Table 3-477. ECAP_ECCTL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	MODCNTRSTS	R/W	0h	This bit field reads current status on modulo counter 00b[R] = CAP1 register gets loaded on next capture event. 01b[R] = CAP2 register gets loaded on next capture event. 10b[R] = CAP3 register gets loaded on next capture event. 11b[R] = CAP4 register gets loaded on next capture event.
13:12	DMAEVTSEL	R/W	0h	DMA event select Capture Mode: 00b[R/W] = DMA interrupt source is CEVT1 01b[R/W] = DMA interrupt source is CEVT2 10b[R/W] = DMA interrupt source is CEVT3 11b[R/W] = DMA interrupt source is CEVT4 APWM Mode: 00b[R/W] = DMA interrupt source is period match 01b[R/W] = DMA interrupt source is compare match 10b[R/W] = DMA interrupt source is period match or compare match 11b[R/W] = Disabled
11	CTRFILTRESET	R/W1TC	0h	Reset Bit 0h[R] = No effect 1h[W] = Resets event filter, counter, modulo counter and CEVT[1,2,3,4] and CNTOVF , HRERROR flags Note: This provides an ability start capture module from known state in case spurious inputs are captured while ECAP is configured.

Copyright © 2026 Texas Instruments Incorporated

Table 3-477. ECAP_ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	APWMPOL	R/W	0h	APWM output polarity select. This is applicable only in APWM operating mode. 0 Output is active high (Compare value defines high time) 1 Output is active low (Compare value defines low time)
9	CAP_APWM	R/W	0h	CAP/APWM operating mode select 0 ECAP module operates in capture mode. This mode forces the following configuration: - Inhibits TSCTR resets via CTR = PRD event - Inhibits shadow loads on CAP1 and 2 registers - Permits user to enable CAP1-4 register load - CAPx/APWMx pin operates as a capture input 1 ECAP module operates in APWM mode. This mode forces the following configuration: - Resets TSCTR on CTR = PRD event (period boundary) - Permits shadow loading on CAP1 and 2 registers - Disables loading of time-stamps into CAP1-4 registers - CAPx/APWMx pin operates as a APWM output
8	SWSYNC	R/W1TS	0h	Software-forced Counter [TSCTR] Synchronizer. This provides the user a method to generate a synchronization pulse through software. In APWM mode, the synchronization pulse can also be sourced from the CTR = PRD event. 0 Writing a zero has no effect. Reading always returns a zero 1 Writing a one forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0,0. After writing a 1, this bit returns to a zero. Note: Selection CTR = PRD is meaningful only in APWM mode; however, you can choose it in CAP mode if you find doing so useful.
7:6	SYNCO_SEL	R/W	0h	Sync-Out Select 0 sync out signal is SWSYNC 1 Select CTR = PRD event to be the sync-out signal 3 Disable sync out signal
5	SYNCI_EN	R/W	0h	Counter [TSCTR] Sync-In select mode 0 Disable sync-in option 1 Enable counter (TSCTR) to be loaded from CTRPHS register upon either a SYNCI signal or a S/W force event.
4	TSCTRSTOP	R/W	0h	Time Stamp [TSCTR] Counter Stop [freeze] Control 0 TSCTR stopped 1 TSCTR free-running
3	REARM	R/W1TS	0h	Re-Arming Control. Note: The re-arm function is valid in one shot or continuous mode 0 Has no effect (reading always returns a 0) 1 Arms the one-shot sequence as follows: (1) Resets the Mod4 counter to zero (2) Unfreezes the Mod4 counter (3) Enables capture register loads

Copyright © 2026 Texas Instruments Incorporated

Table 3-477. ECAP_ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2:1	STOP_WRAP	R/W	3h	Stop value for one-shot mode. This is the number [between 1-4] of captures allowed to occur before the CAP[1-4] registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number [between 1-4] of the capture register in which the circular buffer wraps around and starts again. Notes: STOP_WRAP is compared to Mod4 counter and, when equal, 2 actions occur: - Mod4 counter is stopped [frozen] - Capture register loads are inhibited In one-shot mode, further interrupt events are blocked until re-armed. 0 Stop after Capture Event 1 in one-shot mode Wrap after Capture Event 1 in continuous mode. 1 Stop after Capture Event 2 in one-shot mode Wrap after Capture Event 2 in continuous mode. 2 Stop after Capture Event 3 in one-shot mode Wrap after Capture Event 3 in continuous mode. 3 Stop after Capture Event 4 in one-shot mode Wrap after Capture Event 4 in continuous mode.
0	CONT_ONESHT	R/W	0h	Continuous or one-shot mode control [applicable only in capture mode] 0 Operate in continuous mode 1 Operate in one-Shot mode

Copyright © 2026 Texas Instruments Incorporated

3.7.2.10 ECAP_ECEINT Register

3.7.2.10.1 ECAP_ECEINT Register (Offset = 2Ch) [reset = 0h]

The interrupt enable bits (CEVT1, ...) block any of the selected events from generating an interrupt. Events will still be latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ECCLR registers. The proper procedure for configuring peripheral modes and interrupts is as follows:
- Disable global interrupts
- Stop eCAP counter
- Disable eCAP interrupts
- Configure peripheral registers
- Clear spurious eCAP interrupt flags
- Enable eCAP interrupts
- Start eCAP counter
- Enable global interrupts.

1h	0h	0h		0h	0h	3h	

Table 3-531. EPWM_TBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	FREE_SOFT	R/W	0h	Emulation Mode Bits. These bits select the behavior of the EPWM time-base counter during emulation events 00:Stop after the next time-base counter increment or decrement 01:Stop when counter completes a whole cycle: - Up-count mode: stop when the time-base counter = period [TBCTR = TBPRD] - Down-count mode: stop when the time-base counter = 0x00 [TBCTR = 0x00] - Up-down-count mode: stop when the time-base counter = 0x00 [TBCTR = 0x00] 1x: Free run
13	PHSDIR	R/W	0h	Phase Direction Bit This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter [TBCTR] will count after a synchronization event occurs and a new phase value is loaded from the phase [TBPHS] register. This is irrespective of the direction of the counter before the synchronization event.. In the up-count and down-count modes this bit is ignored. 0:Count down after the synchronization event. 1:Count up after the synchronization event.
12:10	CLKDIV	R/W	0h	Time Base Clock Pre-Scale Bits These bits select the time base clock pre-scale value [TBCLK = EPWMCLK/[HSPCLKDIV * CLKDIV]: 000:/1 [default on reset] 001:/2 010:/4 011:/8 100:/16 101:/32 110:/64 111:/128

Copyright © 2026 Texas Instruments Incorporated

Table 3-531. EPWM_TBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9:7	HSPCLKDIV	R/W	1h	High Speed Time Base Clock Pre-Scale Bits These bits determine part of the time-base clock prescale value. TBCLK = EPWMCLK / [HSPCLKDIV x CLKDIV]. This divisor emulates the HSPCLK in the TMS320x281x system as used on the Event Manager [EV] peripheral. 000:/1 001:/2 [default on reset] 010:/4 011:/6 100:/8 101:/10 110:/12 111:/14
6	SWFSYNC	R/W1TS	0h	Software Forced Sync Pulse 0:Writing a 0 has no effect and reads always return a 0. 1:Writing a 1 forces a one-time synchronization pulse to be generated. SWFSYNC can be enabled to effect EPWMxSYNCO by setting the EPWMSYNCOUTEN.SWEN bit.
5:4	RESERVED_1	R	0h	Reserved
3	PRDLD	R/W	0h	Active Period Reg Load from Shadow Select 0:The period register [TBPRD] is loaded from its shadow register when the time-base counter, TBCTR, is equal to zero and/or a sync event as determined by the TBCTL2[PRDLDSYNC] bit. A write/read to the TBPRD register accesses the shadow register. 1: Immediate Mode [Shadow register bypassed]: A write or read to the TBPRD register accesses the active register.
2	PHSEN	R/W	0h	Counter Reg Load from Phase Reg Enable 0:Do not load the time-base counter [TBCTR] from the time-base phase register [TBPHS]. 1:Allow Counter to be loaded from the Phase register [TBPHS] and shadow to active load events when an EPWMxSYNCI input signal occurs or a software-forced sync signal, see bit 6.
1:0	CTRMODE	R/W	3h	Counter Mode The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 00:Up-count mode 01:Down-count mode 10:Up-down count mode 11:Freeze counter operation [default on reset]

