

LM48821 Boomer® Audio Power Amplifier Series Direct Coupled, Ultra Low Noise, 52mW Differential Input Stereo Headphone Amplifier with I²C Volume Control

Check for Samples: [LM48821](#), [LM48821TLEVAL](#)

FEATURES

- Ground Referenced Outputs
- Differential Inputs
- I²C Volume and Mode Controls
- Available in Space-Saving DSBGA Package
- Ultra Low Current Shutdown Mode
- Advanced Output Transient Suppression Circuitry Eliminates Noises During Turn-On and Turn-Off Transitions
- 2.0V to 4.0V Operation (P_{VDD} and S_{VDD})
- 1.8 to 4.0V Operation (I²C_{VDD})
- No Output Coupling Capacitors, Snubber Networks, Bootstrap Capacitors, or Gain-Setting Resistors Required

APPLICATIONS

- Notebook PCs
- Desktop PCs
- Mobile Phones
- PDAs
- Portable Electronic Devices
- MP3 Players

KEY SPECIFICATIONS

- Improved PSRR at 217Hz: 82dB (typ)
- Stereo Output Power at V_{DD} = 3V, R_L = 16Ω, THD+N = 1%: 52mW (typ)
- Mono Output Power at V_{DD} = 3V, R_L = 16Ω, THD+N = 1%: 93mW (typ)
- Shutdown current: 0.1μA (typ)

DESCRIPTION

With its directly-coupled output technology, the LM48821 is a variable gain audio power amplifier capable of delivering 52mW_{RMS} per channel into a 16Ω single-ended load with less than 1% THD+N from a 3V power supply. The I²C volume control has a range of –76dB to 18dB.

The LM48821's Tru-GND technology utilizes advanced charge pump technology to generate the LM48821's negative supply voltage. This eliminates the need for output-coupling capacitors typically used with single-ended loads.

Boomer audio power amplifiers were designed specifically to provide high quality output power with a minimal amount of external components. The LM48821 does not require output coupling capacitors or bootstrap capacitors, and therefore, is ideally suited for mobile phone and other low voltage applications where minimal power consumption is a primary requirement.

The LM48821 incorporates selectable low-power consumption shutdown and channel select modes.

The LM48821 contains advanced output transient suppression circuitry that eliminates noises which would otherwise occur during turn-on and turn-off transitions.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PIN DESCRIPTIONS

Pin Designator	Pin Name	Pin Function
A1	SV _{DD}	Signal power supply input
A2	SGND	Signal ground
A3	IN A+	Left non-inverting input
A4	IN A-	Left inverting input
B1	V _O A	Left output
B2	V _O B	Right output
B3	IN B+	Right non-inverting input
B4	IN B-	Right inverting input
C1	V _{SS}	DC to DC converter output
C2	SCL	I ² C serial clock input
C3	SDA	I ² C serial data input
C4	I ² CV _{DD}	I ² C supply voltage input
D1	C _{CP-}	DC to DC converter flying capacitor inverting input
D2	PGND	Power ground
D3	C _{CP+}	DC to DC converter flying capacitor non-inverting input
D4	PV _{DD}	DC to DC converter power supply input

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings ⁽¹⁾⁽²⁾⁽³⁾

Supply Voltage	4.5V
Storage Temperature	-65°C to +150°C
Input Voltage	-0.3V to V _{DD} + 0.3V
Power Dissipation ⁽⁴⁾	Internally Limited
ESD Susceptibility ⁽⁵⁾	2000V
ESD Susceptibility ⁽⁶⁾	200V
Junction Temperature	150°C
Thermal Resistance	
θ_{JA} (typ) - (DSBGA) ⁽⁴⁾	105°C/W

- (1) All voltages are measured with respect to the GND pin unless otherwise specified.
- (2) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional but do not specify performance limits. Electrical Characteristics state DC and AC electrical specifications under particular test conditions which ensure specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (4) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX}, θ_{JA} , and the ambient temperature, T_A. The maximum allowable power dissipation is P_{DMAX} = (T_{JMAX} - T_A) / θ_{JA} or the number given in Absolute Maximum Ratings, whichever is lower. For the LM48821, see power derating currents for more information.
- (5) Human body model, 100pF discharged through a 1.5k Ω resistor.
- (6) Machine Model, 220pF - 240pF discharged through all pins.

Operating Ratings

Temperature Range	
T _{MIN} ≤ T _A ≤ T _{MAX}	-40°C ≤ T _A ≤ +85°C
Supply Voltage	
PV _{DD} and SV _{DD}	2.0V ≤ V _{DD} ≤ 4.0V
I ² CV _{DD}	1.8V ≤ I ² CV _{DD} ≤ 4.0V

Audio Amplifier Electrical Characteristics V_{DD} = 3V ⁽¹⁾

The following specifications apply for V_{DD} = 3V, R_L = 16 Ω , A_V = 0dB, unless otherwise specified. Limits apply for T_A = 25°C.

