up

The user can wake up the DP83TC812S-Q1 remotely through energy detection on the MDI or locally using the WAKE pin. For local wake, the WAKE pin must be pulled HIGH. If the WAKE pin is tied LOW, the PHY only exits sleep if energy is detected on the MDI.

7.4.10 TC10 System Example

The following block diagrams explains how TC10 sleep and wake function works in a system.

Figure 7-12. TC10 System Example - Remote Wake

Figure 7-13. TC10 System Example - Local Wake

Remote Wake Up

For remote wake up, the initial state of the system is TC10 sleep. Core voltages to the PHY and MAC are turned off but the VSLEEP of the PHY is present. At some time, wake-up pulses (WUP) are received on the MDI lines. The PHY receives the message and if the sequence is valid then the PHY wakes up and drives INH pin HIGH. INH pin is used as enable input to voltage regulator (meaning, the LDO). Voltage regulators turn on and supply power to a power management device. The power management device then supplies power to the PHY, MAC, and any other devices on the system. The whole system powers up and becomes operational.

Wake Forwarding

DP83TC812-Q1

support wake forwarding feature. When the device received Wake-Up Requests (WUR) or Wake-Up Pulses (MDI) on the MDI then the PHY transmits an 40µs high pulse on the WAKE pin. This can be used to wake-up any other PHYs on the system that are in TC-10 sleep.

Local Wake Up

For local wake, some portion of the system is assumed to already be active and the PHY is in TC10 sleep. As an example, the system can have micro-controller in active mode to control the WAKE pin of the PHY. When the MCU wants to wake up the PHY from TC10 sleep, the MCU raises the WAKE pin to 3.3V to send a wake pulse (min. 40µs). The PHY wakes up and drives INH pin HIGH. INH pin is used as enable input to voltage regulator (meaning, the LDO). Voltage regulators turn on and supply power to a power management device. The power management device then supplies power to the PHY. Any other device on the system that depends on the PHY wake up can now be powered up and the system becomes operational.

Local Sleep

When the PHY is in normal operational mode and the MAC needs to put PHY in TC10 sleep, the MAC initiates the TC10 sleep process using SMI on the PHY. DP83TC812-Q1 then sends LPS signals on MDI to the link partner. If the link partner also agrees to enter TC10 sleep, the host PHY enters TC10 sleep. The link partner then releases the INH pin and the link partner gets pulled low through the external pulldown resistor. Voltage regulator that uses INH pin as enable input is turned off. PHY, MAC, and any other devices that are dependent on the voltage regulator is turned off. The PHY still has VSLEEP voltage present and continues to stay in TC10 sleep.

7.4.11 Media Dependent Interface

7.4.11.1 100BASE-T1 Leader and 100BASE-T1 Follower Configuration

100BASE-T1 Leader and 100BASE-T1 Follower are configured using either hardware bootstraps or through register access.

LED_0 controls the 100BASE-T1 Leader and 100BASE-T1 Follower bootstrap configuration. By default, 100BASE-T1 Follower mode is configured because there is an internal pulldown resistor on the LED_0 pin. If 100BASE-T1 Leader mode configuration through hardware bootstrap is preferred, an external pullup resistor is required.

Additionally, bit[14] in the **MMD1_PMA_CTRL_2 Register (Address 0x1834)** controls the 100BASE-T1 Leader and 100BASE-T1 Follower configuration. When this bit is set, 100BASE-T1 Leader mode is enabled.

7.4.11.2 Auto-Polarity Detection and Correction

During the link training process, the DP83TC812-Q1 100BASE-T1 Follower device can detect polarity reversal and automatically corrects the error. If polarity reversal is detected, the 100BASE-T1 Follower self-inverts transmitted signals to account for the error and verifies compatibility with the 100BASE-T1 Leader. Polarity at the 100BASE-T1 Leader is always observed as correct because polarity detection and correction is handled entirely by the 100BASE-T1 Follower.

Disable the auto-polarity correction in cases where the correction is not required. Disabling of auto-polarity correction is achieved using register 0x0553.

7.4.11.3 Jabber Detection

The jabber function prevents the PCS Receive state machine from locking up into a DATA state if the End-of-Stream Delimiters, ESD1 and ESD2, are never detected or received within the rcv_max_timer. When the maximum receive DATA state timer expires, the PCS Receive state machine is reset and transitions into IDLE state. IEEE 802.3bw specifies that jabber timeout be set to 1.08ms ± 54µs. By default, jabber timeout in the DP83TC812 is set to 1.1ms. This timer is configurable in *Register 0x496[10:0]*.

7.4.11.4 Interleave Detection

The interleave function allows for the DP83TC812-Q1 to detect and de-interleave the serial stream from a connected link partner. The two possible interleave sequences of ternary symbols include: (TA_n, TB_n) or (TB_n, TA_n).

7.4.12 MAC Interfaces

7.4.12.1 Media Independent Interface

The Media Independent Interface (MII) is a synchronous 4-bit wide nibble data interface that connects the PHY to the MAC. The MII is fully compliant with IEEE 802.3-2015 clause 22. The PHY has internal series termination resistors on MII output pins including TX_CLK output when the PHY is operating in MII mode. In this mode, do not leave the MII-TX pins floating or High-Z.

Table 7-4 summarizes the MII signals.

Table 7-4. MII Signals

FUNCTION	PINS
Data Signals	TX_D[3:0]
	RX_D[3:0]
Control Signals	TX_EN, TX_ER
	RX_DV, RX_ER

1	0	0000 through 1111	Normal Data Reception
1	1	0000 through 1111	Data Reception with Errors

7.4.12.2 Reduced Media Independent Interface

The DP83TC812-Q1 incorporates the Reduced Media Independent Interface (RMII) as defined in the RMII Revision 1.2 and 1.0 from the RMII consortium. The purpose of this interface is to provide a reduced pin count alternative to the IEEE 802.3u MII as specified in Clause 22. Architecturally, the RMII specification provides an additional reconciliation layer on either side of the MII, but can be implemented in the absence of an MII.

The DP83TC812-Q1 offers two types of RMII operations: RMII Follower and RMII Leader. In RMII Follower Mode, the DP83TC812-Q1 operates off a 50MHz CMOS-level oscillator, which is either provided by the MAC or synchronous to the MAC reference clock. In RMII Leader operation, the DP83TC812-Q1 operates off of either a 25MHz CMOS-level oscillator connected to XI pin or a 25MHz crystal connected across XI and XO pins. When bootstrapping to RMII Leader Mode, a 50MHz output clock automatically is enabled on RX_D3. Route this 50MHz output clock to the MAC.

The RMII specification has the following characteristics:

- Single clock reference shared between MAC and PHY
- Provides independent 2-bit wide transmit and receive data paths

In this mode, data transfers are two bits for every clock cycle using the 50MHz reference clock for both transmit and receive paths.

The RMII signals are summarized in [Table 7-7](#):

Table 7-7. RMII Signals

FUNCTION	PINS
Data Signals	TX_D[1:0]
	RX_D[1:0]
Control Signals	TX_EN
	CRS_DV

Figure 7-15. RMII Signaling

Table 7-8. RMII Transmit Encoding

TX_EN	TX_D[1:0]	DESCRIPTION
0	00 through 11	Normal Inter-Frame
1	00 through 11	Normal Data Transmission

Table 7-9. RMII Receive Encoding

CRS_DV	RX_ER	RX_D[1:0]	DESCRIPTION
0	0	00 through 11	Normal Inter-Frame
0	1	00	Normal Inter-Frame
0	1	01 through 11	Reserved
1	0	00 through 11	Normal Data Reception
1	1	00 through 11	Data Reception with Errors

RMII Follower: Data on TX_D[1:0] are latched at the PHY with reference to the rising edge of the reference clock at the XI pin. Data is presented on RX_D[1:0] with reference to the same rising clock edges at the XI pin.

RMII Leader: Data on TX_D[1:0] are latched at the PHY with reference to the rising edge of the reference clock at the RX_D3 pin. Data is presented on RX_D[1:0] with reference to the same rising clock edges at the RX_D3 pin.

The DP83TC812-Q1 RMII supplies an RX_DV signal, which provides a simpler method to recover receive data without the need to separate RX_DV from the CRS_DV indication. RX_ER is also supported even though the RMII specification does not require RX_ER.

RMII includes a programmable FIFO to adjust for the frequency differences between the reference clock and the recovered clock. The programmable FIFO, located in the register 0x0011[9:8] and register 0x0648[9:7], minimizes internal propagation delay based on expected maximum packet size and clock accuracy.

Table 7-10. XI Clock PPM = ± 100ppm

Reg 0x0011 <9:8>	Reg 0x0648 <9:7>	INCREMENT PHY LATENCY	MAX PACKET LENGTH WITHOUT ERRORS
01	010	Default	2250
10	100	80ns	7250

7.4.12.3 Reduced Gigabit Media Independent Interface

The DP83TC812-Q1 also supports Reduced Gigabit Media Independent Interface (RGMII) as specified by RGMII version 2.0 with LVCMOS. RGMII is designed to reduce the number of pins required to connect MAC and PHY. To accomplish this goal, the control signals are multiplexed. Both rising and falling edges of the clock are used to sample the control signal pin on transmit and receive paths. Data is samples on just the rising edge of the clock. For 100Mbps operation, RX_CLK and TX_CLK operate at 25MHz.

The RGMII signals are summarized in [Table 7-11](#):

Table 7-11. RGMII Signals

FUNCTION	PINS
Data Signals	TX_D[3:0]
	RX_D[3:0]
Control Signals	TX_CTRL
	RX_CTRL
Clock Signals	TX_CLK
	RX_CLK

Figure 7-16. RGMII Connections

Table 7-12. RGMII Transmit Encoding

TX_CTRL (POSITIVE EDGE)	TX_CTRL (NEGATIVE EDGE)	TX_D[3:0]	DESCRIPTION
0	0	0000 through 1111	Normal Inter-Frame
0	1	0000 through 1111	Reserved
1	0	0000 through 1111	Transmit Error Propagation
1	1	0000 through 1111	Normal Data Transmission

Table 7-13. RGMII Receive Encoding

RX_CTRL (POSITIVE EDGE)	RX_CTRL (NEGATIVE EDGE)	RX_D[3:0]	DESCRIPTION
0	0	0000 through 1111	Normal Inter-Frame
0	1	0000 through 1101	Reserved
0	1	1110	False Carrier Indication
0	1	1111	Reserved
1	0	0000 through 1111	Data Reception with Errors
1	1	0000 through 1111	Normal Data Reception

During packet reception, RX_CLK can stretch on either the positive or negative pulse to accommodate the transition from the internal free running clock to a recovered clock (data synchronous). Data can duplicate on the falling edge of the clock because double data rate (DDR) is only required for 1Gbps operation, which is not supported by the DP83TC812-Q1.

The DP83TC812-Q1 supports in-band status indication to help simplify link status detection. Inter-frame signals on RX_D[3:0] pins as specified in [Table 7-14](#).

