

## TDA4VM Processors

### 1 Features

#### Processor cores:

- C7x floating point, vector DSP, up to 1.0GHz, 80 GFLOPS, 256 GOPS
- Deep-learning matrix multiply accelerator (MMA), up to 8 TOPS (8b) at 1.0GHz
- Vision Processing Accelerators (VPAC) with Image Signal Processor (ISP) and multiple vision assist accelerators
- Depth and Motion Processing Accelerators (DMPAC)
- Dual 64-bit Arm® Cortex®-A72 microprocessor subsystem at up to 2.0GHz
  - 1MB shared L2 cache per dual-core Cortex®-A72 cluster
  - 32KB L1 DCache and 48KB L1 ICache per Cortex®-A72 core
- Six Arm® Cortex®-R5F MCUs at up to 1.0GHz
  - 16K I-Cache, 16K D-Cache, 64K L2 TCM
  - Two Arm® Cortex®-R5F MCUs in isolated MCU subsystem
  - Four Arm® Cortex®-R5F MCUs in general compute partition
- Two C66x floating point DSP, up to 1.35GHz, 40GFLOPS, 160GOPS
- 3D GPU PowerVR® Rogue 8XE GE8430, up to 750MHz, 96GFLOPS, 6Gpix/sec
- Custom-designed interconnect fabric supporting near max processing entitlement

#### Memory subsystem:

- Up to 8MB of on-chip L3 RAM with ECC and coherency
  - ECC error protection
  - Shared coherent cache
  - Supports internal DMA engine
- External Memory Interface (EMIF) module with ECC
  - Supports LPDDR4 memory types
  - Supports speeds up to 4266MT/s
  - 32-bit data bus with inline ECC
- General-Purpose Memory Controller (GPMC)
- 512KB on-chip SRAM in MAIN domain, protected by ECC

#### Functional Safety:

- [Functional Safety-Compliant](#) (on select part numbers)
  - Developed for functional safety applications
  - Documentation available to aid ISO 26262/IEC 61508 functional safety system design up to ASIL D/SIL 3
  - Systematic capability up to ASIL D/SC 3
  - Hardware integrity up to ASIL D/SIL 3 for MCU Domain
  - Hardware integrity up to ASIL B/SIL 2 for Main Domain
- Safety-related certifications
  - [ISO 26262 certification up to ASIL D by TÜV SÜD](#) (SR1.1, SR2.0)
  - [IEC 61508 certification up to SIL 3 by TÜV SÜD](#) (SR1.1, SR2.0)
- AEC-Q100 qualified on part number variants ending in Q1

#### Device security (on select part numbers):

- Secure boot with secure run-time support
- Customer programmable root key, up to RSA-4K or ECC-512
- Embedded hardware security module
- Crypto hardware accelerators – PKA with ECC, AES, SHA, RNG, DES and 3DES

#### High speed serial interfaces:

- Integrated Ethernet switch supporting up to 8 external ports
  - All ports support 2.5Gb SGMII
  - All ports support 1Gb SGMII/RGMII
  - All ports support 100Mb RMII
  - Any two ports support QSGMII (using 4 internal ports per QSGMII)
- Up to four PCI-Express® (PCIe) Gen3 controllers
  - Up to two lanes per controller
  - Gen1 (2.5GT/s), Gen2 (5.0GT/s), and Gen3 (8.0GT/s) operation with auto-negotiation
- Two USB 3.0 dual-role device (DRD) subsystem
  - Two enhanced SuperSpeed Gen1 Ports
  - Each port supports Type-C switching
  - Each port independently configurable as USB host, USB peripheral, or USB DRD

#### Automotive interfaces:

- Sixteen Modular Controller Area Network (MCAN) modules with full CAN-FD support
- Two CSI2.0 4L RX plus One CSI2.0 4L TX
  - 2.5Gbps RX throughput per lane (20Gbps total)

**Display subsystem:**

- One eDP/DP interface with Multi-Display Support (MST)
  - HDCP1.4/HDCP2.2 high-bandwidth digital content protection
- One DSI TX (up to 2.5K)
- Up to two DPI

**Audio interfaces:**

- Twelve Multichannel Audio Serial Port (MCASP) modules

**Video acceleration:**

- Ultra-HD video, one (3840 × 2160p, 60 fps), or two (3840 × 2160p, 30 fps) H.264/H.265 decode
- Full-HD video, four (1920 × 1080p, 60 fps), or eight (1920 × 1080p, 30 fps) H.264/H.265 decode
- Full-HD video, one (1920 × 1080p, 60 fps), or up to three (1920 × 1080p, 30 fps) H.264 encode

**Flash memory interfaces:**

- Embedded MultiMediaCard Interface ( eMMC™ 5.1)
- Universal Flash Storage (UFS 2.1) interface with two lanes
- Two Secure Digital® 3.0/Secure Digital Input Output 3.0 interfaces (SD3.0/SDIO3.0)
- Two simultaneous flash interfaces configured as
  - One OSPI and one QSPI flash interfaces
  - or one HyperBus™ and one QSPI flash interface

**System-on-Chip (SoC) architecture:**

- 16-nm FinFET technology
- 24 mm × 24 mm, 0.8-mm pitch, 827-pin FCBGA (ALF), enables IPC class 3 PCB routing

**TPS6594-Q1 Companion Power Management ICs (PMIC):**

- Functional Safety support up to ASIL-D
- Flexible mapping to support different use cases

### 3 Description

The TDA4VM processor family targeted at ADAS and Autonomous Vehicle (AV) applications and built on extensive market knowledge accumulated over a decade of TI's leadership in the ADAS processor market. The unique combination high-performance compute, deep-learning engine, dedicated accelerators for signal and image processing in a functional safety compliant targeted architecture make the TDA4VM devices a great fit for several industrial applications, such as: Robotics, Machine Vision, Radar, and so on. The TDA4VM provides high performance compute for both traditional and deep learning algorithms at industry leading power/performance ratios with a high level of system integration to enable scalability and lower costs for advanced automotive platforms supporting multiple sensor modalities in centralized ECUs or stand-alone sensors. Key cores include next generation DSP with scalar and vector cores, dedicated deep learning and traditional algorithm accelerators, latest Arm and GPU processors for general compute, an integrated next generation imaging subsystem (ISP), video codec, Ethernet hub and isolated MCU island. All protected by automotive grade safety and security hardware accelerators.

#### Key Performance Cores Overview

The “C7x” next generation DSP combines TI's industry leading DSP and EVE cores into a single higher performance core and adds floating point vector calculation capabilities, enabling backward compatibility for legacy code while simplifying software programming. The new “MMA” deep learning accelerator enables performance up to 8 TOPS within the lowest power envelope in the industry when operating at the typical automotive worst case junction temperature of 125°C. The dedicated ADAS/AV hardware accelerators provide vision pre-processing plus distance and motion processing with no impact on system performance.

#### General Compute Cores and Integration Overview

Separate dual core cluster configuration of Arm® Cortex®-A72 facilitates multi-OS applications with minimal need for a software hypervisor. Up to six Arm® Cortex®-R5F subsystems enable low-level, timing critical processing tasks to leave the Arm® Cortex®-A72's unencumbered for applications. The integrated “8XE GE8430” GPU offers up to 100 GFLOPS to enable dynamic 3D rendering for enhanced viewing applications. Building on the existing world-class ISP, TI's 7th generation ISP includes flexibility to process a broader sensor suite, support for higher bit depth, and features targeting analytics applications. Integrated diagnostics and safety features support operations up to ASIL-D/SIL-3 levels while the integrated security features protect data against modern day attacks. To enable systems requiring heavy data bandwidth, a PCIe hub and Gigabit Ethernet switch are included along with CSI-2 ports to support throughput for many sensor inputs. To further the integration, the TDA4VM family also includes an MCU island eliminating the need for an external system microcontroller.

#### Package Information

PART NUMBER <sup>(1)</sup>	PACKAGE	PACKAGE SIZE <sup>(2)</sup>
TDA4VM...ALF	ALF (FCBGA, 827)	24.0mm × 24.0mm
XJ721E...ALF	ALF (FCBGA, 827)	24.0mm × 24.0mm

(1) For more information, see [Mechanical, Packaging, and Orderable Information](#).

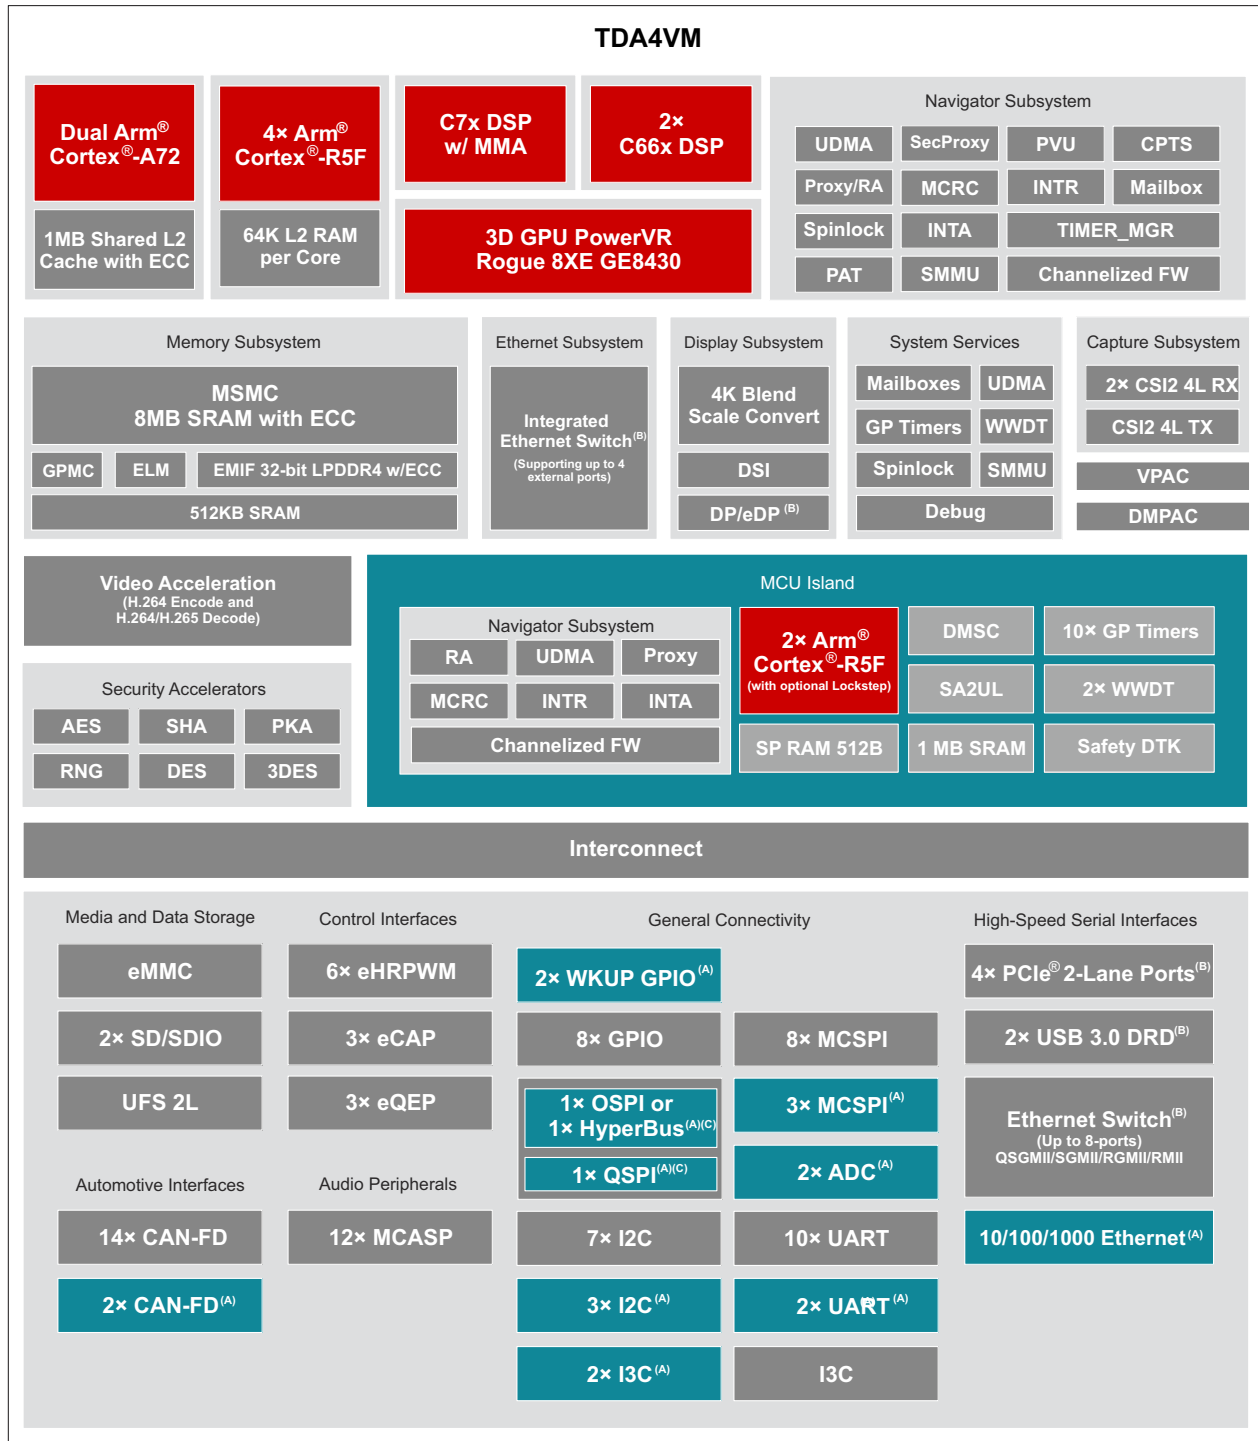

(2) The package size (length × width) is a nominal value and includes pins, where applicable.

### 3.1 Functional Block Diagram

Figure 3-1 is functional block diagram for the device.

#### Note

To understand what device features are currently supported by TI Software Development Kits (SDKs), see the [DRA829 and TDA4VM Software Build Sheet \(PROCESSOR-SDK-J721E\)](#).

A. This interface is located on the MCU Island but is available for the full system to access.

- B. DP, SGMII, USB3.0, and PCIE[3:0] share total of twelve SerDes lanes.
- C. Two simultaneous flash interfaces configured as OSPi0 and OSPi1, or HyperBus™ and OSPi1.

**Software Development Kit for DRA8x & TDA4x Jacinto™ Processors** Processor SDK RTOS (PSDK RTOS) can be used together with Processor SDK Linux (PSDK Linux) or Processor SDK QNX (PSDK QNX), to form a multi-processor software development platform for TDA4x and DRA8x SoCs within the TI's Jacinto™ Processors platform. The SDK provides a comprehensive set of software tools and components to help users develop and deploy their applications on supported J7 SoCs. PSDK RTOS and either PSDK Linux or PSDK QNX can be used together to implement various use-cases in robotics, vision, factory and building automation, and automotive ADAS and gateway systems.

**TDA4VM Evaluation Module** The TDA4VMXEVM is an evaluation platform designed to speed up development efforts and reduce time to market for ADAS applications.

The TDA4x EVM is based on a TDA4VMx System-on-Chip (SoC) that incorporates a powerful heterogeneous, scalable architecture that includes a mix of TI's fixed and floating-point TMS320C66x Digital Signal Processor (DSP) cores, the C71x DSP Core and Matrix Math Accelerator for AI, Arm® Cortex®-A72 cores, integrated ISP and vision processing acceleration, 2D and 3D GPU cores, H.264 encode/H.265 decode acceleration. An on-chip Safety island featuring dual-lockstep R5F cores helps the system achieve ASIL-D/SIL-3 level certification while reducing the need for an external safety microcontroller, further reducing system bill-of-materials. On-chip peripherals allow for multi-camera input via CSI-2 ports, vehicle connectivity based on PCI Express, CAN-FD and Gigabit Ethernet, and display connectivity via DSI interfaces.

The EVM is supported by the Processor SDK which includes foundational drivers, compute and vision kernels, and example application frameworks and demonstrations that show users how to take advantage of the powerful heterogeneous SoC architecture.

- The MUXMODE field is not used to select the multiplexed signal function for this pin. For more information, see *ADC Integration Details* section in *Device Configuration* chapter of the device TRM.

The following list describes the table column headers:

- BALL NUMBER:** Ball numbers on the bottom side associated with each signal on the bottom.
- BALL NAME:** Mechanical name from package device (name is taken from muxmode 0).
- SIGNAL NAME:** Names of signals multiplexed on each ball (also notice that the name of the ball is the signal name in muxmode 0).

#### Note

Table 5-1, *Pin Attributes*, does not take into account the subsystem multiplexing signals. Subsystem multiplexing signals are described in Section 5.3, *Signal Descriptions*.

- MUXMODE:** Multiplexing mode number:
  - MUXMODE 0 is the primary muxmode. The primary muxmode is not necessarily the default muxmode.

#### Note

The default muxmode is the mode at the release of the reset; also see the BALL RESET REL. MUXMODE column.

