# 5-V Input or 3.3-V Input, 3-A, Fully Integrated Converter

Check for Samples: TPS51313

FEATURES

- **Input Voltage VIN Range : 3.1 V to 5.5 V**
- **Bias Voltage VCC Range: 3.1 V to 5.5 V**
- **Output Voltage Range: 0.6 V to 3.3 V**
- **0.6-V, 1% Voltage Reference Accuracy**
- **Switching Frequency: 1 MHz**
- **No External Compensation is Required**
- **Fixed Voltage Servo Soft-Start Function**
- **Thermal Shutdown**

APPLICATIONS

- **Discrete Graphics PCIe® PEX Rail**
- **Low-Voltage Point-of-Load (POL) Rails**

DESCRIPTION

The TPS51313 is an easy-to-use, fully integrated, synchronous buck converter for low voltage point-of-load applications. It is designed to meet the NVIDIA™ OpenVreg Type 0 specifications, including the package and footprint requirement. It supports 3-A (maximum) of dc output current at output voltages from 0.6 V to 3.3 V. The D-CAP2™ mode adaptive, constant on-time control with 1-MHz switching frequency allows a small footprint when designed using all ceramic output capacitors and offers a low external component count. The device also features auto-skip function at light load condition, pre-biased start-up and internally fixed soft-start time. When the device is disabled, the output capacitor is discharged through internal resistor. The TPS51313 is available in a 3 mm x 3 mm, 10-pin DRC package (Green RoHS compliant and Pb free) and is specified between −10°C and 85°C.
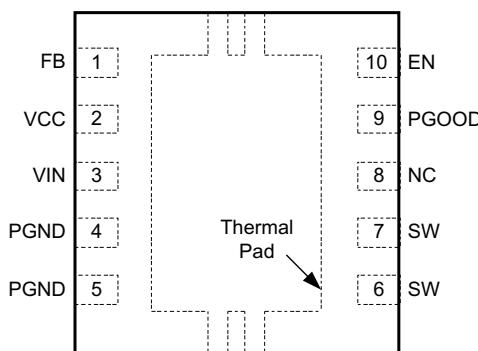

SIMPLIFIED APPLICATION
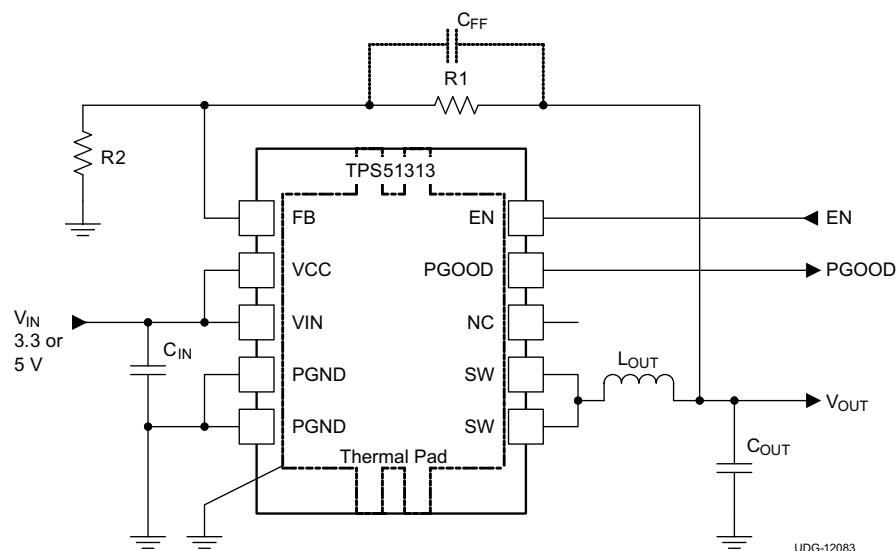

UDG-12083

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION[1]