0h	0h	0h		0h	0h	0h	
7	6	5	4	3	2	1	0
LOADREDMODE		IN_MODE		POLSEL		OUT_MODE	
R/W		R/W		R/W		R/W	
0h		0h		0h		0h	

Table 3-540. EPWM_DBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	HALFCYCLE	R/W	0h	Half Cycle Clocking Enable Bit 0:Full cycle clocking enabled. The dead-band counters are clocked at the TBCLK rate. 1:Half cycle clocking enabled. The dead-band counters are clocked at TBCLK*2.
14	DEDB_MODE	R/W	0h	Dead Band Dual-Edge B Mode Control [S8 switch] 0:Rising edge delay applied to InA/InB as selected by S4 switch [IN-MODE bits] on A signal path only. Falling edge delay applied to InA/InB as selected by S5 switch [INMODE bits] on B signal path only. 1:Rising edge delay and falling edge delay applied to source selected by S4 switch [INMODE bits] and output to B signal path only. Note: When this bit is set to 1, user should always either set OUT_MODE bits such that Apath = InA OR OUTSWAP bits such that OutA=Bpath otherwise, OutA will be invalid.
13:12	OUTSWAP	R/W	0h	Dead Band Output Swap Control Bit 13 controls the S6 switch and bit 12 controls the S7 switch. 00:OutA and OutB signals are as defined by OUT-MODE bits. 01:OutA = A-path as defined by OUT-MODE bits. OutB = A-path as defined by OUT-MODE bits [rising edge delay or delay-bypassed A signal path]. 10:OutA = B-path as defined by OUT-MODE bits [falling edge delay or delay-bypassed B signal path]. OutB = B-path as defined by OUT-MODE bits. 11:OutA = B-path as defined by OUT-MODE bits [falling edge delay or delay-bypassed B signal path]. OutB = A-path as defined by OUT-MODE bits [rising edge delay or delay-bypassed A signal path].
11	SHDWDBFEDMODE	R/W	0h	FED Dead-Band Load Mode 0:Immediate mode. Only the active DBFED register is used. All writes/reads via the CPU directly access the active register for immediate "FED dead-band action." 1:Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode [for compatibility with legacy].

Copyright © 2026 Texas Instruments Incorporated

Table 3-540. EPWM_DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	SHDWDBREDMODE	R/W	0h	RED Dead-Band Load Mode 0:Immediate mode. Only the active DBRED register is used. All writes/reads via the CPU directly access the active register for immediate "RED dead-band action." 1:Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode [for compatibility with legacy].
9:8	LOADFEDMODE	R/W	0h	Active DBFED Load from Shadow Select Mode 00:Load on Counter = 0 [CNT_eq] 01:Load on Counter = Period [PRD_eq] 10:Load on either Counter = 0, or Counter = Period 11:Freeze [no loads possible] Note: has no effect in Immediate mode.
7:6	LOADREDMODE	R/W	0h	Active DBRED Load from Shadow Select Mode 00:Load on Counter = 0 [CNT_eq] 01:Load on Counter = Period [PRD_eq] 10:Load on either Counter = 0, or Counter = Period 11:Freeze [no loads possible] Note: has no effect in Immediate mode.
5:4	IN_MODE	R/W	0h	Dead-Band Input Mode Control Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown. This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays. 00:EPWMxA In [from the action-qualifier] is the source for both falling-edge and rising-edge delay. 01:EPWMxB In [from the action-qualifier] is the source for rising-edge delayed signal. EPWMxA In [from the action-qualifier] is the source for falling-edge delayed signal. 10:EPWMxA In [from the action-qualifier] is the source for rising-edge delayed signal. EPWMxB In [from the action-qualifier] is the source for falling-edge delayed signal. 11:EPWMxB In [from the action-qualifier] is the source for both rising-edge delay and falling-edge delayed signal.
3:2	POLSEL	R/W	0h	Polarity Select Control Bit 3 controls the S3 switch and bit 2 controls the S2 switch. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 2'b11 and DBCTL[IN_MODE] = 0x0. Other enhanced modes are also possible, but not regarded as typical usage modes. 00:Active high [AH] mode. Neither EPWMxA nor EPWMxB is inverted [default]. 01:Active low complementary [ALC] mode. EPWMxA is inverted. 10:Active high complementary [AHC]. EPWMxB is inverted. 11:Active low [AL] mode. Both EPWMxA and EPWMxB are inverted.
1:0	OUT_MODE	R/W	0h	Dead-Band Output Mode Control Bit 1 controls the S1 switch and bit 0 controls the S0 switch. 00:DBM is fully disabled or by-passed. In this mode the POLSEL and IN-MODE bits have no effect. 01:Apath = InA [delay is by-passed for A signal path] Bpath = FED [Falling Edge Delay in B signal path] 10:Apath = RED [Rising Edge Delay in A signal path] Bpath = InB [delay is by-passed for B signal path] 11:DBM is fully enabled [i.e. both RED and FED active]

Table 3-547. EPWM_HRCNFG Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	LINESEL	R/W	0h	Delay Line Selection Bits: Selects which of the 4 delay lines for a particular EPWM/EPWM module to send to CALIN for calibration.
13	RESERVED_1	R	0h	Reserved
12:11	HRLOADB	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPBHR shadow value into the active register. 00:Load on CTR = Zero: Time-base counter equal to zero [TBCTR = 0x0000] 01:Load on CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 10:Load on either CTR = Zero or CTR = PRD 11:Load on CMPB_EQ [Translator Event CMPB-3]
10	CTLMODEB	R/W	0h	Control Mode Bits Selects the register [CMP/TBPRD or TBPHS] that controls the MEP: 0:CMPBHR[8] or TBPRDHR[8] Register controls the edge position [i.e., this is duty or period control mode]. [Default on Reset] 1:TBPHSHR[8] Register controls the edge position [i.e., this is phase control mode].
9:8	EDGMODEB	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position [MEP] logic: 00:HRPWM capability is disabled [default on reset] 01:MEP control of rising edge [CMPBHR] 10:MEP control of falling edge [CMPBHR] 11:MEP control of both edges [TBPHSHR or TBPRDHR]
7	SWAPAB	R/W	0h	Swap EPWM A & B Output Signals This bit enables the swapping of the A & B signal outputs. The selection is as follows: 0:EPWMxA and EPWMxB outputs are unchanged. 1:EPWMxA signal appears on EPWMxB output and EPWMxB signal appears on EPWMxA output.