- MUXMODE 1 through 7 are possible muxmodes for alternate functions. On each pin, some muxmodes are effectively used for alternate functions, while some muxmodes are not used. Only MUXMODE values which correspond to defined functions should be used.
  - MCU\_BOOTMODE pins are latched on the rising edge of MCU\_PORz\_OUT. BOOTMODE pins are latched on the rising edge of PORz\_OUT.
  - An empty box means Not Applicable.
- TYPE:** Signal type and direction:

- I = Input
  - O = Output
  - IO = Input or Output
  - IOD = Open drain terminal - Input or Output
  - IOZ = Input, Output or Three-state terminal
  - OZ = Output or Three-state terminal
  - A = Analog
  - PWR = Power
  - GND = Ground
  - CAP = LDO Capacitor.
6. **BALL RESET STATE:** The state of the terminal at power-on reset:
- DRIVE 0 (OFF): The buffer drives  $V_{OL}$  (pulldown or pullup resistor not activated).
  - DRIVE 1 (OFF): The buffer drives  $V_{OH}$  (pulldown or pullup resistor not activated).
  - OFF: High-impedance
  - PD: High-impedance with an active pulldown resistor
  - PU: High-impedance with an active pullup resistor
  - An empty box means Not Applicable.
7. **BALL RESET REL. MUXMODE:** This muxmode is automatically configured at the release of the rstoutn signal.  
An empty box means Not Applicable.
8. **I/O VOLTAGE VALUE:** This column describes the IO voltage value (the corresponding power supply).  
An empty box means Not Applicable.
9. **POWER:** The voltage supply that powers the terminal IO buffers.  
An empty box means Not Applicable.
10. **HYS:** Indicates if the input buffer has hysteresis:
- Yes: With hysteresis
  - No: Without hysteresis
- An empty box means No.
- For more information, see the hysteresis values in , *Electrical Characteristics* .
11. **BUFFER TYPE:** This column describes the associated output buffer type  
An empty box means Not Applicable.
- For drive strength of the associated output buffer, refer to, *Electrical Characteristics*.
12. **PULL UP/DOWN TYPE:** indicates the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
- PU: Internal pullup
  - PD: Internal pulldown
  - PU/PD: Internal pullup and pulldown
  - An empty box means No pull.

13. **DSIS:** The deselected input state (DSIS) indicates the state driven on the peripheral input (logic "0", logic "1", or "PIN" level) when the peripheral pin function is not selected by any of the PINCTLx registers.
- 0: Logic 0 driven on the input signal port of the peripheral.
  - 1: Logic 1 driven on the input signal port of the peripheral.
  - An empty box means Not Applicable.
14. **RXACTIVE / TXDISABLE:** This column indicates the default value of the RXACTIVE / TXDISABLE bits in the PADCONFIG register.
- RXACTIVE: 0 = receiver disabled, 1 = receiver enabled.
  - TXDISABLE: 0 = driver enabled, 1 = driver disabled.
  - An empty box means Not Applicable.

---

**Note**

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration (HiZ mode is not an input signal).

---

---

**Note**

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This should be avoided.

---

### 5.3 Signal Descriptions

Many signals are available on multiple pins, according to the software configuration of the pin multiplexing options.

The following list describes the column headers:

1. **SIGNAL NAME:** The name of the signal passing through the pin.

---

**Note**

In *Pin Attributes* and *Pin Multiplexing* are not described the subsystem multiplexing signals.

---

2. **DESCRIPTION:** Description of the signal
3. **PIN TYPE:** Signal direction and type:
  - I = Input
  - O = Output
  - IO = Input or Output
  - IOD = Open drain terminal - Input or Output
  - IOZ = Input, Output or Three-state terminal
  - OZ = Output or Three-state terminal
  - A = Analog
  - PWR = Power
  - GND = Ground
  - CAP = LDO Capacitor
4. **BALL:** Associated balls bottom

For more information on the I/O cell configurations, see *Pad Configuration Registers* section in *Device Configuration* chapter in the device TRM.

#### 5.3.1 ADC

---

**Note**

The ADC can be configured to be used as a GPI. For more information, see *Analog-to-Digital Converter (ADC)* section in *Peripherals* chapter in the device TRM.

(2) For MMC2 module to work properly, the MMC2\_SDCD pin should be pulled low to indicate an SD Card/Memory device is present.

### 5.3.21 CPTS

#### Note

Some CPTS signals are connected directly to CPTS modules within the device. Other CPTS signals are connected to the Time Sync Router and fanned out to peripherals linked to the router. Input signals are sent to the peripherals while output signals are sourced from the peripherals. For more information, see the Time Sync and Compare Events section in the Time Sync chapter in the device TRM.

(1) This pin must always be connected via a 1- $\mu$ F  $\pm$ 10% capacitor to VSS.

## 5.4 Pin Multiplexing

### Note

Many device pins support multiple signal functions. Some signal functions are selected via a single layer of multiplexers associated with pins. Other signal functions are selected via two or more layers of multiplexers, where one layer is associated with the pins and other layers are associated with peripheral logic functions.

[Table 5-125, Pin Multiplexing](#) only describes signal multiplexing at the pins. For more information, related to signal multiplexing at the pins, see *Pad Configuration Registers* section in *Device Configuration* chapter in the device TRM. Refer to the respective peripheral chapter in the device TRM for information associated with peripheral signal multiplexing.

### Note

When a pad is set into a pin multiplexing mode which is not defined, that pad's behavior is undefined. This should be avoided.

### Note

[Table 5-125, Pin Multiplexing](#) does not include SerDes signal functions. For more information, refer to the Serializer/Deserializer (SerDes) chapter in the device TRM.

### Note

[Table 5-125, Pin Multiplexing](#) does not include DPHY\_TX signal functions. For more information, refer to the Shared D-PHY Transmitter (DPHY\_TX) chapter in the device TRM.

For more information on the I/O cell configurations, see *Pad Configuration Registers* section in *Device Configuration* chapter in the device TRM.

## 5.5 Pin Connectivity Requirements

This section describes the Unused/Reserved balls connection requirements.

### Note

All power balls must be supplied with the voltages specified in [Section 6.4, Recommended Operating Conditions](#), unless otherwise specified in [Section 5.3, Signal Descriptions](#).

### Note

MMC1\_SDCD and MMC2\_SDCD must be pulled down for respective MMC modules to work properly as a boot source.

BALLS	CONNECTION REQUIREMENTS
A29 / AJ1 / U11 / U12 / U13 / T11 / T12 / T13 / M11 / M12 / M13 / N11 / N12 / N13	These balls do not exist on the package.

---

**Note**

All other unused signal balls **without** Pad Configuration Register can be left unconnected.

---

**Note**

All other unused signal balls **with** a Pad Configuration Register can be left unconnected with their multiplexing mode set to GPIO input and internal pulldown resistor enabled.

Unused balls are defined as those which only connect to a PCB solder pad. This is the only use case where internal pull resistors are allowed as the only source/sink to hold a valid logic level.

Any balls connected to a via, test point, or PCB trace are considered used and must not depend on the internal pull resistor to hold a valid logic level.

Internal pull resistors are weak and may not source enough current to maintain a valid logic level for some operating conditions. This may be the case when connected to components with leakage to the opposite logic level, or when external noise sources couple to signal traces attached to balls which are only pulled to a valid logic level by the internal resistor. Therefore, external pull resistors may be required to hold a valid logic level on balls with external connections.

If balls are allowed to float between valid logic levels, the input buffer may enter a high-current state which could damage the IO cell.

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Section 6.4, Recommended Operating Conditions](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to their associated VSS or VSSA\_x, unless otherwise noted.
- (3) This parameter applies to all IO pins which are not fail-safe and the requirement applies to all values of IO supply voltage. For example, if the voltage applied to a specific IO supply is 0 volts the valid input voltage range for any IO powered by that supply will be –0.3 to +0.3 volts. Special attention should be applied anytime peripheral devices are not powered from the same power sources used to power the respective IO supply. It is important the attached peripheral never sources a voltage outside the valid input voltage range, including power supply ramp-up and ramp-down sequences.
- (4) For current pulse injection:  
Pins stressed per JEDEC JESD78E (Class II) and passed with specified I/O pin injection current and clamp voltage of 1.5 times maximum recommended I/O voltage and negative 0.5 times maximum recommended I/O voltage.  
For overvoltage performance:  
Supplies stressed per JEDEC JESD78E (Class II) and passed specified voltage injection.
- (5) For tape and reel the storage temperature range is [–10°C; +50°C] with a maximum relative humidity of 70%. TI recommends returning to ambient room temperature before usage.
- (6) VDD is the voltage on the corresponding power-supply pin(s) for the IO.
- (7) An external resistor divider is required to create the VMON input value that triggers with V<sub>TH</sub> = 0.45 when the V<sub>SYS</sub> level reaches the minimum allowed threshold. A series resistor R2 (VMON\_ER\_VSYS = V<sub>SYS</sub> × R1 / (R1 + R2)) of at least 10kΩ is recommended to limit current.
- (8) The VMON\_ER\_VSYS pin provides a way to monitor the system power supply. For more information, see [Section 8.3.5 System Power Supply Monitor Design Guidelines](#).

- (9) An external resistor divider is required to limit the voltage applied to this device pin. For more information, see [Section 8.3.4, USB VBUS Design Guidelines](#).

Fail-safe IO terminals are designed such they do not have dependencies on the respective IO power supply voltage. This allows external voltage sources to be connected to these IO terminals when the respective IO power supplies are turned off. The I2C0\_SCL, I2C0\_SDA, I2C1\_SCL, I2C1\_SDA, DDR\_FS\_RESETh, NMIh, VMON\_ER\_VSYS, and VMON\_IR\_VEXT are the only fail-safe IO terminals. All other IO terminals are not fail-safe and the voltage applied to them should be limited to the value defined by the Steady State Max. Voltage at all IO pins parameter in [Section 6.1](#).

- (1) This information is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.  
(2) Unless specified in the table above, all voltage domains and operating conditions are supported in the device at the noted temperatures  
(3) POH is a function of voltage, temperature and time. Usage at higher voltages and temperatures will result in a reduction in POH.  
(4) Automotive profile is defined as 20000 power on hours with junction temperature as follows: 5%@-40°C, 65%@70°C, 20%@110°C, and 10%@125°C.

- (1) The voltage at the device ball must never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, and so forth.
- (2) VDDS\_DDR is required to still be powered with LPDDR4 voltage ranges, even if DDR interface is unused.
- (3) This terminal is connected to analog circuits in the respective USB PHY. The circuit sources a known current while measuring the voltage to determine if the terminal is connected to VSS with a resistance less than 10 Ω or greater than 100 kΩ. The terminal should be connected to ground for USB host operation or open-circuit for USB peripheral operation, and should never be connected to any external voltage source.
- (4) The AVS Voltages are device-dependent, voltage domain-dependent, and OPP-dependent. They must be read from the VTM\_DEVINFO\_VDn. For information about VTM\_DEVINFO\_VDn Registers address, please refer to Voltage and Thermal Manager section in the device TRM. The power supply should be adjustable over the ranges shown in the VDD\_CPU AVS Range entry.

- (5) An external resistor divider is required to limit the voltage applied to this device pin. For more information, see [Section 8.3.4, USB VBUS Design Guidelines](#).

## 6.5 Operating Performance Points

This section describes the operating conditions of the device. This section also contains the description of each Operating Performance Point (OPP) for processor clocks and device core clocks.

[Table 6-1](#) describes the maximum supported frequency per speed grade for the device.

**Table 6-1. Speed Grade Maximum Frequency**

DEVICE	MAXIMUM FREQUENCY (MHz)										
	A72SS0	C66SS0	C71SS0	R5FSS0/1	MCU_R5SS0	GPU	CBASS0	VPAC	DMPAC	DMSC	LPDDR4

TDA4VMxL	1500	1000	750	1000	1000	600	500	600 <sup>(1)</sup>	433 <sup>(1)</sup>	333	3733 MT/s <sup>(2)</sup>
TDA4VMxE	1000	1000	750	1000	1000	400	500	600 <sup>(1)</sup>	N/A	333	3200 MT/s <sup>(2)</sup>

- (1) Max VPAC and DMPAC speeds not available concurrently due to PLL sharing (max combinations are 720/480 and 650/520 for VPAC/DMPAC, respectively).
- (2) Maximum DDR Frequency is limited based on the specific memory type (vendor) used in a system and by PCB implementation. TI strongly recommends that all designs follow the TI LPDDR4 EVM PCB layout exactly in every detail (*routing, spacing, vias/backdrill, PCB material, and so forth*) in order to achieve the full specified clock frequency. For details, see the [Jacinto 7 LPDDR4 Board Design and Layout Guidelines](#).

## 6.6 Electrical Characteristics

### Note

The interfaces or signals described in [Table 6-2](#) through [Table 6-9](#) correspond to the interfaces or signals available in multiplexing mode 0 (Primary Function).

All interfaces or signals multiplexed on the balls described in these tables have the same DC electrical characteristics, unless multiplexing involves a PHY and GPIO combination, in which case different DC electrical characteristics are specified for the different multiplexing modes (Functions).

(1) VDDSHV stands for corresponding power supply. For more information on the power supply name and the corresponding ball, see [Section 5.2, Pin Attributes](#), POWER column.

- (2) The  $I_{OL}$  parameter defines the minimum Low Level Output Current for which the device is able to maintain the specified  $V_{OL}$  value. The value defined by this parameter should be considered the maximum current available to a system implementation which needs to maintain the specified  $V_{OL}$  value for attached components.
- (3)  $f$  = toggle frequency of the input signal in Hz.
- (4) This MIN parameter only applies to input signal functions which are not defined in their respective *Timing and Switching Characteristics* sections. Select the MIN parameter which results in the largest value.
- (5) I2C Hs-mode is not supported, when operating the IO in 3.3-V mode.

## USB2PHY Electrical Characteristics

### Note

USB0 and USB1 Electrical Characteristics are compliant with Universal Serial Bus Revision 2.0 Specification dated April 27, 2000 including ECNs and Errata as applicable.

## SerDes 4-L-PHY/2-L-PHY Electrical Characteristics

### Note

The PCIe interfaces are compliant with the electrical parameters specified in PCI Express® Base Specification Revision 4.0, September 27, 2017.

This Device imposes an additional limit on SERDES REFCLK when used in Input mode with internal termination enabled, as described by parameter V<sub>REFCLK\_TERM</sub> in [Table 6-10, 4-L-PHY SERDES REFCLK Electrical Characteristics](#). Internal termination is enabled by default and must be disabled before applying a reference clock signal that exceeds the limits defined by V<sub>REFCLK\_TERM</sub>. External termination should always be enabled on the source side.

The DDR interface is compatible with JESD209-4B standard compliant LPDDR4 SDRAM devices.

**6.7 VPP Specifications for One-Time Programmable (OTP) eFuses**

This section specifies the operating conditions required for programming the OTP eFuses and is applicable only for High-Security Devices.

### 6.7.1 Recommended Operating Conditions for OTP eFuse Programming

over operating free-air temperature range (unless otherwise noted)

PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
VDD_CORE	Supply voltage range for the core domain during OTP operation	See <a href="#">Section 6.4</a>			V
VDD_MCU	Supply voltage range for the core domain during OTP operation	See <a href="#">Section 6.4</a>			V
VPP_CORE	Supply voltage range for the eFuse ROM domain during normal operation	N/A <sup>(2)</sup>			
	Supply voltage range for the eFuse ROM domain during OTP programming <sup>(1)</sup>	1.71	1.8	1.89	V
VPP_MCU	Supply voltage range for the eFuse ROM domain during normal operation	N/A <sup>(2)</sup>			
	Supply voltage range for the eFuse ROM domain during OTP programming <sup>(1)</sup>	1.71	1.8	1.89	V

- (1) Supply voltage range includes DC errors and peak-to-peak noise. TI power management solutions [TLV70718](#) from the TLV707x family meet the supply voltage range needed for VPP\_CORE and VPP\_MCU.
- (2) N/A stands for Not Applicable.

### 6.7.2 Hardware Requirements

The following hardware requirements must be met when programming keys in the OTP eFuses:

- The VPP\_CORE and VPP\_MCU power supplies must be disabled when not programming OTP registers.
- The VPP\_CORE and VPP\_MCU power supplies must be ramped up after the proper device power-up sequence (for more details, see [Section 6.10.2](#)).

### 6.7.3 Programming Sequence

Programming sequence for OTP eFuses:

- Power on the board per the power-up sequencing. No voltage should be applied on the VPP\_CORE and VPP\_MCU terminals during power up and normal operation.
- Load the OTP write software required to program the eFuse (contact your local TI representative for the OTP software package).
- Apply the voltage on the VPP\_CORE and VPP\_MCU terminals according to the specification in [Section 6.7.1](#).
- Run the software that programs the OTP registers.
- After validating the content of the OTP registers, remove the voltage from the VPP\_CORE and VPP\_MCU terminals.

### 6.7.4 Impact to Your Hardware Warranty

You recognize and accept at your own risk that your use of eFuse permanently alters the TI device. You acknowledge that eFuse can fail due to incorrect operating conditions or programming sequence. Such a failure may render the TI device inoperable and TI will be unable to confirm the TI device conformed to TI device specifications prior to the attempted eFuse. Consequently, TI will have no liability (*warranty or otherwise*) for any TI devices that have been incorrectly eFused by customers.

## 6.8 Thermal Resistance Characteristics

This section provides the thermal resistance characteristics used on this device.

For reliability and operability concerns, the maximum junction temperature of the device has to be at or below the  $T_J$  value identified in [Section 6.4, Recommended Operating Conditions](#).

### 6.8.1 Thermal Resistance Characteristics for ALF Package

It is recommended to perform thermal simulations at the system level with the worst case device power consumption.