Table 7-14. RGMII In-Band Status

RX_CTRL	RX_D3	RX_D[2:1]	RX_D0
00 Note: In-band status is only valid when RX_CTRL is low	Duplex Status: 0 = Half-Duplex 1 = Full-Duplex	RX_CLK Clock Speed: 00 = 2.5MHz 01 = 25MHz 10 = 125MHz 11 = Reserved	Link Status: 0 = Link not established 1 = Valid link established

7.4.12.4 Serial Gigabit Media Independent Interface

The Serial Gigabit Media Independent Interface (SGMII) provides a means for data transfer between MAC and PHY with significantly less signal pins (4 pins) compared to MII (14 pins), RMII (7 pins) or RGMII (12 pins). SGMII uses low-voltage differential signaling (LVDS) to reduce emissions and improve signal quality.

The DP83TC812 SGMII can operate in 4-wire. SGMII is configurable through hardware bootstraps. In 4-wire operation, two differential pairs are used to transmit and receive data. Clock and data recovery are performed in the MAC and in the PHY.

Because the DP83TC812 operates at 100Mbps, the 1.25Gbps rate of the SGMII is excessive. The SGMII specification allows for 100Mbps operation by replicating each byte within a frame 10 times. Frame elongation occurs above the IEEE 802.3 PCS layer, which prevents the start-of-frame delimiter from appearing more than once.

Because the DP83TC812 only supports 100Mbps speed, SGMII Auto-Negotiation is disabled by setting bit[0] = 0b0 in the *Register 0x608*.

The SGMII signals are summarized in [Table 7-15](#).

Table 7-15. SGMII Signals

FUNCTION	PINS
Data Signals	TX_M, TX_P
	RX_M, RX_P

Figure 7-17. SGMII Connections

7.4.13 Serial Management Interface

The Serial Management Interface (SMI) provides access to the DP83TC812S-Q1 internal register space for status information and configuration. The SMI frames and base registers are compatible with IEEE 802.3 clause 22. The implemented register set consists of the registers required by the IEEE 802.3 plus several others to provide additional visibility and controllability of the DP83TC812S-Q1. Additionally, the DP83TC812S-Q1 includes control and status registers added to clause 45 as defined by IEEE 802.3bw. Access to clause 45 register field is achieved using clause 22 access.

The SMI includes the management clock (MDC) and the management input and output data pin (MDIO). The external management entity, also called Station (STA), sources the MDC and can run at a maximum clock rate of 24MHz. MDC is not expected to be continuous, and the external management entity can turn off the MDC when the bus is idle.

The external management entity and by the PHY source the MDIO. The data on the MDIO pin is latched on the rising edge of the MDC. MDIO pin requires a pullup resistor (2.2KΩ) to VDDIO, which pulls MDIO high during IDLE and turnaround.

Up to 9 DP83TC812S-Q1 PHYs can share a common SMI bus. To distinguish between the PHYs, a 4-bit address is used. During power-up-reset, the DP83TC812S-Q1 latches the PHYAD[3:0] configuration pins to determine the address.

The management entity must not start an SMI transaction in the first cycle after power-up-reset. To maintain valid operation, the SMI bus must remain inactive at least one MDC cycle after hard reset is deasserted. In normal MDIO transactions, the register address is taken directly from the management-frame reg_addr field, thus allowing direct access to 32 16-bit registers (including those defined in IEEE 802.3 and vendor specific). The data field is used for both reading and writing. The Start code is indicated by a <01> pattern. This pattern makes sure that the MDIO line transitions from the default idle line state. The definition of turnaround is as an idle bit time inserted between the Register Address field and the Data field. To avoid contention during a read transaction, no device can actively drive the MDIO signal during the first bit of turnaround. The addressed

DP83TC812S-Q1 drives the MDIO with a zero for the second bit of turnaround and follows this with the required data.

For write transactions, the station-management entity writes data to the addressed DP83TC812S-Q1, thus eliminating the requirement for MDIO Turnaround. The turnaround time is filled by the management entity by inserting <10>.

Table 7-16. SMI Protocol Structure

SMI PROTOCOL	<idle> <start> <op code> <device address> <reg address> <turnaround> <data> <idle>
Read Operation	<idle><01><10><AAAA><RRRR><Z0><XXXX XXXX XXXX XXXX><idle>
Write Operation	<idle><01><01><AAAA><RRRR><10><XXXX XXXX XXXX XXXX><idle>

7.4.13.1 Direct Register Access

Direct register access can be used for the first 31 registers (0x0 through 0x1F).

7.4.13.2 Extended Register Space Access

The DP83TC812S-Q1's SMI function supports read or write access to the extended register set using registers REGCR (0x0D) and ADDAR (0x0E) and the MDIO Manageable Device (MMD) indirect method defined in IEEE 802.3ah Draft for Clause 22 for accessing the Clause 45 extended register set.

Note

Registers with addresses above 0x001F require indirect access. For indirect access, a sequence of register writes must be followed. The MMD value defines the Device Address (DEVAD) of the register set. The DEVAD must be configured in the register 0x000D (REGCR) bits [4:0] for indirect access

The DP83TC812S-Q1 supports 3 MMD device addresses:

1. MMD1F (Vendor specific registers): DEVAD [4:0] = '11111'
2. MMD1 (IEEE 802.3az defined registers): DEVAD [4:0] = '00001'
3. MMD3 (IEEE 802.3az defined registers): DEVAD [4:0] = '00011'

Table 7-17. MMD Register Space Division

MMD Register Space	Register Address Range
MMD1F	0x0000 - 0x0FFF
MMD1	0x1000 - 0x1FFF
MMD3	0x3000 - 0x3FFF

The following sections describe how to perform operations on the extended register set using register REGCR and ADDAR. The descriptions use the device address for MMD1F register accesses (DEVAD[4:0] = 11111).

7.4.13.3 Write Operation (No Post Increment)

To write a register in the extended register set:

Instruction	Example: Set reg 0x0170 = 0C50
1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR (0x0D).	Write register 0x0D to value 0x001F
2. Write the desired register address to register ADDAR (0x0E).	Write register 0x0E to value 0x0170
3. Write the value 0x401F (data, no post increment function field = 01, DEVAD = 31) to register REGCR.	Write register 0x0D to value 0x401F
4. Write the content of the desired extended register set register to register ADDAR.	Write register 0x0E to value 0x0C50

Subsequent writes to register ADDAR (step 4) continue to rewrite the register selected by the value in the address register.

Note

Steps (1) and (2) can be skipped if the address register is previously configured.

7.4.13.4 Read Operation (No Post Increment)

To read a register in the extended register set:

Instruction	Example: Read 0x0170
1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.	Write register 0x0D to value 0x001F
2. Write the desired register address to register ADDAR.	Write register 0x0E to value 0x0170
3. Write the value 0x401F (data, no post increment function field = 01, DEVAD = 31) to register REGCR.	Write register 0x0D to value 0x401F
4. Read the content of the desired extended register set register to register ADDAR.	Read register 0x0E

Subsequent reads from register ADDAR (step 4) continue reading the register selected by the value in the address register.

Note

Steps (1) and (2) can be skipped if the address register is previously configured.

7.4.13.5 Write Operation (Post Increment)

To write a register in the extended register set and automatically increment the address register to the next higher value following the write operation:

Instruction	Example: Set reg 0x0170 = 0xC50 & reg 0x0171 = 0x0011
1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.	Write register 0x0D to value 0x001F
2. Write the register address from register ADDAR.	Write register 0x0E to value 0x0170
3. Write the value 0x801F (data, post increment on reads and writes function field = 10, DEVAD = 31) or the value 0xC01F (data, post increment on writes function field = 11, DEVAD = 31) to register REGCR.	Write register 0x0D to value 0x801F
4. Write the content of the desired extended register set register to register ADDAR.	Write register 0x0E to value 0x0C50
5. Subsequent writes to register ADDAR (step 4) writes the next higher addressed data register selected by the value of the address register; the address register is incremented after each access.	Write register 0x0E to value 0x0011

Step 4 Writes register 0x0170 to 0x0C50 and because post increment is enabled, Step 5 writes register 0x0171 to 0x0011.

7.4.13.6 Read Operation (Post Increment)

To read a register in the extended register set and automatically increment the address register to the next higher value following the read operation:

Instruction	Example: Read register 0x0170 & 0x0171
1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.	Write register 0x0D to value 0x001F

Instruction	Example: Read register 0x0170 & 0x0171
2. Write the desired register address to register ADDAR.	Write register 0x0E to value 0x0170
3. Write the value 0x801F (data, post increment on reads and writes function field = 10, DEVAD = 31) to register REGCR.	Write register 0x0D to value 0x801F
4. Read the content of the desired extended register set register to register ADDAR.	Read register 0x0E
5. Subsequent reads to register ADDAR (step 4) reads the next higher addressed data register selected by the value of the address register; the address register is incremented after each access.	Read register 0x0E

Step 4 Reads register 0x0170 and because post increment is enabled, Step 5 reads register 0x0171.

7.5 Programming

7.5.1 Strap Configuration

The DP83TC812S-Q1 uses functional pins as strap options to place the device into specific modes of operation. The values of these pins are sampled at power up and hardware reset (through either the $\overline{\text{RESET}}$ pin or register access). Some strap pins support 3 levels and some strap pins support 2 levels, which are described in greater detail below. PHY address straps, RX_DV/RX_CTRL and RX_ER, are 3-level straps while all other straps are two levels. Configuration of the device can be done through strapping or through serial management interface.

Note

Because strap pins are functional pins after reset is deasserted, strap pins must not be connected directly to VDDIO or VDDMAC or GND. Either pullup resistors, pulldown resistors, or both are required for proper operation.

Note

When using VDDMAC and VDDIO separately, connect strap resistors to the correct voltage rail. The voltage domain of each pin is listed in [Table 7-20](#).

Figure 7-18. Strap Circuit

R_{pullDn} value is included in the Electrical Characteristics table of the datasheet.

Table 7-18. Recommended 3-Level Strap Resistor Ratios for PHY Address

Table 7-20. Bootstraps (continued)

PIN NAME	PIN NO.	DOMAIN	DEFAULT MODE	STRAP FUNCTION			DESCRIPTION
				MODE	AUTO		
LED_1	6	VDDIO	1	1	0		AUTO: Autonomous Disable This is the default strap pin for controlling AUTO feature. If this pin is configured as CLKOUT, the AUTO feature moves to pin 16.
				2	1		

Note

Refer to the [DP83TC812, DP83TC813, and DP83TC814: Configuring for Open Alliance Specification Compliance](#) application note for more information about the register settings used for compliance testing. Use these register settings to achieve the same performance as observed during compliance testing. Managed mode strap option is recommended to prevent the link up process from initiating while the software configuration from the aforementioned application note being executed. Once the software configuration is complete, remove the PHY from Managed mode by setting bit 0x018B[6] to '1'. This bit is auto-cleared after link up

RX_D3 strap pin has a special functionality of controlling the output status of CLKOUT (pin 16) and LED_1 (pin 6). The [Table 7-21](#) table below shows how pin 16 and pin 6 is affected by RX_D3 strap status. Note that RX_D3 option only changes the pin functionality but not the voltage domains. Pin 16 is always in VDDMAC domain and Pin 6 is always in VDDIO domain. If VDDIO and VDDMAC are at separate voltage levels, VDDIO and VDDMAC must be verified that pin 16 and pin 6 are strapped to the respective voltage domains.