Copyright © 2026 Texas Instruments Incorporated

Table 3-547. EPWM_HRCNFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	AUTOCONV	R/W	0h	Auto Convert Delay Line Value Selects whether the fractional duty cycle/period/phase in the CMPAHR/TBPRDHR/TBPHSHR register is automatically scaled by the MEP scale factor in the HRMSTEP register or manually scaled by calculations in application software. The SFO library function automatically updates the HRMSTEP register with the appropriate MEP scale factor. 0:Automatic HRMSTEP scaling is disabled. 1:Automatic HRMSTEP scaling is enabled. If application software is manually scaling the fractional duty cycle, or phase [i.e. software sets CMPAHR = [fraction[PWMduty * PWMperiod] * MEP Scale Factor]<<8 + 0x080 for duty cycle], then this mode must be disabled.
5	SELOUTB	R/W	0h	EPWMxB Output Select Bit This bit selects which signal is output on the EPWMxB channel output. The inversion will take the high resolution mode into account and the inverted signal will contain any high resolution modification. The inversion takes place as the last step in modifying the EPWMxB signal. 0:EPWMxB output is normal. 1:EPWMxB output is inverted version of EPWMxA signal.
4:3	HRLOAD	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPAHR shadow value into the active register. 00:Load on CTR = Zero: Time-base counter equal to zero [TBCTR = 0x0000] 01:Load on CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 10:Load on either CTR = Zero or CTR = PRD 11:Load on CMPA_EQ [Translator Event CMPA-3]
2	CTLMODE	R/W	0h	Control Mode Bits Selects the register [CMP/TBPRD or TBPHS] that controls the MEP: 0:CMPAHR[8] or TBPRDHR[8] Register controls the edge position [i.e., this is duty or period control mode]. [Default on Reset] 1:TBPHSHR[8] Register controls the edge position [i.e., this is phase control mode].
1:0	EDGMODE	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position [MEP] logic: 00:HRPWM capability is disabled [default on reset] 01:MEP control of rising edge [CMPAHR] 10:MEP control of falling edge [CMPAHR] 11:MEP control of both edges [TBPHSHR or TBPRDHR]

Table 3-549. EPWM_HRPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15:7	RESERVED_1	R	0h	Reserved
6:4	PWMSYNCSELX	R/W	0h	Extended selection bits for EPWMSYNCPER 000:EPWMSYNCPER is defined by PWMSYNCSEL - > default condition [compatible with previous EPWM versions] 001:Reserved 010:Reserved 011:Reserved 100:CTR = CMPC, Count direction Up 101:CTR = CMPC, Count direction Down 110:CTR = CMPD, Count direction Up 111:CTR = CMPD, Count direction Down
3	HRPSYNCE	R/W	0h	SYNC Enable Bit [TRSYNCE]/High Resolution Period SYNC Enable Bit [HRPSYNCE]
2	TBPHSHRLOADE	R/W	0h	TBPHSHR Load Enable This bit allows you to synchronize EPWM modules with a high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event. This allows for multiple EPWM modules operating at the same frequency to be phase aligned with high-resolution. 0:Disables synchronization of high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event: 1:Synchronize the high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital comparator synchronization event. The phase is synchronized using the contents of the high-resolution phase TBPHSHR register. The TBCTL[PHSEN] bit which enables the loading of the TBCTR register with TBPHS register value on a SYNCIN or TBCTL[SWFSYNC] event works independently. However, users need to enable this bit also if they want to control phase in conjunction with the high-resolution period feature. This bit and the TBCTL[PHSEN] bit must be set to 1 when high-resolution period is enabled for up-down count mode even if TBPHSHR = 0x0000. This bit does not need to be set when only high-resolution duty is enabled.
1	PWMSYNCSEL	R/W	0h	PWMSYNC Source Select Bit: This bit selects the source for the EPWMSYNCPER signal that goes to the CMPSS and GPDAC: 0 CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 1 CTR = zero: Time-base counter equal to zero [TBCTR = 0x00]

Table 3-568. EPWM_TBPHS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	TBPHS	R/W	0h	Phase Offset Register These bits set time-base counter phase of the selected EPWM relative to the time-base that is supplying the synchronization input signal. - If TBCTL[PHSEN] = 0, then the synchronization event is ignored and the time-base counter is not loaded with the phase. - If TBCTL[PHSEN] = 1, then the time-base counter [TBCTR] will be loaded with the phase [TBPHS] when a synchronization event occurs. The synchronization event can be initiated by the input synchronization signal [EPWMxSYNCI] or by a software forced synchronization.
15:0	TBPHSHR	R/W	0h	Phase Offset [High Resolution] Register. TBPHSHR must not be used. Instead TRREM [HRPWM remainder register] must be used to mimic the functionality of TBPHSHR. The lower 8 bits in this register are ignored - writes are ignored and reads return zero

Table 3-572. EPWM_CMPA Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	CMPA	R/W	0h	Compare A Register The value in the active CMPA register is continuously compared to the time-base counter [TBCTR]. When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare A" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include: - Do nothing the event is ignored. - Clear: Pull the EPWMxA and/or EPWMxB signal low - Set: Pull the EPWMxA and/or EPWMxB signal high - Toggle the EPWMxA and/or EPWMxB signal Shadowing of this register is enabled and disabled by the CMPCTL[SHDWAMODE] bit. By default this register is shadowed. - If CMPCTL[SHDWAMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADAMODE] bit field determines which event will load the active register from the shadow register. - Before a write, the CMPCTL[SHDWAFULL] bit can be read to determine if the shadow register is currently full. - If CMPCTL[SHDWAMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. - In either mode, the active and shadow registers share the same memory map address.

Table 3-576. EPWM_GLDCTL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:2	RESERVED_1	R	0h	Reserved
1	GFRCLD	R/W1TS	0h	Force Load Event in One Shot Mode 0:Writing of 0 will be ignored. Always reads back a 0. 1:Force one load event at the input of the event pre-scale counter as shown in the diagram below. This bit is intended to be used for testing and/or software force loading of the events in global load mode.
0	OSHTLD	R/W1TS	0h	Enable Reload Event in One Shot Mode 0:Writing of 0 will be ignored. Always reads back a 0. 1:Turns the one shot latch condition ON. Upon occurrence of a chosen load strobe, one shadow to active reload occurs and the latch will be cleared. Hence Writing 1 to this bit would allow one load strobe event to pass through and block further strobe events.

2	OST	R	0h	Latched Status Flag for A One-Shot Trip Event 0:No one-shot trip event has occurred. 1:Indicates a trip event has occurred on a pin selected as a one-shot trip source. This bit is cleared by Writing the appropriate value to the TZCLR register.

Copyright © 2026 Texas Instruments Incorporated

Table 3-586. EPWM_TZFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	CBC	R	0h	Latched Status Flag for Cycle-By-Cycle Trip Event 0:No cycle-by-cycle trip event has occurred. 1:Indicates a trip event has occurred on a signal selected as a cycle-by-cycle trip source. The TZFLG[CBC] bit will remain set until it is manually cleared by the user. If the cycle-by-cycle trip event is still present when the CBC bit is cleared, then CBC will be immediately set again. The specified condition on the signal is automatically cleared when the EPWM time-base counter reaches zero [TBCTR = 0x00] if the trip condition is no longer present. The condition on the signal is only cleared when the TBCTR = 0x00 no matter where in the cycle the CBC flag is cleared. This bit is cleared by Writing the appropriate value to the TZCLR register.
0	INT	R	0h	Latched Trip Interrupt Status Flag 0:Indicates no interrupt has been generated. 1:Indicates an EPWMx_TZINT VIM interrupt was generated because of a trip condition. No further EPWMx_TZINT VIM interrupts will be generated until this flag is cleared. If the interrupt flag is cleared when either CBC or OST is set, then another interrupt pulse will be generated. Clearing all flag bits will prevent further interrupts. This bit is cleared by Writing the appropriate value to the TZCLR register.