NO.	PARAMETER	DESCRIPTION	ALF PACKAGE	
			°C/W <sup>(1) (3)</sup>	AIR FLOW (m/s) <sup>(2)</sup>
T1	$RO_{JC}$	Junction-to-case	0.25	N/A
T2	$RO_{JB}$	Junction-to-board	2.1	N/A
T3	$RO_{JA}$	Junction-to-free air	11.5	0
T4		Junction-to-moving air	7.4	1
T5			6.5	2
T6			6	3
T7	$\Psi_{JT}$	Junction-to-package top	0.1	0
T8			0.1	1
T9			0.1	2
T10			0.1	3
T11	$\Psi_{JB}$	Junction-to-board	1.6	0
T12			1.7	1
T13			1.6	2
T14			1.5	3

(1) These values are based on a JEDEC defined 2S2P system (with the exception of the Theta JC [ $RO_{JC}$ ] value, which is based on a JEDEC defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-6, *Integrated Circuit Thermal Test Method Environmental Conditions - Forced Convection (Moving Air)*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Packages*

(2) m/s = meters per second.

(3) °C/W = degrees Celsius per watt.

## 6.9 Temperature Sensor Characteristics

This section summarizes the Voltage and Temperature Module (VTM) on die temperature sensor characteristics.

For reliability and operability concerns, the maximum junction temperature of the device has to be at or below the  $T_J$  value identified in the *Recommended Operating Conditions*.

**Table 6-12. VTM Die Temperature sensor Characteristics**

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$T_{acc}$	VTM temperature sensor accuracy	-40 to 110 °C	-5		5	°C
		110 to 125 °C	-2		2	°C

## 6.10 Timing and Switching Characteristics

### Note

The default SLEWRATE settings in each pad configuration register must be used to ensure timings, unless specific instructions are given otherwise.

### 6.10.1 Timing Parameters and Information

The timing parameter symbols used in [Section 6.10](#) are created in accordance with JEDEC Standard 100. To shorten the symbols, some pin names and other related terminologies have been abbreviated in [Table 6-13](#):

**Table 6-13. Timing Parameters Subscripts**

SYMBOL	PARAMETER
c	Cycle time (period)
d	Delay time
dis	Disable time
en	Enable time
h	Hold time
su	Setup time
START	Start bit
t	Transition time
v	Valid time
w	Pulse duration (width)
X	Unknown, changing, or don't care level
F	Fall time
H	High
L	Low
R	Rise time
V	Valid
IV	Invalid
AE	Active Edge
FE	First Edge
LE	Last Edge
Z	High impedance

### 6.10.2 Power Supply Sequencing

This section describes power supply sequencing required to ensure proper device operation. The device can be operated using either an isolated or combined MCU & Main power distribution network (PDN). Two different primary power sequences are recommended based upon isolated and combined MCU & Main PDNs. In addition, the device can be operated in either MCU Only or DDR Retention low power modes. Two different desired device power supply sequences for entry and exit of low power modes are shown.

The power supply names used in this section are specific to this device and align to names given in the Signal Descriptions section. Common power supply names may be used across different devices within the Jacinto 7™ processor family. These common supply names will have very similar if not identical functions across devices.

All power sequencing timing diagrams shown will use the following terminology:

- Primary = Essential power sequences of all voltage domains between off and full active states.
- $V_{OPR\ MIN}$  = Minimum operational voltage level that ensures functionality as specified in Recommended Operating Conditions
- Ramp-up = start of a voltage supply transition time from off condition to  $V_{opr\ min}$ .
- Ramp-down = start of a voltage supply transition time from  $V_{opr}$  to off condition
- Supply\_“n” = multiple instances of similar power supplies (i.e.  $VDDSHV_n = VDDSHV_0, VDDSHV_1, VDDSHV_2 \dots VDDSHV_6$ )
- Supply\_“xxx” = multiple instances of similar power supplies used for different signal types (i.e.  $VDDA_{1P8\_xxx} = VDDA_{1P8\_DSITX}, VDDA_{1P8\_USB}, VDDA_{0P8\_DSITX}, VDDA_{0P8\_USB},$  etc.)
- Time stamps = “T#” markers with descriptions and approximate elapsed times for general reference. Specific timing transitions are dependent upon PDN design (see PDN User Guide for details).

#### 6.10.2.1 Power Supply Slew Rate Requirement

To maintain the safe operating range of the internal ESD protection devices, TI recommends limiting the maximum slew rate of supplies to be less than 100 mV/us, as shown in [Figure 6-2](#). For instance, a 1.8V supply should have a ramp time  $> 18 \mu s$  to ensure the slew rate  $< 100 mV/us$ .

[Figure 6-2](#) describes the Power Supply Slew Rate Requirement in the device.

**Figure 6-2. Power Supply Slew and Slew Rate**

#### 6.10.2.2 Combined MCU and Main Domains Power-Up Sequencing

[Figure 6-3](#) describes the primary power-up sequencing when similar MCU and Main voltage domains are combined into common power rails. Combining MCU and Main voltage domains simplifies PDN design by reducing total number of power rails and sources while making MCU and Main processor sub-systems operational dependent on common power rails. [Table 8-1](#) in [Section 8.1](#), *Power Supply Mapping* captures recommended device power supply groups to power rail mapping summary.

Figure 6-3. Combined MCU and Main Domains, Primary Power-Up Sequence

- Time Stamp Markers
  - T0 – 3.3V voltages start ramp-up to  $V_{OPR\ MIN}$ . (0ms)
  - T1 – 1.8V voltages start ramp-up to  $V_{OPR\ MIN}$ . (2ms)
  - T2 – Low voltage core supplies start ramp-up to  $V_{OPR\ MIN}$ . (3ms)
  - T3 – Low voltage RAM array voltages start ramp-up to  $V_{OPR\ MIN}$ . (4ms)
  - T4 – OSC1 is stable and PORz/MCU\_PORz are de-asserted to release processor from reset. (13ms)
- Any MCU or Main dual voltage IO supplies (VDDSHVn\_MCU or VDDSHVn) being supplied by 3.3V to support 3.3V digital interfaces. A few supplies could have varying start times between T0 to T1 due to PDN designs using different power resources with varying turn-on & ramp-up time delays.
- Any MCU or Main dual voltage IO supplies (VDDSHVn\_MCU or VDDSHVn) being supplied by 1.8V to support 1.8V digital interfaces. When eMMC memories are used, Main 1.8V supplies could have a ramp-up aligned to T3 due to PDN designs grouping supplies with VDD\_MMC0.
- VDDSHV5 supports MMC1 signaling for SD memory cards. If compliant high-speed SD card operation is needed, then an independent, dual voltage (3.3V/1.8V) power source and rail are required. The start of ramp-up to 3.3V will be same as other 3.3V domains as shown. If SD card is not needed or standard data

- rates with fixed 3.3V operation is acceptable, then domain can be grouped with digital IO 3.3V power rail. If a SD card is capable of operating with fixed 1.8V, then domain can be grouped with digital IO 1.8V power rail.
5. VDDA\_3P3\_USB is 3.3V analog domain used for USB 2.0 differential interface signaling. A low noise, analog supply is recommended to provide best signal integrity for USB data eye mask compliance. The start of ramp-up to 3.3V will be same as other 3.3V domains as shown. If USB interface is not needed or data bit errors can be tolerated, then domain can be grouped with 3.3V digital IO power rail either directly or through a supply filter.
  6. VDDA\_1P8\_<phy> are 1.8V analog domains supporting multiple serial PHY interfaces. A low noise, analog supply is recommended to provide best signal integrity, interface performance and spec compliance. If any of these interfaces are not needed, data bit errors or non-compliant operation can be tolerated, then domains can be grouped with digital IO 1.8V power rail either directly or through an in-line supply filter is allowed.
  7. VDD\_MMC0 is 1.8V digital supply supporting MMC0 signaling for eMMC interface. If MMC0 or eMMC0 interface is not needed, then domain can be grouped with digital IO 1.8V power rail with power up time stamp at T1. However, if MMC0 interface is needed, then VDD\_MMC0 must not start ramp-up until time stamp T3 after VDD\_CORE has reached  $V_{OPR\_MIN}$ . Any MCU or Main dual voltage IO operating at 1.8V can be grouped with VDD\_MMC0 into a common power rail with power up time stamp T3.
  8. VDD\_MCU is a digital voltage supply with a wide operational voltage range and power sequencing flexibility, enabling it to be grouped and ramped-up with either 0.8V VDD\_CORE at time stamp T2 or 0.85V RAM array domains (VDDAR\_xxx) at time stamp T3.
  9. VDDA\_1P8\_<clk/pll/ana> are 1.8V analog domains supporting clock oscillator, PLL and analog circuitry needing a low noise supply for optimal performance. It is not recommended to combine analog VDDA\_1P8\_<phy> domains or digital VDDSHVn\_MCU and VDDSHVn IO domains since high frequency switching noise could negatively impact jitter performance of clock, PLL and DLL signals.
  10. VDDA\_0P8\_<dll/pll> are 0.8V analog domains supporting PLL and DLL circuitry needing a low noise supply for optimal performance. It is not recommended to combine these domains with any other 0.8V domains since high frequency switching noise could negatively impact jitter performance of PLL and DLL signals.
  11. Minimum set-up and hold times shown with respect to MCU\_PORz and PORz asserting high to latch MCU\_BOOTMODEn (referenced to MCU\_VDDSHV0) and BOOTMODEn (reference to VDDSHV2) settings into registers during power up sequence.
  12. Minimum elapsed time from crystal oscillator circuitry being energized (VDDS\_OSC1 at T1) until stable clock frequency is reached depends upon on crystal oscillator, capacitor parameters and PCB parasitic values. A conservative 10ms elapsed time defined by (T4 – T1) time stamps is shown. This could be reduced depending upon customer's clock circuit (that is, crystal oscillator or clock generator) and PCB designs.

### 6.10.2.3 Combined MCU and Main Domains Power- Down Sequencing - Option 1

Figure 6-4 describes the device power-down sequencing for option 1.

Figure 6-4. Combined MCU and Main Domains, Primary Power-Down Sequence - Option 1

1. Time Stamp Markers

T0 – MCU\_PORz & PORz assert low to put all processor resources in safe state. (0ms)

T1 – Main DDR, SRAM Core & SRAM CPU power supplies start ramp-down. (0.5ms)

T2 – Low voltage core supplies start supply ramp-down. (2.5ms)

T3 - 1.8V voltages start supply ramp-down. (3.0ms)

T4 – 3.3V voltages start supply ramp-down. (3.5ms)

2. Any MCU or Main dual voltage IO supplies (VDDSHVn\_MCU or VDDSHVn) being supplied by 3.3V to support 3.3V digital interfaces

3. Any MCU or Main dual voltage IO supplies (VDDSHVn\_MCU or VDDSHVn) being supplied by 1.8V to support 1.8V digital interfaces. When eMMC memories are used, Main 1.8V supplies could have a ramp-down aligned to T1 due to PDN designs grouping supplies with VDD\_MMC0.

4. VDDSHV5 supports MMC1 signaling for SD memory cards. A dual voltage (3.3V/1.8V) power rail is required for compliant, high-speed SD card operations. If compliant highspeed SD card operation is needed, then an independent, dual voltage (3.3V/1.8V) power source and rail are required. The start of ramp-down from 3.3V/1.8V will be same as other 3.3V domains as shown. If SD card is not needed or standard data rates with fixed 3.3V operation is acceptable, then domain can be grouped with digital IO 3.3V power rail. If a SD card is capable of operating with fixed 1.8V, then domain can be grouped with digital IO 1.8V power rail.
5. VDDA\_3P3\_USB is 3.3V analog domain used for USB 2.0 differential interface signaling. A low noise, analog supply is recommended to provide best signal integrity for USB data eye mask compliance. The start of ramp-down from 3.3V will be same as other 3.3V domains as shown. If USB interface is not needed or data bit errors can be tolerated, then domain can be grouped with 3.3V digital IO power rail either directly or through a supply filter.
6. VDDA\_1P8\_<phy> are 1.8V analog domains supporting multiple serial PHY interfaces. A low noise, analog supply is recommended to provide best signal integrity, interface performance and spec compliance. If any of these interfaces are not needed, data bit errors or non-compliant operation can be tolerated, then domains can be grouped with digital IO 1.8V power rail either directly or through an in-line supply filter is allowed.
7. VDD\_MMC0 is 1.8V digital supply supporting MMC0 signaling for eMMC interface and must ramp-down at time stamp T1 before VDD\_CORE starts ramp-down. Any MCU or Main dual voltage IO operating at 1.8V can be grouped with VDD\_MMC0 into a common power rail with power down time stamp T1. If MMC0 or eMMC0 interface is not needed, then domain can be grouped with digital IO 1.8V power rail and ramp-down at time stamp T3.
8. VDD\_MCU is a digital voltage supply with a wide operational voltage range and power sequencing flexibility, enabling it to be grouped and ramped-down with either 0.8V VDD\_CORE at time stamp T2 or 0.85V RAM array domains (VDDAR\_xxx) at time stamp T1.
9. VDDA\_1P8\_<clk/pll/ana> are 1.8V analog domains supporting clock oscillator, PLL and analog circuitry needing a low noise supply for optimal performance. It is not recommended to combine analog VDDA\_1P8\_<phy> domains or digital VDDSHVn\_MCU and VDDSHVn IO domains since high frequency switching noise could negatively impact jitter performance of clock, PLL and DLL signals.
10. MCU\_PORz and PORz must be asserted low for  $T\Delta 1 = 200\mu\text{s}$  min to ensure SoC resources enter into safe state before any voltage begins to ramp down.

#### 6.10.2.4 Combined MCU and Main Domains Power- Down Sequencing - Option 2

Figure 6-5 describes the device power-down sequencing for option 2.

J7ES\_ELCH\_02

**Figure 6-5. Combined MCU and Main Domains, Primary Power-Down Sequence - Option 2**

1. Time Stamp Markers

T0 – MCU\_PORz & PORz assert low to put all processor resources in safe state. (0ms)

T1 – All power supplies start ramp-down. (1µs)

2. MCU\_PORz and PORz must be asserted low for  $T_{\Delta 1} = 200\mu\text{s}$  min to ensure SoC resources enter into safe state before any voltage begins to ramp down.

**6.10.2.5 Isolated MCU and Main Domains Power-Up Sequencing**

Isolated MCU and Main voltage domains enable an SoC's MCU and Main processor sub-systems to operate independently. There are 2 reasons an SoC's PDN design may need to support independent MCU and Main processor functionality. First is to provide flexibility to enable SoC low power modes that can significantly reduce SoC power dissipation when processor operations are not needed. Second is to enable robustness to gain freedom from interference (FFI) of a single fault impacting both MCU and Main processor sub-systems which

is especially beneficial if using the SoC's MCU as the system safety monitoring processor. The number of additional PDN power rails needed is dependent upon number of different MCU IO signaling voltage levels. If only 1.8V IO signaling is used, the only 2 additional power rails could be required. If both 1.8 and 3.3V IO signaling is desired, then 4 additional power rails could be needed. Table 8-2 in Section 8.1, Power Supply Mapping captures recommended device power supplies to power rail mapping summary.

**Figure 6-6. Isolated MCU and Main Domains, Primary Power-Up Sequence**

1. Time Stamp Markers

- T0 – 3.3V voltages start ramp-up to  $V_{OPR\ MIN}$ . (0ms)
- T1 – 1.8V voltages start ramp-up to  $V_{OPR\ MIN}$ . (2ms)
- T2 – Low voltage core supplies start ramp-up to  $V_{OPR\ MIN}$ . (3ms)

T3 – Low voltage RAM array voltages start ramp-up to  $V_{OPR\ MIN}$ . (4ms)

T4 – OSC1 is stable and PORz/MCU\_PORz are de-asserted to release processor from reset. (13ms)

2. Any MCU or Main dual voltage IO supplies (VDDSHVn\_MCU or VDDSHVn) being supplied by 3.3V to support 3.3V digital interfaces. A few supplies could have varying start times between T0 to T1 due to PDN designs using different power resources with varying turn-on & ramp-up time delays.
3. Any MCU or Main dual voltage IO supplies (VDDSHVn\_MCU or VDDSHVn) being supplied by 1.8V to support 1.8V digital interfaces. When eMMC memories are used, Main 1.8V supplies could have delayed start times that aligns to T3 due to PDN designs grouping supplies with VDD\_MMC0.
4. VDDSHV5 supports MMC1 signaling for SD memory cards. If compliant UHS-I SD card operation is needed, then an independent, dual voltage (3.3V/1.8V) power source and rail are required. The start of ramp-up to 3.3V will be same as other 3.3V domains as shown. If SD card is not needed or standard data rates with fixed 3.3V operation is acceptable, then supply can be grouped with digital IO 3.3V power rail. If a SD card is capable of operating with fixed 1.8V, then supply can be grouped with digital IO 1.8V power rail.
5. VDDA\_3P3\_USB is 3.3V analog supply used for USB 2.0 differential interface signaling. A low noise, analog supply is recommended to provide best signal integrity for USB data eye mask compliance. The start of ramp-up to 3.3V will be same as other 3.3V domains as shown. If USB interface is not needed or data bit errors can be tolerated, then supply can be grouped with 3.3V digital IO power rail either directly or through a supply filter.
6. VDDA\_1P8\_<phy> are 1.8V analog supplies supporting multiple serial PHY interfaces. A low noise, analog supply is recommended to provide best signal integrity, interface performance and spec compliance. If any of these interfaces are not needed, data bit errors or non-compliant operation can be tolerated, then supplies can be grouped with digital IO 1.8V power rail either directly or through an in-line supply filter is allowed.
7. VDD\_MMC0 is 1.8V digital supply supporting MMC0 signaling for eMMC interface and must ramp up at time stamp T3. Any MCU or Main dual voltage IO operating at 1.8V can be grouped with VDD\_MMC0 into a common power rail with a ramp-up at time stamp T3. If MMC0 or eMMC0 interface is not needed, then domain can be grouped with digital IO 1.8V power rail with ramp-up at time stamp T1.
8. VDD\_MCU is a digital voltage supply with a wide operational voltage range and power sequencing flexibility, enabling it to be grouped and ramped-up with either 0.8V VDD\_CORE at time stamp T2 or 0.85V RAM array domains (VDDAR\_xxx) at time stamp T3.
9. VDDA\_1P8\_<clk/pll/ana> are 1.8V analog supplies supporting clock oscillator, PLL and analog circuitry needing a low noise supply for optimal performance. It is not recommended to combine analog VDDA\_1P8\_<phy> domains or digital VDDSHVn\_MCU and VDDSHVn IO domains since high frequency switching noise could negatively impact jitter performance of clock, PLL and DLL signals.
10. VDDA\_0P8\_<dll/pll> are 0.8V analog supplies supporting PLL and DLL circuitry needing a low noise supply for optimal performance. It is not recommended to combine these domains with any other 0.8V domains since high frequency switching noise could negatively impact jitter performance of PLL and DLL signals.
11. Minimum set-up and hold times shown with respect to MCU\_PORz and PORz asserting high to latch MCU\_BOOTMODEn (referenced to MCU\_VDDSHV0) and BOOTMODEn (reference to VDDSHV2) settings into registers during power up sequence.