In clock output daisy chain applications, if VDDMAC and VDDIO are at different voltages then clock output must route to pin 6. Internal oscillator of the DP83TC812 operates in the VDDIO domain, so clock output must also be used on the pin in VDDIO domain, such as pin 6. In clock output daisy-chain applications where VDDMAC and VDDIO are same, ignore this requirement. Ignore this requirement in applications where clock output is unused.

Table 7-21. Clock Output Pin Selection

CLKOUT_PIN	DESCRIPTION
0	Pin 16 is Clock output, Pin 6 is LED_1 pin. AUTO is controlled by straps on pin 6.
1	Pin 6 is Clock output, Pin 16 is LED_1 pin. AUTO is controlled by straps on pin 16.

AUTO	DESCRIPTION
0	Autonomous Mode, PHY able to establish link after power-up
1	Managed Mode, PHY must be allowed to establish link after power-up based on register write

Table 7-24. MAC Interface Selection Bootstraps

MAC[2]	MAC[1]	MAC[0]	DESCRIPTION
0	0	0	SGMII (4-wire) ⁽¹⁾
0	0	1	MII
0	1	0	RMII Follower
0	1	1	RMII Leader
1	0	0	RGMII (Align Mode)

Table 7-24. MAC Interface Selection Bootstraps (continued)

MAC[2]	MAC[1]	MAC[0]	DESCRIPTION
1	0	1	RGMII (TX Internal Delay Mode)
1	1	0	RGMII (TX and RX Internal Delay Mode)
1	1	1	RGMII (RX Internal Delay Mode)

(1) SGMII strap mode is only available on 'S' type device variant. For 'R' type device variant, this strap mode is RESERVED

Table 7-25. PHY Address Bootstraps

PHY_AD[3:0]	RX_CTRL STRAP MODE	RX_ER STRAP MODE	DESCRIPTION Section 7.5.1
0000	1	1	PHY Address: 0b000000 (0x0)
0001	-	-	NA
0010	-	-	NA
0011	-	-	NA
0100	2	1	PHY Address: 0b001000 (0x4)
0101	3	1	PHY Address: 0b001010 (0x5)
0110	-	-	NA
0111	-	-	NA
1000	1	2	PHY Address: 0b010000 (0x8)
1001	-	-	NA
1010	1	3	PHY Address: 0b010100 (0xA)
1011	-	-	NA
1100	2	2	PHY Address: 0b011000 (0xC)
1101	3	2	PHY Address: 0b011010 (0xD)
1110	2	3	PHY Address: 0b011100 (0xE)
1111	3	3	PHY Address: 0b011110 (0xF)

7.5.2 LED Configuration

The DP83TC812S-Q1 supports up to three configurable Light Emitting Diode (LED) pins: LED_0, LED_1, and LED_2 (CLKOUT). Several functions can be multiplexed onto the LEDs for different modes of operation. LED operations are selected using register 0x0450. By default, Pin 14 of the DP83TC813 outputs the CLKOUT signal. To instead have the LED1 signal on Pin 14, write the following registers:

Write register 0x045F = 0x000F

Write register 0x0452 = 0x0000

Write register 0x0451 = 0x0009

Because the LED output pins are also used as strap pins, external components required for strapping and the user must consider the LED usage to avoid contention. Specifically, when the LED outputs are used to drive LEDs directly, the active state of each output driver is dependent on the logic level sampled by the corresponding input upon power up or hardware reset.

[Figure 7-19](#) shows the two proper ways of connecting LEDs directly to the DP83TC812S-Q1

Figure 7-19. Example Strap Connections

7.5.3 PHY Address Configuration

The DP83TC812S-Q1 can be set to respond to any of nine possible PHY addresses through bootstrap pins. The PHY address latches into the device upon power-up or hardware reset. Each PHY on the serial management bus in the system must have a unique PHY address.

By default, DP83TC812S-Q1 latches to a PHY address of 0 (<0b00000>). Change this address by adding pullup resistors to bootstrap pins found in [Section 7.5.3](#).

8 Register Maps

8.1 Register Access Summary

There are two different methods for accessing registers within the field. Direct register access method is only allowed for the first 31 registers (0x0 through 0x1F). Registers beyond 0x1F must be accessed by use of the Indirect Method (Extended Register Space) described in [Section 7.4.13.2](#).

Table 8-1. MMD Register Space Division

MMD REGISTER SPACE	REGISTER ADDRESS RANGE
MMD1F	0x0000 - 0x0FFF
MMD1	0x1000 - 0x1FFF
MMD3	0x3000 - 0x3FFF

Note

For MMD1 and MMD3, the most significant nibble of the register address is used to denote the respective MMD space. This nibble must be ignored during actual register access operation. For example, to access register 0x1836, use 0x1 as the MMD indicator and 0x0836 as the register address.

Table 8-2. Register Access Summary

REGISTER FIELD	REGISTER ACCESS METHODS
0x0 through 0x1F	Direct Access
	Indirect Access, MMD1F = '11111' Example: to read register 0x17 in MMD1F field with no post increment Step 1) write 0x1F to register 0xD Step 2) write 0x17 to register 0xE Step 3) write 0x401F to register 0xD Step 4) read register 0xE
MMD1F Field 0x20 - 0xFFFF	Indirect Access, MMD1F = '11111' Example: to read register 0x462 in MMD1F field with no post increment Step 1) write 0x1F to register 0xD Step 2) write 0x462 to register 0xE Step 3) write 0x401F to register 0xD Step 4) read register 0xE
MMD1 Field 0x0 - 0xFFFF	Indirect Access, MMD1 = '00001' Example: to read register 0x7 in MMD1 field (register 0x1007) with no post increment Step 1) write 0x1 to register 0xD Step 2) write 0x7 to register 0xE Step 3) write 0x4001 to register 0xD Step 4) read register 0xE

8.2 DP83TC812 Registers

Table 8-3 lists the memory-mapped registers for the DP83TC812 registers. All register offset addresses not listed in **Table 8-3** should be considered as reserved locations and the register contents should not be modified.

Table 8-3. DP83TC812 Registers

Offset	Acronym	Register Name	Section

Complex bit access types are encoded to fit into small table cells. [Table 8-4](#) shows the codes that are used for access types in this section.

Table 8-4. DP83TC812 Access Type Codes

Access Type	Code	Description
Read Type		
H	H	Set or cleared by hardware
R	R	Read
RC	R C	Read to Clear
RH	R H	Read Set or cleared by hardware
Write Type		
W	W	Write
W0S	W 0S	Write 0 to set
W1S	W 1S	Write 1 to set
WSC	W	Write
Reset or Default Value		
-n		Value after reset or the default value

8.2.1 BMCR Register (Offset = 0h) [Reset = 2100h]

BMCR is shown in [Table 8-5](#).

Return to the [Summary Table](#).

Table 8-5. BMCR Register Field Descriptions

Bit	Field	Type	Reset	Description
15	MII Reset	RH/W1S	0h	This bit is auto-cleared 0h = No reset 1h = Digital in reset and all MII registers (0x0 - 0xF) reset to default
14	xMII Loopback	R/W	0h	1b = Enable MII loopback 0b = Disable MII loopback When xMII loopback mode is activated, the transmitted data presented on xMII TXD is looped back to xMII RXD internally. There is no LINK indication generated when xMII loopback is enabled.
13	Speed Select	R	1h	Speed Selection: Always 100-Mbps Speed
12	Auto-Negotiation Enable	R	0h	Auto-Negotiation: Not supported on this device
11	Power Down	R/W	0h	This bit can be programmed to enter and exit IEEE power down mode This bit provide status when using INT_N as power down pin 0h = Normal Mode 1h = IEEE Power Down
10	Isolate	R/W	0h	Isolate: Isolates the port from the xMII with the exception of the serial management interface 0h = Normal Mode 1h = Enable Isolate Mode
9	RESERVED	R	0h	Reserved
8	Duplex Mode	R	1h	0h = Half duplex 1h = Full Duplex
7	RESERVED	R	0h	Reserved
6-0	RESERVED	R	0h	Reserved

8.2.2 BMSR Register (Offset = 1h) [Reset = 0061h]

BMSR is shown in [Table 8-6](#).

Return to the [Summary Table](#).

Table 8-6. BMSR Register Field Descriptions

Bit	Field	Type	Reset	Description
15	100Base-T4	R	0h	Always 0 - PHY not able to perform 100Base-T4
14	100Base-X Full Duplex	R	0h	0h = PHY not able to perform full duplex 100Base-X 1h = PHY able to perform full duplex 100Base-X
13	100Base-X Half Duplex	R	0h	0h = PHY not able to perform half duplex 100Base-X 1h = PHY able to perform half duplex 100Base-X
12	10 Mbps Full Duplex	R	0h	0h = PHY not able to operate at 10Mbps in full duplex 1h = PHY able to operate at 10Mbps in full duplex
11	10 Mbps Half Duplex	R	0h	0h = PHY not able to operate at 10Mbps in half duplex 1h = PHY able to operate at 10Mbps in half duplex
10-7	RESERVED	R	0h	Reserved
6	MF Preamble Suppression	R	1h	0h = PHY will not accept management frames with preamble suppressed 1h = PHY will accept management frames with preamble suppressed
5	Auto-Negotiation Complete	R	1h	0h = Auto Negotiation process not completed (either still in process, disabled or reset) 1h = Auto-Negotiation process completed
4	Remote fault	H	0h	0h = No remote fault condition detected 1h = Remote fault condition detected
3	Auto-Negotiation Ability	R	0h	0h = PHY is not able to perform Auto-Negotiation 1h = PHY is able to perform Auto-Negotiation
2	Link Status (Latch Low)	0h	0h = Link is down atleast once 1h = Link is up	0h = No jabber condition detected 1h = Jabber condition detected
1	Jabber Detect	H	0h	
0	Extended Capability	R	1h	0h = Basic register set capabilities only 1h = Extended register capabilities

8.2.3 PHYIDR1 Register (Offset = 2h) [Reset = 2000h]

PHYIDR1 is shown in [Table 8-7](#).

Return to the [Summary Table](#).

Table 8-7. PHYIDR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	Organizationally Unique Identifier 1	R	2000h	Unique Identifier for the part

8.2.4 PHYIDR2 Register (Offset = 3h) [Reset = A271h]

PHYIDR2 is shown in [Table 8-8](#).

Return to the [Summary Table](#).

Table 8-8. PHYIDR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-10	Organizationally Unique Identifier 2	R	28h	Unique Identifier for the part
9-4	Model Number	R	27h	Unique Identifier for the part
3-0	Revision Number	R	1h	Unique Identifier for the part 0h = Silicon Rev 1.0 1h = Silicon Rev 2.0

8.2.5 PHYSTS Register (Offset = 10h) [Reset = 0004h]

PHYSTS is shown in [Table 8-9](#).

