

MSP430F643x ミクスト・シグナル・マイクロコントローラ

1 特長

- 低い電源電圧範囲: 1.8V~3.6V
- 超低消費電力
 - アクティブ・モード (AM):
すべてのシステム・クロックがアクティブ:
270µA/MHz (8MHz, 3.0V)、フラッシュ・プログラム
実行時 (標準値)
 - スタンバイ・モード(LPM3):
ウォッチドッグ (水晶振動子を使用)、電源スーパー
バイザが動作、すべての RAM を保持、高速ウェー
クアップ:
1.8µA (2.2V)、2.1µA (3.0V) (標準値)
 - シャットダウン・リアルタイム・クロック (RTC) モード
(LPM3.5) :
シャットダウン・モード、RTC (水晶振動子を使用)
が動作:
1.1µA (3.0V) (標準値)
 - シャットダウン・モード (LPM4.5):
0.3µA (3.0V) (標準値)
- スタンバイ・モードから 3µs (標準値) でウェークアップ
- 16 ビット RISC アーキテクチャ、拡張メモリ、最大
20MHz のシステム・クロック
- 柔軟な電力管理システム
 - プログラム可能な、レギュレートされたコア電源電圧
を持つ、完全に統合された LDO
 - 電源電圧の管理、監視、およびブラウナウト
- 統合クロック・システム
 - FLL 制御ループによる周波数安定化
 - 低電力、低周波数の内部クロック・ソース (VLO)
 - 調整済みの低周波数内部基準源 (REFO)
 - 32kHz の水晶振動子 (XT1)
 - 最高 32MHz の高周波数水晶振動子 (XT2)
- 4 個の 16 ビット・タイマと 3、5、または 7 個のキャプチャ/比較レジスタ

3 概要

TI MSP 430™ ファミリの超低消費電力マイクロコントローラは複数のデバイスで構成され、それぞれが各種のアプリケーションを対象とする異なるペリフェラルを搭載しています。このアーキテクチャは 5 つの低消費電力モードを持ち、携帯用測定器用途でバッテリー駆動時間を延長するよう最適化されています。このデバイスには、強力な 16 ビット RISC CPU、16 ビット・レジスタ、および定数ジェネレータが搭載されており、コード効率が最大限に発揮されます。デジタル制御発振器 (DCO) により、低消費電力モードからアクティブ・モードへ 3µs (標準値) でウェークアップできます。

MSP430F643x は、3.3V LDO、高性能 12 ビット ADC、コンパレータ、2 つの USCI、ハードウェア乗算器、DMA、4 つの 16 ビット・タイマ、アラーム機能付き RTC モジュール、LCD ドライバ、最大 74 本の I/O ピンを搭載したマイクロコントローラです。

モジュールの完全な説明については、『MSP430F5xx および MSP430F6xx ファミリー・ユーザー・ガイド』を参照してください。

- 2 つのユニバーサル・シリアル通信インターフェイス (USCI)
 - USCI_A0、USCI_A1 がそれぞれ次の機能をサポート:
 - 自動ボーレート検出機能付きの拡張 UART
 - IrDA エンコーダおよびデコーダ
 - 同期 SPI
 - USCI_B0、USCI_B1 がそれぞれ次の機能をサポート:
 - I²C
 - 同期 SPI
- 3.3V 電源システム内蔵
- 共有基準電圧、サンプル・アンド・ホールド、自動スキャン機能を内蔵した 12 ビット A/D コンバータ(ADC)
- 同期機能付きの 2 つの 12 ビット D/A コンバータ (DAC)
- 電圧コンパレータ
- コントラスト制御を搭載し、最大 160 セグメントに対応する内蔵 LCD ドライバ
- ハードウェア乗算器で 32 ビットの演算をサポート
- シリアルのオンボード・プログラミング、外部のプログラミング電圧不要
- 6 チャンネルの内蔵 DMA
- 電源電圧バックアップ・スイッチ付きの RTC モジュール
- 「デバイスの比較」に、提供しているファミリー製品をまとめています。

2 アプリケーション

- アナログおよびデジタル・センサ・システム
- デジタル・モーター制御
- リモート・コントロール
- サーモスタット
- デジタル・タイマ
- ハンドヘルド・メータ

5 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from revision E to revision F

Changes from September 18, 2018 to September 10, 2020	Page
• 文書全体にわたってセクション、表、図、相互参照の採番方法を更新.....	1
• 文書全体にわたって nFBGA パッケージ (ZCA) の情報を追加.....	1
• Removed package options that are no longer available in 表 6-1, <i>Device Comparison</i> (MSP430F6436 in ZQW)	7
• Updated the list of devices available in the 113-Pin ZQW package in the caption of 図 7-3	8
• Changed the MAX value of the I _{ERASE} and I _{MERASE} , I _{BANK} parameters in セクション 8.54, <i>Flash Memory</i>	55
• Corrected the connection of the P7SEL.x signal in 図 9-11, <i>Port P7 (P7.4 to P7.7) Diagram</i>	98