**6.10.2.8 Entry and Exit of MCU Only State**

Entry into MCU Only lower power state is accomplished by executing a power down sequence except for the 4 MCU supply groups (VDDSHVx\_MCU at 3.3V, VDDSHVx\_MCU at 1.8V, VDDA\_MCU\_PLLGRP0/VDDA\_MCU\_TEMP analog supplies at 1.8V, VDD\_MCU/VDDAR\_MCU at 0.85V) that remain energized. Exit from MCU Only state is accomplished by executing a power up sequence with the 4 MCU supply groups

remaining energized throughout the sequence. The example diagram shown is for an Isolated MCU & Main PDN type with eMMC support.

**Figure 6-9. Entry and Exit of MCU Only Sequencing**

**6.10.2.9 Entry and Exit of DDR Retention State**

Entry into DDR Retention (Suspend-to-RAM or S2R) state is accomplished by executing a power down sequence except for the 1 device DDR supply group (VDDS\_DDR\_BIAS, VDDS\_DDR, and VDDS\_DDR\_C at 1.1V), and 1 additional discrete SDRAM supply (VDD\_LPDDR4\_1V8 at 1.8V; not shown in diagram below) that remain energized. Exit from DDR Retention state is accomplished by executing a power up sequence with these 2 DDR supply groups remaining energized throughout the sequence. The example diagram shown is for an Isolated MCU & Main PDN type with eMMC support.

### 6.10.4 Clock Specifications

#### 6.10.4.1 Input and Output Clocks / Oscillators

Various external clock inputs/outputs are needed to drive the device. Summary of these input clock signals is as follows:

- OSC1\_XO/OSC1\_XI — External main crystal interface pins connected to internal oscillator which sources reference clock and provides reference clock to PLLs within MAIN domain. Also, for audio applications, high-frequency oscillator 0 is used to provide audio clock frequencies to MCASPs.
- High frequency oscillators inputs
  - OSC1\_XO/OSC1\_XI — external main crystal interface pins connected to internal oscillator which sources reference clock. Provides reference clock to PLLs within MCU domain and MAIN domain. This high-frequency oscillator is used to provide audio clock frequencies to MCASPs.
  - WKUP\_OSC0\_XO/WKUP\_OSC0\_XI — external main crystal interface pins connected to internal oscillator which sources reference clock. Provides reference clock to PLLs within WKUP and MAIN domain.
- Low frequency oscillator input
  - WKUP\_LFOSC\_XO/WKUP\_LFOSC\_XI — external main crystal interface pins connected to internal oscillator which sources reference clock provides a clock for low power operation in deeper sleep modes.
- General purpose clock inputs
  - MCU\_EXT\_REFCLK0 — optional external. Provides system clock input (MCU domain).
  - EXT\_REFCLK1 — optional external System clock input (MAIN domain). Optionally PLL2 (PER1) and MCASP can be sourced by EXT\_REFCLK1 (sourced externally).
  - SERDES4\_REFCLK\_P/N — SerDes reference clock input for PCIe or Optional USB3 and SGMII interfaces.
  - PCIE\_REFCLK[3:0]N/P — There are 4 differential clock input/output pins to support PCIe devices.
- External video pixel clock inputs
  - VOUT0\_EXTCLKIN — optional for the DPI0 port of DSS.
  - VOUT1\_EXTCLKIN — optional for the DPI1 port of DSS.
- External CPTS reference clock inputs

- MCU\_CPTS\_RFT\_CLK — CPTS reference clock inputs for MCU\_CPTS\_RFT\_CLK.
- CPTS\_RFT\_CLK — CPTS reference clock inputs for CPTS\_RFT\_CLK.
- External audio reference clock input/output pins
  - AUDIO\_EXT\_REFCLK0
  - AUDIO\_EXT\_REFCLK1
  - AUDIO\_EXT\_REFCLK2
  - AUDIO\_EXT\_REFCLK3

The vendors are equipped to determine what load capacitors will best tune their resonator/crystal to the microcontroller device for optimum startup and operation over temperature/voltage extremes.

**Figure 6-26. WKUP\_OSC0 Start-up Time**

**6.10.4.1.1.1 Load Capacitance**

The crystal circuit must be designed such that it applies the appropriate capacitive load to the crystal, as defined by the crystal manufacturer. The capacitive load,  $C_L$ , of this circuit is a combination of discrete capacitors  $C_{L1}$ ,  $C_{L2}$ , and several parasitic contributions. PCB signal traces which connect crystal circuit components to WKUP\_OSC0\_XI and WKUP\_OSC0\_XO have parasitic capacitance to ground,  $C_{PCBXI}$  and  $C_{PCBXO}$ , where the PCB designer should be able to extract parasitic capacitance for each signal trace. The WKUP\_OSC0 circuits and device package have combined parasitic capacitance to ground,  $C_{PCBXI}$  and  $C_{PCBXO}$ , where these parasitic capacitance values are defined in [Table 6-33](#).

**Figure 6-27. Load Capacitance**

Load capacitors,  $C_{L1}$  and  $C_{L2}$  in [Figure 6-25](#), should be chosen such that the below equation is satisfied.  $C_L$  in the equation is the load specified by the crystal manufacturer.

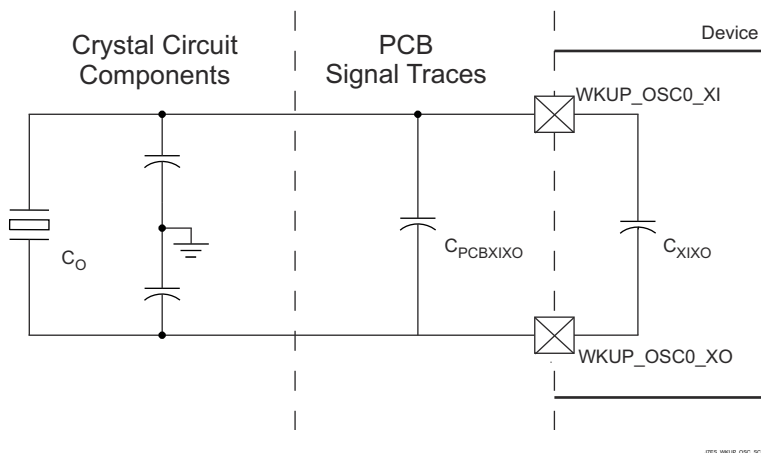

$$C_L = [(C_{L1} + C_{PCBXI} + C_{XI}) \times (C_{L2} + C_{PCBXO} + C_{XO})] / [(C_{L1} + C_{PCBXI} + C_{XI}) + (C_{L2} + C_{PCBXO} + C_{XO})]$$

To determine the value of  $C_{L1}$  and  $C_{L2}$ , multiply the capacitive load value  $C_L$  by 2. Using this result, subtract the combined values of  $C_{PCBXI} + C_{XI}$  to determine the value of  $C_{L1}$  and the combined values of  $C_{PCBXO} + C_{XO}$  to determine the value of  $C_{L2}$ . For example, if  $C_L = 10$  pF,  $C_{PCBXI} = 2.9$  pF,  $C_{XI} = 0.5$  pF,  $C_{PCBXO} = 3.7$  pF,  $C_{XO} = 0.5$  pF, the value of  $C_{L1} = [(2C_L) - (C_{PCBXI} + C_{XI})] = [(2 \times 10 \text{ pF}) - 2.9 \text{ pF} - 0.5 \text{ pF}] = 16.6$  pF and  $C_{L2} = [(2C_L) - (C_{PCBXO} + C_{XO})] = [(2 \times 10 \text{ pF}) - 3.7 \text{ pF} - 0.5 \text{ pF}] = 15.8$  pF

#### 6.10.4.1.1.2 Shunt Capacitance

The crystal circuit must also be designed such that it does not exceed the maximum shunt capacitance for WKUP\_OSC0 operating conditions defined in Table 6-32. Shunt capacitance,  $C_{shunt}$ , of the crystal circuit is a combination of crystal shunt capacitance and parasitic contributions. PCB signal traces which connect crystal circuit components to WKUP\_OSC0 have mutual parasitic capacitance to each other,  $C_{PCBXIXO}$ , where the PCB designer should be able to extract mutual parasitic capacitance between these signal traces. The device package also has mutual parasitic capacitance,  $C_{XIXO}$ , where this mutual parasitic capacitance value is defined in Table 6-33.

PCB routing should be designed to minimize mutual capacitance between XI and XO signal traces. This is typically done by keeping signal traces short and not routing them in close proximity. Mutual capacitance can also be minimized by placing a ground trace between these signals when the layout requires them to be routed in close proximity. It is important to minimize the mutual capacitance on the PCB to provide as much margin as possible when selecting a crystal.

**Figure 6-28. Shunt Capacitance**

A crystal should be chosen such that the below equation is satisfied.  $C_O$  in the equation is the maximum shunt capacitance specified by the crystal manufacturer.

$$C_{shunt} \geq C_O + C_{PCBXIXO} + C_{XIXO}$$

For example, the equation would be satisfied when the crystal being used is 25 MHz with an ESR = 30  $\Omega$ ,  $C_{PCBXIXO} = 0.04$  pF,  $C_{XIXO} = 0.01$  pF, and shunt capacitance of the crystal is less than or equal to 6.95 pF.

#### 6.10.4.1.2 WKUP\_OSC0 LVC MOS Digital Clock Source

Figure 6-29 shows the recommended oscillator connections when WKUP\_OSC0\_XI is connected to a 1.8-V LVC MOS square-wave digital clock source.

#### Note

A DC steady-state condition is not allowed on WKUP\_OSC0\_XI when the oscillator is powered up. This is not allowed because WKUP\_OSC0\_XI is internally AC coupled to a comparator that may enter an unknown state when DC is applied to the input. Therefore, application software should power down WKUP\_OSC0 any time WKUP\_OSC0\_XI is not toggling between logic states.

#### 6.10.4.1.3.1 Load Capacitance

The crystal circuit must be designed such that it applies the appropriate capacitive load to the crystal, as defined by the crystal manufacturer. The capacitive load,  $C_L$ , of this circuit is a combination of discrete capacitors  $C_{L1}$ ,  $C_{L2}$ , and several parasitic contributions. PCB signal traces which connect crystal circuit components to OSC1\_XI and OSC1\_XO have parasitic capacitance to ground,  $C_{PCBXI}$  and  $C_{PCBXO}$ , where the PCB designer should be able to extract parasitic capacitance for each signal trace. The OSC1 circuits and device package have combined parasitic capacitance to ground,  $C_{PCBXI}$  and  $C_{PCBXO}$ , where these parasitic capacitance values are defined in Table 6-35.

Figure 6-32. Load Capacitance

Load capacitors,  $C_{L1}$  and  $C_{L2}$  in Figure 6-30, should be chosen such that the below equation is satisfied.  $C_L$  in the equation is the load specified by the crystal manufacturer.

$$C_L = [(C_{L1} + C_{PCBXI} + C_{XI}) \times (C_{L2} + C_{PCBXO} + C_{XO})] / [(C_{L1} + C_{PCBXI} + C_{XI}) + (C_{L2} + C_{PCBXO} + C_{XO})]$$

To determine the value of  $C_{L1}$  and  $C_{L2}$ , multiply the capacitive load value  $C_L$  by 2. Using this result, subtract the combined values of  $C_{PCBXI} + C_{XI}$  to determine the value of  $C_{L1}$  and the combined values of  $C_{PCBXO} + C_{XO}$  to determine the value of  $C_{L2}$ . For example, if  $C_L = 10$  pF,  $C_{PCBXI} = 2.9$  pF,  $C_{XI} = 0.5$  pF,  $C_{PCBXO} = 3.7$  pF,  $C_{XO} = 0.5$  pF, the value of  $C_{L1} = [(2C_L) - (C_{PCBXI} + C_{XI})] = [(2 \times 10 \text{ pF}) - 2.9 \text{ pF} - 0.5 \text{ pF}] = 16.6$  pF and  $C_{L2} = [(2C_L) - (C_{PCBXO} + C_{XO})] = [(2 \times 10 \text{ pF}) - 3.7 \text{ pF} - 0.5 \text{ pF}] = 15.8$  pF

#### 6.10.4.1.3.2 Shunt Capacitance

The crystal circuit must also be designed such that it does not exceed the maximum shunt capacitance for OSC1 operating conditions defined in Table 6-34. Shunt capacitance,  $C_{shunt}$ , of the crystal circuit is a combination of crystal shunt capacitance and parasitic contributions. PCB signal traces which connect crystal circuit components to OSC1 have mutual parasitic capacitance to each other,  $C_{PCBXIXO}$ , where the PCB designer should be able to extract mutual parasitic capacitance between these signal traces. The device package also has mutual parasitic capacitance,  $C_{XIXO}$ , where this mutual parasitic capacitance value is defined in Table 6-35.

PCB routing should be designed to minimize mutual capacitance between XI and XO signal traces. This is typically done by keeping signal traces short and not routing them in close proximity. Mutual capacitance can also be minimized by placing a ground trace between these signals when the layout requires them to be routed in close proximity. It is important to minimize the mutual capacitance on the PCB to provide as much margin as possible when selecting a crystal.

**Figure 6-33. Shunt Capacitance**

A crystal should be chosen such that the below equation is satisfied.  $C_O$  in the equation is the maximum shunt capacitance specified by the crystal manufacturer.

$$C_{shunt} \geq C_O + C_{PCBXIXO} + C_{XIXO}$$

For example, the equation would be satisfied when the crystal being used is 25 MHz with an ESR = 30  $\Omega$ ,  $C_{PCBXIXO} = 0.04$  pF,  $C_{XIXO} = 0.01$  pF, and shunt capacitance of the crystal is less than or equal to 6.95 pF.

#### 6.10.4.1.4 Auxiliary OSC1 LVCMOS Digital Clock Source

Figure 6-34 shows the recommended oscillator connections when OSC1 is connected to a 1.8-V LVCMOS square-wave digital clock source.

#### Note

A DC steady-state condition is not allowed on OSC1\_XI when the oscillator is powered up. This is not allowed because OSC1\_XI is internally AC coupled to a comparator that may enter a unknown state when DC is applied to the input. Therefore, application software should power down OSC1 any time OSC1\_XI is not toggling between logic states.

**Figure 6-34. 1.8-V LVCMOS-Compatible Clock Input**

#### 6.10.4.1.5 Auxiliary OSC1 Not Used

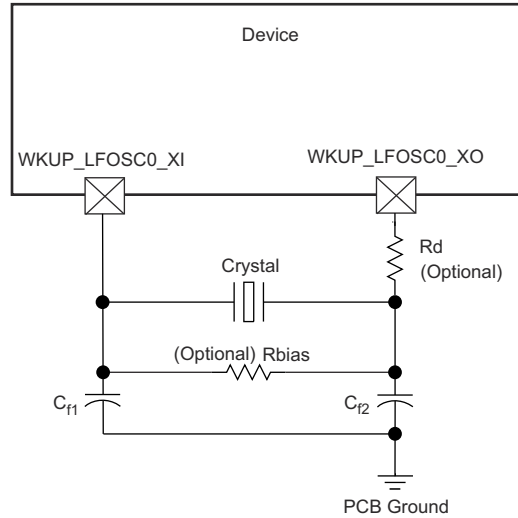

Figure 6-35 shows the recommended oscillator connections when OSC1 is not used. OSC1\_XI must be connected to VSS through an external pull resistor ( $R_{pd}$ ) to ensure this input is held to a valid low level when unused since the internal pull-down resistor is disabled by default.

**Figure 6-35. OSC1 Not Used**

#### 6.10.4.1.6 WKUP\_LFOSC0 Internal Oscillator Clock Source

Figure 6-36 shows the recommended crystal circuit. It is recommended that preproduction printed-circuit board (PCB) designs include the two optional resistors  $R_{bias}$  and  $R_d$  in case they are required for proper oscillator operation when combined with production crystal circuit components. In most cases,  $R_{bias}$  is not required and  $R_d$  is a 0- $\Omega$  resistor. These resistors may be removed from production PCB designs after evaluating oscillator performance with production crystal circuit components installed on preproduction PCBs.