Table 3-595. EPWM_ETPS Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	SOCBCNT	R	0h	EPWM ADC Start-of-Conversion B Event [EPWMxSOCB] Counter Register These bits indicate how many selected ETSEL[SOCBSEL] events have occurred: 00:No events have occurred. 01:1 event has occurred. 10:2 events have occurred. 11:3 events have occurred.
13:12	SOCBPRD	R/W	0h	EPWM ADC Start-of-Conversion B Event [EPWMxSOCB] Period Select These bits determine how many selected ETSEL[SOCBSEL] events need to occur before an EPWMxSOCB pulse is generated. To be generated, the pulse must be enabled [ETSEL[SOCBEN] = 1]. The SOCB pulse will be generated even if the status flag is set from a previous start of conversion [ETFLG[SOCB] = 1]. Once the SOCB pulse is generated, the ETPS[SOCBCNT] bits will automatically be cleared. 00:Disable the SOCB event counter. No EPWMxSOCB pulse will be generated 01:Generate the EPWMxSOCB pulse on the first event: ETPS[SOCBCNT] = 2'b01 10:Generate the EPWMxSOCB pulse on the second event: ETPS[SOCBCNT] = 2'b10 11:Generate the EPWMxSOCB pulse on the third event: ETPS[SOCBCNT] = 2'b11
11:10	SOCACNT	R	0h	EPWM ADC Start-of-Conversion A Event [EPWMxSOCA] Counter Register These bits indicate how many selected ETSEL[SOCASEL] events have occurred: 00:No events have occurred. 01:1 event has occurred. 10:2 events have occurred. 11:3 events have occurred.

Table 3-595. EPWM_ETPS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9:8	SOCAPRD	R/W	0h	EPWM ADC Start-of-Conversion A Event [EPWMxSOCA] Period Select These bits determine how many selected ETSEL[SOCASEL] events need to occur before an EPWMxSOCA pulse is generated. To be generated, the pulse must be enabled [ETSEL[SOCAEN] = 1]. The SOCA pulse will be generated even if the status flag is set from a previous start of conversion [ETFLG[SOCA] = 1]. Once the SOCA pulse is generated, the ETPS[SOCACNT] bits will automatically be cleared. 00:Disable the SOCA event counter. No EPWMxSOCA pulse will be generated 01:Generate the EPWMxSOCA pulse on the first event: ETPS[SOCACNT] = 2'b01 10:Generate the EPWMxSOCA pulse on the second event: ETPS[SOCACNT] = 2'b10 11:Generate the EPWMxSOCA pulse on the third event: ETPS[SOCACNT] = 2'b11
7:6	RESERVED_1	R	0h	Reserved
5	SOCPSSEL	R/W	0h	EPWMxSOC A/B Pre-Scale Selection Bits 0:Selects ETPS [SOCACNT/SOCBCNT] and [SOCAPRD/SOCBPRD] registers to determine frequency of events [interrupt once every 0-3 events]. 1:Selects ETSOCPS [SOCACNT2/SOCBCNT2] and [SOCAPRD2/SOCBPRD2] registers to determine frequency of events [interrupt once every 0-15 events].
4	INTPSSEL	R/W	0h	EPWMxINTn Pre-Scale Selection Bits 0:Selects ETPS [INTCNT, and INTPRD] registers to determine frequency of events [interrupt once every 0-3 events]. 1:Selects ETINTPS [INTCNT2, and INTPRD2] registers to determine frequency of events [interrupt once every 0-15 events].
3:2	INTCNT	R	0h	EPWM Interrupt Event [EPWMx_INT] Counter Register These bits indicate how many selected ETSEL[INTSEL] events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, ETSEL[INT] = 0 or the interrupt flag is set, ETFLG[INT] = 1, the counter will stop counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD]. 00:No events have occurred. 01:1 event has occurred. 10:2 events have occurred. 11:3 events have occurred.
1:0	INTPRD	R/W	0h	EPWM Interrupt [EPWMx_INT] Period Select These bits determine how many selected ETSEL[INTSEL] events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled [ETSEL[INT] = 1]. If the interrupt status flag is set from a previous interrupt [ETFLG[INT] = 1] then no interrupt will be generated until the flag is cleared via the ETCLR[INT] bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the ETPS[INTCNT] bits will automatically be cleared. Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear. Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented. 00:Disable the interrupt event counter. No interrupt will be generated and ETFRC[INT] is ignored. 01:Generate an interrupt on the first event INTCNT = 01 [first event] 10:Generate interrupt on ETPS[INTCNT] = 2'b10 [second event] 11:Generate interrupt on ETPS[INTCNT] = 2'b11 [third event]

RESERVED_1						SHDWMODE	CAPE
R						R/W	R/W
0h						0h	0h

Table 3-610. EPWM_DCCAPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	CAPMODE	R/W	0h	Counter Capture Mode 0:When a DCEVTFILT occurs and the counter capture is enabled, then the current TBCNT value is captured in the active register. When the respective trip event occurs, further trip [capture] events are ignored until the next PRD_eq or CNT_zero event [as selected by the PULSESEL bit in the DCFCTL register] re-triggers the capture mechanism. If active mode is enabled, via SHDWMODE bit in DCC0PCTL register, CPU reads of this register will return the active register value. If shadow mode is enabled, via SHDWMODE bit in DCC0PCTL register, the active register is copied to the shadow register on the PRD_eq or CNT_zero event [whichever is selected by PULSESEL bit in DCFCTL register]. CPU reads of this register will return the shadow register value. 1:When a DCEVTFILT occurs and the counter capture is enabled, then the current TBCNT value is captured in the active register. When the respective trip event occurs - it will set the CAPSTS flag and further trip [capture] events are ignored until this bit is cleared. CAPSTS can be cleared by writing to CAPCLR bit in DCC0PCTL register and it re-triggers the capture mechanism. If active mode is enabled, via SHDWMODE bit in DCC0PCTL register, CPU reads of this register will return the active register value. If shadow mode is enabled, via SHDWMODE bit in DCC0PCTL register, the active register is copied to the shadow register on the PRD_eq or CNT_zero event [whichever is selected by PULSESEL bit in DCFCTL register]. CPU reads of this register will return the shadow register value.
14	CAPCLR	R/W1TS	0h	DC Capture Latched Status Clear Flag 0:Writing a 0 has no effect. 1:Writing a 1 will clear this CAPSTS [set] condition.
13	CAPSTS	R	0h	Latched Status Flag for Capture Event 0:No DC capture event occurred. 1:A DC capture event has occurred.
12:2	RESERVED_1	R	0h	Reserved

Copyright © 2026 Texas Instruments Incorporated

Table 3-610. EPWM_DCCAPCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	SHDWMODE	R/W	0h	TBCTR Counter Capture Shadow Select Mode 0:Enable shadow mode. The DCC0P active register is copied to shadow register on a TBCTR = TBPRD or TBCTR = zero event as defined by the DCFCTL[PULSESEL] bit. CPU reads of the DCC0P register will return the shadow register contents. 1:Active Mode. In this mode the shadow register is disabled. CPU reads from the DCC0P register will always return the active register contents.
0	CAPE	R/W	0h	TBCTR Counter Capture Enable/Disable 0:Disable the time-base counter capture. 1:Enable the time-base counter capture.

Table 3-611. EPWM_DCFOFFSET Register Field Descriptions

Bit	Field	Type	Reset	Description
15:0	DCFOFFSET	R/W	0h	Blanking Window Offset These 16-bits specify the number of TBCLK cycles from the blanking window reference to the point when the blanking window is applied. The blanking window reference is either period or zero as defined by the DCFCTL[PULSESEL] bit. This offset register is shadowed and the active register is loaded at the reference point defined by DCFCTL[PULSESEL]. The offset counter is also initialized and begins to count down when the active register is loaded. When the counter expires, the blanking window is applied. If the blanking window is currently active, then the blanking window counter is restarted.