Changes from revision D to revision E

Changes from December 9, 2015 to September 17, 2018	Page
• Added セクション 6.1, <i>Related Products</i>	7
• Added typical conditions statements at the beginning of セクション 8, <i>Specifications</i>	17
• Changed the MIN value of the V _(DVCC_BOR_hys) parameter from 60 mV to 50 mV in セクション 8.21, <i>PMM, Brownout Reset (BOR)</i>	30
• Updated notes (1) and (2) and added note (3) in セクション 8.27, <i>Wake-up Times From Low-Power Modes and Reset</i>	32
• Removed ADC12DIV from the formula for the TYP value in the second row of the t _{CONVERT} parameter in セクション 8.38, <i>12-Bit ADC, Timing Parameters</i> , because ADC12CLK is after division.....	42
• Removed the note that started "This impedance depends on..." from the "Reference input resistance" parameter in セクション 8.48, <i>12-Bit DAC, Reference Input Specifications</i>	50
• Added second row for t _{EN_CMP} with Test Conditions of "CBPWRMD = 10" and MAX value of 100 μs in セクション 8.51, <i>Comparator_B</i>	52
• Renamed FCTL4.MGR0 and MGR1 in the f _{MCLK_MGR} parameter in セクション 8.54, <i>Flash Memory</i> to be consistent with header files	55
• Replaced former section <i>Development Tools Support</i> with セクション 10.3, <i>Tools and Software</i>	110

Changes from revision C to revision D

Changes from August 6, 2013 to December 8, 2015	Page
• 全体を通してドキュメントのフォーマットと編成を変更、セクションの番号追加も含む.....	1
• すべての機能ブロック図をセクション 4「機能ブロック図」に移動	3
• Added USB column to 表 6-1, <i>Family Members</i>	7
• Added セクション 6, <i>Device Comparison</i> , and moved 表 6-1 to it.....	7
• Added "Port U is supplied by the LDOO rail" to the PU.0 and PU.1 descriptions in セクション 7.2, <i>Signal Descriptions</i>	11
• Added セクション 8.2, <i>ESD Ratings</i>	17
• Added note to C _{VCORE}	17
• Added セクション 8.7, <i>Thermal Resistance Characteristics</i>	21
• Added note to R _{Pull}	22
• Changed TYP value of C _{L,eff} with Test Conditions of "XTS = 0, XCAPx = 0" from 2 pF to 1 pF.....	26
• In V _{BAT3} parameter description, changed from "V _{BAT3} ≠ V _{BAT} /3" to "V _{BAT3} = V _{BAT} /3".....	34
• Changed from f _{DAC12_0OUT} to f _{DAC12_1OUT} in the first row of the Test Conditions for the "Channel-to-channel crosstalk" parameter.....	51
• Changed the value of DAC12_xDAT from 7F7h to F7Fh and changed the x-axis label from f _{Toggle} to 1/f _{Toggle} in 図 8-22, <i>Crosstalk Test Conditions</i>	51

- Corrected the spelling of the MRG bits in the $f_{MCLK,MRG}$ parameter in [セクション 8.54, Flash Memory](#) 55
- Removed RTC_B from LPM4.5 wake-up options..... 58
- Throughout document, changed all instances of "bootstrap loader" to "bootloader" 60
- Added the paragraph that starts "Using the MSP430 RTC_B Module With Battery Backup Supply describes how..." 64
- Corrected names of interrupt events PMMSWBOR (BOR) and PMMSWPOR (POR) in [表 9-10, System Module Interrupt Vector Registers](#) 65
- Corrected spelling of NMIIFG (added missing "I") in [表 9-10, System Module Interrupt Vector Registers](#) 65
- Added connection from "LCDS40...LCDS42" to AND gate in [図 9-7, Port P5 \(P5.2 to P5.7\) Diagram](#) 93
- Added P7SEL.2 and XT2BYPASS inputs with AND and OR gates in [図 9-10, Port P7 \(P7.3\) Diagram](#) 97
- Changed P7SEL.3 column from X to 0 for "P7.3 (I/O)" rows..... 97
- Changed [表 9-61, Port PU.0, PU.1 Functions](#) 104
- Added [セクション 10](#) and moved *Development Tools Support, Device and Development Tool Nomenclature, Trademarks, and Electrostatic Discharge Caution* sections to it..... 108
- Added [セクション 11, Mechanical, Packaging, and Orderable Information](#) 115

The following table lists the changes to this data sheet from the original release through revision C.

- (1) I = input, O = output, N/A = not available on this package offering
- (2) V_{CORE} is for internal use only. No external current loading is possible. V_{CORE} should only be connected to the recommended capacitor value, C_{V_{CORE}}.
- (3) When this pin is configured as reset, the internal pullup resistor is enabled by default.
- (4) See the *Package Option Addendum* in [セクション 11](#) to determine which devices are available in each package.

8 Specifications

All graphs in this section are for typical conditions, unless otherwise noted.

Typical (TYP) values are specified at $V_{CC} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$, unless otherwise noted.