**Figure 6-36. WKUP\_LFOSC0 Crystal Implementation**

Table 6-36 presents LFXOSC modes of operation.

**Table 6-36. LFXOSC Modes of Operation**

MODE	BP_C	PD_C	XI	XO	CLK_OUT	DESCRIPTION
ACTIVE	0	0	XTAL	XTAL	CLK_OUT	Active oscillator mode providing 32kHz
PWRDN	0	1	X	PD	LOW	Output will be pulled down to LOW. PAD to be tri-stated. Active mode disabled
BYPASS	1	0	CLK	PD	CLK	XI is driven by external clock source. XO is pulled down to LOW. Due to ESD diode to supply, XI should not be driven unless oscillator supply is present.

**Note**

User should set CTRLMMR\_WKUP\_LFXOSC\_TRIM[18:16] i\_mult = 3b'001 for CL in the range 6pf to 9.5pf. CTRLMMR\_WKUP\_LFXOSC\_TRIM [18:16] i\_mult = 3b'010 for CL in the range 8.5pf to 12pf. Default setting is 3b'010.

**Note**

The load capacitors,  $C_{f1}$  and  $C_{f2}$  in Figure 6-37, should be chosen such that the below equation is satisfied.  $C_L$  in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator WKUP\_LFOSC0\_XI, WKUP\_LFOSC0\_XO, and VSS pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

#### 6.10.4.2 Output Clocks

The device provides several system clock outputs. Summary of these output clocks are as follows:

- **MCU\_CLKOUT0**
  - Reference clock output for Ethernet PHYs (50 MHz or 25 MHz)
- **MCU\_SYSCLKOUT0**
  - SYSCLK0 of WKUP\_PLLCTRL0 is divided by 6 and then sent out of the device as a LVCMOS clock signal (MCU\_SYSCLKOUT0). This signal can be used to test if the main chip clock is functioning or not.
- **MCU\_OBSCLK0**
  - On the clock output MCU\_OBSCLK0, oscillators and PLLs clocks can be observed for tests and debug.
- **SYSCLKOUT0**
  - SYSCLK0 from the MAIN\_PLL controller is divided by 6 and then sent out of the device as a LVCMOS clock signal (SYSCLKOUT0). This signal can be used to test if the main chip clock is functioning or not.
- **CLKOUT**
  - Reference clock output
- **OBSCLK[2:0]**
  - On the clock output OBSCLK0, oscillators and PLLs clocks can be observed for tests and debug.

### 6.10.4.3 PLLs

Power is supplied to the Phase-Locked Loop circuitries (PLLs) by internal regulators that derive power from the off-chip power-supply.

There are total of three PLLs in the device in WKUP and MCU domains:

- MCU\_PLL0 (MCU R5FSS PLL) with WKUP\_PLLCTRL0
- MCU\_PLL1 (MCU PERIPHERAL PLL)
- MCU\_PLL2 (MCU CPSW PLL)

There are total of twenty PLLs in the device in MAIN domain:

- PLL0 (MAIN PLL) with PLLCTRL0
- PLL1 (PER0 PLL)
- PLL2 (PER1 PLL)
- PLL3 (CPSW9G PLL)
- PLL4 (AUDIO0 PLL)
- PLL5 (VIDEO PLL)
- PLL6 (GPU PLL)
- PLL7 (C7x PLL)
- PLL8 (ARM0 PLL)
- PLL12 (DDR PLL)
- PLL13 (C66 PLL)
- PLL14 (R5F PLL)
- PLL15 (AUDIO1 PLL)
- PLL16 (DSS PLL0)
- PLL17 (DSS PLL1)
- PLL18 (DSS PLL2)
- PLL19 (DSS PLL3)
- PLL23 (DSS PLL7)
- PLL24 (MLB PLL)
- PLL25 (VISION PLL)

#### Note

The input reference clock (OSC1\_XI/OSC1\_XO) is specified and the lock time is ensured by the PLL controller, as documented in the *Device Configuration* chapter in the device TRM.

### 6.10.4.4 Module and Peripheral Clocks Frequencies

[Section 6.10.5, Peripherals](#) section documents the maximum frequency associated with the peripheral clocks of the device.

For more details on the clocking structure of each module, reference *Device Configurations* chapter in the device TRM.

## 6.10.5 Peripherals

### 6.10.5.1 ATL

The device contains ATL module that can be used for asynchronous sample rate conversion of audio. The ATL calculates the error between two time bases, such as audio syncs, and optionally generates an averaged clock using cycle stealing via software.

#### Note

For more information about ATL, see *Audio Tracking Logic (ATL)* section in *Peripherals* chapter in the device TRM.

Table 6-39 represents ATL timing conditions.

**Table 6-39. ATL Timing Conditions**

PARAMETER		MODE	MIN	MAX	UNIT
<b>INPUT CONDITIONS</b>					
SR <sub>i</sub>	Input slew rate	External reference CLK	0.5	5	V/ns
<b>OUTPUT CONDITIONS</b>					
C <sub>L</sub>	Output load capacitance	Internal reference CLK	1	10	pF

Section 6.10.5.1.1, Section 6.10.5.1.2, Section 6.10.5.1.3, and Section 6.10.5.1.4 present timing requirements and switching characteristics for ATL.

#### 6.10.5.1.1 ATL\_PCLK Timing Requirements

NO.	PARAMETER		MODE	MIN	MAX	UNIT
D1	t <sub>c(pclk)</sub>	Cycle time, ATL_PCLK	External reference CLK	5		ns

			100Mbps	1		ns
			1000Mbps	1		ns

- A. RGMII\_RXC must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. RGMII\_RXD[3:0] carries data bits 3-0 on the rising edge of RGMII\_RXC and data bits 7-4 on the falling edge of RGMII\_RXC. Similarly, RGMII\_RXCTL carries RXDV on rising edge of RGMII\_RXC and RXERR on falling edge of RGMII\_RXC.

6.10.5.3.3.4 RGMII[x]\_TD[3:0], and RGMII[x]\_TX\_CTL Switching Characteristics – RGMII Mode

see Figure 6-48

NO.	PARAMETER		MODE	MIN	MAX	UNIT
RGMII9	$t_{osu(tdV-txcV)}$	Output setup time, RGMII[x]_TD[3:0] valid to RGMII[x]_TXC transition	10Mbps	1.2		ns
			100Mbps	1.2		ns
			1000Mbps	1.05		ns
	$t_{osu(tx_ctlV-txcV)}$	Output setup time, RGMII[x]_TX_CTL valid to RGMII[x]_TXC transition	10Mbps	1.2		ns
			100Mbps	1.2		ns
			1000Mbps	1.05		ns
RGMII10	$t_{oh(tdV-txcV)}$	Output hold time, RGMII[x]_TD[3:0] valid after RGMII[x]_TXC transition	10Mbps	1.2		ns
			100Mbps	1.2		ns
			1000Mbps	1.05		ns
	$t_{oh(tx_ctlV-txcV)}$	Output hold time, RGMII[x]_TX_CTL valid after RGMII[x]_TXC transition	10Mbps	1.2		ns
			100Mbps	1.2		ns
			1000Mbps	1.05		ns

- A. TXC is delayed internally before being driven to the RGMII[x]\_TXC pin. This internal delay is always enabled.
- B. Data and control information is received using both edges of the clocks. RGMII\_TD[3:0] carries data bits 3-0 on the rising edge of RGMII\_TXC and data bits 7-4 on the falling edge of RGMII\_TXC. Similarly, RGMII\_TX\_CTL carries TXDV on rising edge of RGMII\_TXC and RTXERR on falling edge of RGMII\_TXC.

- A. RGMII\_RXC must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. RGMII\_RXD[3:0] carries data bits 3-0 on the rising edge of RGMII\_RXC and data bits 7-4 on the falling edge of RGMII\_RXC. Similarly, RGMII\_RXCTL carries RXDV on rising edge of RGMII\_RXC and RXERR on falling edge of RGMII\_RXC.

- A. TXC is delayed internally before being driven to the RGMII[x]\_TXC pin. This internal delay is always enabled.
- B. Data and control information is received using both edges of the clocks. RGMII\_TD[3:0] carries data bits 3-0 on the rising edge of RGMII\_TXC and data bits 7-4 on the falling edge of RGMII\_TXC. Similarly, RGMII\_TX\_CTL carries TXDV on rising edge of RGMII\_TXC and RTXERR on falling edge of RGMII\_TXC.

**6.10.5.5 CSI-2**

**Note**

For more information, see the Camera Streaming Interface Receiver (CSI\_RX\_IF) chapter in the device TRM.

The CSI\_RX\_IF deals with the processing of the pixel data coming from an external image sensor and data from memory. It is a key component for the following multimedia applications: camera viewfinder, video record, and still image capture.

The CSI\_RX\_IF has a primary serial interface (CSI-2 port) compliant with the MIPI D-PHY RX specification v1.2 and the MIPI CSI-2 specification v1.3, with 4 differential data lanes plus 1 differential clock lane in synchronous mode, double data rate. Refer to the specification for timing details.

- 2.5 Gbps (1.25 GHz) for each lane.

#### 6.10.5.6 DDRSS

For more details about features and additional description information on the device LPDDR4 Memory Interfaces, see the corresponding sections within [Section 5.3, Signal Descriptions](#) and [Section 7, Detailed Description](#).

The device has dedicated interface to LPDDR4. It supports JEDEC JESD209-4B standard compliant LPDDR4 SDRAM devices with the following features:

- 32-bit data path to external SDRAM memory
- Memory device capacity: Up to 8GB address space available over two chip selects (4GB per rank)
- No support for byte mode, or memories with more than 17 row address bits

[Table 6-52](#) and [Figure 6-55](#) present switching characteristics for DDRSS.

#### 6.10.5.8 eCAP

The supported features by the device ECAP are:

- 32-bit time base counter
- 4-event time-stamp registers (each 32 bits)
- Independent edge polarity selection for up to four sequenced time-stamp capture events
- Interrupt capabilities on any of the four capture events
- Input capture signal pre-scaling (from 1 to 16)
- Support of different capture modes (single shot capture, continuous mode capture, absolute timestamp capture or difference mode time-stamp capture)

Table 6-56 represents ECAP timing conditions.

**Table 6-56. ECAP Timing Conditions**

PARAMETER		MIN	MAX	UNIT

### 6.10.5.9 EPWM

The supported features by the device EPWM are:

- Dedicated 16-bit time-base counter with period and frequency control
- Two independent PWM outputs which can be used in different configurations (with single-edge operation, with dual-edge symmetric operation or one independent PWM output with dual-edge asymmetric operation)
- Asynchronous override control of PWM signals during fault conditions
- Programmable phase-control support for lag or lead operation relative to other EPWM modules
- Dead-band generation with independent rising and falling edge delay control
- Programmable trip zone allocation of both latched and un-latched fault conditions
- Events enabling to trigger both CPU interrupts and start of ADC conversions

Table 6-57 represents EPWM timing conditions.

#### 6.10.5.10 eQEP

The supported features by the device eQEP are:

- Input Synchronization
- Three Stage/Six Stage Digital Noise Filter
- Quadrature Decoder Unit
- Position Counter and Control unit for position measurement
- Quadrature Edge Capture unit for low speed measurement
- Unit Time base for speed/frequency measurement
- Watchdog Timer for detecting stalls

**6.10.5.11 GPIO**

The device has ten instances of GPIO modules. The GPIO modules are integrated in three groups.

- Group one: WKUP\_GPIO0 and WKUP\_GPIO1
- Group two: GPIO0, GPIO2, GPIO4, and GPIO6
- Group three: GPIO1, GPIO3, GPIO5, and GPIO7

Within each group, exactly one module is selected to control the corresponding I/O pins and pin interrupts.

The GPIO pins are grouped into banks (16 pins per bank), which means that each GPIO module provides up to 144 dedicated general-purpose pins with input and output capabilities; thus, the general-purpose interface supports up to 432 (3 instances × (9 banks × 16 pins)) pins. Since WKUP\_GPIOu\_[84:143] (u = 0, 1), GPIO<sub>n</sub>\_[128:143] (n = 0, 2, 4, 6), and GPIO<sub>m</sub>\_[36:143] (m = 1, 3, 5, 7) are reserved in this device, general purpose interface supports up to 248 I/O pins.

For more details about features and additional description information on the device General-Purpose Interface, see the corresponding sections within [Section 5.3, Signal Descriptions](#) and [Section 7, Detailed Description](#).

**Note**

The general-purpose input/output i (i = 0 to 1) is also referred to as GPIOi.

(1) In GPMC\_WAIT[j], j is equal to 0, 1, 2, or 3.

(2) Wait monitoring support is limited to a WaitMonitoringTime value > 0. For a full description of wait monitoring feature, see *General-Purpose Memory Controller (GPMC)* section in the device TRM.

(3) For div\_by\_1\_mode:

- GPMC\_CONFIG1\_i Register: GPMCFCLKDIVIDER = 0h:
  - GPMC\_CLK frequency = GPMC\_FCLK frequency
- GPMC\_CONFIG1\_i Register: GPMCFCLKDIVIDER = 1h to 3h:
  - GPMC\_CLK frequency = GPMC\_FCLK frequency / (2 to 4)

(4) For 100 MHz:

- CTRLMMR\_GPMC\_CLKSEL[1-0] CLK\_SEL = 01 = MAIN\_PLL2\_HSDIV1\_CLKOUT / 3

For 133 MHz:

- CTRLMMR\_GPMC\_CLKSEL[1-0] CLK\_SEL = 00 = MAIN\_PLL0\_HSDIV3\_CLKOUT

FA20 <sup>(2)</sup>	t <sub>acc1-pgmode(d)</sub>	Page mode successive data access time	div_by_1_mode		P <sup>(4)</sup>	ns
FA21 <sup>(3)</sup>	t <sub>acc2-pgmode(d)</sub>	Page mode first data access time	div_by_1_mode		H <sup>(5)</sup>	ns

- (1) The FA5 parameter illustrates the amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data is internally sampled by active functional clock edge. FA5 value must be stored inside the AccessTime register bit field.
- (2) The FA20 parameter illustrates amount of time required to internally sample successive input page data. It is expressed in number of GPMC functional clock cycles. After each access to input page data, next input page data is internally sampled by active functional clock edge after FA20 functional clock cycles. The FA20 value must be stored in the PageBurstAccessTime register bit field.
- (3) The FA21 parameter illustrates amount of time required to internally sample first input page data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, first input page data is internally sampled by active functional clock edge. FA21 value must be stored inside the AccessTime register bit field.

- (4) P = PageBurstAccessTime × (TimeParaGranularity + 1) × GPMC\_FCLK<sup>(6)</sup>
- (5) H = AccessTime × (TimeParaGranularity + 1) × GPMC\_FCLK<sup>(6)</sup>
- (6) GPMC\_FCLK is general-purpose memory controller internal functional clock period in ns.

### 6.10.5.12.3 GPMC and NAND Flash — Asynchronous Mode

Section 6.10.5.12.3.1 and Section 6.10.5.12.3.2 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-76 through Figure 6-79).

#### 6.10.5.12.3.1 GPMC and NAND Flash Timing Requirements – Asynchronous Mode

NO.	PARAMETER	MODE <sup>(4)</sup>	MIN	MAX	UNIT
			133 MHz <sup>(5)</sup>		
GNF12 <sup>(1)</sup>	t <sub>acc(d)</sub> Access time, input data GPMC_AD[15:0] <sup>(3)</sup> div_by_1_mode;		J <sup>(2)</sup>		ns

(1) The GNF12 parameter illustrates the amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of the read cycle and after GNF12 functional clock cycles, input data is internally sampled by the active functional clock edge. The GNF12 value must be stored inside AccessTime register bit field.

(2)  $J = \text{AccessTime} \times (\text{TimeParaGranularity} + 1) \times \text{GPMC\_FCLK}^{(3)}$

(3) GPMC\_FCLK is general-purpose memory controller internal functional clock period in ns.

(4) For div\_by\_1\_mode:

- GPMC\_CONFIG1\_i Register: GPMCFCLKDIVIDER = 0h;  
– GPMC\_CLK frequency = GPMC\_FCLK frequency

(5) For 133 MHz:

- CTRLMMR\_GPMC\_CLKSEL[1-0] CLK\_SEL = 00 = MAIN\_PLL0\_HSDIV3\_CLKOUT

### 6.10.5.13 HyperBus

For more details about features and additional description information on the device HyperBus, see the corresponding sections within [Section 5.3, Signal Descriptions](#) and [Section 7, Detailed Description](#).

Section 6.10.5.13.1, Section 6.10.5.13.2, and Section 6.10.5.13.3 assume testing over the recommended operating conditions and electrical characteristic conditions (see Figure 6-80, Figure 6-81, and Figure 6-82).

Table 6-62 represents HyperBus timing conditions.

**Table 6-62. HyperBus Timing Conditions**

PARAMETER	DESCRIPTION	MIN	MAX	UNIT
<b>INPUT CONDITIONS</b>				
$SR_i$	Input slew rate	2	5	V/ns
<b>OUTPUT CONDITIONS</b>				
$C_L$	Output load capacitance	1.5	10	pF
<b>PCB CONNECTIVITY REQUIREMENTS</b>				
$t_d$ (Trace Mismatch Delay)	Propagation delay mismatch between traces	CK and CKn; RWDS and DQ[7:0]	10	ps
		CK/CKn and RWDS; CK/CKn and CSn	200	ps
		CK/CKn and DQ[7:0]	35	ps

#### 6.10.5.14 I2C

The Inter-IC module is compliant with the Philips I2C Bus Specification, revision 2.1. Refer to the specification for timing details for all but rise/fall time parameters.