T_A	PACKAGE	ORDERABLE DEVICE NUMBER	PINS	OUTPUT SUPPLY	MINIMUM QUANTITY	ECO PLAN
−10°C to 85°C	Plastic SON (DRC)	TPS51313DRCR	10	Tape and reel	3000	Green (RoHS and no Pb/Br)
		TPS51313DRCT		Mini reel	250	

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS[1]

		VALUE		UNIT
		MIN	MAX	
Input voltage range[2]	VIN, VCC	−0.3	6.0	V
	SW	−2.0	6.0	
	SW (transient 20nsec)	-3.0	8.5	
	EN	−0.3	6.0	
	FB	−1	3.6	
Output voltage range[2]	PGOOD	−0.3	6.0	V
Junction temperature, T_J			125	°C
Storage temperature, T_{stg}		−55	150	°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to the network ground terminal unless otherwise noted.

THERMAL INFORMATION

APPLICATION INFORMATION

Functional Overview

TPS51313 is a D-CAP2 mode adaptive on time converter with internal integrator. Monolithically integrate high side and low side FET supports output current to a maximum of 3-ADC. The converter automatically runs in discontinuous conduction mode to optimize light load efficiency. A switching frequency of 1-MHz enables optimization of the power train for the cost, size and efficiency performance of the design.

PWM Operation

The PWM operation is comprised of three separate loops, A, B and C as shown in Figure 6.
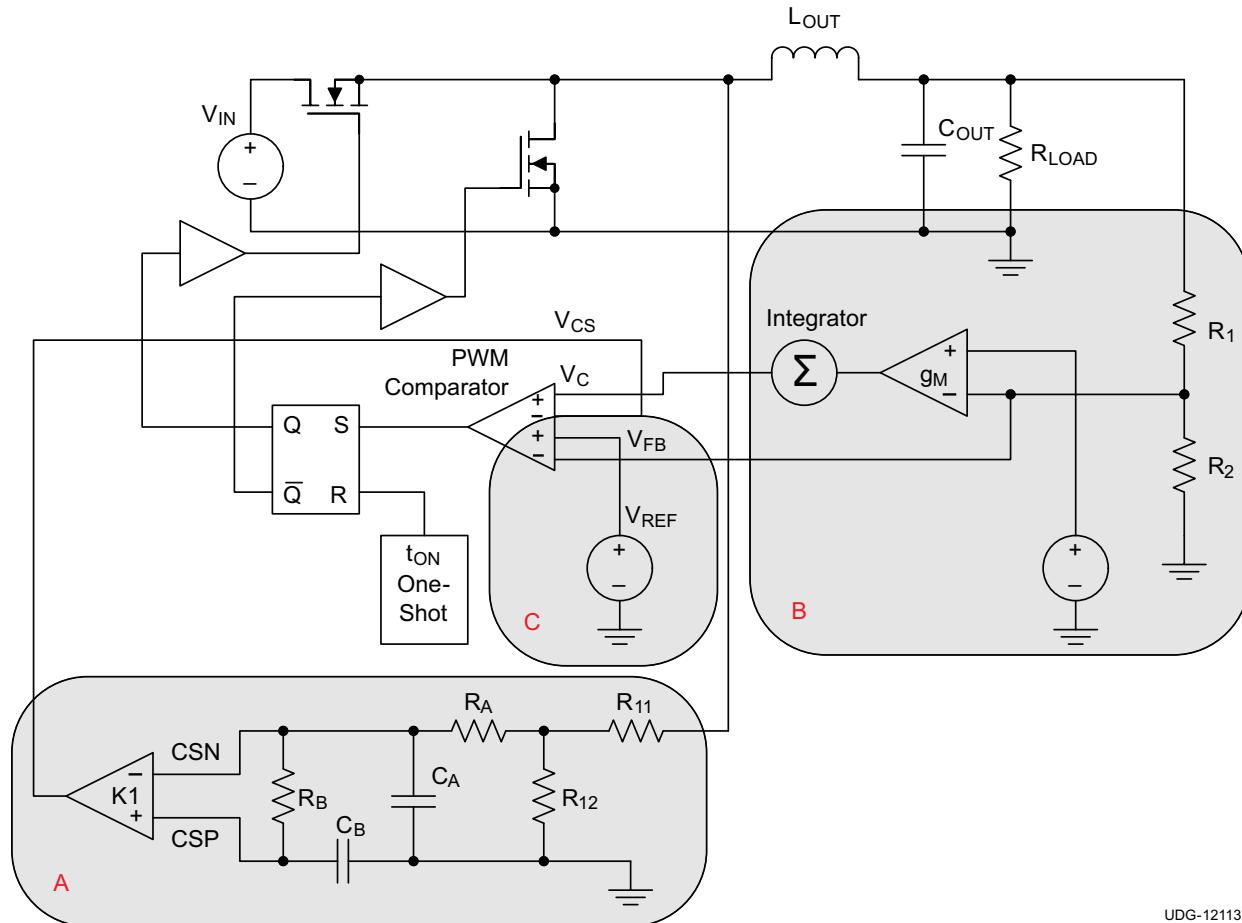