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	MIN	MAX	UNIT
Voltage applied at V_{CC} to V_{SS}	-0.3	4.1	V
Voltage applied to any pin (excluding V _{CORE} , V _{BUS} , V18) ⁽²⁾	-0.3	$V_{CC} + 0.3$	V
Diode current at any device pin		±2	mA
Maximum junction temperature, T_J		95	°C
Storage temperature, T_{stg} ⁽³⁾	-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to V_{SS} . V_{CORE} is for internal device use only. No external DC loading or voltage should be applied.
- (3) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

8.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

		PMMCOREVx = 1, 2 V ≤ V _{CC} ≤ 3.6 V		0	12.0	
		PMMCOREVx = 2, 2.2 V ≤ V _{CC} ≤ 3.6 V		0	16.0	
		PMMCOREVx = 3, 2.4 V ≤ V _{CC} ≤ 3.6 V		0	20.0	

- (1) TI recommends powering AV_{CC} and DV_{CC} from the same source. A maximum difference of 0.3 V between AV_{CC} and DV_{CC} can be tolerated during power up and operation.
- (2) The minimum supply voltage is defined by the supervisor SVS levels when it is enabled. See the threshold parameters in [セクション 8.23](#) for the exact values and more details.
- (3) The MSP430 CPU is clocked directly with MCLK. Both the high and low phase of MCLK must not exceed the pulse duration of the specified maximum frequency.
- (4) A capacitor tolerance of ±20% or better is required.
- (5) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.

NOTE: The numbers within the fields denote the supported PMMCOREVx settings.

8.7 Thermal Resistance Characteristics

PARAMETER		VALUE	UNIT
$R\theta_{JA}$	Junction-to-ambient thermal resistance, still air ⁽¹⁾	LQFP (PZ)	122
		BGA (ZQW)	108
$R\theta_{JC(TOP)}$	Junction-to-case (top) thermal resistance ⁽²⁾	LQFP (PZ)	83
		BGA (ZQW)	72
$R\theta_{JB}$	Junction-to-board thermal resistance ⁽³⁾	LQFP (PZ)	98
		BGA (ZQW)	76

- (1) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, High-K board, as specified in JE5D51-7, in an environment described in JE5D51-2a.
- (2) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (3) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JE5D51-8.

8.8 Schmitt-Trigger Inputs – General-Purpose I/O

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)⁽¹⁾

PARAMETER		TEST CONDITIONS	V _{CC}	MIN	TYP	MAX	UNIT

PARAMETER		TEST CONDITIONS	V _{CC}	MIN	MAX	UNIT
t _(int)	External interrupt timing ⁽²⁾	Port P1, P2, P3, P4: P1.x to P4.x, External trigger pulse duration to set interrupt flag	2.2 V, 3 V	20		ns

- (1) Some devices may contain additional ports with interrupts. See the block diagram and terminal function descriptions.
 (2) An external signal sets the interrupt flag every time the minimum interrupt pulse duration t_(int) is met. It may be set by trigger signals shorter than t_(int).

8.10 Leakage Current – General-Purpose I/O

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V _{CC}	MIN	MAX	UNIT
I _{lkg(Px.x)}	High-impedance leakage current	See ⁽¹⁾ (2)	1.8 V, 3 V		±50	nA

- (1) The leakage current is measured with V_{SS} or V_{CC} applied to the corresponding pins, unless otherwise noted.
 (2) The leakage of the digital port pins is measured individually. The port pin is selected for input and the pullup or pulldown resistor is disabled.

8.11 Outputs – General-Purpose I/O (Full Drive Strength)

- (1) Includes parasitic bond and package capacitance (approximately 2 pF per pin). Because the PCB adds additional capacitance, TI recommends verifying the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (2) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- (3) Measured with logic-level input frequency but also applies to operation with crystals.
- (4) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies in between might set the flag.
- (5) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
 - Keep the trace between the device and the crystal as short as possible.
 - Design a good ground plane around the oscillator pins.
 - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
 - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
 - Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
 - If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.
- (6) When XT1BYPASS is set, XT1 circuit is automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this datasheet.
- (7) Maximum frequency of operation of the entire device cannot be exceeded.

- (8) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVE_x settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
- For XT1DRIVE_x = 0, C_{L,eff} ≤ 6 pF.
 - For XT1DRIVE_x = 1, 6 pF ≤ C_{L,eff} ≤ 9 pF.
 - For XT1DRIVE_x = 2, 6 pF ≤ C_{L,eff} ≤ 10 pF.
 - For XT1DRIVE_x = 3, C_{L,eff} ≥ 6 pF.

$t_{\text{WAKE-UP-SLOW}}$	Wake-up time from LPM2, LPM3, or LPM4 to active mode ^{(2) (3)}	PMMCOREV = SVSMLRRL = n (where n = 0, 1, 2, or 3), SVSLFP = 0		150	165	μs	
$t_{\text{WAKE-UP-LPM5}}$	Wake-up time from LPM3.5 or LPM4.5 to active mode ⁽⁴⁾			2	3	ms	
$t_{\text{WAKE-UP-RESET}}$	Wake-up time from $\overline{\text{RST}}$ or BOR event to active mode ⁽⁴⁾			2	3	ms	

- (1) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVS_L) and low-side monitor (SVM_L). $t_{\text{WAKE-UP-FAST}}$ is possible with SVS_L and SVM_L in full performance mode or disabled. For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the [MSP430F5xx and MSP430F6xx Family User's Guide](#).
- (2) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVS_L) and low-side monitor (SVM_L). $t_{\text{WAKE-UP-SLOW}}$ is set with SVS_L and SVM_L in normal mode (low current mode). For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the [MSP430F5xx and MSP430F6xx Family User's Guide](#).
- (3) The wake-up times from LPM0 and LPM1 to AM are not specified. They are proportional to MCLK cycle time but are not affected by the performance mode settings as for LPM2, LPM3, and LPM4.
- (4) This value represents the time from the wake-up event to the reset vector execution.