Table 3-617. EPWM_DCCAP Register Field Descriptions

Bit	Field	Type	Reset	Description
15:0	DCCAP	R	0h	Digital Compare Time-Base Counter Capture To enable time-base counter capture, set the DCC0PCLT[CAPE] bit to 1. If enabled, reflects the value of the time-base counter [TBCTR] on the low to high edge transition of a filtered [DCEVTFLT] event. Further capture events are ignored until the next period or zero as selected by the DCFCTL[PULSESEL] bit. Shadowing of DCC0P is enabled and disabled by the DCC0PCTL[SHDWMODE] bit. By default this register is shadowed. - If DCC0PCTL[SHDWMODE] = 0, then the shadow is enabled. In this mode, the active register is copied to the shadow register on the TBCTR = TBPRD or TBCTR = zero as defined by the DCFCTL[PULSESEL] bit. CPU reads of this register will return the shadow register value. - If DCC0PCTL[SHDWMODE] = 1, then the shadow register is disabled. In this mode, CPU reads will return the active register value. The active and shadow registers share the same memory map address.

Table 3-631. EPWM_XLOAD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	RESERVED_1	R	0h	Reserved
1	FRCLD	R/W1TS	0h	Force reload event in one shot mode : Writing a 1 to this bit turn force one load event at the input of the event pre-scale counter as shown in the diagram below. This bit is intended to be used for testing and/or software force loading of the events in global load mode. Writing of 0 will be ignored. Always reads back a 0.
0	STARTLD	R/W1TS	0h	Enable reload event : Writing a 1 to this bit turn the one shot latch condition ON. Upon occurrence of a chosen load strobe, one shadow to active reload occurs and the latch will be cleared. Hence Writing "1" to this bit would allow load strobe event to pass through and block further strobe events. Writing of 0 will be ignored. Always reads back a 0.

Table 3-695. EPWM_DEMONCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED_1	R	0h	Reserved
15:0	CNT	R	0h	An 16-bit counter which monitors the frequency of diode mode trip events. When TripHorTripL is active: Increment CNT [increment INCSTEP on every EPWMxSYNC] When TripHorTripL is in-active: Decrement CNT [decrement DECSTEP on every EPWMxSYNC] If[CNT > THRESHOLD] then generate DETRIP and clear the counter. If[[CNT - DECSTEP] < 0] then CNT = 0 If[[CNT + INCSTEP] >= 0xFFFF] then CNT = 0xFFFF Note : CNT is cleared when DECTL.ENABLE is 0 Note: DEMONTHRES == 0x0 should not generate trip as the DEMONTHRES and DEMONCNT registers have reset value of 0x0

Table 3-705. EQEP_QPOSCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	QPOSCNT	R/W	0h	Position Counter This 32-bit position counter register counts up/down on every eQEP pulse based on direction input. This counter acts as a position integrator whose count value is proportional to position from a give reference point. This Register acts as a Read ONLY register while counter is counting up/down. Note: It is recommended to only write to the position counter register [QPOSCNT] during initialization, i.e. when the eQEP position counter is disabled [QPEN bit of QEPCTL is zero]. Once the position counter is enabled [QPEN bit is one], Writing to the eQEP position counter register [QPOSCNT] may cause unexpected results.

Table 3-729. EQEP_QEPCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11:10	SEI	R/W	0h	Strobe event initialization of position counter 0 Does nothing (action disabled) 1 Does nothing (action disabled) 2 Initializes the position counter on rising edge of the QEPS signal 3 Clockwise Direction: Initializes the position counter on the rising edge of QEPS strobe Counter Clockwise Direction: Initializes the position counter on the falling edge of QEPS strobe
9:8	IEI	R/W	0h	Index event init of position count 0 Do nothing (action disabled) 1 Do nothing (action disabled) 2 Initializes the position counter on the rising edge of the QEPI signal (QPOSCNT = QPOSINIT) 3 Initializes the position counter on the falling edge of QEPI signal (QPOSCNT = QPOSINIT)
7	SWI	R/W	0h	Software init position counter 0 Do nothing (action disabled) 1 Initialize position counter (QPOSCNT=QPOSINIT). This bit is not cleared automatically
6	SEL	R/W	0h	Strobe event latch of position counter 0 The position counter is latched on the rising edge of QEPS strobe (QPOSSLAT = POSCCNT). Latching on the falling edge can be done by inverting the strobe input using the QSP bit in the QDECCTL register 1 Clockwise Direction: Position counter is latched on rising edge of QEPS strobe Counter Clockwise Direction: Position counter is latched on falling edge of QEPS strobe
5:4	IEL	R/W	0h	Index event latch of position counter [software index marker] 0 Reserved 1 Latches position counter on rising edge of the index signal 2 Latches position counter on falling edge of the index signal 3 Software index marker. Latches the position counter and quadrature direction flag on index event marker. The position counter is latched to the QPOSILAT register and the direction flag is latched in the QEPSTS[QDLF] bit. This mode is useful for software index marking.
3	QPEN	R/W	0h	Quadrature position counter enable/software reset 0 Reset the eQEP peripheral internal operating flags/read-only registers. Control/configuration registers are not disturbed by a software reset. When QPEN is disabled, some flags in the QFLG register do not get reset or cleared and show the actual state of that flag. 1 eQEP position counter is enabled

3.10.2.2 SDFM_SDIFLGCLR Register

3.10.2.2.1 SDFM_SDIFLGCLR Register (Offset = 4h) [reset = 0h]

SD Module Interrupt Flag Clear Bits:
Writing a "1" will clear the respective flag bit in the SDIFLG register.
Writes of "0" are ignored.
Note: If user writes a "1" to clear a bit on the same cycle that the hardware is trying to set the bit to "1", then hardware has priority and the bit will not be cleared.

Table 3-935. FSI_TX_CFG_TX_MASTER_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15:8	KEY	W	0h	Write Key In order to write to any bit in this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after Writing, so it must be written again for every change to this register.
7:2	RESERVED_1	R	0h	Reserved
1	FLUSH	R/W	0h	Flush Operation Start bit This bit will cause the transmitter to initiate a flush pattern of a single toggle on the TXD0 and TXD1 followed by five full cycles of TXCLK. This bit should be written only when the CORE_RST bit is 0 and the clock to the Transmitter core is turned on. 0h[R/W] = Clear this bit. 1h[R/W] = Setting this bit will Initiate flush sequence. To properly execute a flush sequence, Set FLUSH to 1, wait for five TXCLK cycles then clear FLUSH to 0. Note: The KEY field must contain 0xA5 for any write to this bit to take effect. The software must keep this bit set to 1 for at least five TXCLK cycles before setting it back to 0.
0	CORE_RST	R/W	0h	Transmitter Master Core Reset bit This bit controls the transmitter master core reset. In order to send any frame, this bit must be cleared. 0h[R/W] = Transmitter core is not in reset and can transmit frames. 1h[R/W] = Transmitter core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

Bit	Field	Type	Reset	Description
15:11	RESERVED_1	R	0h	Reserved
10	SEL_TDM_IN	R/W	0h	Input TDM port Select bit This bit selects the input port for the transmitter core between the TDM input pins or the RX module. When this bit is '0', the inputs selected for TDM are from the TDM input pins. When this bit is '1', then inputs selected for TDM are from the RX module.
9	TDM_ENABLE	R/W	0h	Transmit TDM Mode Enable bit. This bit enables the TDM Mode for multi-target TDM operation. 0h[R/W] Transmit TDM Mode is not enabled. 1h[R/W] Transmit TDM Mode is enabled.
8	SEL_PLLCLK	R/W	0h	Input Clock Select bit This bit selects the input clock source for the transmitter core. 0h[R/W] = SYSCLK is the source of the transmitter clock into the clock prescaler. 1h[R/W] = PLLRAWCLK is the source of the transmitter core clock into the clock prescaler.
7	PING_TO_MODE	R/W	0h	Ping Counter Reset Mode Select bit This bit selects when the ping counter will reset. 0h[R/W] = The ping counter will reset and restart only on hardware initiated ping frames, when ping counter has timed out. 1h[R/W] = The ping counter will reset and restart on any software initiated frame as well as a ping counter timeout
6	SW_CRC	R/W	0h	CRC Source Select bit This bit selects the source of the CRC value that is transmitted. 0h[R/W] = The transmitted CRC value is computed by hardware. 1h[R/W] = The transmitted CRC value is sourced from the value programmed in the TX_USER_CRC register.