Symbol	Parameter	Conditions	LM48821		Units (Limits)
			Typical ⁽²⁾	Limits ^{(3) (4)}	
I _{DD}	Quiescent Power Supply Current	V _{IN} = 0V, inputs terminated, both channels enabled	3.0	4.5	mA (max)
		V _{IN} = 0V, inputs terminated, one channel enabled	2.0	3.0	mA
I _{SD}	Shutdown Current	Right and Left Enable bits set to 0	0.1	1.2	μ A (max)
V _{OS}	Output Offset Voltage	R _L = 32 Ω	0.5	2.5	mV (max)
A _V	Volume Control Range	[B0:B4] = 00000	-76		dB
		[B0:B4] = 11111	+18		dB
Δ A _V	Channel-to-Channel Gain Match		±0.015		dB
A _{V-MUTE}	Mute Gain		-76		dB
R _{IN}	Input Resistance	Gain = 18dB	9	5 15	k Ω (min) k Ω (max)
		Gain = -76dB	81		k Ω

- (1) All voltages are measured with respect to the GND pin unless otherwise specified.
- (2) Typicals are measured at +25°C and represent the parametric norm.
- (3) Limits are specified to AOQL (Average Outgoing Quality Level).
- (4) Data sheet min and /max specification limits are specified by design, test, or statistical analysis.

Audio Amplifier Electrical Characteristics $V_{DD} = 3V$ ⁽¹⁾ (continued)

 The following specifications apply for $V_{DD} = 3V$, $R_L = 16\Omega$, $A_V = 0dB$, unless otherwise specified. Limits apply for $T_A = 25^\circ C$.

Symbol	Parameter	Conditions	LM48821		Units (Limits)
			Typical ⁽²⁾	Limits ^{(3) (4)}	
P _{OUT}	Output Power	THD+N = 1% (max); f _{IN} = 1kHz, R _L = 16Ω, per channel	52	43	mW (min)
		THD+N = 1% (max); f _{IN} = 1kHz, R _L = 32Ω, per channel	53	45	mW (min)
		THD+N = 1% (max); f _{IN} = 1kHz, R _L = 16Ω, single channel driven	93	80	mW (min)

I²C COMPATIBLE INTERFACE

The LM48821 uses a serial data bus that conforms to the I²C protocol. Controlling the chip's functions is accomplished with two wires: serial clock (SCL) and serial data (SDA). The clock line is uni-directional. The data line is bi-directional (open-collector). The maximum clock frequency specified by the I²C standard is 400kHz. In this discussion, the master is the controlling microcontroller and the slave is the LM48821.

The bus format for the I²C interface is shown in [Figure 57](#). The bus format diagram is broken up into six major sections: The Start Signal, the I²C Address, an Acknowledge bit, the I²C data, second Acknowledge bit, and the Stop Signal.

The start signal is generated by lowering the data signal while the clock signal is high. The start signal will alert all devices attached to the I²C bus to check the incoming address against their own address.

The 8-bit chip address is sent next, most significant bit first. The data is latched in on the rising edge of the clock. Each address bit must be stable while the clock level is high.

After the last bit of the address bit is sent, the master releases the data line high (through a pull-up resistor). Then the master sends an acknowledge clock pulse. If the LM48821 has received the address correctly, then it holds the data line low during the clock pulse. If the data line is not held low during the acknowledge clock pulse, then the master should abort the rest of the data transfer to the LM48821. The 8 bits of data are sent next, most significant bit first. Each data bit should be valid while the clock level is stable high.

After the data byte is sent, the master must check for another acknowledge to see if the LM48821 received the data.

If the master has more data bytes to send to the LM48821, then the master can repeat the previous two steps until all data bytes have been sent.

The stop signal ends the transfer. To signal stop, the data signal goes high while the clock signal is high. The data line should be held high when not in use.

The LM48821's I²C address is shown in [Table 1](#). The I²C data register and its control bit names are shown in [Table 2](#). The data values for the volume control are shown in [Table 3](#).

I²C INTERFACE POWER SUPPLY PIN (I²CV_{DD})

The LM48821's I²C interface is powered up through the I²CV_{DD} pin. The LM48821's I²C interface operates at a voltage level set by the I²CV_{DD} pin. This voltage can be independent from the main power supply pin (V_{DD}). This is ideal whenever logic levels for the I²C interface are dictated by a microcontroller or microprocessor that is operating at a lower supply voltage than the main battery of a portable system.

POWER SUPPLY BYPASSING

As with any power amplifier, proper supply bypassing is critical for low noise performance and high power supply rejection. Applications that employ a 3.3V voltage regulator typically use a 10μF in parallel with a 0.1μF filter capacitors to stabilize the regulator's output, reduce noise on the regulated supply lines, and improve the regulator's transient response. However, their presence does not eliminate the need for a local 1.0μF tantalum bypass capacitance connected between the LM48821's supply pins and ground. Keep the length of leads and traces that connect capacitors between the LM48821's power supply pins and ground as short as possible.

ELIMINATING THE OUTPUT COUPLING CAPACITOR

The LM48821 features a low noise inverting charge pump that generates an internal negative supply voltage. This allows the LM48821 to reference its amplifier outputs to ground instead of a half-supply voltage, like traditional capacitivel-coupled headphone amplifiers. Because there is no DC bias voltage associated with either stereo output, the large DC blocking capacitors (typically 220μF) are not necessary. The coupling capacitors are replaced by two, small ceramic charge pump capacitors, saving board space and cost.