- (1) The temperature sensor is provided by the REF module. See the REF module parametric, I_{REF+} , regarding the current consumption of the temperature sensor.
- (2) The temperature sensor offset can be significant. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor. The TLV structure contains calibration values for $30^\circ\text{C} \pm 3^\circ\text{C}$ and $85^\circ\text{C} \pm 3^\circ\text{C}$ for each of the available reference voltage levels. The sensor voltage can be computed as $V_{SENSE} = TC_{SENSOR} \times (\text{Temperature}, ^\circ\text{C}) + V_{SENSOR}$, where TC_{SENSOR} and V_{SENSOR} can be computed from the calibration values for higher accuracy. See also the [MSP430F5xx and MSP430F6xx Family User's Guide](#).
- (3) The typical equivalent impedance of the sensor is 51 k Ω . The sample time required includes the sensor-on time $t_{SENSOR(on)}$.
- (4) The on-time $t_{VMID(on)}$ is included in the sampling time $t_{VMID(sample)}$; no additional on time is needed.

- (1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance, C_i, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to let the charge settle for 12-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (4) The accuracy limits minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.
- (5) Connect two decoupling capacitors, 10 μF and 100 nF, to VREF to decouple the dynamic current required for an external reference source if it is used for the ADC12_A. Also see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

- (1) The reference is supplied to the ADC by the REF module and is buffered locally inside the ADC. The ADC uses two internal buffers, one smaller and one larger for driving the V_{REF+} terminal. When REFOUT = 1, the reference is available at the V_{REF+} terminal, as well as, used as the reference for the conversion and uses the larger buffer. When REFOUT = 0, the reference is only used as the reference for the conversion and uses the smaller buffer.
- (2) The internal reference current is supplied by the AVCC terminal. Consumption is independent of the ADC12ON control bit, unless a conversion is active. REFOUT = 0 represents the current contribution of the smaller buffer. REFOUT = 1 represents the current contribution of the larger buffer without external load.
- (3) Contribution only due to the reference and buffer including package. This does not include resistance due to PCB traces or other external factors.
- (4) Calculated using the box method: (MAX(-40°C to +85°C) – MIN(-40°C to +85°C)) / MIN(-40°C to +85°C) / (85°C – (-40°C)).
- (5) The condition is that the error in a conversion started after t_{REFON} is less than ±0.5 LSB. The settling time depends on the external capacitive load when REFOUT = 1.
- (6) Connect two decoupling capacitors, 10 µF and 100 nF, to VREF to decouple the dynamic current required for an external reference source if it is used for the ADC12_A. Also see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

- (7) The temperature sensor is provided by the REF module. Its current is supplied by terminal AVCC and is equivalent to I_{REF+} with REFON = 1 and REFOUT = 0.
- (8) For devices without the ADC12, the parametric with ADC12SR = 0 are applicable.

- (1) This parameter is not production tested.
- (2) Parameters calculated from the best-fit curve from 0x0F to 0xFFF. The best-fit curve method is used to deliver coefficients "a" and "b" of the first-order equation: $y = a + bx$. $V_{DAC12_xOUT} = E_O + (1 + E_G) \times (V_{eREF+} / 4095) \times DAC12_xDAT$, DAC12IR = 1.
- (3) The offset calibration works on the output operational amplifier. Offset calibration is triggered by setting the DAC12CALON bit.
- (4) The offset calibration can be done if DAC12AMPx = {2, 3, 4, 5, 6, 7}. The output operational amplifier is switched off with DAC12AMPx = {0, 1}. TI recommends configuring the DAC12 module before initiating calibration. Port activity during calibration may effect accuracy and is not recommended.

- (2) f_{TCK} may be restricted to meet the timing requirements of the module selected.

9 Detailed Description

9.1 Overview

The MSP430F643x devices include an integrated 3.3-V LDO, a high-performance 12-bit ADC, a comparator, two USCs, a hardware multiplier, DMA, four 16-bit timers, an RTC module with alarm capabilities, an LCD driver, and up to 74 I/O pins.

9.2 CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers (see [Figure 9-1](#)).

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be managed with all instructions.

9.3 Instruction Set

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data. 表 9-1 lists examples of the three types of instruction formats; 表 9-2 lists the address modes.