Return to the [Summary Table](#).

Table 8-9. PHYSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0h	Reserved
14	RESERVED	R	0h	Reserved
13	receive_error_latch	H	0h	Receiver error counter since last read. Clears on read
12	RESERVED	R	0h	Reserved
11	RESERVED	R	0h	Reserved
10	Signal Detect	R/W0S	0h	Channel ok latch low 0h = Channel ok had been reset 1h = Channel ok is set
9	Descrambler Lock Status (Latch Low)	R/W0S	0h	Descrambler lock latch low 0h = Descrambler is unlocked at least once 1h = Descrambler is locked
8	RESERVED	R	0h	Reserved
7	Interrupt Pin Status	H	0h	Interrupts pin status, cleared on reading 0x12 0h = Interrupt pin set 1h = Interrupt pin not set
6	RESERVED	R	0h	Reserved
5	jabber_dtct	R	0h	duplicate from reg.0x1.1
4	RESERVED	R	0h	Reserved
3	MII Loopback Status	R	0h	MII loopback status 0h = No MII loopback 1h = MII loopback
2	Duplex Mode Status	R	1h	Duplex mode status 0h = Half duplex 1h = Full duplex
1	RESERVED	R	0h	Reserved
0	RESERVED	R	0h	Reserved

8.2.6 PHYSCR Register (Offset = 11h) [Reset = 010Bh]

PHYSCR is shown in [Table 8-10](#).

Return to the [Summary Table](#).

Table 8-10. PHYSCR Register Field Descriptions

Bit	Field	Type	Reset	Description
15	Disable CLK125	R/W	0h	1h = Disable CLK125 (Sourced by the CLK125 port)
14	Power Save Mode Enable	R/W	0h	Enable power save mode configuration from register
13-12	Power Save Mode	R/W	0h	0h = Normal mode 1h = IEEE mode: power down all digital and analog blocks, if bit [11] set to zero, PLL is also powered down 0b10 = Reserved 0b11 = Reserved
11	SGMII Soft Reset	R/WSC	0h	SGMII Digital Reset This bit is auto-cleared
10	MAC Isolate for PHY_ADDR 0x00	R/W	0h	MAC Isolate is enabled only if PHY address is 0x00 Reg0x0[10] works for all PHY addresses including 0x00 0h = Normal mode 1h = Isolate mode (No output from PHY to MAC)
9-8	RMII TX FIFO Depth	R/W	1h	0h = 4 nibbles 1h = 5 nibbles 2h = 6 nibbles
7	RESERVED	R	0h	Reserved
6-4	RESERVED	R	0h	Reserved
3	Interrupt Polarity	R/W	1h	0h = Active high 1h = Active low
2	Force Interrupt	R/W	0h	1h = Force interrupt pin
1	Interrupts Enable	R/W	1h	0h = Disable interrupts 1h = Enable interrupts
0	Interrupt Pin Configuration	R/W	1h	0h = Configure INT_N pin as power down input pin 1h = Configure INT_N pin is as interrupt output pin

8.2.7 MISR1 Register (Offset = 12h) [Reset = 0000h]

MISR1 is shown in [Table 8-11](#).

Return to the [Summary Table](#).

Table 8-11. MISR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0h	Reserved
14	Energy Detect Change Status	H	0h	Status is changed to 1 when there is a change of MDI Energy detection output Status is cleared on read of this register
13	Link Status Change Status	H	0h	Status is changed to 1 when there is a change of link status Status is cleared on read of this register
12	Wake on LAN Status	H	0h	Status is changed to 1 when WOL is received Status is cleared on read of this register
11	ESD Fault Detected Status	H	0h	Status is changed to 1 when ESD fault is detected Status is cleared on read of this register
10	Training Done Status	H	0h	Status is changed to 1 when training is done Status is cleared on read of this register
9	False Carrier Counter Half Full Status	H	0h	Status is changed to 1 when false carrier counter is half full Status is cleared on read of this register
8	RX Error Counter Half Full Status	H	0h	Status is changed to 1 when RX Error Counter in 0x15 is half full Status is cleared on read of this register
7	Link Quality Change Indication	R/W	0h	Enable Interrupt on Link Quality status. 0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
6	Energy Detect Change Indication	R/W	0h	Enable Interrupt on change of Energy Detect histr. Status 0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
5	Link Status Change Indication	R/W	0h	Enable Interrupt on change of link status 0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
4	Wake on LAN Indication	R/W	0h	Enable Interrupt on WoL detection 0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
3	ESD Fault Detected Indication	R/W	0h	Enable Interrupt on ESD detect event 0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
2	Link Training Completed Indication	R/W	0h	Enable Interrupt on M/S Link Training Completed event 0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
1	False Carrier Counter Half Full Indication	R/W	0h	Enable Interrupt on False Carrier Counter Register half-full event 0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
0	RX Error Counter Half Full Indication	R/W	0h	Enable Interrupt on Receive Error Counter Register half-full event 0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set

8.2.8 MISR2 Register (Offset = 13h) [Reset = 0000h]

MISR2 is shown in [Table 8-12](#).

Return to the [Summary Table](#).

Table 8-12. MISR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	Under Voltage Status	H	0h	Status is changed to 1 when Under Voltage is detected Status is cleared on read of this register
14	Over Voltage Status	H	0h	Status is changed to 1 when Over Voltage is detected Status is cleared on read of this register
13	RESERVED	R	0h	Reserved
12	RESERVED	R	0h	Reserved
11	RESERVED	R	0h	Reserved
10	Sleep Mode Status	H	0h	Status is changed to 1 when sleep mode has changed Status is cleared on read of this register
9	Data Polarity Change Status	H	0h	Status is changed to 1 when MDI lines polarity change is detected Status is cleared on read of this register
8	Jabber Detect Status	H	0h	Status is changed to 1 when jabber is detected Status is cleared on read of this register
7	Under Voltage Indication	R/W	0h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
6	Over Voltage Indication	R/W	0h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
5	RESERVED	R	0h	Reserved
4	RESERVED	R	0h	Reserved
3	RESERVED	R	0h	Reserved
2	RESERVED	R	0h	Reserved
1	Data Polarity Change Indication	R/W	0h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
0	Jabber Detect Indication	R/W	0h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set

8.2.9 RECR Register (Offset = 15h) [Reset = 0000h]

RECR is shown in [Table 8-13](#).

Return to the [Summary Table](#).

Table 8-13. RECR Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	RX Error Count	RC	0h	RX_ER Counter: When a valid carrier is presented (only while RX_DV is set), and there is at least one occurrence of an invalid data symbol, this 16-bit counter increments for each receive error detected. The RX_ER counter does not count in xMII loopback mode. The counter stops when at the maximum count (0xFFFF). When the counter exceeds half-full (0x7FFF), an interrupt is generated. This register is cleared on read.

8.2.10 BISCR Register (Offset = 16h) [Reset = 0100h]

BISCR is shown in [Table 8-14](#).

Return to the [Summary Table](#).

Table 8-14. BISCR Register Field Descriptions

Bit	Field	Type	Reset	Description
15-11	RESERVED	R	0h	Reserved
10	PRBS Lock Lost Latch Status	H	0h	
9	RESERVED	R	0h	Reserved
8	Core Power Mode	R	1h	0h = Core is in power down or sleep mode 1h = Core is in normal power mode
7	RESERVED	R	0h	Reserved
6	Data Transmission to MDI in xMII Loopback	R/W	0h	Transmit data control during xMII Loopback 0h = Suppress data during xMII loopback 1h = Transmit data on MDI during xMII loopback
5-2	Loopback Mode	R/W	0h	Enable Loopbacks other than PCS loopback. 0x16[1] must be 0 1h = Digital Loopback 2h = Analog Loopback 4h = Reverse Loopback 8h = External Loopback
1	PCS Loopback Enable	R/W	0h	0h = Disable PCS Loopback 1h = Enable PCS Loopback
0	RESERVED	R	0h	Reserved

8.2.11 MISR3 Register (Offset = 18h) [Reset = 00X5h]

MISR3 is shown in [Table 8-15](#).

Return to the [Summary Table](#).

Table 8-15. MISR3 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0h	Reserved
14	No Link Status	H	0h	Status is changed to 1 when Link has not been observed within time programmed in 0x563 after training starts Status is cleared on read of this register
13	Sleep Fail Status	H	0h	Status is changed to 1 when Sleep Negotiation Fails Status is cleared on read of this register
12	Power-On Reset Done Status	H	0h	Status is changed to 1 Power-On Reset is done after the the supplies are up Status is cleared on read of this register
11	No Frame Status	H	0h	Status is changed to 1 when No frame is detected until Status is cleared on read of this register
10	WUR Received Status	H	0h	Status is changed to 1 when WUR command is received from link partner Status is cleared on read of this register
9	Remote Wake-up Status	H	0h	Status is 1 after power-up if device is woken-up remotely Status is cleared on read of this register
8	LPS Received Status	H	0h	Status is changed to 1 when LPS command is received from link partner Status is cleared on read of this register
7	RESERVED	R	0h	Reserved
6	No Link Indication	R/W	0h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
5	Sleep Fail Indication	R/W	1h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
4	Power-On Reset Done Indication	R/W	0h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
3	No Frame Indication	R/W	0h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
2	WUR Received Indication	R/W	1h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
1	Remote Wake-up Indication	R/W	0h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set
0	LPS Received Indication	R/W	1h	0h = Indication is disabled 1h = Enable indication on INT_N pin if corresponding Interrupt Status is set

8.2.12 REG_19 Register (Offset = 19h) [Reset = 0800h]

REG_19 is shown in [Table 8-16](#).

Return to the [Summary Table](#).

Table 8-16. REG_19 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	RESERVED	R	0h	Reserved
13	RESERVED	R	0h	Reserved
12	RESERVED	R	0h	Reserved
11	RESERVED	R	0h	Reserved
10	DSP Energy Detect	R	0h	DSP energy detected status
9-5	RESERVED	R	0h	Reserved
4-0	PHY Address	R	0h	PHY Address latched from straps

8.2.13 TC10 Abort Register (Offset = 1Bh) [Reset = 0000h]

TC10 Abort Register is shown in [Table 8-17](#).

Return to the [Summary Table](#).

Table 8-17. TC10 Abort Register Field Descriptions

Bit	Field	Type	Reset	Description
15-2	RESERVED	R	0h	Reserved
1	Sleep Abort through GPIO	R/W	0h	Enables aborting TC10 using GPIO. One of CLKOUT/LED_1 pins which is being used as an LED can be used to abort 0h = Disable TC10 abort using GPIO 1h = Enable TC10 abort using GPIO
0	Sleep Abort	R/W	0h	loc_sleep_abprt as defined by TC10 standard. Aborts sleep negotiation while in SLEEP_ACK state 0h = Allow TC10 sleep negotiation 1h = Abort TC10 sleep negotiation

8.2.14 CDCR Register (Offset = 1Eh) [Reset = 0000h]

CDCR is shown in [Table 8-18](#).

Return to the [Summary Table](#).