Figure 6. PWM Operation

Internal Current Loop (A)

Loop A is the internal current loop. The current information is sampled, divided and averaged at the SW node. The RC time constant and the gain of the current sense amplifier is chosen to cover the wide range of power stage design intended for this application.

Internal Voltage Loop (B)

Loop B is the internal voltage loop. The feedback voltage information is compared to the voltage reference at the input of the g_M amplifier, the internal integrator is designed to provide a zero at the double pole location to boost phase margin at the desired crossover frequency.

Fast Feedforward Loop (C)

Loop C is the additional loop that acts a direct fast feedforward loop to enhance the transient response.

In steady state operation as shown in Figure 7, the on time is initiated by the interaction of the three loops mentioned above. When the (V_C– V_{CS}) is rising above threshold defined by ($V_{FB} - V_{REF}$), the PWM comparator issues the on time pulse after the propagation delay. The demand of on time occurs when the artificial current has reached the valley point. The load regulation is maintained by the integrator provided by the g_M amplifier and internal integrator.

In transient operation as shown in Figure 8, the benefit of this topology is becoming evident. In an all MLCC output configuration, especially when the output capacitance is low, when the load step is applied, the output voltage is immediately discharged to try to keep the load demand. The immediate reflection of the load demand is instantly reflected in the FB voltage. The ($V_{FB} - V_{REF}$) is thus served as a termination voltage level for the ($V_C - V_{CS}$), thus modulating the initiation of the on time. The transient response can be improved further by amplifying the difference between V_{FB} and the V_{REF} reference.