表 9-1. Instruction Word Formats

INSTRUCTION WORD FORMAT	EXAMPLE	OPERATION
Dual operands, source-destination	ADD R4,R5	R4 + R5 → R5
Single operands, destination only	CALL R8	PC → (TOS), R8 → PC

9.4 Operating Modes

These devices have one active mode and seven software-selectable low-power modes of operation. An interrupt event can wake up the device from any of the low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

Software can configure the following operating modes:

- Active mode (AM)
 - All clocks are active
- Low-power mode 0 (LPM0)
 - CPU is disabled
 - ACLK and SMCLK remain active, MCLK is disabled
 - FLL loop control remains active
- Low-power mode 1 (LPM1)
 - CPU is disabled
 - FLL loop control is disabled
 - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 2 (LPM2)
 - CPU is disabled
 - MCLK, FLL loop control, and DCOCLK are disabled
 - DC generator of the DCO remains enabled
 - ACLK remains active
- Low-power mode 3 (LPM3)

 - DC generator of the DCO is disabled
 - ACLK remains active
- Low-power mode 4 (LPM4)
 - CPU is disabled
 - ACLK is disabled
 - MCLK, FLL loop control, and DCOCLK are disabled
 - DC generator of the DCO is disabled
 - Crystal oscillator is stopped
 - Complete data retention
- Low-power mode 3.5 (LPM3.5)
 - Internal regulator disabled
 - No data retention
 - RTC enabled and clocked by low-frequency oscillator
 - Wake-up signal from $\overline{\text{RST}}/\text{NMI}$, RTC_B, P1, P2, P3, and P4
- Low-power mode 4.5 (LPM4.5)
 - Internal regulator disabled
 - No data retention
 - Wake-up signal from $\overline{\text{RST}}/\text{NMI}$, P1, P2, P3, and P4

9.5 Interrupt Vector Addresses

The interrupt vectors and the power-up start address are in the address range 0FFFFh to 0FF80h (see 表 9-3). The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

- (1) Multiple source flags
- (2) Interrupt flags are in the module.
- (3) A reset is generated if the CPU tries to fetch instructions from within peripheral space or vacant memory space.
(Non)maskable: the individual interrupt-enable bit can disable an interrupt event, but the general-interrupt enable cannot disable it.
- (4) Reserved interrupt vectors at addresses are not used in this device and can be used for regular program code if necessary. To maintain compatibility with other devices, TI recommends reserving these locations.

(5) Only on devices with peripheral module DAC12_A, otherwise reserved.

(2) Backup RAM is accessed through the control registers BAKMEM0, BAKMEM1, BAKMEM2, and BAKMEM3.

9.7 Bootloader (BSL)

The BSL lets users program the flash memory or RAM using a UART serial interfaces. Access to the device memory by the BSL is protected by a user-defined password. Use of the BSL requires external access to six pins (see 表 9-5). BSL entry requires a specific entry sequence on the RST/NMI/SBWTDIO and TEST/SBWTDIO pins. For complete description of the features of the BSL and its implementation, see [MSP430™ Flash Devices Bootloader \(BSL\) User's Guide](#).

9.8 JTAG Operation

9.8.1 JTAG Standard Interface

The MSP430 family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the RST/NMI/SBWTIO is required to interface with MSP430 development tools and device programmers. 表 9-6 lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#).

9.8.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430 family supports the two wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. 表 9-7 lists the Spy-Bi-Wire interface pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#).

9.9 Flash Memory

The flash memory can be programmed by the JTAG port, Spy-Bi-Wire (SBW), the BSL, or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 128 bytes each. Each segment in main memory is 512 bytes in size.

- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually, or as a group with segments 0 to n. Segments A to D are also called *information memory*.
- Segment A can be locked separately.

9.10 RAM

The RAM is made up of n sectors. Each sector can be completely powered down to save leakage; however, all data is lost. Features of the RAM include:

- RAM has n sectors. The size of a sector can be found in [セクション 9.6](#).
- Each sector 0 to n can be complete disabled; however, data retention is lost.
- Each sector 0 to n automatically enters low power retention mode when possible.

9.11 Backup RAM

The backup RAM provides a limited number of bytes of RAM that are retained during LPMx.5 and during operation from a backup supply if the Battery Backup System module is implemented.

Eight bytes of backup RAM are available. The backup RAM can be wordwise accessed by the control registers BAKMEM0, BAKMEM1, BAKMEM2, and BAKMEM3.

9.12 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. Peripherals can be managed using all instructions. For complete module descriptions, see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

9.12.1 Digital I/O

Up to nine 8-bit I/O ports are implemented: P1 through P6, P8, and P9 are complete, P7 contains six individual I/O ports, and PJ contains four individual I/O ports.

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Programmable drive strength on all ports.
- All eight bits of ports P1, P2, P3, and P4 support edge-selectable interrupt input.
- All instructions support read and write access to port-control registers.
- Ports can be accessed byte-wise (P1 through P9) or word-wise in pairs (PA through PD).

9.12.2 Port Mapping Controller

The port mapping controller allows the flexible and reconfigurable mapping of digital functions to port P2. [表 9-8](#) lists the mnemonic for each function that can be assigned.

9.12.3 Oscillator and System Clock

The clock system is supported by the Unified Clock System (UCS) module that includes support for a 32-kHz watch crystal oscillator (in XT1 LF mode; XT1 HF mode is not supported), an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), an integrated internal digitally controlled oscillator (DCO), and a high-frequency crystal oscillator XT2. The UCS module is designed to meet the requirements of both low system cost and low power consumption. The UCS module features digital

frequency-locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the watch-crystal frequency. The internal DCO provides a fast turnon clock source and stabilizes in 3 μ s (typical). The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32-kHz watch crystal (XT1), a high-frequency crystal (XT2), the internal low-frequency oscillator (VLO), the trimmed low-frequency oscillator (REFO), or the internal digitally-controlled oscillator DCO.
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources available to ACLK.
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, ACLK/32.