Table 8-18. CDCR Register Field Descriptions

Bit	Field	Type	Reset	Description
15	TDR Start	RH/W1S	0h	Bit is cleared after TDR run is complete 1h = Start TDR
14	TDR Auto-Run Enable	R/W	0h	0h = Start TDR manually using 0x1E[15] 1h = Start TDR automatically on link down
13-2	RESERVED	R	0h	Reserved
1	TDR Done Status	R	0h	0h = TDR on-going or not initiated 1h = TDR done
0	TDR Fail Status	R	0h	0h = TDR ran successfully 1h = TDR run failed

8.2.15 PHYRCR Register (Offset = 1Fh) [Reset = 0000h]

PHYRCR is shown in [Table 8-19](#).

Return to the [Summary Table](#).

Table 8-19. PHYRCR Register Field Descriptions

Bit	Field	Type	Reset	Description
15	Hard Reset	RH/W1S	0h	Hardware Reset (Reset digital + register file) This bet is self clearing 0h = Normal Operation 1h = Resets PHY and clears registers. Does not resample the straps.
14	Soft Reset	RH/W1S	0h	0h = Normal Operation 1h = Restart PHY. Resets PHY but does not clear registers. Does not resample the straps. This bit is self cleared.
13	RESERVED	R	0h	Reserved
12-8	RESERVED	R	0h	Reserved
7	Standby Mode	R/W	0h	0h = Normal operation 1h = Standby mode enabled
6	RESERVED	R	0h	Reserved
5	RESERVED	R	0h	Reserved
4-0	RESERVED	R	0h	Reserved

8.2.16 Register_133 (Offset = 133h) [Reset = 0000h]

Register_133 is shown in [Table 8-20](#).

Return to the [Summary Table](#).

Table 8-20. Register_133 Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0h	Reserved
14	Link Up Status	R	0h	Link Up status as defined by C&S
13	PHY Control In Send Data Mode	R	0h	PHY Control In Send Data Status
12	Link Status	R	0h	Link status set by link monitor
11-8	RESERVED	R	0h	Reserved
7	RESERVED	R	0h	Reserved
6	RESERVED	R	0h	Reserved
5	RESERVED	R	0h	Reserved
4	RESERVED	R	0h	Reserved
3	RESERVED	R	0h	Reserved
2	Descrambler Lock Status	R	0h	Status of descrambler 0h = Scrambler Not Locked 1h = Scrambler Locked
1	Local Receiver Status	R	0h	Local receiver status 0h = Local PHY received link invalid 1h = Local PHY received link valid
0	Remote Receiver Status	R	0h	Remote receiver status 0h = Remote PHY received link invalid 1h = Remote PHY received link valid

8.2.17 Register_17F (Offset = 17Fh) [Reset = 4028h]

Register_17F is shown in [Table 8-21](#).

Return to the [Summary Table](#).

Table 8-21. Register_17F Field Descriptions

Bit	Field	Type	Reset	Description
15	WUR from WAKE pin	R/W	0h	Enable WUR transmission when a pulse is transmitted on WAKE pin Threshold of WAKE pulse width can be configured through 0x17F[7:0] 1h = Enable sending WUR
14	WUP Enable	R/W	1h	Enable WUP transmission after local wake This option can be effectively used when PHY powers-up in Standby mode through strap 0h = WUP transmission is disabled 1h = WUP transmission is enabled
13-8	RESERVED	R	0h	Reserved
7-0	Wake Pulse Threshold	R/W	28h	Width of WAKE pulse in microseconds required to initiate WUR during an active link

8.2.18 Register_180 (Offset = 180h) [Reset = 0000h]

Register_180 is shown in [Table 8-22](#).

Return to the [Summary Table](#).

Table 8-22. Register_180 Field Descriptions

Bit	Field	Type	Reset	Description
15-5	RESERVED	R	0h	Reserved
4-3	Sleep Request Timer Configuration	R/W	0h	0h = 16ms 1h = 4ms 2h = 32ms 3h = 40ms
2	RESERVED	R	0h	Reserved
1-0	Sleep Acknowledge Timer Configuration	R/W	0h	0h = 8ms 1h = 6ms 2h = 24ms 3h = 32ms

8.2.19 Register_181 (Offset = 181h) [Reset = 0000h]

Register_181 is shown in [Table 8-23](#).

Return to the [Summary Table](#).

Table 8-23. Register_181 Field Descriptions

Bit	Field	Type	Reset	Description
15-10	RESERVED	R	0h	Reserved
9-0	RX LPS Count	R	0h	Indicates number of LPS codes received

8.2.20 Register_182 (Offset = 182h) [Reset = 0000h]

Register_182 is shown in [Table 8-24](#).

Return to the [Summary Table](#).

Table 8-24. Register_182 Field Descriptions

Bit	Field	Type	Reset	Description
15-10	RESERVED	R	0h	Reserved
9-0	RX WUR Count	R	0h	Indicates number of WUR codes received

8.2.21 LPS_CFG4 Register (Offset = 183h) [Reset = 0000h]

LPS_CFG4 is shown in [Table 8-25](#).

Return to the [Summary Table](#).

Table 8-25. LPS_CFG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	Send WUP in Disable Transmit State	R/W	0h	Write 1 to this bit to send WUP when PHY control is in DISABLE_TRANSMIT state
14	Force LPS Sleep Enable	R/W	0h	Force control enable for sleep from LPS SM to PHY control SM
13	Force LPS Sleep	R/W	0h	Force value for sleep from LPS SM to PHY control SM
12	Force Enable for TX LPS	R/W	0h	Force enable for TX_LPS
11	Force TX LPS	R/W	0h	Force value for TX_LPS
10	Force LPS Link Control Enable	R/W	0h	Force link control enable to LPS state machine
9	Force LPS Link Control	R/W	0h	Force link control value from LPS state machine
8	Force LPS State Machine Enable	R/W	0h	Force enable for LPS state machine
7	RESERVED	R	0h	Reserved
6-0	Force LPS State Machine Value	R/W	0h	Force value of LPS state machine

8.2.22 LPS_CFG Register (Offset = 184h) [Reset = 0223h]

LPS_CFG is shown in [Table 8-26](#).

Return to the [Summary Table](#).

Table 8-26. LPS_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
15	cfg_reset_wur_cnt_rx_data	R/W	0h	When set, resets the WUR received symbol counter upon receiving data
14-13	RESERVED	R	0h	Reserved
12	cfg_reset_lps_cnt_rx_data	R/W	0h	When set, resets the LPS received symbol counter upon receiving data
11-10	RESERVED	R	0h	Reserved
9	cfg_reset_wur_cnt_tx_data	R/W	1h	When set, resets the transmitted WUR symbols count when sending data
8-7	RESERVED	R	0h	Reserved
6	cfg_reset_lps_cnt_tx_data	R/W	0h	When set, resets the transmitted LPS symbols count when sending data
5	cfg_wake_fwd_en_wup_psv_link	R/W	1h	Control to enable/disable Wake forwarding on WAKE pin when WUP is received when in PASSIVE_LINK mode 0h = Disables wake forwarding 1h = Enables wake forwarding
4	Wake Forward Force	R/W	0h	1b = Force pulse on WAKE pin Pulse Width is configurable by bits [3:2] The bit is self-cleared
3-2	Wake Forward Pulse Width	R/W	0h	Configures the pulse width on WAKE pin for wake-forwarding 00b: 50µs 01b: 500µs 10b: 2ms 11b: 20ms
1	Wake Forward Enable	R/W	1h	Enable Wake Forwarding on WAKE pin on reception of WUR Command 0h = Enable Wake forwarding 1h = Disable Wake forwarding
0	cfg_wake_fwd_en_wup	R/W	1h	If set, enables doing wake forwarding when WUP symbols are received 0h = Do not do wake forwarding on WAKE pin 1h = Do wake forwarding on WAKE pin

8.2.23 LPS_CFG5 Register (Offset = 185h) [Reset = 0000h]

LPS_CFG5 is shown in [Table 8-27](#).

Return to the [Summary Table](#).

Table 8-27. LPS_CFG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-13	WUP Timer	R/W	0h	Time for which PHY control SM stays in WAKE_TRANSMIT 0h = 1ms 1h = 0.7ms 2h = 1.3ms 3h = 0.85ms 4h = 1.5ms 5h = 2ms 6h = 2.5ms 7h = 3ms
12-4	RESERVED	R	0h	Reserved
3-2	WUR Symbol Gap	R/W	0h	Max gap allowed between two WUR symbols for acknowledgement of WUR
1-0	LPS Symbol Gap	R/W	0h	Max gap allowed between two LPS symbols for acknowledgement of LPS

8.2.24 LPS_CFG7 Register (Offset = 187h) [Reset = 0000h]

LPS_CFG7 is shown in [Table 8-28](#).

Return to the [Summary Table](#).

Table 8-28. LPS_CFG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	LPS Stop at Limit	R/W	0h	Configures the device to stop sending LPS codes once done sending the number of codes configured in 0x1879:0 0h = Continues even after reaching limit 1h = Stops after reaching limit
14-8	RESERVED	R	0h	Reserved
9-0	LPS Limit Select	R/W	0h	Indicates number of LPS symbols to be transmitted before tx_lps_done becomes true

8.2.25 LPS_CFG8 Register (Offset = 188h) [Reset = 0080h]

LPS_CFG8 is shown in [Table 8-29](#).

Return to the [Summary Table](#).

Table 8-29. LPS_CFG8 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-10	RESERVED	R	0h	Reserved
9-0	WUR Symbol Number	R/W	80h	Indicates number of WUR symbols to be transmitted

8.2.26 LPS_CFG9 Register (Offset = 189h) [Reset = 0040h]

LPS_CFG9 is shown in [Table 8-30](#).

Return to the [Summary Table](#).

Table 8-30. LPS_CFG9 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-10	RESERVED	R	0h	Reserved
9-0	cfg_rx_lps_sel	R/W	40h	Indicates number of LPS symbols to be received to set lps_recv

8.2.27 LPS_CFG10 Register (Offset = 18Ah) [Reset = 0040h]

LPS_CFG10 is shown in [Table 8-31](#).

Return to the [Summary Table](#).

Table 8-31. LPS_CFG10 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-10	RESERVED	R	0h	Reserved
9-0	cfg_rx_wur_sel	R/W	40h	Indicates number of WUR symbols to be received to acknowledge WUR and do wake forwarding

8.2.28 LPS_CFG2 Register (Offset = 18Bh) [Reset = 1C4Bh]

LPS_CFG2 is shown in [Table 8-32](#).

Return to the [Summary Table](#).