Philips I2C specification rise/fall timings apply only to MCU\_I2C0, WKUP\_I2C0, and I2C[0-1]. All other instances of I2C use standard LVCMOS buffers to emulate open-drain buffers, and their rise/fall times should be referenced using the device IBIS model.

For more details about features and additional description information on the device Inter-Integrated Circuit, see the corresponding sections within [Section 5.3, Signal Descriptions](#) and [Section 7, Detailed Description](#).

### 6.10.5.15 I3C

### 6.10.5.16 MCAN

For more details about features and additional description information on the device Controller Area Network Interface, see the corresponding sections within [Section 5.3, Signal Descriptions](#) and [Section 7, Detailed Description](#).

#### Note

The device has multiple MCAN modules. MCANn is a generic prefix applied to MCAN signal names, where n represents the specific MCAN module.

**Table 6-68. MCAN Timing Conditions**

PARAMETER		MIN	MAX	UNIT
<b>INPUT CONDITIONS</b>				
SR <sub>i</sub>	Input slew rate	2	15	V/ns

### 6.10.5.18 MCSPI

For more details about features and additional description information on the device Serial Port Interface, see the corresponding sections within [Section 5.3, Signal Descriptions](#) and [Section 7, Detailed Description](#).

For more information, see *Multichannel Serial Peripheral Interface (MCSPI)* section in *Peripherals* chapter in the device TRM.

[Table 6-73](#) represents MCSPI timing conditions.

#### Note

The IO timings provided in this section are applicable for all combinations of signals for MCU\_SPI0 and MCU\_SPI1. However, the timings are only valid for MCU\_SPI0 and MCU\_SPI1 if signals within a single IOSET are used. The IOSETs are defined in the [Table 6-78](#) and [Table 6-79](#) tables.

#### 6.10.5.19 MMCSd

The MMCSd Host Controller provides an interface to embedded Multi-Media Card (MMC), Secure Digital (SD), and Secure Digital IO (SDIO) devices. The MMCSd Host Controller deals with MMC/SD/SDIO protocol at transmission level, data packing, adding cyclic redundancy checks (CRCs), start/end bit insertion, and checking for syntactical correctness.

For more details about MMCSd interfaces, see the corresponding MMC0, MMC1, and MMC2 sections within *Signal Descriptions* and *Detailed Description*.

#### Note

Some operating modes require software configuration of the MMC DLL delay settings, as shown in [Table 6-80](#) and [Table 6-90](#).

For more information, see *Multi-Media Card/Secure Digital (MMCSd) Interface* section in *Peripherals* chapter in the device TRM.

#### 6.10.5.19.1 MMC0 - eMMC Interface

MMC0 interface is compliant with the JEDEC eMMC electrical standard v5.1 (JESD84-B51) and it supports the following eMMC applications:

- Legacy speed
- High speed SDR
- High speed DDR
- HS200

[Table 6-80](#) presents the required DLL software configuration settings for MMC0 timing modes.

**6.10.5.19.2 MMC1/2 - SD/SDIO Interface**

MMC1 and MMC2 interfaces are compliant with the SD Host Controller Standard Specification 4.10 and SD Physical Layer Specification v3.01 as well as SDIO Specification v3.00 and they support the following SD Card applications:

- Default speed
- High speed
- UHS-I SDR12
- UHS-I SDR25
- UHS-I SDR50
- UHS-I SDR104

- UHS-I DDR50

- The JTAG signals are split across two IO power domains on the device. Timings parameters defined in this table only apply when the two IO power domains are operating at the same voltage. Values for these timing parameters are not defined when operating the two IO power domains at different voltages since propagation delay through the device IO buffers differ when some are operating at 1.8V while others are operating at 3.3V. This effectively reduces timing margin beyond the values defined in this table. The JTAG interface is still expected to function when the two IO power domains are operated at different voltages, assuming the system designer has implemented appropriate level shifters and the operating frequency is reduced to accommodate additional delay inserted by the level-shifters and IO buffers operating at different voltages.

## 7 Detailed Description

### 7.1 Overview

The TDA4VM processor family is based on the evolutionary Jacinto 7 architecture, targeted at ADAS and Autonomous Vehicle (AV) applications and built on extensive market knowledge accumulated over a decade of TI's leadership in the ADAS processor market. The TDA4VM provides high performance compute for both traditional and deep learning algorithms at industry leading power/performance ratios with a high level of system integration to enable scalability and lower costs for advanced automotive platforms supporting multiple sensor modalities in centralized ECUs or stand-alone sensors. Key cores include next generation DSP with scalar and vector cores, dedicated deep learning and traditional algorithm accelerators, latest Arm and GPU processors for general compute, an integrated next generation imaging subsystem (ISP), video codec, Ethernet hub and isolated MCU island. All protected by automotive grade safety and security hardware accelerators.

## 7.2 Processor Subsystems

### 7.2.1 Arm Cortex-A72

The device implements one dual-core Arm® Cortex®-A72 MPU, which is integrated inside the Compute Cluster, along with other modules. The Cortex-A72 cores are general-purpose processors that can be used for running customer applications.

The A72SS is built around the Arm Cortex-A72 MPCore (A72 cluster), which is provided by Arm and configured by TI. It is based on the symmetric multiprocessor (SMP) architecture, and thus it delivers high performance and optimal power management and debug capabilities.

The A72 processor is a multi-issue out-of-order superscalar execution engine with integrated L1 instruction and data caches, compatible with Armv8-A architecture. The Armv8-A architecture brings a number of new features. These include 64-bit data processing, extended virtual addressing and 64-bit general purpose registers.

For more information, see *Dual-A72 MPU Subsystem* section in *Processors and Accelerators* chapter in the device TRM.

### 7.2.2 Arm Cortex-R5F

The MCU\_ARMSS is a dual-core implementation of the Arm® Cortex®-R5F processor configured for split/lock operation. It also includes accompanying memories (L1 caches and tightly-coupled memories), standard Arm® CoreSight™ debug and trace architecture, integrated Vectored Interrupt Manager (VIM), ECC Aggregators, and various wrappers for protocol conversion and address translation for easy integration into the SoC.

For more information, see *Dual-R5F MCU Subsystem* section in *Processors and Accelerators* chapter in the device TRM.

### 7.2.3 DSP C71x

The TMS320C71x is the next-generation fixed and floating-point DSP platform. The C71x DSP is a new core in the Texas Instruments' DSP family. The C71x DSP supports vector signal processing, providing significant lift in DSP processing power over a broad range of general signal processing tasks in comparison to the C6x DSP family. In addition, the C71x provides several specialized functions which accelerate targeted functions by more than 30 times. Besides expanding vector processing capabilities, the new C71x core also incorporates advanced techniques to improve control code efficiency and ease of programming such as branch prediction, protected pipeline, precise exception and virtual memory management.

For more information, see *C71x DSP Subsystem* section in *Processors and Accelerators* chapter in the device TRM.

### 7.2.4 DSP C66x

The C66x subsystem is based on the TI's standard TMS320C66x DSP CorePac module. It includes subsystem logic to ease the C66x CorePac integration into the SoC, while maximizing software reuse from previous devices.

The C66x DSP extends the performance of the C64x+ and C674x DSPs through enhancements and new features. Many of the new features target increased performance for vector processing. The C64x+ and C674x DSPs support 2-way SIMD operations for 16-bit data and 4-way SIMD operations for 8-bit data. On C66x DSP, the vector processing capability is improved by extending the width of the SIMD instructions.

The C66x DSP can execute instructions that operate on 128-bit vectors. For example, the QMPY32 instruction is able to perform the element-to-element multiplication between two vectors of four 32-bit data each. The C66x DSP also supports SIMD for floating-point operations. Improved vector processing capability (each instruction can process multiple data in parallel) combined with the natural instruction level parallelism of C6000 architecture (for example, execution of up to eight instructions per cycle) results in a very high level of parallelism that can be exploited by DSP programmers through the use of TI's optimized C/C++ compiler.

For more information, see *C66x DSP Subsystem* section in *Processors and Accelerators* chapter in the device TRM.

## 7.3 Accelerators and Coprocessors

### 7.3.1 GPU

The Graphics Processing Unit (GPU) accelerates 3-dimensional (3D) and 2-dimensional (2D) graphics and compute applications.

The GPU module is a scalable architecture which efficiently processes a number of different workload concurrently:

- 3D Graphic Workload, which involves vertex data and pixel data processing for rendering of 3D scenes.
- 2D Graphic Workload, which involves pixel data processing for rendering 2D objects.
- Compute Applications Workload, which involves general purpose data processing.

For more information, see *Graphics Accelerator (GPU)* section in *Processors and Accelerators* chapter in the device TRM.

### 7.3.2 VPAC

The Vision Pre-processing Accelerator (VPAC) is a set of common vision primitive functions, performing memory-to-memory (M2M) pixel data processing tasks, such as: color processing and enhancement, noise filtering, wide dynamic range (WDR) processing, lens distortion correction, pixel remap for dewarping, on-the-fly scale generation, on-the-fly pyramid generation. The VPAC offloads these common tasks from the main SoC processors (ARM, DSP, etc.), so these CPUs can be utilized for differentiated high-level algorithms. The VPAC is designed to support multiple cameras by working in time-multiplexing mode. The VPAC works as front end to vision processing and prepares frame/scales for further processing by other vision accelerators or processor cores in the SoC.

For more information, see *Vision Pre-processing Accelerator (VPAC)* section in *Processors and Accelerators* chapter in the device TRM.

### 7.3.3 DMPAC

The Depth and Motion Perception Accelerator (DMPAC) is a power efficient hardware accelerator that computes dense stereo depth maps (*depth*) and dense optical flow vectors (*motion*) from camera inputs.

The image/video sensor-based environmental perception (also known as scene understanding) is at the core of many emerging applications in automotive, industrial and consumer electronics. Typically, this involves detection of all objects in the scene along with their 3D position and motion with regards to the observer or the car by analyzing one or many related input video streams. Various computer vision algorithms are used to achieve these tasks.

A very robust method of obtaining the 3D depth from images is to use two cameras in a stereo setup - two cameras with known relative positions and camera parameters. The two images of the same scene, captured from two different camera poses/perspectives, are analyzed to find disparities among every pixel positions in the images. This is known as the Stereo Disparity map. The disparity values of every pixel can be used to obtain the 3D positions of the object/space they belong to via triangulation.

On the other hand, by analyzing two images from a single camera, captured at two different time instances (that is, two temporal frames in a video), one can determine where each pixel in a past frame moved to in the future frame. This is known as the Optical Flow vector. The flow vectors for each pixel position can be used to obtain 3D structure of the scene, identify moving objects and determine their relative speed and direction of motion.

The DMPAC is dedicated to the aforesaid image processing tasks. The stereo and optical flow processing is partitioned into two top level sub-blocks: the Dense Optical Flow (DOF) engine and the Stereo Disparity Engine (SDE). The DOF and SDE blocks share a common shared local memory, DMA, external messaging and control infrastructure.

For more information, see *Depth and Motion Perception Accelerator (DMPAC)* section in *Processors and Accelerators* chapter in the device TRM.

### **7.3.4 D5520MP2**

The DECODER module is a D5520MP2 dual-core PowerVR® VPU (video processor unit).

The D5520MP2 is capable of supporting:

- 1x 4kp60 decode or
- 2x 4kp30 decodes or
- 4x 1080p60 decodes or
- 8x 1080p30 decodes

For more information, see *Multi-Standard HD Video Decoder (D5520MP2)* section in *Processors and Accelerators* chapter in the device TRM.

### **7.3.5 VXE384MP2**

The ENCODER module is a VXE384MP2 core PowerVR® VPU (video processor unit).

The VXE384MP2 is capable of supporting:

- 1x 1080p60 video stream encoding or
- 2x or 3x 1080p30 video stream encodings

For more information, see *Multi-Standard HD Video Encoder (VXE384MP2)* section in *Processors and Accelerators* chapter in the device TRM.

## 7.4 Other Subsystems

### 7.4.1 MSMC

The Multicore Shared Memory Controller (MSMC) forms the heart of the compute cluster (COMPUTE\_CLUSTER0) providing high-bandwidth resource access both to and from all of the connected processing elements and the rest of the system. MSMC serves as the data-movement backbone of the compute cluster.

For more information, see *Multicore Shared Memory Controller (MSMC)* section in *Device Configuration* chapter in the device TRM.

### 7.4.2 NAVSS

#### 7.4.2.1 NAVSS0

Main SoC Navigator Subsystem (NAVSS0) consists of DMA/Queue Management components – UDMA and Ring Accelerator (UDMASS), Peripherals (Module subsystem [MODSS]), Virtualization translation (VirtSS), and a North Bridge (NBSS).

#### 7.4.2.2 MCU\_NAVSS

MCU Navigator Subsystem (MCU NAVSS) has a subset of the modules of the main NAVSS and is instantiated in the MCU domain.

MCU Navigator Subsystem consists of DMA/Queue Management components – UDMA and Ring Accelerator (UDMASS), and Peripherals (Module subsystem [MODSS]).

For more information, see *Main Navigator Subsystem (NAVSS)* and *MCU Navigator Subsystem (MCU NAVSS)* sections in the device TRM.

### 7.4.3 PDMA Controller

The Peripheral DMA is a simple DMA which has been architected to specifically meet the data transfer needs of peripherals, which perform data transfers using memory mapped registers accessed via a standard non-coherent bus fabric. The PDMA module is intended to be located close to one or more peripherals which require an external DMA for data movement and is architected to reduce cost by using VBUSP interfaces and supporting only statically configured Transfer Request (TR) operations.

The PDMA is only responsible for performing the data movement transactions which interact with the peripherals themselves. Data which is read from a given peripheral is packed by a PDMA source channel into a PSI-L data stream which is then sent to a remote peer UDMA-P destination channel which then performs the movement of the data into memory. Likewise, a remote UDMA-P source channel fetches data from memory and transfers it to a peer PDMA destination channel over PSI-L which then performs the writes to the peripheral.

The PDMA architecture is intentionally heterogeneous (UDMA-P + PDMA) to right size the data transfer complexity at each point in the system to match the requirements of whatever is being transferred to or from. Peripherals are typically FIFO based and do not require multi-dimensional transfers beyond their FIFO dimensioning requirements, so the PDMA transfer engines are kept simple with only a few dimensions (typically for sample size and FIFO depth), hardcoded address maps, and simple triggering capabilities.

Multiple source and destination channels are provided within the PDMA which allow multiple simultaneous transfer operations to be ongoing. The DMA controller maintains state information for each of the channels and employs round-robin scheduling between channels in order to share the underlying DMA hardware.

For more information, see *PDMA Controller* section in *DMA Controllers* chapter in the device TRM.

### 7.4.4 Power Supply

The device requires 6 power supply types and 1 internal LDO connection type, see *Power Supply Signal Descriptions*:

- Digital IO Voltages
- Digital Low Voltages

- Digital AVS Voltage
- Analog PHY & CLK Voltages
- Analog Low Voltages
- Efuse Programming Voltages
- LDO Bulk Filter Capacitors

Common device power supply input types can be grouped together into power rails. All power rails must be supplied by power resources designed to support the most stringent power supply voltage specification and total load current demands. Two recommended Power Distribution Networks (PDNs) have been defined that either combine or isolate MCU and Main domains, (refer to [Section 8.1](#), *Power Supply Mapping*).

It is possible that a few power supply inputs may not be needed in some systems. In such cases, all unused supply inputs, other than VPP\_CORE & VPP\_MCU, must be connected to a valid power rail with a proper voltage level in order to ensure device reliability (refer to [Section 6.4](#), *Recommended Operating Conditions*). The following examples are given for reference:

1. If MCU Island safety monitor or MCU Only low power processing are not used, then VDD\_MCU supply can be combined with the VDD\_CORE supply with compatible operating voltage specification.
2. If UHS-I SD Card or USB2.0 interface is not needed, then VDDSHV5 (MMC1 interface) and VDDA\_USB\_3P3 (USB PHY interface) can be combined with VDD\_IO\_3V3 digital IO power rail.
3. If General Purpose device type is used, then Efuse programming voltages VPP\_CORE & VPP\_MCU are not needed and should be left unconnected.

## 7.4.5 Peripherals

### 7.4.5.1 ADC

The Analog-to-Digital Converter (ADC) module contains a single 12-bit ADC which can be multiplexed to any 1 of 8 analog inputs (channels).

For more information, see *Analog-to-Digital Converter (ADC)* section in *Peripherals* chapter in the device TRM.

### 7.4.5.2 ATL

The Audio Tracking Logic (ATL) is used by HD Radio™ applications to synchronize the digital audio output to the baseband clock. This same IP can also be used generically to track errors between two reference signals (such as frame syncs) and generate a modulated clock output (using software-controlled cycle stealing) which averages to some desired frequency. This process can be used as a hardware assist for asynchronous sample rate conversion algorithms.

For more information, see *Audio Tracking Logic (ATL)* section in *Peripherals* chapter in the device TRM.

### 7.4.5.3 CSI

#### 7.4.5.3.1 Camera Streaming Interface Receiver (CSI\_RX\_IF) and MIPI DPHY Receiver (DPHY\_RX)

The integration of the CSI\_RX\_IF module allows the device to stream video inputs from multiple cameras to the image processing accelerator (VPAC) or to internal memory. The video input may also be retransmitted via the transmitter CSI (CSI\_TX\_IF) for debug and test purposes.

