3 概要

ESD224は、USB 3.0およびHDMI 2.0などの高速アプリケーション用の双方向TVS ESD保護ダイオード・アレイです。ESD224は、IEC 61000-4-2国際規格で規定されている最大レベル(レベル4)のESD耐性を備えています。ESD224は、差動マッチングされた直列素子を内蔵することで、下流のESDクランピング性能を拡張するとともに、高速インターフェイスへの信号の準拠を維持しています。ESD224の内蔵ESD保護回路で実現される非常に低いクランピング性能と高い差動帯域幅により、このデバイスはHDMI 2.0に準拠しながら、下流のHDMIデバイスを堅牢に保護できます。

ESD224は、業界標準のUSON-10 (DQA)パッケージで供給されます。このパッケージは0.5mmピン・ピッチを採用しているため、実装が容易で、設計時間を短縮できます。

7 Parameter Measurement Setup

7.1 IEC 61000-4-2 System Level ESD Test Setup with HDMI Driver for Clamping Voltage Measurement

11 shows the setup used to perform System Level ESD test to evaluate the clamping performance of ESD224 in real-world applications where the device is protecting a downstream HDMI driver System-on-Chip. IEC 61000-4-2 8kV Contact stress was applied at the connector pin and the voltage waveform on the system-side pin was captured to look at the clamping voltage presented by ESD224 to the down stream HDMI driver.

8 Detailed Description

8.1 Overview

The ESD224 is a bidirectional ESD Protection Diode with ultra-low capacitance. This device can dissipate ESD strikes above the maximum level specified by the IEC 61000-4-2 International Standard. The ultra-low capacitance makes this device ideal for protecting any super high-speed signal pins.

8.2 Functional Block Diagram

Copyright © 2018, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 IEC 61000-4-2 ESD Protection

The I/O pins can withstand ESD events up to ± 12 -kV contact and ± 15 -kV air gap. The ESD-surge clamp diverts the current to ground.

8.3.2 IEC 61000-4-4 EFT Protection

The I/O pins can withstand an electrical fast transient burst of up to 80 A (5/50 ns waveform, 4 kV with 50- Ω impedance). The ESD-surge clamp diverts the current to ground.

8.3.3 IEC 61000-4-5 Surge Protection

The I/O pins can withstand surge events up to 2 A and 17 W (8/20 μ s waveform). The ESD-surge clamp diverts this current to ground.

8.3.4 IO Capacitance

The capacitance between each I/O pin to ground is 0.5 pF (typical). This device supports data rates up to 6 Gbps.

8.3.5 DC Breakdown Voltage

The DC breakdown voltage of each I/O pin is a minimum of ± 5.5 V. This ensures that sensitive equipment is protected from surges above the reverse standoff voltage of ± 3.6 V.

Feature Description (continued)

8.3.6 Ultra Low Leakage Current

The I/O pins feature an ultra-low leakage current of 10 nA (maximum) with a bias of ± 2.5 V.

8.3.7 Low ESD Clamping Voltage

The I/O pins feature an ESD clamp that is capable of clamping the voltage to 8 V ($I_{PP} = 16$ A TLP) on the system side pins when the system draws at least 3 A.

8.3.8 Supports High Speed Interfaces

This device is capable of supporting high speed interfaces up to 6 Gbps, because of the extremely low IO capacitance.

8.3.9 Industrial Temperature Range

This device features an industrial operating range of -40°C to $+125^{\circ}\text{C}$.

8.4 Device Functional Modes

The ESD224 is a passive integrated circuit that triggers when voltages are above V_{BRF} or below V_{BRR} . During ESD events, voltages as high as ± 15 kV (air) can be directed to ground via the internal diode network. When the voltages on the protected line fall below the trigger levels of ESD224 (usually within 100s of nano-seconds) the device reverts to passive.

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The ESD224 is a diode type TVS which is used to provide a path to ground for dissipating ESD events on high-speed signal lines between a human interface connector and a system. As the current from ESD passes through the TVS, only a small voltage drop is present across the diode. Part of this voltage drop across the diode drops across the series element between the connector side pin and the system-side pin. Therefore, the effective voltage drop across the protected IC is smaller than the voltage drop across the diode. It is recommended to avoid through-routing for this ESD diode (single trace connecting both the connector side pin and the system side pin) for the best ESD performance.

图 12. ESD224 Protecting the HDMI Interface

Typical Application (continued)

9.2.1 Design Requirements

In this design example, two ESD224 devices, one TPD4E05U06 and one TPD1E05U06 device are used to protect an HDMI 2.0 interface. For HDMI 2.0 application design parameters listed in 表 1 are known.

表 1. Design Parameters

DESIGN PARAMETER	VALUE
Signal range on high speed differential data lines	0 to 3.6 V
Operating frequency of high speed data lines	3 GHz (First Harmonic)
Signal range on control lines (CEC, UTILITY, DDC_CLK and DDC_DAT)	0 to 5 V

9.2.2 Detailed Design Procedure

9.2.2.1 Signal Range

ESD224 supports signal ranges between -3.6 V and 3.6 V , which supports the high-speed lines on the HDMI 2.0 application. The TPD4E05U06 and TPD1E05U06 support signal ranges between 0 V and 5.5 V , which supports the HDMI control lines.

9.2.2.2 Operating Frequency

The ESD224 has a 0.5 pF (typical) capacitance, which supports the HDMI 2.0 rate of 6 Gbps . The TPD4E05U06 and TPD1E05U06 have a typical capacitance of 0.5 pF and 0.42 pF respectively, which easily support the control lines. The ESD224 has 4 identical protection channels for the differential HDMI high-speed signal lines. The symmetrical pin out of the device with a ground pin between the two differential signal pins makes it suitable for this application.

9.2.3 Application Curves

10 Power Supply Recommendations

This device is a passive ESD device so there is no need to power it. Take care not to violate the recommended I/O specification (–3.6 V to 3.6 V) to ensure the device functions properly.

11 Layout

11.1 Layout Guidelines

- The optimum placement is as close to the connector as possible.
 - EMI during an ESD event can couple from the trace being struck to other nearby unprotected traces, resulting in early system failures.
 - The PCB designer must minimize the possibility of EMI coupling by keeping any unprotected traces away from the protected traces which are between the TVS and the connector.
- For the best ESD performance, do not use through-routing for the data channels. Connecting pins 1 and 10, 2 and 9, 4 and 7, 5 and 6 together with through routing will reduce the clamping voltage performance of ESD224.
- Route the protected traces as straight as possible.
- Eliminate any sharp corners on the protected traces between the TVS and the connector by using rounded corners with the largest radii possible.
 - Electric fields tend to build up on corners, increasing EMI coupling.

11.2 Layout Examples

There is no Through-Routing for the ESD224 Pins Connecting to the High Speed Data Lines.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