Table 8-32. LPS_CFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-13	RESERVED	R	0h	Reserved
12	cfg_stop_sleep_neg_on_n o_send_n	R/W	1h	If this bit is set, TC10 statemachine reverts back to NORMAL state from SLEEP_ACK or SLEEP_REQ states when Link is dropped
11	cfg_stop_sleep_neg_on_a ctivity	R/W	1h	When packets are either transmitted or received by the PHY, setting this bit Stops sleep negotiation and TC10 state machine reverts back to NORMAL state when it is in SLEEP_ACK or SLEEP_REQ state(when sleep negotiation is ongoing)
10	RESERVED	R	0h	Reserved
9	RESERVED	R	0h	Reserved
8	cfg_tc10_dis_bond_pad_b ypass	R/W	0h	TC10 Enable 0h = enables TC10 feature 1h = disables TC10 feature
7	RESERVED	R	0h	Ignore on read
6	cfg_auto_mode_en	R/W	1h	LPS autonomous mode enable if(RX_D3_strap ==1) reset_val = ~CLKOUT_strap else reset_val = ~LED_1_strap This bit is Auto-cleared after Link-Up 0h = AUTO mode disabled 1h = AUTO mode enable
5	cfg_lps_mon_en	R/W	0h	Normal to Standby Transition Enable 0h = Disable normal to standby transition on over temp/under volt 1h = Enable normal to standby transition on over temp/under volt
4	RESERVED	R	0h	Reserved
3	RESERVED	R	0h	Reserved
2	RESERVED	R	0h	Reserved
1	cfg_lps_sleep_en	R/W	1h	Enable transition to Standby mode instead of Sleep mode after successful sleep negotiation (referred to as TC10_SBY) 0h = Enter standby after negotiated LPS 1h = Enter sleep after negotiated LPS
0	RESERVED	R	0h	Reserved

8.2.29 LPS_CFG3 Register (Offset = 18Ch) [Reset = 0000h]

LPS_CFG3 is shown in [Table 8-33](#).

Return to the [Summary Table](#).

Table 8-33. LPS_CFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description

8-0	cfg_lps_pwr_mode	RH/W1S	0h	001h = Normal command 002h = Sleep request 010h = Standby command 080h = WUR command

8.2.30 LPS_STATUS Register (Offset = 18Eh) [Reset = 0000h]

LPS_STATUS is shown in [Table 8-34](#).

Return to the [Summary Table](#).

Table 8-34. LPS_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-7	RESERVED	R	0h	Reserved
6-0	status_lps_st	R	0h	LPS SM state 01h = SLEEP 02h = STANDBY 04h = NORMAL 08h = SLEEP_ACK 10h = SLEEP_REQ 20h = SLEEP_FAIL 40h = SLEEP_SILENT 41h = PASSIVE_LINK

8.2.31 TDR_TX_CFG Register (Offset = 300h) [Reset = 2710h]

TDR_TX_CFG is shown in [Table 8-35](#).

Return to the [Summary Table](#).

Table 8-35. TDR_TX_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	cfg_tdr_tx_duration	R/W	2710h	TDR transmit duration in usec, Default : 10000usec

8.2.32 TAP_PROCESS_CFG Register (Offset = 301h) [Reset = 1703h]

TAP_PROCESS_CFG is shown in [Table 8-36](#).

Return to the [Summary Table](#).

Table 8-36. TAP_PROCESS_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
15-13	RESERVED	R	0h	Reserved
12-8	cfg_end_tap_index	R/W	17h	End echo coefficient index for peak detect sweep during TDR
7-5	RESERVED	R	0h	Reserved
4-0	cfg_start_tap_index	R/W	3h	Starting echo coefficient index for peak detect sweep during TDR

8.2.33 TDR_CFG1 Register (Offset = 302h) [Reset = 0045h]

TDR_CFG1 is shown in [Table 8-37](#).

Return to the [Summary Table](#).

Table 8-37. TDR_CFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	RESERVED	R	0h	Reserved
7-4	cfg_forward_shadow	R/W	4h	Num of neighboring echo coeff taps to be considered for calculating local maximum
3-2	cfg_post_silence_time	R/W	1h	Post-Silence state timer in ms 0x00 : 0ms 0x01 : 10ms 0x10 : 100ms 0x11 : 1000ms
1-0	cfg_pre_silence_time	R/W	1h	Pre-Silence state timer in ms 0x00 : 0ms 0x01 : 10ms 0x10 : 100ms 0x11 : 1000ms

8.2.34 TDR_CFG2 Register (Offset = 303h) [Reset = 0419h]

TDR_CFG2 is shown in [Table 8-38](#).

Return to the [Summary Table](#).

Table 8-38. TDR_CFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-13	RESERVED	R	0h	Reserved
12-8	cfg_tdr_filt_loc_offset	R/W	4h	tap index offset of dynamic peak equation, cfg_start_tap_index + 1'b1
7-0	cfg_tdr_filt_init	R/W	19h	Value of peak_th at x=start_tap_index of dynamic peak threshold equation

8.2.35 TDR_CFG3 Register (Offset = 304h) [Reset = 0030h]

TDR_CFG3 is shown in [Table 8-39](#).

Return to the [Summary Table](#).

Table 8-39. TDR_CFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	RESERVED	R	0h	Reserved
7-0	cfg_tdr_filt_slope	R/W	30h	Slope of dynamic peak threshold equation (0.4)

8.2.36 TDR_CFG4 Register (Offset = 305h) [Reset = 0004h]

TDR_CFG4 is shown in [Table 8-40](#).

Return to the [Summary Table](#).

Table 8-40. TDR_CFG4 Register Field Descriptions

8.2.62 SGMII_CTRL_2 Register (Offset = 60Ch) [Reset = 0024h]

SGMII_CTRL_2 is shown in [Table 8-66](#).

Return to the [Summary Table](#).

Table 8-66. SGMII_CTRL_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-9	RESERVED	R	0h	Reserved
8	sgmii_cdr_lock_force_val	R/W	0h	SGMII cdr lock force value
7	sgmii_cdr_lock_force_ctrl	R/W	0h	SGMII cdr lock force enable
6	sgmii_mr_restart_an	RH/W1S	0h	Restart sgmii autonegotiation
5-3	tx_half_full_th	R/W	4h	SGMII TX sync FIFO half full threshold
2-0	rx_half_full_th	R/W	4h	SGMII RX sync FIFO half full threshold

8.2.63 SGMII_FIFO_STATUS Register (Offset = 60Dh) [Reset = 0000h]

SGMII_FIFO_STATUS is shown in [Table 8-67](#).

Return to the [Summary Table](#).

Table 8-67. SGMII_FIFO_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-4	RESERVED	R	0h	Reserved
3	sgmii_rx_af_full_err	H	0h	SGMII RX fifo full error 0h = No error indication 1h = SGMII RX fifo full error has been indicated
2	sgmii_rx_af_empty_err	H	0h	SGMII RX fifo empty error 0h = No error indication 1h = SGMII RX fifo empty error has been indicated
1	sgmii_tx_af_full_err	H	0h	SGMII TX fifo full error 0h = No error indication 1h = SGMII TX fifo full error has been indicated
0	sgmii_tx_af_empty_err	H	0h	SGMII TX fifo empty error 0h = No error indication 1h = SGMII TX fifo empty error has been indicated

8.2.64 PRBS_STATUS_1 Register (Offset = 618h) [Reset = 0000h]

PRBS_STATUS_1 is shown in [Table 8-68](#).

Return to the [Summary Table](#).

Table 8-68. PRBS_STATUS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	RESERVED	R	0h	Reserved
7-0	prbs_err_ov_cnt	R	0h	Holds number of error counter overflow that received by the PRBS checker. Value in this register is locked when write is done to register 0x001B bit[0] or bit[1]. Counter stops on 0xFF. Note: when PRBS counters work in single mode, overflow counter is not active

8.2.65 PRBS_CTRL_1 Register (Offset = 619h) [Reset = 0574h]

PRBS_CTRL_1 is shown in [Table 8-69](#).

Return to the [Summary Table](#).

Table 8-69. PRBS_CTRL_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	RESERVED	R	0h	Reserved
13	cfg_pkt_gen_64	R/W	0h	0h = Transmit 1518 byte packets in packet generation mode 1h = Transmit 64 byte packets in packet generation mode
12	send_pkt	RH/W1S	0h	Enables generating MAC packet with fix/incremental data w CRC (pkt_gen_en has to be set and cfg_pkt_gen_prbs has to be clear) Cleared automatically when pkt_done is set
11	RESERVED	R	0h	Reserved
10-8	cfg_prbs_chk_sel	R/W	5h	000 : Checker receives from RGMII TX 001 : Checker receives from SGMII TX 010 : Checker receives from RMII RX 011 : Checker receives from MII 101 : Checker receives from Cu RX 110 : Reserved 111 : Reserved
7	RESERVED	R	0h	Reserved
6-4	cfg_prbs_gen_sel	R/W	7h	000 : PRBS transmits to RGMII RX 001 : PRBS transmits to SGMII RX 010 : PRBS transmits to RMII RX 011 : PRBS transmits to MII RX 101 : PRBS transmits to Cu TX 110 : Reserved 111 : Reserved
3	cfg_prbs_cnt_mode	R/W	0h	0h = Single mode, When one of the PRBS counters reaches max value, PRBS checker stops counting. 1h = Continuous mode, when one of the PRBS counters reaches max value, pulse is generated and counter starts counting from zero again
2	cfg_prbs_chk_enable	R/W	1h	Enable PRBS checker
1	cfg_pkt_gen_prbs	R/W	0h	If set: (1) When pkt_gen_en is set, PRBS packets are generated continuously (3) When pkt_gen_en is cleared, PRBS RX checker is still enabled If cleared: (1) When pkt_gen_en is set, non - PRBS packet is generated (3) When pkt_gen_en is cleared, PRBS RX checker is disabled as well
0	pkt_gen_en	R/W	0h	Enable/disable for prbs/packet generator 0h = Disable for prbs/packet generator 1h = Enable for prbs/packet generator

8.2.66 PRBS_CTRL_2 Register (Offset = 61Ah) [Reset = 05DCh]

PRBS_CTRL_2 is shown in [Table 8-70](#).

Return to the [Summary Table](#).

Table 8-70. PRBS_CTRL_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	Packet Length	R/W	5DCh	Sets packet length (in bytes) between the PRBS packets or nonPRBS packets generated

8.2.67 PRBS_CTRL_3 Register (Offset = 61Bh) [Reset = 007Dh]

PRBS_CTRL_3 is shown in [Table 8-71](#).

Return to the [Summary Table](#).

Table 8-71. PRBS_CTRL_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	RESERVED	R	0h	Reserved
7-0	PRBS IPG	R/W	7Dh	Sets IPG (in bytes) between the PRBS packets or non-PRBS packets generated

8.2.68 PRBS_STATUS_2 Register (Offset = 61Ch) [Reset = 0000h]

PRBS_STATUS_2 is shown in [Table 8-72](#).

Return to the [Summary Table](#).

Table 8-72. PRBS_STATUS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	PRBS Checker Byte Count	R	0h	Holds number of total bytes that received by the PRBS checker. Value in register is locked when 0x620[0] or 0x620[1] are written. When PRBS Count Mode set to zero, count stops on 0xFFFF. This counter is cleared if this counter is read after programming 0x620[1]=1.

8.2.69 PRBS_STATUS_3 Register (Offset = 61Dh) [Reset = 0000h]

PRBS_STATUS_3 is shown in [Table 8-73](#).

Return to the [Summary Table](#).