Copyright © 2026 Texas Instruments Incorporated

Table 3-939. FSI_TX_CFG_TX_OPER_CTRL_LO_ALT2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5:3	START_MODE	R/W	0h	Transmission Start Mode Select bit These bits select the method by which a new frame transmission is started. 0h[R/W] = Only a software write to TX_FRAME_CTRL.START initiate a new transmission. 1h[R/W] = The configured external trigger will initiate a new transmission. 2h[R/W] = Either Writing to TX_FRAME_CTRL.START or the TX_FRAME_TAG_UDATA register will initiate a new transmission. All other combinations of bits are illegal and reserved for future use.
2	SPI_MODE	R/W	0h	SPI Mode Select bit This bit enables and disables SPI compatibility mode. 0h[R/W] = FSI is in normal mode of operation. 1h[R/W] = FSI is operating in SPI compatibility mode.
1:0	DATA_WIDTH	R/W	0h	Transmit Data Width Select bits These bits define the number of data lines used by the transmitter. 0h[R/W] = Data will be transmitted on one data line [TXD0] 1h[R/W] = Data will be transmitted on two data lines [TXD0 and TXD1]. The format of the data is described in the FSI_TX TRM chapter. 2h 3h[R/W] = Reserved

Table 3-943. FSI_TX_CFG_TX_FRAME_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	START	R/W	0h	Start Transmission bit This bit will cause the FSI to start transmitting the next frame. 0h[R/W] = Writing a 0 to this bit will have no effect. 1h[R/W] = Start the next transmission. This bit will be cleared by hardware.
14:8	RESERVED_1	R	0h	Reserved
7:4	N_WORDS	R/W	0h	Number of Words to be Transmitted This field defines the number of words which will be transmitted in a DATA_N_WORD frame. This is a user-defined field that must match the corresponding field in the receiver. Set this bitfield to be one less than the number of words to be transmitted. 0h[R/W] = 1 data word frame [16-bit data]. 1h[R/W] = 2 data word frame [32-bit data]. .. Fh [R/W] = 16 data word frame [256-bit data].
3:0	FRAME_TYPE	R/W	0h	Transmit Frame Type This field determines the type of frame that will be transmitted next. 0000b[R/W] = Ping Frame. This frame can be sent either by software or automatically by hardware. 0100b[R/W] = DATA_1_WORD Frame. One word data frame [16-bit data]. 0101b[R/W] = DATA_2_WORD Frame. Two word data frame [32-bit data]. 0110b[R/W] = DATA_4_WORD Frame. Four word data frame [64-bit data]. 0111b[R/W] = DATA_6_WORD Frame. Six word data frame [96-bit data]. 0011b[R/W] = DATA_N_WORD Frame. The N_WORDS field will determine the number of words [1 to 16] to be sent. Both the transmitter and receiver must have the same value programmed. 1111b[R/W] = Error Frame. This frame can be used during error conditions or any condition where the transmitter wants to notify the receiver of a high priorty status. However, the user software is at liberty to use this for any purpose. 0001b 0010b and 1000bthrough 1110bare Reserved and should not be used.

R/W					R/W	R/W	R/W
0h					0h	0h	0h

Table 3-951. FSI_TX_CFG_TX_PING_CTRL_ALT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:9	RESERVED_1	R	0h	Reserved
8:3	EXT_TRIG_SEL	R/W	0h	External Trigger Select bits This bitfield will select one of the 64 external trigger inputs to as the source to generate a ping frame. A ping frame will only be generated if the EXT_TRIG_EN bit is set. 0h[R/W] = Trigger 1 will be used to generate a ping frame. 1h[R/W] = Trigger 2 will be used to generate a ping frame. .. 3Fh [R/W] = Trigger 64 will be used to generate a ping frame.
2	EXT_TRIG_EN	R/W	0h	External Trigger Enable bit This bit will allow the external trigger logic to generate a ping frame. 0h[R/W] = External triggers will not be used to generate ping frames. 1h[R/W] = The selected external trigger [selected by EXT_TRIG_SEL bits] will be able to generate a ping frame. The ping timer will be ignored if this bit is set.
1	TIMER_EN	R/W	0h	Ping Timer Enable bit This bit will enable the ping timer for generating periodic ping frames. 0h[R/W] = The ping timer is disabled and will not generate ping frames. 1h[R/W] = The ping timer is enabled and can be used to generate ping frames.Once the timer count reaches the value set by the TX_PING_TO_REF register, it will initiate a ping frame transmission. Note: If the ping timer is used, EXT_TRIG_EN should not be set as it will override this function.
0	CNT_RST	R/W	0h	Ping Counter Reset bit Writing a 1 to this bit will reset the ping counter to 0. The counter will stay in reset as long as this bit is set to 1. This bit needs to be cleared to 0 to use the counter. 0h[R/W] = Clear the CNT_RST. 1h[R/W] = The ping counter will be reset to 0.

Table 3-982. FSI_RX_CFG_RX_MASTER_CTRL_ALTC Register Field Descriptions

Bit	Field	Type	Reset	Description
15:8	KEY	W	0h	Write Key. In order to write to this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after Writing, so it must be written again for every change to this register.
7:5	RESERVED_1	R	0h	Reserved
4	DATA_FILTER_EN	R/W	0h	Data Filter Enable Bit. 0h[R/W] = Data filtering is disabled. 1h[R/W] = Data filtering is enabled.
3	INPUT_ISOLATE	R/W	0h	When set to 1, the FSI RX inputs [RXCLK, RXD0 and RXD1] will be isolated from what is driven from the device pins and will be held at inactive level of '1'.This isolation facilitates the user to switch the RX inputs to a different set of device pins and hence any potential glitch that could occur during the process of switching will not effect the RX module itself.
2	SPI_PAIRING	R/W	0h	Clock Pairing for SPI-like Behavior Enable bit This bit enables the internal clock pairing with the FSI TX module. This feature internally connects the TXCLK to RXCLK allowing the FSI TX module, acting as a SPI master, to clock data into the receiver and out of the transmitter like a standard SPI module. This configuration is valid when the Module is in SPI mode only [RX_OPER_CTRL.SPI_MODE = 1] 0h[R/W] = SPI clock pairing is not enabled. 1h[R/W] = SPI clock pairing is enabled. The RXCLK will be internally connected to the TXCLK of the corresponding FSI module. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

Copyright © 2026 Texas Instruments Incorporated

Table 3-982. FSI_RX_CFG_RX_MASTER_CTRL_ALTC Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	INT_LOOPBACK	R/W	0h	Internal Loopback Enable bit This bit enables the internal loopback functionality of the FSI receiver. By enabling this bit, a mux will select the signals coming directly from the corresponding FSI transmitter module rather than from the pins. 0h[R/W] = Internal loopback is disabled. The FSI RX module will receive signals coming from the pins. 1h[R/W] = Internal loopback is enabled. The FSI RX module will receive signals from the directly from FSI TX module rather than the pins. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.
0	CORE_RST	R/W	0h	Receiver Controller Core Reset bit This bit controls the receiver master core reset. In order to receive any frame, this bit must be cleared. Note: For reset to take affect, the FSI RX module must be held in reset for at least 4 SYSCLK cycles. 0h[R/W] = Receiver core is not in reset and can receive frames. 1h[R/W] = Receiver core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