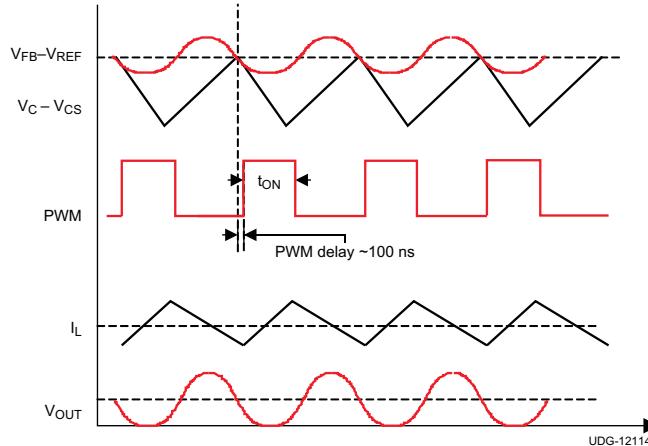

Figure 7. Steady-State Operation
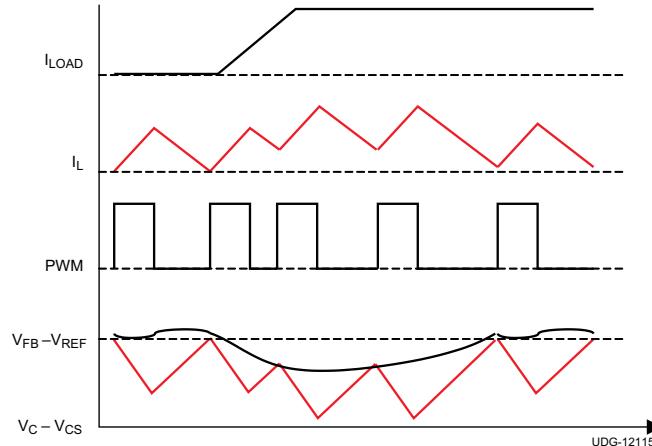

Figure 8. Transient Operation

PWM Frequency

The TPS51313 operates at a switching frequency of 1 MHz.

Light Load Power Saving Features

The TPS51313 offers an automatic pulse-skipping feature to provide excellent efficiency over the entire load range. The converter senses the current when the low-side FET is on and prevents negative current flow by turning off the low side FET. This saves power by eliminating re-circulation of the inductor current. When the bottom FET is turned off, the converter enters discontinuous mode, and the switching frequency decreases, reducing switching loss.

Power Sequences

TPS51313 initiates the soft-start process when the EN, VIN and VCC pins are ready. The soft-start time 300 µs when the reference voltage is between 0 V and 0.6 VREF. The actual output ramp-up time is the same as that of the VREF start-up time, which is 300 µs.

Power Good Signal

The TPS51313 has one open-drain power good (PGOOD) pin. During initial startup, there is a 1.3-ms power good high propagation delay after EN goes high. The PGOOD de-asserts when the EN is pulled low or an undervoltage condition on VCC or VIN or any other faults (such as V_{OUT}, UVP, OCP, OVP) that require latch off action is detected.

Protection Features

The TPS51313 offers many features to protect the converter power chain as well as the system electronics.

Input Undervoltage Protection on V_{CC} and V_{IN} (UVLO)

The TPS51313 continuously monitor the voltage on the V_{CC} and V_{IN} to ensure the voltage level is high enough to bias the converter properly and to provide sufficient gate drive potential to maintain high efficiency for the converter. The converter starts with V_{CC} and V_{IN} approximately 2.95 V and has a nominal of 250 mV of hysteresis, assuming EN is above the logic threshold level. If the UVLO level is reached for either V_{CC} or V_{IN}, the converter transitions the SW node into a tri-state and remains off until the device is reset by both V_{CC} and V_{IN} reaches 2.95 V (nominal). The PGOOD is deasserted when UVLO is detected and remains low until the device is reset. The device resumes operation when VIN recoveres to 2.95 V (nominal).

Output Overvoltage Protection (OVP)

The TPS51313 has OVP protection circuit. An OVP event is detected when the FB voltage is approximately 130% x 0.6VREF. In this case, the converter de-asserts the PGOOD signal and performs the overvoltage protection function. The converter latches off both high-side and low-side FET (after a typical delay of 1.9 μs) and remains in this state until the device is reset by EN, or V_{CC} or V_{IN}.

Output Undervoltage Protection (UVP)

Output undervoltage protection works in conjunction wit the current protection described in the Overcurrent and Current Limit Protection section. If the FB voltage drops below 50% x 0.6 V_{REF}, after a delay of 2.4 μs, the converter latches off. Undervoltage protection can be reset by EN, V_{CC} or V_{IN}.

Overcurrent and Current Limit Protection

The TPS51313 provides an overcurrent protection function. The minimum OCP level is 4.8-A DC. When the current limit is exceeded for consecutive 9 cycles, the converter latches off and remains latched off until it is reset by EN, V_{CC} or V_{IN}.

The TPS51313 also provides current limit protection function. If the sense current is above the OCL setting, the converter delays the next on pulse until the current level drops below the OCL limit. Current limiting occurs on a pulse-by-pulse basis. During a fast or very fast overcurrent event, the output voltage tends to droop until the UVP limit is reached. Then the converter de-asserts the PGOOD signal, and latches off after a delay between 1 μs and 2 μs . The converter remains in this state until the device is reset by EN, V_{CC} or V_{IN}.