Table 8-73. PRBS_STATUS_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	PRBS Checker Packet Count-1	R	0h	Holds Bits [15:0] of number of total packets received by the PRBS checker Value in register is locked when 0x620[0] or 0x620[1] are written When PRBS Count Mode set to zero, count stops on 0xFFFFFFFF This counter is cleared if 0x61D,0x61E are read in the same order after programming 0x620[1]=1

8.2.70 PRBS_STATUS_4 Register (Offset = 61Eh) [Reset = 0000h]

PRBS_STATUS_4 is shown in [Table 8-74](#).

Return to the [Summary Table](#).

Table 8-74. PRBS_STATUS_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	PRBS Checker Packet Count-2	R	0h	Holds Bits [31:16] of number of total packets received by the PRBS checker Value in register is locked when 0x620[0] or 0x620[1] are written When PRBS Count Mode set to zero, count stops on 0xFFFFFFFF This counter is cleared if 0x61D,0x61E are read in the same order after programming 0x620[1]=1

8.2.71 PRBS_STATUS_5 Register (Offset = 620h) [Reset = 0000h]

PRBS_STATUS_5 is shown in [Table 8-75](#).

Return to the [Summary Table](#).

Table 8-75. PRBS_STATUS_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-13	RESERVED	R	0h	Reserved
12	MAC Packet Gen Done	R	0h	Set when all MAC packets with CRC are transmitted 0h = MAC packet transmission in progress 1h = MAC packets transmission completed
11	MAC Packet Gen Busy	R	0h	0h = Packet generator is not in process 1h = Packet generator is in process
10	PRBS Checker Packet Count Overflow Status	R	0h	If PRBS Checker Packet Count overflows, this status bit is set to 1 This overflow status is cleared after clearing PRBS byte counter using 0x620[1]
9	PRBS Checker Byte Count Overflow Status	R	0h	If PRBS Checker Byte Count overflows, this status bit is set to 1 This overflow status is cleared after clearing PRBS byte counter using 0x620[1]
8	PRBS Lock	R	0h	1h = PRBS checker is locked and synced with the received stream
7-0	PRBS Error Count	R	0h	Writing 1 to bit 0 locks all PRBS counters Writing 1 to bit1 locks all PRBS counters and clears the counters on read of those specific registers Bits [1:0] are self-cleared after write Reading Bits[7:0] after writing bit0/bit1, gives the number of error bits received by PRBS checker When PRBS Count Mode set to zero, count stops on 0xFF

8.2.72 PRBS_STATUS_6 Register (Offset = 622h) [Reset = 0000h]

PRBS_STATUS_6 is shown in [Table 8-76](#).

Return to the [Summary Table](#).

Table 8-76. PRBS_STATUS_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	PRBS Packer Error Count-1	R	0h	Holds Bits [15:0] of number of total packets received with error by the PRBS checker Value in register is locked when 0x620[0] or 0x620[1] are written When PRBS Count Mode set to zero, count stops on 0xFFFFFFFF This counter is cleared if 0x622,0x623 are read in the same order after programming 0x620[1]=1

8.2.73 PRBS_STATUS_7 Register (Offset = 623h) [Reset = 0000h]

PRBS_STATUS_7 is shown in [Table 8-77](#).

Return to the [Summary Table](#).

Table 8-77. PRBS_STATUS_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	PRBS Packer Error Count-2	R	0h	Holds Bits [31:16] of number of total packets received with error by the PRBS checker Value in register is locked when 0x620[0] or 0x620[1] are written When PRBS Count Mode set to zero, count stops on 0xFFFFFFFF This counter is cleared if 0x622,0x623 are read in the same order after programming 0x620[1]=1

8.2.74 PRBS_CTRL_4 Register (Offset = 624h) [Reset = 5511h]

PRBS_CTRL_4 is shown in [Table 8-78](#).

Return to the [Summary Table](#).

Table 8-78. PRBS_CTRL_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	MAC Packet Data	R/W	55h	Fixed data to be sent when MAC Packet Mode is set to Fixed mode
7-6	MAC Packet Mode	R/W	0h	0h = Incremental 1h = Fixed 2h = PRBS 3h = PRBS
5-3	Pattern Length in MAC Packets	R/W	2h	Number of bytes of valid pattern in packet (Max - 6)
2-0	Packet Count for MAC Packets Mode	R/W	1h	0h = 1 packet 1h = 10 packets 2h = 100 packets 3h = 1000 packets 4h = 10000 packets 5h = 100000 packets 6h = 1000000 packets 7h = Continuous packets

8.2.75 PATTERN_CTRL_1 Register (Offset = 625h) [Reset = 0000h]

PATTERN_CTRL_1 is shown in [Table 8-79](#).

Return to the [Summary Table](#).

Table 8-79. PATTERN_CTRL_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	Pattern in MAC Packets [15:0]	R/W	0h	Bytes 0,1 of programmable pattern in MAC packets

8.2.76 PATTERN_CTRL_2 Register (Offset = 626h) [Reset = 0000h]

PATTERN_CTRL_2 is shown in [Table 8-80](#).

Return to the [Summary Table](#).

Table 8-80. PATTERN_CTRL_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	Pattern in MAC Packets [31:16]	R/W	0h	Bytes 2,3 of programmable pattern in MAC packets

8.2.77 PATTERN_CTRL_3 Register (Offset = 627h) [Reset = 0000h]

PATTERN_CTRL_3 is shown in [Table 8-81](#).

Return to the [Summary Table](#).

Table 8-81. PATTERN_CTRL_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	Pattern in MAC Packets [47:32]	R/W	0h	Bytes 4,5 of programmable pattern in MAC packets

8.2.78 PMATCH_CTRL_1 Register (Offset = 628h) [Reset = 0000h]

PMATCH_CTRL_1 is shown in [Table 8-82](#).

Return to the [Summary Table](#).

Table 8-82. PMATCH_CTRL_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	Destination Address in MAC Packets [15:0]	R/W	0h	Destination Address field in the generated MAC packets

8.2.79 PMATCH_CTRL_2 Register (Offset = 629h) [Reset = 0000h]

PMATCH_CTRL_2 is shown in [Table 8-83](#).

Return to the [Summary Table](#).

Table 8-83. PMATCH_CTRL_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	Destination Address in MAC Packets [31:16]	R/W	0h	Destination Address field in the generated MAC packets

8.2.80 PMATCH_CTRL_3 Register (Offset = 62Ah) [Reset = 0000h]

PMATCH_CTRL_3 is shown in [Table 8-84](#).

Return to the [Summary Table](#).

Table 8-84. PMATCH_CTRL_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	Destination Address in MAC Packets [47:32]	R/W	0h	Destination Address field in the generated MAC packets

8.2.81 TX_PKT_CNT_1 Register (Offset = 639h) [Reset = 0000h]

TX_PKT_CNT_1 is shown in [Table 8-85](#).

Return to the [Summary Table](#).

Table 8-85. TX_PKT_CNT_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	TX Packet Count [15:0]	RC	0h	Lower 16 bits of TX packets from MAC counter Note : Register is cleared when 0x639, 0x63A, 0x63B are read in sequence

8.2.82 TX_PKT_CNT_2 Register (Offset = 63Ah) [Reset = 0000h]

TX_PKT_CNT_2 is shown in [Table 8-86](#).

Return to the [Summary Table](#).

Table 8-86. TX_PKT_CNT_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	TX Packet Count [31:16]	RC	0h	Upper 16 bits of TX packets from MAC counter Note : Register is cleared when 0x639, 0x63A, 0x63B are read in sequence

8.2.83 TX_PKT_CNT_3 Register (Offset = 63Bh) [Reset = 0000h]

TX_PKT_CNT_3 is shown in [Table 8-87](#).

Return to the [Summary Table](#).

Table 8-87. TX_PKT_CNT_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	TX Error Packet Count	RC	0h	TX packets from MAC with CRC error counter Note : Register is cleared when 0x639, 0x63A, 0x63B are read in sequence

8.2.84 RX_PKT_CNT_1 Register (Offset = 63Ch) [Reset = 0000h]

RX_PKT_CNT_1 is shown in [Table 8-88](#).

Return to the [Summary Table](#).

Table 8-88. RX_PKT_CNT_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	RX Packet Count [15:0]	RC	0h	Lower 16 bits of RX packets received from MDI Note : Register is cleared when 0x63C, 0x63D, 0x63E are read in sequence

8.2.85 RX_PKT_CNT_2 Register (Offset = 63Dh) [Reset = 0000h]

RX_PKT_CNT_2 is shown in [Table 8-89](#).

Return to the [Summary Table](#).

Table 8-89. RX_PKT_CNT_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	RX Packet Count [31:16]	RC	0h	Upper 16 bits of RX packets received from MDI Note : Register is cleared when 0x63C, 0x63D, 0x63E are read in sequence

8.2.86 RX_PKT_CNT_3 Register (Offset = 63Eh) [Reset = 0000h]

RX_PKT_CNT_3 is shown in [Table 8-90](#).

Return to the [Summary Table](#).

Table 8-90. RX_PKT_CNT_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	RX Error Packet Count	RC	0h	Rx packet with error (CRC error) counter Note : Register is cleared when 0x63C, 0x63D, 0x63E are read in sequence

8.2.87 RMII_CTRL_1 Register (Offset = 648h) [Reset = 0120h]

RMII_CTRL_1 is shown in [Table 8-91](#).

Return to the [Summary Table](#).

Table 8-91. RMII_CTRL_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-11	RESERVED	R	0h	Reserved
10	RMII TXD Delay Disable	R/W	0h	If set, disables delay of TXD in RMII mode
9-7	RMII Half Full Threshold	R/W	2h	FIFO Half Full Threshold in nibbles for the RMII Rx FIFO
6	RMII Enable	R/W	0h	1h = RMII Enable
5	cfg_rmii_bypass_afifo_en	R/W	1h	0h = RMII async fifo not bypassed 1h = RMII async fifo bypass enable
4	RMII Follower Enable	R/W	0h	Not recommended to configure this bit. Can be used as a status bit 1h = RMII Follower mode is enabled
3	RESERVED	R	0h	Reserved
2	RESERVED	R	0h	Reserved
1	RMII Rev1.0 Enable	R/W	0h	1h = Enable RMII rev1.0
0	RMII Enhanced Mode Enable	R/W	0h	1h = Enable RMII Enhanced mode

8.2.88 RMII_STATUS_1 Register (Offset = 649h) [Reset = 0000h]

RMII_STATUS_1 is shown in [Table 8-92](#).

Return to the [Summary Table](#).

Table 8-92. RMII_STATUS_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-2	RESERVED	R	0h	Reserved

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The DP83TC812 is a single-port 100Mbps Automotive Ethernet PHY. It supports IEEE 802.3bw and allows for connections to an Ethernet MAC through MII, RMII, RGMII, or SGMII. When using the device for Ethernet applications, it is necessary to meet certain requirements for normal operation. The following subsections are intended to assist in appropriate component selection and required connections.

Note

Refer to SNLA389 Application Note for more information about the register settings used for compliance testing. It is necessary to use these register settings to achieve the same performance as observed during compliance testing.