R/W	R/W				R/W	R/W	
0h	0h				0h	0h	

Table 3-984. FSI_RX_CFG_RX_OPER_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15:9	RESERVED_1	R	0h	Reserved
8	PING_WD_RST_MODE	R/W	0h	Ping Watchdog Timeout Mode Select bit This bit selects the mode by which the ping watchdog counter is reset. The watchdog counter can be reset and restarted only by ping frames or by any received frame. 0h[R/W] = The ping watchdog counter will reset and restart only by ping frames. 1h[R/W] = The ping watchdog counter will reset and restart by any received frame.
7	ECC_SEL	R/W	0h	ECC Data Width Select bit This bit selects between whether the ECC computation is done on 16-bit or 32-bit words. 0h[R/W] = 32-bit ECC is used. 1h[R/W] = 16-bit ECC is used.
6:3	N_WORDS	R/W	0h	Number of Words to Receive This field defines the number of words which will be received in a DATA_N_WORD frame. This is a user-defined field that must match the corresponding field in the transmitter. Set this bitfield to be one less than the number of words to be received. This value is only applicable when the frame type received is DATA_N_WORD. 0h[R/W] = 1 data word frame [16-bit data]. 1h[R/W] = 2 data word frame [32-bit data]. .. Fh [R/W] = 16 data word frame [256-bit data].
2	SPI_MODE	R/W	0h	SPI Mode Enable bit This bit enables and disables the SPI compatibility mode of the FSI RX. The received data must be formatted as an FSI frame in order for the data to properly be received. SPI compatibility mode will allow FSI RX to receive data that is sent using SPI signal format. Refer to the applicable section in the FSI TRM chapter for more information. 0h[R/W] = FSI is in normal mode of operation. 1h[R/W] = FSI is operating in SPI compatibility mode.

14	ERROR_TAG_MATCH	R	0h	Error Tag Match Flag This bit indicates that an error frame was received with a tag comparison matching the masked tag reference. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No tag-matched error frame received. 1h[R] = A tag-matched error frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
13	DATA_TAG_MATCH	R	0h	Data Tag Match Flag This bit indicates that a dataframe was received with a tag comparison matching the masked tag reference. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No tag-matched data frame received. 1h[R] = A tag-matched data frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
12	PING_TAG_MATCH	R	0h	Ping Tag Match Flag This bit indicates that a ping frame was received with a tag comparison matching the masked tag reference. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No tag-matched ping frame received. 1h[R] = A tag-matched ping frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
11	DATA_FRAME	R	0h	Data Frame Received Flag This bit indicates that an data frame has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No data frame has been received. 1h[R] = A data frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.

Copyright © 2026 Texas Instruments Incorporated

Table 3-992. FSI_RX_CFG_RX_EVT_STS_ALT1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	FRAME_OVERRUN	R	0h	Frame Overrun Flag This bit indicates that a frame overrun condition has occured. This bit gets set to 1 when a new DATA/ERROR frame is received and the corresponding DATA_FRAME_RCVD/ERROR_FRAME_RCVD flag is still set to 1. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Frame overrun has not ocurred. 1h[R] = Frame overrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
9	PING_FRAME	R	0h	Ping Frame Received Flag This bit indicates that an ping frame has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No ping frame has been received. 1h[R] = A ping frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
8	ERR_FRAME	R	0h	Error Frame Received Flag This bit indicates that an error frame has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No error frame has been received. 1h[R] = An error frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
7	BUF_UNDERRUN	R	0h	Receive Buffer Underrun Flag This bit indicates that a buffer underrun condition has occured in the receive buffer. This will happen when software reads the buffer which is empty and has no valid data. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Receive Buffer Underrun has not ocurred. 1h[R] = Receive Buffer Underrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
6	FRAME_DONE	R	0h	Frame Done Flag This bit indicates that a frame has been successfully received without error. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No frame has been successfully received. 1h[R] = A frame has been successfully received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
5	BUF_OVERRUN	R	0h	Receive Buffer Overrun Flag This bit indicates that a buffer overrun condition has occured in the receive buffer. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Receive buffer overrun has not ocurred. 1h[R] = Receive buffer overrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
4	EOF_ERR	R	0h	End-of-Frame Error Flag This bit indicates that an invalid end-of-frame bit pattern has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Invalid end-of-frame has not been received. 1h[R] = Invalid end-of-frame has been received To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.

Copyright © 2026 Texas Instruments Incorporated

Table 3-992. FSI_RX_CFG_RX_EVT_STS_ALT1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	TYPE_ERR	R	0h	Frame Type Error Flag This bit inditcates that an invalid frame type has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Invalid frame type has not been received. 1h[R] = Invalid frame type has been received To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
2	CRC_ERR	R	0h	CRC Error Flag This bit indicates that a CRC error has occured. A CRC error will be generated on a data frame where the received CRC and the computed CRC do not match. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = CRC error has not occured. 1h[R] = CRC error has occured. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
1	FRAME_WD_TO	R	0h	Frame Watchdog Timeout Flag This bit indicates that the frame watchdog timer has timed out. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Frame watchdog timeout has not occured. 1h[R] = Frame watchdog timeout has occured. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
0	PING_WD_TO	R	0h	Ping Watchdog Timeout Flag This bit indicates that the ping watchdog timer has timed out. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Ping watchdog timeout has not occured. 1h[R] = Ping watchdog timeout has occured. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.

Bit	Field	Type	Reset	Description
15:2	RESERVED_1	R	0h	Reserved
1	FRAME_WD_EN	R/W	0h	Frame Watchdog Counter Enable bit This bit will enable or disable the frame watchdog counter. The counter [RX_FRAME_WD_CNT] will begin counting from 0 when a valid start-of-frame pattern is received. When the reference value [RX_FRAME_WD_REF] is reached, it will generate a frame watchdog timeout event [RX_EVT_STS.FRAME_WD_TO] and the counter value will reset to 0 and continue counting on the next valid start-of-frame. 0h[R/W] = The frame watchdog counter is disabled and not running. 1h[R/W] = The frame watchdog counter logic is enabled and running.
0	FRAME_WD_CNT_RST	R/W	0h	Frame Watchdog Counter Reset bit This bit will reset the frame watchdog counter to 0. Writing a 1 to this bit will reset the frame watchdog counter to 0. The counter will stay in reset as long as this bit is set to 1. This bit needs to be cleared to 0 to use the counter 0h[R/W] = Clear the FRAME_WD_CNT_RST. 1h[W] = The frame watchdog counter will be reset to 0.

Table 3-1016. FSI_RX_CFG_RX_PING_WD_CNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	PING_WD_CNT	R	0h	Ping Watchdog Counter Value This is the 32-bit read-only register which shows the current value of the ping watchdog counter. This counter is reset to 0 in a variety of ways: A write to PING_WD_RST, a match with PING_WD_REF, or the reception of a ping frame.