9.12.4 Power-Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, as well as brownout protection. The brownout circuit is implemented to provide the proper internal reset signal to the device during power-on and power-off. The SVS and SVM circuitry detects if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (the device is not automatically reset). SVS and SVM circuitry is available on the primary supply and core supply.

9.12.5 Hardware Multiplier (MPY) (Link to User's Guide)

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations.

9.12.6 Real-Time Clock (RTC_B)

The RTC_B module can be configured for real-time clock (RTC) or calendar mode providing seconds, minutes, hours, day of week, day of month, month, and year. Calendar mode integrates an internal calendar which compensates for months with less than 31 days and includes leap year correction. The RTC_B also supports flexible alarm functions and offset-calibration hardware. The implementation on this device supports operation in LPM3.5 mode and operation from a backup supply.

[Using the MSP430 RTC_B Module With Battery Backup Supply](#) describes how to use the RTC_B with battery backup supply functionality to retain the time and keep the RTC counting through loss of main power supply, and how to perform correct reinitialization when the main power supply is restored.

9.12.7 Watchdog Timer (WDT_A)

The primary function of the WDT_A module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals.

9.12.8 System Module (SYS)

The SYS module handles many of the system functions within the device. These include power-on reset and power-up clear handling, NMI source selection and management, reset interrupt vector generators, bootloader entry mechanisms, and configuration management (device descriptors). SYS also includes a data exchange mechanism through JTAG called a JTAG mailbox that can be used in the application.

表 9-10 lists the SYS interrupt vector registers.

9.12.9 DMA Controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC12_A conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral. [表 9-11](#) lists the trigger assignments for each DMA channel.

9.12.10 Universal Serial Communication Interface (USCI)

The USCI modules are used for serial data communication. The USCI module supports synchronous communication protocols such as SPI (3 or 4 pin) and I²C, and asynchronous communication protocols such as

UART, enhanced UART with automatic baudrate detection, and IrDA. Each USCI module contains two portions, A and B.

The USCI_An module provides support for SPI (3 or 4 pin), UART, enhanced UART, or IrDA.

The USCI_Bn module provides support for SPI (3 or 4 pin) or I²C.

The MSP430F643x series includes two complete USCI modules (n = 0 or 1).

9.12.11 Timer TA0

Timer TA0 is a 16-bit timer/counter (Timer_A type) with five capture/compare registers. TA0 can support multiple capture/compares, PWM outputs, and interval timing (see 表 9-12). TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each capture/compare register.

Timer TA1 is a 16-bit timer/counter (Timer_A type) with three capture/compare registers. TA1 supports multiple capture/comparisons, PWM outputs, and interval timing (see [表 9-13](#)). TA1 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each capture/compare register.

9.12.14 Timer TB0

Timer TB0 is a 16-bit timer/counter (Timer_B type) with seven capture/compare registers. TB0 supports multiple capture/comparisons, PWM outputs, and interval timing (see 表 9-15). TB0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each capture/compare register.

- (1) Only on devices with peripheral module DAC12_A.
- (2) Timer functions selectable by the port mapping controller.

9.12.15 Comparator_B

The primary function of the Comparator_B module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

9.12.16 ADC12_A

The ADC12_A module supports fast 12-bit analog-to-digital conversions. The module implements a 12-bit SAR core, sample select control, reference generator, and a 16-word conversion-and-control buffer. The conversion-and-control buffer allows up to 16 independent ADC samples to be converted and stored without any CPU intervention.

The DAC12_A module is a 12-bit R-ladder voltage-output DAC. The DAC12_A may be used in 8-bit or 12-bit mode, and may be used with the DMA controller. When multiple DAC12_A modules are present, they may be grouped together for synchronous operation.

9.12.18 CRC16

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

9.12.19 Voltage Reference (REF) Module

The REF module generates all of the critical reference voltages that can be used by the various analog peripherals in the device.

9.12.20 LCD_B

The LCD_B driver generates the segment and common signals that are required to drive a liquid crystal display (LCD). The LCD_B controller has dedicated data memories to hold segment drive information. Common and segment signals are generated as defined by the mode. Static, 2-mux, 3-mux, and 4-mux LCDs are supported. The module can provide a LCD voltage independent of the supply voltage with its integrated charge pump. It is possible to control the level of the LCD voltage, and thus the contrast, by software. The module also provides an automatic blinking capability for individual segments.

9.12.21 LDO and PU Port

The integrated 3.3-V power system incorporates an integrated 3.3-V LDO regulator that allows the entire MSP430 microcontroller to be powered from nominal 5-V LDO when it is made available for the system. Alternatively, the power system can supply power only to other components within the system, or it can be unused altogether.