9.2 Typical Applications

Figure 9-2 through Figure 9-6 show some the typical applications for the DP83TC812x-Q1.

Figure 9-1. Typical Application (General)

Figure 9-2. Typical Application (MII)

Figure 9-6. Typical Application (SGMII)

9.2.1 Design Requirements

For these typical applications, use the following as design parameters from the table below. Refer to [Section 9.3](#) for detailed connection diagram.

Table 9-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V _{DDIO}	1.8V, 2.5V, or 3.3V
V _{DDMAC}	1.8V, 2.5V, or 3.3V
V _{DDA}	3.3V
V _{SLEEP}	3.3V
Decoupling capacitors V _{DDIO} ^{(1) (2)}	0.01µF
(Optional) ferrite bead for V _{DDIO} ⁽²⁾	1kΩ at 100MHz (BLM18KG601SH1D)
Decoupling capacitors V _{DDMAC} ⁽¹⁾	0.01µF, 0.47µF
Ferrite bead for V _{DDMAC}	1kΩ at 100MHz (BLM18KG601SH1D)
Decoupling capacitors V _{DDA} ⁽¹⁾	0.01µF, 0.47µF
(Optional) ferrite bead for V _{DDA}	1kΩ at 100MHz (BLM18KG601SH1D)
Decoupling capacitors V _{SLEEP}	0.1µF
DC Blocking Capacitors ⁽¹⁾	0.1µF

Table 9-1. Design Parameters (continued)

DESIGN PARAMETER	EXAMPLE VALUE
Common-Mode Choke	200μH
Common Mode Termination Resistors ⁽³⁾	1kΩ
MDI Coupling Capacitor ⁽¹⁾	4.7nF
ESD Shunt ⁽¹⁾	100kΩ
Reference Clock	25MHz

- (1) 10% tolerance components are recommended.
 (2) If VDDIO is separate from VDDMAC then additional ferrite bead and 0.47μF capacitor is required on VDDIO.
 (3) 1% tolerance components are recommended.

9.2.1.1 Physical Medium Attachment

There must be no metal running beneath the common-mode choke. CMCs can inject noise into metal beneath them, which can affect the emissions and immunity performance of the system. Because the DP83TC812S-Q1 is a voltage mode line driver, no external termination resistors are required. The ESD shunt and MDI coupling capacitor must be connected to ground. Verify that the common mode termination resistors are 1% tolerance or better to improve differential coupling.

9.2.1.1.1 Common-Mode Choke Recommendations

The following CMCs are recommended for use with the DP83TC812S-Q1 :

Table 9-2. Recommended CMCs

MANUFACTURER	PART NUMBER
Pulse Electronics	AE2002
Murata	DLW43MH201XK2L
Murata	DLW32MH201XK2
TDK	ACT1210L-201

Table 9-3. CMC Electrical Specifications

PARAMETER	TYP	UNITS	CONDITIONS
Insertion Loss	-0.5	dB	1 – 30MHz
	-1.0	dB	30 – 60MHz
Return Loss	-26	dB	1 – 30MHz
	-20	dB	30 – 60MHz
Common-Mode Rejection	-24	dB	1MHz
	-42	dB	10 – 100MHz
	-25	dB	400MHz
Differential Common-Mode Rejection	-70	dB	1 – 10MHz
	-50	dB	100MHz
	-24	dB	1000MHz

9.2.2 Detailed Design Procedure

When creating a new system design with an Ethernet PHY, follow this schematic capture procedure:

1. Use the 'Strap Tool' tab from the [Schematic Checklist](#) to select the correct external bootstrap resistors.
2. Select desired PHY hardware configurations described in [Section 7.5.1](#).
3. Go through and use the 'Pinwise Checklist' tab [Schematic Checklist](#) as a guide for your schematic design.
4. Use [DP83TC812](#), [DP83TC813](#), and [DP83TC814: Configuring for Open Alliance Specification Compliance](#) as a guide for selecting components for the MDI circuit connected to the TRD_M and TRD_P pins.

The following layout procedure must be followed:

1. Locate the PHY near the edge of the board so that short MDI traces can be routed to the desired connector.
2. Place the MDI external components: CMC, DC-blocking capacitors, CM termination, MDI-coupling capacitor, and ESD shunt.
3. Create metal pour keepout under the CMC on the top layer and at least one layer beneath the top later.
4. The MDI TRD_M and TRD_P traces are routed with 100Ω differential.
5. Place the clock source near the XI and XO pins.
6. In MII, RMII, or RGMII mode, the xMII pins are routed 50Ω and are single-ended with reference to ground.
7. The transmit path xMII pins are routed such that setup and hold timing does not violate the PHY requirements.
8. The receive path xMII pins are routed such that setup and hold timing does not violate the MAC requirements.
9. In SGMII mode, the xMII RX_P, RX_M, TX_P, and TX_M pins are routed 100Ω differential.
10. Place the MDIO pullup close to the PHY.
11. Go through 'Layout Checklist' tab from the [Schematic Checklist](#) to guide your design.

9.2.3 Application Curves

The following curves are obtained using the PHY evaluation module under nominal conditions.

Figure 9-7. MDI IDLE Stream

Figure 9-8. MDI IDLE Stream (Variable Persistence)

9.3 Power Supply Recommendations

The DP83TC812S-Q1 is capable of operating with a wide range of IO supply voltages (3.3V, 2.5V, or 1.8V). No power supply sequencing is required. Please note that inputs pins must not be driven until VDDA and VDDIO are stable. The recommended power supply de-coupling network is shown in the figure below. For improved conducted emissions, an optional ferrite bead can be placed between the supply and the PHY de-coupling network.

Typical TC-10 application block diagram along with supply and peripherals is shown below. TPS7B81-Q1 is the recommended part number to be used as 3.3V LDO for the VSLEEP rail. The low quiescent current of this LDO makes the LDO designed for TC-10 applications.

Figure 9-9. Typical TC-10 Application With Peripherals

When VDDIO and VDDMAC are separate, both voltage rails must have a dedicated network of ferrite bead, 0.47μF, and 0.01μF capacitors. VSLEEP can also be connected to VDDA, 0.1μF capacitor must be retained in this configuration.

9.4 Layout

9.4.1 Layout Guidelines

9.4.1.1 Signal Traces

PCB traces are lossy and long traces can degrade signal quality. Traces must be kept short as possible. Unless mentioned otherwise, all signal traces must be 50Ω, single-ended impedance. Differential traces must be 50Ω single-ended and 100Ω differential. Make sure impedance is controlled throughout. Impedance discontinuities cause reflections leading to emissions and signal integrity issues. Stubs must be avoided on all signal traces, especially differential signal pairs.

Figure 9-10. Differential Signal Trace Routing

Within the differential pairs, trace lengths must be run parallel to each other and matched in length. Matched lengths minimize delay differences, avoiding an increase in common mode noise and emissions. Length matching is also important for MAC interface connections. All transmit signal traces must be length matched to each other and all receive signal traces must be length matched to each other. For SGMII differential traces, keep the skew mismatch below 20ps.

Ideally, there must be no crossover on signal path traces. High speed signal traces must be routed on internal layers to improved EMC performance. However, vias present impedance discontinuities and must be minimized when possible. Route trace pairs on the same layer. Signals on different layers must not cross each other without at least one return path plane between them. Differential pairs must always have a constant coupling distance between them. For convenience and efficiency, TI recommends routing critical signals first (that is, MDI differential pairs, reference clock, and MAC IF traces).

9.4.1.2 Return Path

A general best practice is to have a solid return path beneath all signal traces. This return path can be a continuous ground or DC power plane. Reducing the width of the return path can potentially affect the impedance of the signal trace. This effect is more prominent when the width of the return path is comparable to the width of the signal trace. Breaks in return path between the signal traces must be avoided at all cost. A signal crossing a split plane can cause unpredictable return path currents and can impact signal quality and result in emissions issues.

Figure 9-11. Power and Ground Plane Breaks

9.4.1.3 Metal Pour

All metal pours that are not signals or power must be tied to ground. There must be no floating metal in the system, and there must be no metal between differential traces.

9.4.1.4 PCB Layer Stacking

To meet signal integrity and performance requirements, minimum four-layer PCB is recommended. However, a six-layer PCB and above must be used when possible.

Figure 9-12. Recommended PCB Layer Stack-Up

9.4.2 Layout Example

There is an evaluation board references for the DP83TC812-Q1 . The DP83TC812EVM-MC is a media converter board which can be used for interoperability and bit error rate testing.

Figure 9-13. MDI Low-Pass Filter Layout Recommendation

10 Device and Documentation Support

Note

TI is transitioning to use more inclusive terminology. Some language can be different than what is expected in certain technology areas.

10.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

10.3 Community Resources

10.4 Trademarks

PHYTER™ and TI E2E™ are trademarks of Texas Instruments.
All trademarks are the property of their respective owners.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (November 2024) to Revision D (July 2026)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• Updated pin functions table to clarify population of rail pull-up resistors.....	5
• Updated pin domain table.....	5
• Updated Power-Up Timing timing diagram.....	26
• Added information to clarify that registers 0x063C, 0x063D, and 0x063E must be read together.....	37
• Updated order of encoding cases in RGMII Transmit Encoding.....	52
• Updated order of encoding cases in RGMII Receive Encoding.....	52
• Updated address ranges in Register Space Division.....	54
• Updated register address range.....	55
• Updated register address range in MMD Register Space Division.....	62
• Updated Typical Application (General) figure.....	165

Changes from Revision B (January 2023) to Revision C (November 2024)

Page

• Updated Pin 9 and Pin 21 pin descriptions and package label.....	5
• Table 5-1 Pin Functions: Updated MDIO pin description to include link to Compliance Test Modes section.....	5
• Table 6-1 Pin Functions: Updated description for RX_D3 for SGMII mode.....	5
• Table 6-1 Pin Functions: Updated Pin 15 description to include register writes for programming Pin 15 as RX_DV and CRS_DV.....	5
• Table 6-1 Pin Functions: Clarified that RX_D3 and RX_D2 are not used in RMII Slave mode.....	5
• Removed RGMII Timing Diagrams for Internal Delay Enabled and Internal Delay Disabled modes and created a new RGMII Transmit Timing Diagram for clarity.....	26
• Corrected description for register 0x310 Bit 6.....	35
• Corrected order of register writes for enabling data generator/checker.....	38
• Updated Serial Management Interface section with better wording and clarity.....	54
• Table 7-25. PHY Address Bootstraps: Corrected binary representations of PHY addresses 0xC and 0xD.....	57
• Deleted Register 0x18, Bit 15, Register 0x60B, Register 0x609, Register 0x603, and Register 0x12, Bit 7...	63
• Updated Register 0x456 Bit Description.....	63
• Updated Register 0x1F Bit 15 and Bit 14 Description.....	63
• Added general typical application diagram.....	165
• Updated RGMII Typical Application diagram to include 25MHz input.....	165
• Simplified and updated the Detailed Design Procedure and added a link to the Schematic Checklist.....	168

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