Thermal Protection

The TPS51313 has an internal temperature sensor. When the die temperature reaches a nominal of 145°C, the device shuts down until the temperature cools by approximately 20°C. Then the converter restarts. The thermal shutdown is an non-latched behavior.

REFERENCE DESIGN

Application Schematic

This section describes a simplified design procedure for a discrete graphics processor PEX rail application using the TPS51313 converter. Figure 9 shows the application schematic..
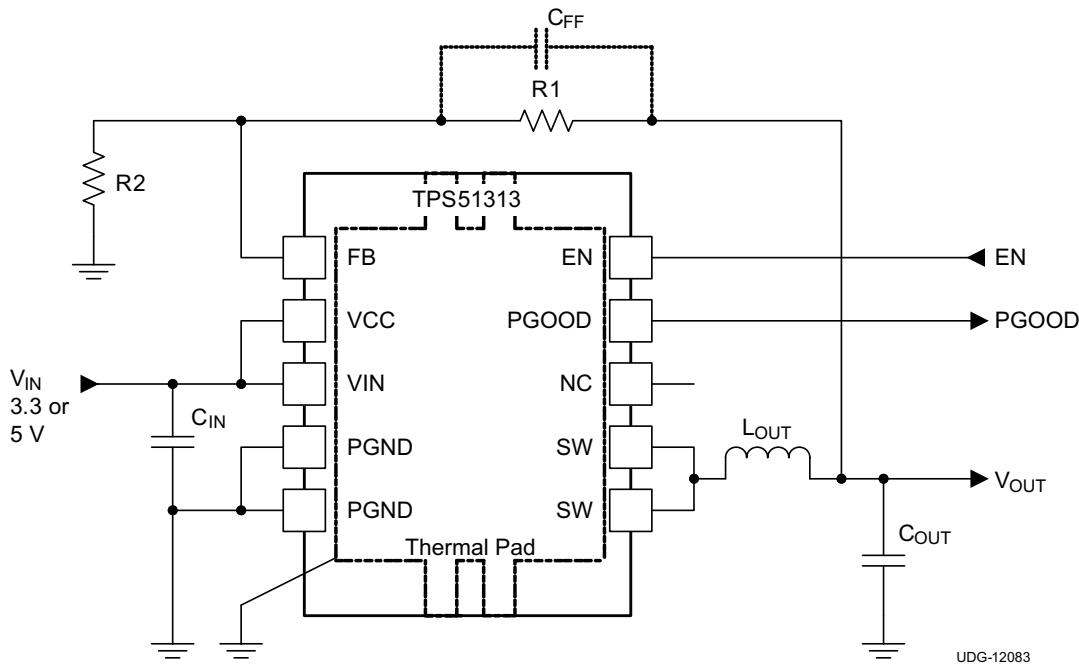

Figure 9. Reference Design Schematic

Table 1. Reference Design List of Materials

FUNCTION	MANUFACTURER	PART NUMBER
Output Inductor	Vishay	IHLP-1212AB-11
Ceramic Output Capacitors	Panasonic	ECJ2FB0J226M
	Murata	GRM21BR60J226ME39L

Design Procedure

Step One. Determine the specifications.

. The PEX rail requirement provides the following key paramaters.
- V_{OUT} = 1.05 V
- $I_{CC(max)}$ = 3 A
- ΔI = 2A (transient load step and release)
- di/dt = 2.5A/µs

Step Two. Determine the system parameters.

The input voltage range and operating frequency are of primary interest. For example,
- V_{IN} = V_{CC} = 3.3 V
- f_{SW} = 1 MHz.
- Maximum height of power chain components = 1.2 mm

Product Folder Links :*TPS51313*

Step Three. Set the output voltage.

Use Equation 1 to determine the output voltage.

$$V_{OUT} = V_{REF} \times \frac{(R1 + R2)}{R2}$$

(1)

The output voltage is determined by 0.6-V votlage reference and the resistor dividers (R1 and R2). The output voltage is regulated to the FB pin. For this V_{OUT} = 1.05 V, reference design, select R1 = 30 kΩ and R2 = 40 kΩ. (see Figure 9) To improve signal-to-noise performance of the converter, add a small feedforward capacitor (typically approximately 27 pF or less) in parallel with the upper resistor (R1).