The Port U pins (PU.0 and PU.1) function as general-purpose high-current I/O pins. These pins can only be configured together as either both inputs or both outputs. Port U is supplied by the LDO rail. If the 3.3-V LDO is not being used in the system (disabled), the LDO pin can be supplied externally.

9.12.22 Embedded Emulation Module (EEM)

The EEM supports real-time in-system debugging. The L version of the EEM has the following features:

- Eight hardware triggers or breakpoints on memory access
- Two hardware triggers or breakpoints on CPU register write access
- Up to 10 hardware triggers can be combined to form complex triggers or breakpoints
- Two cycle counters
- Sequencer
- State storage
- Clock control on module level

9.12.23 Peripheral File Map

表 9-16 lists the register base address for all of the available peripheral modules.

- (1) X = Don't care
- (2) Default condition
- (3) Setting the P5SEL.0 bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. An external voltage can be applied to VeREF+ and used as the reference for the ADC12_A, Comparator_B, or DAC12_A.
- (4) Setting the P5SEL.0 bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. The ADC12_A VREF+ reference is available at the pin.
- (5) Setting the P5SEL.1 bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. An external voltage can be applied to VeREF- and used as the reference for the ADC12_A, Comparator_B, or DAC12_A.
- (6) Setting the P5SEL.1 bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. The ADC12_A VREF- reference is available at the pin.

10.1 Getting Started and Next Steps

For more information on the MSP430™ family of devices and the tools and libraries that are available to help with your development, visit the [MSP430 ultra-low-power sensing & measurement MCUs overview](#).

10.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [☒ 10-1](#) provides a legend for reading the complete device name.

10.3 Tools and Software

All MSP microcontrollers are supported by a wide variety of software and hardware development tools. Tools are available from TI and various third parties. See them all at [MSP430 ultra-low-power MCUs – Design & development](#).

表 10-1 lists the debug features of the MSP430F643x MCUs. See the [Code Composer Studio™ IDE for MSP430™ MCUs User's Guide](#) for details on the available features.

Design Kits and Evaluation Modules

[MSP-TS430PZ100C - 100-pin Target Development Board for MSP430F5x and MSP430F6x MCUs](#)

The MSP-TS430PZ100USB is a stand-alone 100-pin ZIF socket target board used to program and debug the MSP430 MCU in-system through the JTAG interface or the Spy Bi-Wire (2-wire JTAG) protocol.

[100-pin Target Development Board and MSP-FET Programmer Bundle for MSP430F5x and MSP430F6x MCUs](#)

The MSP-FET is a powerful flash emulation tool to quickly begin application development on the MSP430 MCU. It includes USB debugging interface used to program and debug the MSP430 in-system through the JTAG interface or the pin saving Spy Bi-Wire (2-wire JTAG) protocol. The flash memory can be erased and programmed in seconds with only a few keystrokes, and because the MSP430 flash is ultra-low power, no external power supply is required.

Software

[MSP430Ware™ Software](#)

MSP430Ware software is a collection of code examples, data sheets, and other design resources for all MSP430 devices delivered in a convenient package. In addition to providing a complete collection of existing MSP430 design resources, MSP430Ware software also includes a high-level API called MSP430 Driver Library. This library makes it easy to program MSP430 hardware. MSP430Ware software is available as a component of CCS or as a stand-alone package.

[MSP430F563x, MSP430F663x Code Examples](#)

C code examples are available for every MSP device that configures each of the integrated peripherals for various application needs.

[MSP Driver Library](#)

Driver Library's abstracted API keeps you above the bits and bytes of the MSP430 hardware by providing easy-to-use function calls. Thorough documentation is delivered through a helpful API Guide, which includes details on each function call and the recognized parameters. Developers can use Driver Library functions to write complete projects with minimal overhead.

[MSP EnergyTrace™ Technology](#)

EnergyTrace technology for MSP430 microcontrollers is an energy-based code analysis tool that measures and displays the application's energy profile and helps to optimize it for ultra-low-power consumption.

[ULP \(Ultra-Low Power\) Advisor](#)

ULP Advisor™ software is a tool for guiding developers to write more efficient code to fully utilize the unique ultra-low power features of MSP and MSP432 microcontrollers. Aimed at both experienced and new microcontroller developers, ULP Advisor checks your code against a thorough ULP checklist to squeeze every last nano amp out of your application. At build time, ULP Advisor will provide notifications and remarks to highlight areas of your code that can be further optimized for lower power.

[IEC 60730 Software Package](#)

The IEC 60730 MSP430 software package was developed to be useful in assisting customers in complying with IEC 60730-1:2010 (Automatic Electrical Controls for Household and Similar Use – Part 1: General Requirements) for up to Class B products, which includes home appliances, arc detectors, power converters, power tools, e-bikes, and many others. The IEC 60730 MSP430 software package can be embedded in customer applications running on MSP430s to help simplify the customer's certification efforts of functional safety-compliant consumer devices to IEC 60730-1:2010 Class B.

[Fixed Point Math Library for MSP](#)

The MSP IQmath and Qmath Libraries are a collection of highly optimized and high-precision mathematical functions for C programmers to seamlessly port a floating-point algorithm into fixed-point code on MSP430 MCUs. These routines are typically used in computationally intensive real-time applications where optimal execution speed, high accuracy, and ultra-low energy are critical. By using the IQmath and Qmath libraries, it is possible to achieve execution speeds considerably faster and energy consumption considerably lower than equivalent code written using floating-point math.