Eliminating the output coupling capacitors also improves low frequency response. In traditional headphone amplifiers, the headphone impedance and the output capacitor form a high pass filter that not only blocks the DC component of the output, but also attenuates low frequencies, impacting the bass response. Because the LM48821 does not require the output coupling capacitors, the low frequency response of the device is not degraded.

In addition to eliminating the output coupling capacitors, the ground referenced output nearly doubles the output voltage swing and available dynamic range of the LM48821 when compared to a traditional capacitively-coupled output headphone amplifier operating from the same supply voltage.

OUTPUT TRANSIENT ELIMINATED

The LM48821 contains advanced circuitry that virtually eliminates output transients ('clicks' and 'pops'). This circuitry attenuates output transients when the supply voltage is first applied or when the part resumes operation after using the shutdown mode.

POWER DISSIPATION

Power dissipation is a major concern when using any power amplifier and must be thoroughly understood to ensure a successful design. Equation 1 states the maximum power dissipation point for a single-ended amplifier operating at a given supply voltage and driving a specified output load.

$$P_{\text{DMAX}} = (2V_{\text{DD}})^2 / (2\pi^2 R_L) \quad (1)$$

Since the LM48821 has two power amplifiers in one package, the maximum internal power dissipation point is twice that of the number which results from Equation 1. Even with large internal power dissipation, the LM48821 does not require heat sinking over a large range of ambient temperatures. The maximum power dissipation point obtained must not be greater than the power dissipation that results from Equation 2:

$$P_{DMAX} = (T_{JMAX} - T_A) / (\theta_{JA}) \quad (2)$$

For the DSBGA package, $\theta_{JA} = 105^\circ\text{C/W}$. $T_{JMAX} = 150^\circ\text{C}$ for the LM48821. Depending on the ambient temperature, T_A , of the system surroundings, Equation 2 can be used to find the maximum internal power dissipation supported by the IC packaging. If the result of Equation 1 is greater than that of Equation 2, then either the supply voltage must be decreased, the load impedance increased or T_A reduced. Power dissipation is a function of output power and thus, if typical operation is not around the maximum power dissipation point, the ambient temperature may be increased accordingly.

SELECTING EXTERNAL COMPONENTS

Optimizing the LM48821's performance requires properly selecting external components. Though the LM48821 operates well when using external components with wide tolerances, best performance is achieved by optimizing component values.

Charge Pump Capacitor Selection

Use low ESR (equivalent series resistance) (<100m Ω) ceramic capacitors with an X7R dielectric for best performance. Low ESR capacitors keep the charge pump output impedance to a minimum, extending the headroom on the negative supply. Higher ESR capacitors result in reduced output power from the audio amplifiers.

Charge pump load regulation and output impedance are affected by the value of the flying capacitor (connected between the C_{CP-} and C_{CP+} pins). A larger valued C_1 (up to 4.7 μF) improves load regulation and minimizes charge pump output resistance. Beyond 4.7 μF , the switch-on-resistance dominates the output impedance.

The output ripple is affected by the value and ESR of the output capacitor (connected between the V_{SS} and PGND pins). Larger capacitors reduce output ripple on the negative power supply. Lower ESR capacitors minimize the output ripple and reduce the output impedance of the charge pump.

The LM48821 charge pump design is optimized for 4.7 μF , low ESR, ceramic, flying, and output capacitors.

Power Supply Bypass Capacitor

For good THD+N and low noise performance and to ensure correct power-on behavior at the maximum allowed power supply voltage, a local 4.7 μF power supply bypass capacitor should be connected as physically closed as possible to the PV_{DD} pin.

Input Capacitor Value Selection

Amplifying the lowest audio frequencies requires high value input coupling capacitors (the 0.47 μF capacitors in Figure 1). A high value capacitor can be expensive and may compromise space efficiency in portable designs. In many cases, however, the speakers used in portable systems, whether internal or external, have little ability to reproduce signals below 150Hz. Applications using speakers with this limited frequency response reap little improvement by using high value input and output capacitors.

Besides affecting system cost and size, the input coupling capacitor value has an effect on the LM48821's click and pop performance. The magnitude of the pop is directly proportional to the input capacitor's size. Thus, pops can be minimized by selecting an input capacitor value that is no higher than necessary to meet the desired -3dB frequency.

The LM48821's nominal input resistance at full volume is 10k Ω and a minimum of 5k Ω . This input resistance and the input coupling capacitor value produce a -3dB high pass filter cutoff frequency that is found using Equation 3.

$$f_{-3dB} = 1/2\pi R_i C_i \quad (3)$$

REVISION HISTORY

Rev	Date	Description
1.0	06/06/07	Initial release.
A	05/02/2013	Changed layout of National Data Sheet to TI format.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM48821TL/NOPB	ACTIVE	DSBGA	YZR	16	250	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-40 to 85	G16	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