Step Four. Determine inductor value and choose inductor.

Smaller inductance yields better transient performance but the consequence is higher ripple and lower efficiency. Higher values have the opposite characteristics. It is common practice to limit the ripple current to 25% to 50% of the maximum current. In this case, use 40%:

$$I_{P-P} = 3\,A \times 0.4 = 1.2\,A$$

where

- f_{SW} = 1 MHz
- V_{IN} = 3.3 V
- V_{OUT} = 1.05 V

(2)

$$L = \frac{V \times dT}{I_{P-P}} = \left(\frac{(V_{IN} - V_{OUT})}{I_{P-P}} \right) \times \left(\frac{V_{OUT}}{(f_{SW} \times V_{IN})} \right) = 0.596\,\mu H$$

(3)

For this application, a 0.56-µH, 18.7-mΩ inductor from Vishay with part number IHLP-1212AB-11 is chosen. Maximum height for this inductor is 1.2 mm.

Step Five. Determine the output capacitance.

To determine C_{OUT} based on transient and stability requirement, first calculate the minimum output capacitance for a given transient.

Equation 4 and Equation 5 calculate the minimum output capacitance for meeting the transient requirement, which is 33.8-µF assuming a ±3% voltage allowance for load step and release.

$$C_{OUT(min\_under)} = \frac{L \times \Delta I_{LOAD(max)}^2 \times \left(\frac{V_{VOUT} \times t_{SW}}{V_{IN(min)}} + t_{MIN(off)} \right)}{2 \times \Delta V_{LOAD(insert)} \times \left(\left(\frac{V_{IN(min)} - V_{VOUT}}{V_{IN(min)}} \right) \times t_{SW} - t_{MIN(off)} \right) \times V_{VOUT}}$$

(4)

$$C_{OUT(min\_over)} = \frac{L_{OUT} \times \left(\Delta I_{LOAD(max)} \right)^2}{2 \times \Delta V_{LOAD(release)} \times V_{VOUT}}$$

(5)

This design uses 3 22-µF capacitors with consideration of the MLCC derating effect (60% derating for both AC and DC effect).

Step Six. Establishing the internal compensation loop.

The TPS51313 is designed with an internal compensation loop. The internal integrator zero location is approximately 60 kHz. When the power stage double pole frequency contributed by the L_{OUT} and C_{OUT} is less than or equal to that of the zero frequency location, the converter is stable with sufficient margin.

Step Seven. Select decoupling and peripheral components.

For TPS51313 peripheral capacitors use the following minimum value of ceramic capacitance, X5R or better temperature coefficient is recommended. Tighter tolerances and higher voltage ratings are always appropriate.

V_{CC} and V_{IN} decoupling ≥ 2 × 10 µF, 6.3 V

Pull up resistor on PGOOD = 100 kΩ

Step Eight. (Optional) Snubber design for optimizing maximum switch node ringing.

For TPS51313 layout design, if the maximum switch node voltage is above 8.5 V for 20 ns, snubber circuit is recommended to limit the maximum voltage to be within the absolute maximum voltage rating (see Absolute maximum rating table on page 2). A series combination of R and C (where the value of R is approximately 2.2 Ω, and the value of C is approximately 470 pF) from SW node to PGND can be added to achieve effective snubbing for SW node.

Layout Considerations

Good layout is essential for stable power supply operation. Follow these guidelines for an efficient PCB layout.
* Widen the PGND connection area as much as possible.
* Place V_{IN}, V_{CC} decoupling capacitors as close to the device as possible.
* Use wide traces for the VIN, SW and PGND pins. These nodes carry high current and also serve as heat sinks.
* Place FB and voltage setting dividers as close to the device as possible.

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale, TI's General Quality Guidelines, or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