[Floating Point Math Library for MSP430](#)

Continuing to innovate in the low-power and low-cost microcontroller space, TI brings you MSPMATHLIB. Leveraging the intelligent peripherals of our devices, this floating point math library of scalar functions brings you up to 26x better performance. Mathlib is easy to integrate into your designs. This library is free and is integrated in both Code Composer Studio and IAR IDEs. Read the user's guide for an in depth look at the math library and relevant benchmarks.

Development Tools

[Code Composer Studio™ Integrated Development Environment for MSP Microcontrollers](#)

The Code Composer Studio integrated development environment (IDE) supports all MSP microcontroller devices. The Code Composer Studio IDE comprises a suite of embedded software utilities used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar utilities and interfaces allow users to get started faster than ever before. The Code Composer Studio IDE combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers. When using the Code Composer Studio IDE with an MSP430 MCU, a unique and powerful set of plugins and embedded software utilities are made available to fully leverage the MSP430 microcontroller.

[Command-Line Programmer](#)

MSP Flasher is an open-source shell-based interface for programming MSP microcontrollers through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP Flasher can download binary files (.txt or .hex) files directly to the MSP microcontroller without an IDE.

MSP MCU Programmer and Debugger

The MSP-FET is a powerful emulation development tool – often called a debug probe – that lets users quickly begin application development on MSP low-power microcontrollers (MCU). Creating MCU software usually requires downloading the resulting binary program to the MSP device for validation and debugging. The MSP-FET provides a debug communication pathway between a host computer and the target MSP. Furthermore, the MSP-FET also provides a Backchannel UART connection between the computer's USB interface and the MSP UART. This gives the MSP programmer a convenient method to communicate serially between the MSP and a terminal running on the computer. It also supports loading programs (often called firmware) to the MSP target using the BSL (bootloader) through the UART and I²C communication protocols.

MSP-GANG Production Programmer

The MSP Gang Programmer is a device programmer that can program up to eight identical MSP430 or MSP432 flash or FRAM devices at the same time. The MSP Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that allow the user to fully customize the process. The MSP Gang Programmer is provided with an expansion board, called the Gang Splitter, that implements the interconnections between the MSP Gang Programmer and multiple target devices. Eight cables are provided that connect the expansion board to eight target devices (through JTAG or Spy-Bi-Wire connectors). The programming can be done with a PC or as a stand-alone device. A PC-side graphical user interface is also available and is DLL-based.

10.4 Documentation Support

The following documents describe the MSP430F643x MCUs. Copies of these documents are available on the Internet at www.ti.com.

Receiving Notification of Document Updates

To receive notification of documentation updates—including silicon errata—go to the product folder for your device on ti.com (for links to the product folders, see [セクション 10.5](#)). In the upper right corner, click the "Alert me" button. This registers you to receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

User's Guides

[MSP430x5xx and MSP430x6xx Family User's Guide](#)

Detailed information on the modules and peripherals available in this device family.

[IAR Embedded Workbench IDE for MSP430 MCUs User's Guide](#)

This manual describes the use of IAR Embedded Workbench (EW430) with the MSP430 ultra-low-power microcontrollers.

[MSP430™ Flash Devices Bootloader \(BSL\) User's Guide](#)

The MSP430 BSL lets users communicate with embedded memory in the MSP430 microcontroller during the prototyping phase, final production, and in service. Both the programmable memory (flash memory) and the data memory (RAM) can be modified as required. Do not confuse the bootloader with the bootstrap loader programs found in some digital signal processors (DSPs) that automatically load program code (and data) from external memory to the internal memory of the DSP.

[MSP430 Programming With the JTAG Interface](#)

This document describes the functions that are required to erase, program, and verify the memory module of the MSP430 flash-based and FRAM-based microcontroller families using the JTAG communication port. In addition, it describes how to program the JTAG access security fuse that is available on all MSP430 devices. This document describes device access using both the standard 4-wire JTAG interface and the 2-wire JTAG interface, which is also referred to as Spy-Bi-Wire (SBW).

[MSP430 Hardware Tools User's Guide](#)

This manual describes the hardware of the TI MSP-FET430 Flash Emulation Tool (FET). The FET is the program development tool for the MSP430 ultra-low-power microcontroller. Both available interface types, the parallel port interface and the USB interface, are described.

Application Reports

[MSP430 32-kHz Crystal Oscillators](#)

Selection of the right crystal, correct load circuit, and proper board layout are important for a stable crystal oscillator. This application report summarizes crystal oscillator function and explains the parameters to select the correct crystal for MSP430 ultra-low-power operation. In addition, hints and examples for correct board layout are given. The document also contains detailed information on the possible oscillator tests to ensure stable oscillator operation in mass production.

[MSP430 System-Level ESD Considerations](#)

System-level ESD has become increasingly demanding with silicon technology scaling towards lower voltages and the need for designing cost-effective and ultra-low-power components. This application report addresses three different ESD topics to help board designers and OEMs understand and design robust system-level designs.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