For more information, see *Camera Streaming Interface (CSI)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.3.2 Camera Streaming Interface Transmitter (CSI\_TX\_IF)

The integration of the CSI\_TX\_IF module allows the device to stream out video data from memory, or retransmit from the CSI receivers as an optional loopback output for diagnostics, debug, and test purposes.

For more information, see *Camera Streaming Interface (CSI)* section in *Peripherals* chapter in the device TRM.

### 7.4.5.4 CPSW2G

The two-port Gigabit Ethernet MAC (MCU\_CPSW0) subsystem provides Ethernet packet communication for the device and is configured in a similar manner as an Ethernet switch. MCU\_CPSW0 features the Reduced Gigabit

Media Independent Interface (RGMI), Reduced Media Independent Interface (RMII), and the Management Data Input/Output (MDIO) interface for physical layer device (PHY) management.

For more information, see *Gigabit Ethernet Switch (CPSW0)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.5 CPSW9G

The 9-port Gigabit Ethernet Switch (CPSW0) subsystem provides Ethernet packet communication for the device and can be configured as an Ethernet switch. CPSW0 features the Serial Gigabit Media Independent Interface (SGMI), Reduced Gigabit Media Independent Interface (RGMI), Reduced Media Independent Interface (RMII) and the Management Data Input/Output (MDIO) interface for physical layer device (PHY) management.

For more information, see *Gigabit Ethernet Switch (MCU\_CPSW0)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.6 DCC

The Dual Clock Comparator (DCC) is used to determine the accuracy of a clock signal during the time execution of an application. Specifically, the DCC is designed to detect drifts from the expected clock frequency. The desired accuracy can be programmed based on calculation for each application. The DCC measures the frequency of a selectable clock source using another input clock as a reference.

For more information, see *Dual Clock Comparator (DCC)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.7 DDRSS

The DDR subsystem in this device comprises DDR controller, DDR PHY and wrapper logic to integrate these blocks in the device. The DDR subsystem is referred to as DDRSS0 and is used to provide an interface to external SDRAM devices which can be utilized for storing program or data. DDRSS0 is accessed via MSMC, and not directly through the system interconnect.

For more information, see *DDR Subsystem (DDRSS)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.8 DSS

The DSS is a flexible composition-enabled display subsystem, that supports multiple high resolution display outputs. It consists of one Display Controller (DISPC) and one Frame Buffer Decompression Core (FBDC). The DISPC supports a multi-layer blending and transparency for each of its display outputs. The DISPC also supports a write-back pipeline with scaling to enable memory-to-memory composition and/or to capture a display output for Ethernet video encoding.

For more information, see *Display Subsystem (DSS)* section in *Peripherals* chapter in the device TRM.

##### 7.4.5.8.1 DSI

The MIPI DSI v1.3.1 Controller (DSITX) implements the stream arbitration and low-level protocol layer functionalities required by MIPI DSI 1.3 standard. It supports up to 4 x 2.5 Gbps D-PHY data lanes in a single-link configuration and handles the byte lane mapping per use case (1, 2, 3, or 4-lanes). The accompanying DSI (Physical Layer) D-PHY module (DPHYTX) provides the video output interfacing by implementing a four-lane MIPI D-PHY transmitter.

For more information, see *Display Subsystem (DSS) and Display Peripherals* section in *Peripherals* chapter in the device TRM.

##### 7.4.5.8.2 eDP

The VESA DP1.4/eDP1.4 Compliant Transmitter Host Controller (EDP) can output up to 4 video streams (through Multiple Stream Transport / MST) and one audio stream through the 4-lane accompanying SerDes module. It provides up to 25.92 Gbps of application bandwidth. An additional eDP (Physical Layer) auxiliary PHY (AUXPHY) module implements a doubly-terminated differential pair required for 1 Mbps data rates over a long (15m) cable.

For more information, see *Display Subsystem (DSS) and Display Peripherals* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.9 VPFE

The Video Processing Front End (VPFE) is an input interface module that receives raw (unprocessed) image/video data or YUV digital video data from external imaging peripherals (such as image sensors, video decoders, etc) and performs DMA transfers to store the captured data in the system DDR memory.

For more information, see *Video Processing Front End (VPFE)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.10 eCAP

The enhanced Capture (ECAP) module can be used for:

- Sample rate measurements of audio inputs
- Speed measurements of rotating machinery (for example, toothed sprockets sensed via Hall sensors)
- Elapsed time measurements between position sensor pulses
- Period and duty cycle measurements of pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors.

For more information, see *Enhanced Capture (ECAP) Module* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.11 EPWM

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention. It needs to be highly programmable and very flexible while being easy to understand and use. The EPWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the EPWM is built up from smaller single channel modules with separate resources and that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand its operation quickly.

In the further description the letter x within a signal or module name is used to indicate a generic EPWM instance on a device. For example, output signals EPWMxA and EPWMxB refer to the output signals from the EPWM\_x instance. Thus, EPWM1A and EPWM1B belong to EPWM1, EPWM2A and EPWM2B belong to EPWM2, and so forth.

Additionally, the EPWM integration allows this synchronization scheme to be extended to the capture peripheral modules (ECAP). The number of modules is device-dependent and based on target application needs. Modules can also operate stand-alone.

For more information, see *Enhanced Pulse Width Modulation (EPWM) Module* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.12 ELM

The Error Location Module (ELM) is used with the GPMC. Syndrome polynomials generated on-the-fly when reading a NAND flash page and stored in GPMC registers are passed to the ELM. A host processor can then correct the data block by flipping the bits to which the ELM error-location outputs point.

When reading from NAND flash memories, some level of error-correction is required. In the case of NAND modules with no internal correction capability, sometimes referred to as *bare NANDs*, the correction process is delegated to the memory controller. ELM can be also used to support parallel NOR flash or NAND flash.

For more information, see *Error Location Module (ELM)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.13 ESM

The Error Signaling Module (ESM) aggregates safety-related events and/or errors from throughout the device into one location. It can signal both low and high priority interrupts to a processor to deal with a safety event and/or manipulate an I/O error pin to signal an external hardware that an error has occurred. Therefore an external controller is able to reset the device or keep the system in safe, known state.

For more information, see *Error Signaling Module (ESM)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.14 eQEP

The Enhanced Quadrature Encoder Pulse (EQEP) peripheral is used for direct interface with a linear or rotary incremental encoder to get position, direction and speed information from a rotating machine for use in high performance motion and position control system. The disk of an incremental encoder is patterned with a single track of slots patterns. These slots create an alternating pattern of dark and light lines. The disk count is defined as the number of dark/light line pairs that occur per revolution (lines per revolution). As a rule, a second track is added to generate a signal that occurs once per revolution (index signal: QEPI), which can be used to indicate an absolute position. Encoder manufacturers identify the index pulse using different terms such as index, marker, home position and zero reference.

For more information, see *Enhanced Quadrature Encoder Pulse (EQEP) Module* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.15 GPIO

The General-Purpose Input/Output (GPIO) peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs. When configured as an output, the user can write to an internal register to control the state driven on the output pin. When configured as an input, user can obtain the state of the input by reading the state of an internal register.

In addition, the GPIO peripheral can produce host CPU interrupts and DMA synchronization events in different interrupt/event generation modes.

For more information, see *General-Purpose Interface (GPIO)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.16 GPMC

The General-Purpose Memory Controller is a unified memory controller dedicated for interfacing with external memory devices like:

- Asynchronous SRAM-like memories and application-specific integrated circuit (ASIC) devices
- Asynchronous, synchronous, and page mode (available only in non-multiplexed mode) burst NOR flash devices
- NAND flash
- Pseudo-SRAM devices

For more information, see *General-Purpose Memory Controller (GPMC)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.17 Hyperbus

The Hyperbus module is a part of the device Flash Subsystem (FSS).

The Hyperbus module is low pin count memory interface that provides high read/write performance. The Hyperbus module connects to hyperbus memory (HyperFlash or HyperRAM) and uses simple hyperbus protocol for read and write transactions.

There is one Hyperbus™ module inside the device. The Hyperbus module includes one Hyperbus Memory Controller (HBMC).

For more information, see *Hyperbus Interface* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.18 I2C

The device contains ten multimaster Inter-Integrated Circuit (I2C) controllers each of which provides an interface between a local host (LH), such as an Arm or a Digital Signal Processor (DSP), and any I<sup>2</sup>C-bus-compatible device that connects via the I<sup>2</sup>C serial bus. External components attached to the I<sup>2</sup>C bus can serially transmit and receive up to 8 bits of data to and from the LH device through the 2-wire I<sup>2</sup>C interface.

Each multimaster I2C module can be configured to act like a slave or master I<sup>2</sup>C-compatible device.

The WKUP\_I2C0, MCU\_I2C0, I2C0, and I2C1 controllers have dedicated I<sup>2</sup>C compliant open drain buffers, and support high speed mode (up to 3.4 Mbps in 1.8 V mode and up to 400 kbps in 3.3 V mode). The MCU\_I2C1,

I2C2, I2C3, I2C4, I2C5, and I2C6 controllers are multiplexed with standard LVCMOS I/O, connected to emulate open drain, and support fast mode (up to 400 kbps in 1.8 V/3.3 V mode). The I2C emulation is achieved by configuring the LVCMOS buffers to output Hi-Z instead of driving high when transmitting logic 1.

For more information, see *Inter-Integrated Circuit (I2C) Interface* section in *Peripherals* chapter in the device TRM.

#### **7.4.5.19 I3C**

The device contains three Improved Inter-Integrated Circuit (I3C) controllers each of which provides an interface between a local host (LH), such as an Arm, and any I3C-bus-compatible device that connects via the I3C serial bus.

For more information, see *Improved Inter-Integrated Circuit (I3C) Interface* section in *Peripherals* chapter in the device TRM.

#### **7.4.5.20 MCAN**

The Controller Area Network (CAN) is a serial communications protocol which efficiently supports distributed real-time control. CAN has high immunity to electrical interference. In a CAN network, many short messages are broadcast to the entire network, which provides for data consistency in every node of the system.

The MCAN module supports both classic CAN and CAN FD (CAN with Flexible Data-Rate) specifications. CAN FD feature allows high throughput and increased payload per data frame. The classic CAN and CAN FD devices can coexist on the same network without any conflict.

For more information, see *Modular Controller Area Network (MCAN)* section in *Peripherals* chapter in the device TRM.

#### **7.4.5.21 MCASP**

The MCASP functions as a general-purpose audio serial port are optimized to the requirements of various audio applications. The MCASP module can operate in both transmit and receive modes. The MCASP is useful for time-division multiplexed (TDM) stream, Inter-IC Sound (I2S) protocols reception and transmission as well as for an inter-component digital audio interface transmission (DIT). The MCASP has the flexibility to gluelessly connect to a Sony/Philips digital interface (S/PDIF) transmit physical layer component.

Although inter-component digital audio interface reception (DIR) mode (this is, S/PDIF stream receiving) is not natively supported by the MCASP module, a specific TDM mode implementation for the MCASP receivers allows an easy connection to external DIR components (for example, S/PDIF to I2S format converters).

For more information, see *Multichannel Audio Serial Port (MCASP)* section in *Peripherals* chapter in the device TRM.

#### **7.4.5.22 MCRC Controller**

VBUSM CRC controller is a module which is used to perform CRC (Cyclic Redundancy Check) to verify the integrity of a memory system. A signature representing the contents of the memory is obtained when the contents of the memory are read into MCRC Controller. The responsibility of MCRC controller is to calculate the signature for a set of data and then compare the calculated signature value against a predetermined good signature value. MCRC controller provides four channels to perform CRC calculation on multiple memories in parallel and can be used on any memory system. Channel 1 can also be put into data trace mode, where MCRC controller compresses each data being read through CPU read data bus.

For more information, see *MCRC Controller* section in *Interprocessor Communication* chapter in the device TRM.

#### **7.4.5.23 MCSPI**

The MCSPI module is a multichannel transmit/receive, master/slave synchronous serial bus.

There are total of eleven MCSPI modules in the device.

For more information, see *Multichannel Serial Peripheral Interface (MCSPi)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.24 MMC/SD

The MMCSd Host Controller provides an interface to eMMC 5.1 (embedded MultiMedia Card), SD 4.10 (Secure Digital), and SDIO 4.0 (Secure Digital IO) devices. The MMCSd Host Controller deals with MMC/SD/SDIO protocol at transmission level, data packing, adding cyclic redundancy checks (CRCs), start/end bit insertion, and checking for syntactical correctness.

For more information, see *Multimedia Card/Secure Digital (MMC/SD) Interface* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.25 OSPI

The Octal Serial Peripheral Interface (OSPI) module is a kind of Serial Peripheral Interface (SPI) module which allows single, dual, quad or octal read and write access to external flash devices. This module has a memory mapped register interface, which provides a direct memory interface for accessing data from external flash devices, simplifying software requirements.

The OSPI module is used to transfer data, either in a memory mapped direct mode (for example a processor wishing to execute code directly from external flash memory), or in an indirect mode where the module is set-up to silently perform some requested operation, signalling its completion via interrupts or status registers. For indirect operations, data is transferred between system memory and external flash memory via an internal SRAM which is loaded for writes and unloaded for reads by a device master at low latency system speeds. Interrupts or status registers are used to identify the specific times at which this SRAM should be accessed using user programmable configuration registers.

For more information, see *Octal Serial Peripheral Interface (OSPI)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.26 PCIE

The Peripheral Component Interconnect Express (PCIe) subsystem is built around a multi-lane dual-mode PCIe controller that provides low pin-count, high reliability, and high-speed data transfers at rates of up to 8.0 Gbps per lane for serial links on backplanes and printed wiring boards.

For more information, see *Peripheral Component Interconnect Express (PCIe) Subsystem* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.27 SerDes

SerDes's goal is to convert device (SoC) parallel data into serialized data that can be output over a high-speed electrical interface. In the opposite direction, SerDes converts high-speed serial data into parallel data that can be processed by the device. To this end, the SerDes contains a variety of functional blocks to handle both the external analog interface as well as the internal digital logic.

For more information, see *Serializer/Deserializer (SerDes)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.28 WWDT

The Windowed Watchdog Timer provides timer functionality for operating systems and for benchmarking code. The module incorporates several counters, which define the timebases needed for scheduling in the operating system. The module is implemented with an RTI module, but only WWDT is supported.

This module is specifically designed to fulfill the requirements for OSEK (“Offene Systeme und deren Schnittstellen für die Elektronik im Kraftfahrzeug”; “Open Systems and the Corresponding Interfaces for Automotive Electronics”) as well as OSEK/Time compliant operating systems.

For more information, see *Real Time Interrupt (RTI) Module* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.29 Timers

All timers include specific functions to generate accurate tick interrupts to the operating system.

Each timer can be clocked from several different independent clocks. The selection of clock source is made from registers in the MCU\_CTRL\_MMR0/CTRL\_MMR0.

In the MCU domain the device provides 10 timer pins to be used as MCU Timer Capture inputs or as MCU Timer PWM outputs. In order to provide maximum flexibility, these 10 pins may be used with any of MCU\_TIMER0 through MCU\_TIMER9 instances. System level muxes are used to control the capture source pin for each MCU\_TIMER[9-0] and the MCU\_TIMER[9-0] source for each MCU\_TIMER\_IO[1-0] PWM output.

In the MAIN domain the device provides 8 timer pins to be used as Timer Capture inputs or as Timer PWM outputs. For maximum flexibility, these 8 pins may be used with any of TIMER0 through TIMER19 instances. System level muxes are used to control the capture source pin for each TIMER[19-0] and the TIMER[19-0] source for each TIMER\_IO[7-0] PWM output.

Each odd numbered timer instance from each of the domains may be optionally cascaded with the previous even numbered timer instance from the same domain to form up to a 64-bit timer. For example, TIMER1 may be cascaded to TIMER0, MCU\_TIMER1 may be cascaded to MCU\_TIMER0, etc.

When cascaded, TIMER<sub>i</sub> acts as a 32-bit prescaler to TIMER<sub>i+1</sub>, as well as MCU\_TIMER<sub>n</sub> acts as a 32-bit prescaler to MCU\_TIMER<sub>n+1</sub>. TIMER<sub>i</sub> / MCU\_TIMER<sub>n</sub> must be configured to generate a PWM output edge at the desired rate to increment the TIMER<sub>i+1</sub> / MCU\_TIMER<sub>n+1</sub> counter.

For more information, see *Timers* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.30 UART

The UART is a slave peripheral that utilizes the DMA for data transfer or interrupt polling via host CPU. There are twelve UART modules in the device. All UART modules support IrDA and CIR modes when 48 MHz function clock is used. Each UART can be used for configuration and data exchange with a number of external peripheral devices or interprocessor communication between devices.

For more information, see *Universal Synchronous/Asynchronous Receiver/Transmitter (UART)* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.31 USB

Similar to earlier versions of USB bus, USB 3.0 is a general-purpose cable bus, supporting data exchange between a host device and a wide range of simultaneously accessible peripherals.

The device supports two identical USB subsystems:

- USB3SS0 is SuperSpeed (SS) USB 3.0 Dual-Role-Device (DRD) subsystem with on-chip SS (USB3.0) PHY and HS/FS/LS (1) (USB2.0) PHY
- USB3SS1 is SuperSpeed (SS) USB 3.0 Dual-Role-Device (DRD) subsystem with on-chip SS (USB3.0) PHY and HS/FS/LS (USB2.0) PHY

For more information, see *Universal Serial Bus (USB) Subsystem* section in *Peripherals* chapter in the device TRM.