Table 3-1032. FSI_RX_CFG_RX_FRAME_TAG_CMP Register Field Descriptions

Bit	Field	Type	Reset	Description
15:10	RESERVED_1	R	0h	Reserved
9	BROADCAST_EN	R/W	0h	Broadcast Enable bit This will enable the reception of a ping frame broadcast. When this bit is set, bit 3 of the received tag will be treated as a broadcast notification. If bit 3 of the received tag is set to 1, a ping tag match event will be triggered regardless of the. A match caused by the comparison of TAG_MASK and TAG_REF will still be considered a match and the frame tag match event will be triggered as normal This bit only takes effect only if CMP_EN is set to 1. 0h[R/W] Broadcast frame match disabled. 1h[R/W] Broadcast frame match enabled.
8	CMP_EN	R/W	0h	Frame Tag Compare Enable bit Set this bit to enable the comparison of an incoming frame tag and the value stored in the frame tag reference. A match caused by the comparison of TAG_MASK, TAG_REF, and the incoming frame tag will trigger the apprpriate frame tag match event. 0h[R/W] Frame tag comparison is disabled. 1h[R/W] Frame tag comparison is enabled.
7:4	TAG_MASK	R/W	0h	Frame Tag Mask Any bit position in this register set to 0 will be used in the comparison of the incoming frame tag and the value stored in TAG_REF. A bit position set to 1 will be ignored in the tag comparison. This mask value is used only for non-ping frames.
3:0	TAG_REF	R/W	0h	Frame Tag Reference The reference tag to check against when comparing the TAG_MASK and the incoming frame tag. This reference value is used only for non-ping frames.

Bit	Field	Type	Reset	Description
15:10	RESERVED_1	R	0h	Reserved
9	BROADCAST_EN	R/W	0h	Broadcast Enable bit This will enable the reception of a ping frame broadcast. When this bit is set, bit 3 of the received tag will be treated as a broadcast notification. If bit 3 of the received tag is set to 1, a ping tag match event will be triggered regardless of the. A match caused by the comparison of TAG_MASK and TAG_REF will still be considered a match and the ping tag match event will be triggered as normal This bit only takes effect only if CMP_EN is set to 1. 0h[R/W] Broadcast frame match disabled. 1h[R/W] Broadcast frame match enabled.
8	CMP_EN	R/W	0h	Ping Tag Compare Enable bit Set this bit to enable the comparison of an incoming ping tag and the value stored in the ping tag reference. A match caused by the comparison of TAG_MASK, TAG_REF, and the incoming ping tag will trigger a ping frame tag match event. 0h[R/W] Ping tag comparison is disabled. 1h[R/W] Ping tag comparison is enabled.
7:4	TAG_MASK	R/W	0h	Ping Tag Mask Any bit position in this register set to 0 will be used in the comparison of the incoming ping frame tag and the value stored in TAG_REF. A bit position set to 1 will be ignored in the tag comparison. This mask value is used only for ping frames.
3:0	TAG_REF	R/W	0h	Ping Tag Reference The reference tag to check against when comparing the TAG_MASK and the incoming ping tag. This reference value is used only for ping frames.

Bit	Field	Type	Reset	Description
31:4	RESERVED_2	R	0h	Reserved
3	RX_CORE_STS	R	0h	Receiver Core Status bit This bit indicates the status of the receiver core. If this bit is set, the receiver should undergo a reset and subsequent resynchronization with the transmitter. This bit will be always be set when the receiver has detected and end of frame error or a frame type error. This bit can also be set if the receiver becomes corrupted due to noise on the signal lines. If the receiver has experienced a ping watchdog or frame watchdog timeout, this bit should be read to determine if the cause was due to a corrupt transaction, thus putting the receiver core into an unrecoverable state. Only a soft reset will reset the recevier core and thus reset this bit. 0h[R] The receiver core is operating normally. 1h[R] The receiver core has entered into an error state and should be reset.

Bit	Field	Type	Reset	Description
31:30	SCHEME	R	1h	This identifies the scheme revision ID register type implemented for this module
29:28	RESERVED_1	R	0h	Reserved
27:16	FUNC	R	0h	Functional Release Number Reflects software-compatability. If there is no software compatability, a unique func number is assigned; for compatible modules, the same number is maintained.
15:11	RTL	R	0h	Design Release Number Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented.
10:8	MAJOR	R	0h	Major Revision Number Represents major changes to the module [e.g. entirely new features are added/changed]. The major revision number for this module.
7:6	CUSTOM	R	0h	Custom Module Number Indicates a special version of the module. May not be supported by standard software.
5:0	MINOR	R	0h	Minor Revision Number Represents minor changes to the module [e.g. enhancements to existing features]. The minor revision number for this module.

15:4	RESERVED_1	R	0h	Reserved
3:0	TESTEN	R/W	0h	1010: Parity test feature is enabled All other values: Parity test feature is disabled Note: When the parity test feature is enabled, acutal registers are not accessible in the memory map. Instead, the parity values are accessible. Parity is computed for every byte and the correponding parity value is available at the bit-0 of every byte. Value of '1' written to the parity bit after enabling the parity test feature can be used to inject the error by inverting the stored parity value.

15:4	RESERVED_1	R	0h	Reserved
3:0	TESTEN	R/W	0h	1010: Parity test feature is enabled All other values: Parity test feature is disabled Note: When the parity test feature is enabled, acutal registers are not accessible in the memory map. Instead, the parity values are accessible. Parity is computed for every byte and the correponding parity value is available at the bit-0 of every byte. Value of '1' written to the parity bit after enabling the parity test feature can be used to inject the error by inverting the stored parity value.

Table 4-375. VIM0_INTVECTOR_Q Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address [Base Address + 0x18] or FIQ Vector Address [Base Address + 0x1C] and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1:0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-421. VIM1_INTVECTOR_Q Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address [Base Address + 0x18] or FIQ Vector Address [Base Address + 0x1C] and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1:0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

1h			0h			0h	

Table 4-541. STC_STCGCR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	INTCOUNT_B16	R/W	1h	Number of intervals of the self test run [RWP - Read, Priviledge Mode Write only] Count of intervals that need to be covered for a specific selftest run. The selftest controller sends out complete indication once it runs all of the intervals programmed in this field. INTCOUNT_B16=0 is an invalid configuration for a selftest.
15:11	NU0	R	0h	Reserved bits
10:8	CAP_IDLE_CYCLE	R/W	1h	Idle cycles before and after capture clock [RWP - Read, Priviledge Mode Write only] Idle Cycles before and after capture clock. This value is used to insert that many idle cycles in the Capture phase. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
7:5	SCANEN_HIGH_CAP_IDLE_CYCLE	R/W	1h	Idle cycles before and after capture clock [RWP - Read, Priviledge Mode Write only]. *NOT BYTE ACCESSIBLE Idle Cycles between scan_en going high to func_clk_en generation and scan_en going high to misr_log_en generation. This value is used to insert that many idle cycles in the shift clock [scan_en going high to func_clk_en generation] and misr_log_clk [scan_en going high to misr_log_en generation] generation. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
4:2	NU1	NU1	0h	Reserved bits

Copyright © 2026 Texas Instruments Incorporated

Table 4-541. STC_STCGCR0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1:0	RS_CNT_B1	R/W	0h	Restart/Continue or preload [RWP - Read, Priviledge Mode Write only] This bit specifies the selftest controller whether to continue the run from next interval onwards, restart from ROM address 0 or preload from a prescribed interval. This bit gets reset after the completion of selftest run. 00 = Continue NSTC run from previous interval 01 = Restart NSTC run from ROM address 0 1X = Start from segment number specified in STC_SEGPLR register

Table 4-545. STC_STCTPR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	TO_PRELOAD	R/W	FFFFFFFFh	Self test time out preload [RWP - Read, Priviledge Mode Write only] This register contains the total number of STC clock cycles it will take before a self-test timeout error will be triggered after the initiation of the self-test run. This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues. This register should be loaded with a meaningful count value for this feature to be effective. This register value [preload count value] gets loaded into the self test timeout down counter whenever a self test run is initiated [ST_ENA is enabled]. and gets disabled on completion of a self test run.

Table 4-577. STC_CORE1_CURMISR_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	C1MISR3	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

Table 4-613. STC_CORE1_CURMISR_21 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	C1MISR21	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

Table 4-649. STC_CORE2_CURMISR_11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	C2MISR11	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.