#### 7.4.5.32 UFS

The Universal Flash Storage (UFS) interface is a standard-based serial interface engine.

There is one UFS module inside the device - UFS0. The UFS module includes one UFS 2.1 host controller (HC) with an integrated M-PHY.

The UFS module complies with the standards as listed in [Table 7-1](#).

## 8 Applications and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Power Supply Mapping

This Jacinto 7™ processor device can be operated in several different modes of operation depending upon the number of power resources, power supply groups (i.e. power rails) and control signals available:

- Full Active
- MCU Only low power mode
- DDR Retention (Suspend-to-RAM or S2R) low power mode
- MCU Island safety monitor
- Extended MCU safety monitor

Two power distribution networks (PDNs) that support these different operational modes are recommended and provide optional end product features. To name a few:

- Dual Voltage (1.8V & 3.3V) IO Interfaces
- Compliant UHS-I SD Card
- Compliant USB2.0
- High Security device type Efuse programming on-board for in-field updates

An Isolated PDN provides independent MCU & Main power resources & rails (see [Table 8-2](#)) to support power rail Freedom From Interference (FFI) as desired to reach end product system functional safety targets. An isolated PDN is needed to support MCU Only lower power mode or MCU Island safety monitoring. MCU ONLY can significantly reduce device power by disabling all Main processing while only keeping MCU processor resources active. A Combined PDN reduces total number of power resources & rails by grouping MCU & Main supplies into common power rails (see [Table 8-1](#)). This PDN can be used for Extended MCU safety processing but does not allow for MCU Island safety monitor or MCU Only low power modes. The DDR Retention low power mode can be supported with either an Isolated or Combined PDN scheme.

The TPS6594x & LP8764x Power Management ICs (PMICs) are key power components in the two recommended PDNs. Additional discrete power components may be added as desired to support optional system features. TI has optimized recommended PDNs using these PMICs for the following reasons:

- Full device performance entitlement as validated on TI Evaluation boards
- Enable all system functional safety features and analysis captured in device safety manual
- Support power rail load steps, supply voltage accuracies and maximum load currents with margins
- Meet device primary & low power mode supply sequencing requirements (refer to [Section 6.10.2, Power Supply Sequencing](#))
- Provide Adaptive Voltage Scaling (AVS) Class 0 device requirements with TI validated software

## 8.2 Device Connection and Layout Fundamentals

### 8.2.1 Power Supply Decoupling and Bulk Capacitors

#### 8.2.1.1 Power Distribution Network Implementation Guidance

The *Jacinto 7 Processor Power Distribution Networks: Implementation and Analysis (SPRACN5)* provides guidance for successful implementation of the power distribution network. This includes PCB stackup guidance as well as guidance for optimizing the selection and placement of the decoupling capacitors. TI supports *only* designs that follow the board design guidelines contained in the application report.

#### 8.2.2 External Oscillator

For more information, see [Section 6.10.4.1](#), Input and output Clocks/Oscillators.

### **8.2.3 JTAG and EMU**

Texas Instruments supports a variety of eXtended Development System (XDS) JTAG controllers with various debug capabilities beyond only JTAG support. A summary of this information is available in the [XDS Target Connection Guide](#).

For more recommendations on EMU routing, see [Emulation and Trace Headers Technical Reference Manual](#)

### **8.2.4 Reset**

The device incorporates four external reset pins (MCU\_PORz, MCU\_RESETz, PORz, and RESET\_REQz) and four reset status pins (MCU\_PORz\_OUT, MCU\_RESETSTATz, PORz\_OUT, and RESETSTATz). These pins can be driven by an external power good circuitry or Power Management IC (PMIC). MCU\_PORz and Main PORz pins should be held active low during the entire power-up phase, and until all power supplies as well as the HFOSC0 clock are stable.

All MCU domain resets act as master resets to the whole device, whereas Main domain resets only reset Main domain (MCU domain is reset isolated from all Main domain resets).

### **8.2.5 Unused Pins**

For more information about Unused Pins, see [Connections for Unused Pins](#)

### **8.2.6 Hardware Design Guide for Jacinto™ 7 Devices**

The Hardware Design Guide for Jacinto™ 7 Devices document describes hardware system design considerations for the Jacinto™ 7 family of processors. This design guide is intended to be used as an aid during the development of application hardware.

## 8.3 Peripheral- and Interface-Specific Design Information

### 8.3.1 LPDDR4 Board Design and Layout Guidelines

The goal of the [Jacinto 7 LPDDR4 Board Design and Layout Guidelines](#) is to make the LPDDR4 system implementation straightforward for all designers. Requirements have been distilled down to a set of layout and routing rules that allow designers to successfully implement a robust design for the topologies that TI supports. TI only supports board designs using LPDDR4 memories that follow the guidelines in this document.

### 8.3.2 OSPI and QSPI Board Design and Layout Guidelines

The following section details the routing guidelines that must be observed when routing the OSPI and QSPI interfaces.

#### 8.3.2.1 No Loopback and Internal Pad Loopback

- The MCU\_OSPI[x]\_CLK output signal must be connected to the CLK pin of the flash device
- The signal propagation delay from the MCU\_OSPI[x]\_CLK signal to the flash device must be  $< 450$  ps ( $\sim 7$ cm as stripline or  $\sim 8$ cm as microstrip)
- $50\ \Omega$  PCB routing is recommended along with series terminations, as shown in [Figure 8-1](#)
- Propagation delays and matching:
  - A to B  $< 450$  ps
  - Matching skew:  $< 60$  ps

OSPI\_Board\_01

\*  $0\ \Omega$  resistor (R1), located as close as possible to the MCU\_OSPI[x]\_CLK pin, is placeholder for fine tuning, if needed.

**Figure 8-1. OSPI Interface High Level Schematic**

#### 8.3.2.2 External Board Loopback

- The MCU\_OSPI[x]\_CLK output signal must be connected to the CLK pin of the flash device
- The MCU\_OSPI[x]\_LBCLKO output signal must be looped back into the MCU\_OSPI[x]\_DQS input
- The signal propagation delay from the MCU\_OSPI[x]\_CLK pin to the flash device CLK input pin (A to B) should be approximately equal to half of the signal propagation delay from the MCU\_OSPI[x]\_LBCLKO pin to the MCU\_OSPI[x]\_DQS pin  $((C\ to\ D)/2)$ . See the note below.
- The signal propagation delay from the MCU\_OSPI[x]\_CLK pin to the flash device CLK input pin (A to B) must be approximately equal to the signal propagation delay of the control and data signals between the flash device and the SoC device (E to F, or F to E)
- $50\ \Omega$  PCB routing is recommended along with series terminations, as shown in [Figure 8-2](#)
- Propagation delays and matching:
  - $A\ to\ B = E\ to\ F = (C\ to\ D) / 2$

- Matching skew: < 60 ps

**Note**

The OSPI Board Loopback Hold time requirement (described in [Section 6.10.5.21, OSPI](#)) is larger than the Hold time provided by a typical flash device. Therefore, the length of MCU\_OSPI[x]\_LBCLKO pin to the MCU\_OSPI[x]\_DQS pin (C to D) can be shortened to compensate.

\* 0 Ω resistor (R1), located as close as possible to the MCU\_OSPI[x]\_CLK and MCU\_OSPI[x]\_LBCLKO pins, is a placeholder for fine tuning, if needed.

**Figure 8-2. OSPI Interface High Level Schematic**

**8.3.2.3 DQS (only available in Octal Flash devices)**

- The MCU\_OSPI[x]\_CLK output signal must be connected to the CLK pin of the flash device
- The DQS pin of the flash devices must be connected to MCU\_OSPI[x]\_DQS signal
- The signal propagation delay from the MCU\_OSPI[x]\_CLK pin to the flash device CLK input pin (A to B) should be approximately equal to the signal propagation delay from the MCU\_OSPI[x]\_DQS pin to the DQS output pin (C to D)
- 50 Ω PCB routing is recommended along with series terminations, as shown in [Figure 8-3](#)
- Propagation delays and matching:
  - A to B = C to D
  - Matching skew: < 60 ps

\* 0 Ω resistor (R1), located as close as possible to the MCU\_OSPI[x]\_CLK pin, is a placeholder for fine tuning, if needed.

**Figure 8-3. OSPI Interface High Level Schematic**

### 8.3.3 SERDES REFCLK Design Guidelines

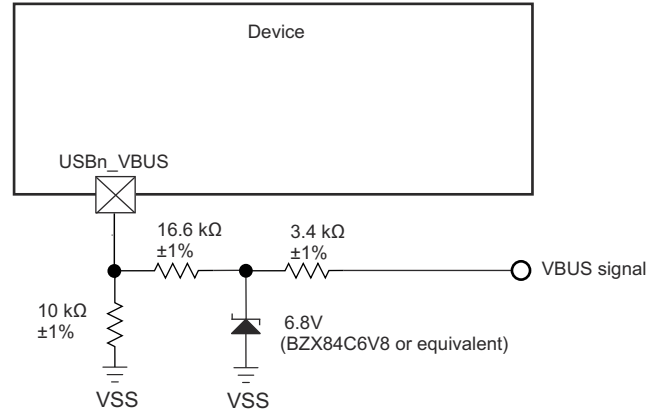

The following section details the routing guidelines that must be observed when terminating the SERDES REFCLK and is applicable only when SERDES REFCLK is configured to input mode.

1. 50 Ω to GND is recommended on each leg.
2. Internal AC coupling is always enabled, so external biasing is not needed.

### 8.3.4 USB VBUS Design Guidelines

The USB 3.1 specification allows the VBUS voltage to be as high as 5.5 V for normal operation, and as high as 20 V when the Power Delivery addendum is supported. Some applications require a max voltage to be 30 V.

The device requires the VBUS signal voltage be scaled down using an external resistor divider (as shown in the [Figure 8-4](#)), which limits the voltage applied to the actual device pin (USB0\_VBUS, USB1\_VBUS). The tolerance of these external resistors should be equal to or less than 1%, and the leakage current of zener diode at 5 V should be less than 100 nA.

J7ES\_USB\_VBUS\_01

A. USBn\_VBUS, where n = 0 or 1.

**Figure 8-4. USB VBUS Detect Voltage Divider / Clamp Circuit**

The USB0\_VBUS and USB1\_VBUS pins can be considered to be fail-safe because the external circuit in [Figure 8-4](#) limits the input current to the actual device pin in a case where VBUS is applied while the device is powered off.

### 8.3.5 System Power Supply Monitor Design Guidelines

The VMON\_ER\_VSYS pin provides a way to monitor a system power supply. This system power supply is typically a single pre-regulated power source for the entire system. This supply is monitored by comparing the output of an external voltage divider circuit sourced by this supply with an internal voltage reference, with a power fail event being triggered when the voltage applied to VMON\_ER\_VSYS drops below the internal reference voltage. The actual system power supply voltage trip point is determined by the system designer when selecting component values used to implement the external resistor voltage divider circuit. When designing the resistor divider circuit it is important to understand various factors which contribute to variability in the system power supply monitor trip point. The first thing to consider is the initial accuracy of the VMON\_ER\_VSYS input threshold which has a nominal value of 0.45 V, with a variation of  $\pm 3\%$ . Precision 1% resistors with similar thermal coefficient are recommended for implementing the resistor voltage divider. This minimizes variability contributed by resistor value tolerances. Input leakage current associated with VMON\_ER\_VSYS must also be considered since any current flowing into the pin creates a loading error on the voltage divider output. The VMON\_ER\_VSYS input leakage current may be in the range of 10 nA to 2.5  $\mu$ A when applying 0.45 V.

#### Note

The resistor voltage divider shall be designed such that its output voltage never exceeds the maximum value defined in [Section 6.4, Recommended Operating Conditions](#) during normal operating conditions.

[Figure 8-5](#) presents an example, where the system power supply is nominally 5 V and the maximum trigger threshold is 5 V - 10%, or 4.5 V.

For this example, it is important to understand which variables effect the maximum trigger threshold when selecting resistor values. It is obvious a device which has a VMON\_ER\_VSYS input threshold of 0.45 V + 3% needs to be considered when trying to design a voltage divider that doesn't trip until the system supply drops 10%. The effect of resistor tolerance and input leakage also needs to be considered, but how these contributions effect the maximum trigger point may not be obvious. When selecting component values which produce a maximum trigger voltage, the system designer must consider a condition where the value of R1 is 1% low and the value of R2 is 1% high combined with a condition where input leakage current for the VMON\_ER\_VSYS pin is 2.5  $\mu$ A. When implementing a resistor divider where R1 = 4.81 K $\Omega$  and R2 = 40.2 K $\Omega$ , the result is a maximum trigger threshold of 4.523 V.

Once component values have been selected to satisfy the maximum trigger voltage as described above, the system designer can determine the minimum trigger voltage by calculating the applied voltage that produces an output voltage of 0.45 V - 3% when the value of R1 is 1% high and the value of R2 is 1% low, and the input leakage current is 10 nA, or zero. Using an input leakage of zero with the resistor values given above, the result is a minimum trigger threshold of 4.008 V.

This example demonstrates a system power supply voltage trip point that ranges from 4.008 V to 4.523 V. Approximately 250 mV of this range is introduced by VMON\_ER\_VSYS input threshold accuracy of  $\pm 3\%$ , approximately 150 mV of this range is introduced by resistor tolerance of  $\pm 1\%$ , and approximately 100 mV of this range is introduced by loading error when VMON\_ER\_VSYS input leakage current is 2.5  $\mu\text{A}$ .

The resistor values selected in this example produces approximately 100  $\mu\text{A}$  of bias current through the resistor divider when the system supply is 4.5 V. The 100 mV of loading error mentioned above could be reduced to about 10 mV by increasing the bias current through the resistor divider to approximately 1 mA. So resistor divider bias current vs loading error is something the system designer needs to consider when selecting component values.

The system designer should also consider implementing a noise filter on the voltage divider output since VMON\_ER\_VSYS has minimum hysteresis and a high-bandwidth response to transients. This could be done by installing a capacitor across R1 as shown in Figure 8-5. However, the system designer must determine the response time of this filter based on system supply noise and expected response to transient events.

Figure 8-5 presents an example, when the system power supply voltage is nominally 5 V and the desired trigger threshold is -10% or 4.5 V.

### 8.3.6 High Speed Differential Signal Routing Guidance

The [High Speed Interface Layout Guidelines](#) provides guidance for successful routing of the high speed differential signals. This includes PCB stackup and materials guidance as well as routing skew, length and spacing limits. TI supports *only* designs that follow the board design guidelines contained in the application report.

### 8.3.7 Thermal Solution Guidance

The [Thermal Design Guide for DSP and ARM Application Processors](#) provides guidance for successful implementation of a thermal solution for system designs containing this device. This document provides background information on common terms and methods related to thermal solutions. TI only supports designs that follow system design guidelines contained in the application report.

## 9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

### 9.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, TDA4VM). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For orderable part numbers of TDA4VM devices in the ALF package type, see the Package Option Addendum of this document, the TI website ([ti.com](http://ti.com)), or contact your TI sales representative.

#### 9.1.1 Standard Package Symbolization

---

#### Note

Some devices may have a cosmetic circular marking visible on the top of the device package which results from the production test process. In addition, some devices may also show a color variation in the package substrate which results from the substrate manufacturer. These differences are cosmetic only with no reliability impact.

- To designate the stages in the product development cycle, TI assigns prefixes to the part numbers. These prefixes represent evolutionary stages of product development from engineering prototypes through fully qualified production devices. Prototype devices are shipped against the following disclaimer:  
“This product is still in development and is intended for internal evaluation purposes.”  
Notwithstanding any provision to the contrary, TI makes no warranty expressed, implied, or statutory, including any implied warranty of merchantability of fitness for a specific purpose, of this device.
- J721E is the base part number for the superset device. Software should constrain the features used to match the intended production device.
- For HS device support, TI recommends the 0, 5, or D device types. The R and P (HS “prime”) device types are not recommended for most applications, as they require extra steps in the manufacturing process and have a higher cost.

## 9.2 Tools and Software

The following products support development for TDA4VM platforms:

### Development Tools

**Code Composer Studio™ Integrated Development Environment** Code Composer Studio (CCS) Integrated Development Environment (IDE) is a development environment that supports TI's Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a suite of tools used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

**Pin mux tool** The Pin MUX Utility is a software tool which provides a Graphical User Interface for configuring pin multiplexing settings, resolving conflicts and specifying I/O cell characteristics for TI MPUs. Results are output as C header/code files that can be imported into software development kits (SDKs) or used to configure customer's custom software. Version 4 of the Pin Mux utility adds the capability of automatically selecting a mux configuration that satisfies the entered requirements.

For a complete listing of development-support tools for the processor platform, visit the Texas Instruments website at [ti.com](http://ti.com). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

## 9.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The following documents describe the TDA4VM devices.

### Technical Reference Manual

**J721E DRA829/TDA4VM/AM752x Processors Silicon Revisions 2.0, 1.1, and 1.0 Technical Reference Manual** Details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the TDA4VM family of devices.

### Errata

**J721E DRA829/TDA4VM/AM752x Processors Silicon Revision 1.0 Silicon Errata** Describes the known exceptions to the functional specifications for the device.

## 9.4 Support Resources

**TI E2E™ support forums** are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

## 9.5 Trademarks

eMMC™ is a trademark of MultiMediaCard Association.

HyperBus™ is a trademark of Mobiveil Inc.

CoreSight™ is a trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

Code Composer Studio™ and TI E2E™ are trademarks of Texas Instruments.

## 9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
