

# TPS742 1.5A、超低ドロップアウトレギュレータ、プログラム可能なソフト スタート機能付き

## 1 特長

- 入力電圧範囲: 0.8V~5.5V
- ソフトスタート (SS) ピンを使うことで、外部コンデンサで設定するランプ時間に合わせた線形スタートアップが可能
- ライン、負荷、温度の全範囲にわたって 1% の精度
- 外部バイアス電源により、最低 0.8V の入力電圧をサポート
- 可変出力 (0.8V~3.6V)
- 非常に低いドロップアウト:
  - 60mV (従来チップ、1.5A (標準値) 時)
  - 55mV (新チップ、1.5A (標準値) 時)
- 2.2 $\mu$ F 以上の出力コンデンサで安定動作 (新チップ)
- 出力コンデンサなし、または任意の値のコンデンサで安定動作 (従来チップ)
- 優れた過度応答
- オープンドレイン形式のパワー グッド
- アクティブ High イネーブル

## 2 アプリケーション

- ネットワーク接続ストレージ (NAS) - エンタープライズ  
ラック サーバー
- ネットワーク インターフェイス カード (NIC)
- 商用ネットワークとサーバーの電源

## 3 概要

TPS742 シリーズの低ドロップアウト (LDO) リニア レギュレータは、広範なアプリケーション向けの使いやすく堅牢な電力管理ソリューションです。ソフトスタートをユーザーがプログラムできるので、スタートアップ時の容量性突入電流を低減して、入力電源のストレスを最小限に抑えることができます。ソフトスタートは単調性で、多くの種類のプロセッサや ASIC への電源供給に適しています。イネーブル入力とパワー グッド出力により、外部レギュレータとの間でシーケンシングを簡単に行えます。この優れた柔軟性により、FPGA、DSP、および特殊なスタートアップ要件を持つ他のアプリケーションのシーケンス要件を満たすソリューションを構成できます。

高精度の基準電圧およびエラー アンプは、負荷、ライン、温度、プロセスの全体にわたって 1% の精度を維持します。本デバイスは 2.2 $\mu$ F 以上 (新チップ) の任意のタイプのコンデンサで安定して動作し、-40°C~+125°C で仕様が規定されています。

### パッケージ情報

部品番号	パッケージ (1)	パッケージ サイズ (2)
TPS74201	RGW (VQFN, 20)	5mm × 5mm
	RGR (VQFN, 20)	3.5mm × 3.5mm
	KTW (DDPAK/TO-263, 7)	10.1mm × 15.24mm

- (1) 利用可能なすべてのパッケージについては、「[メカニカル、パッケージ、および注文情報](#)」を参照してください。
- (2) パッケージ サイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます。

代表的なアプリケーションの可変出力バージョン

ターンオン応答

## 4 Pin Configuration and Functions

図 4-1. RGW and RGR Packages, 20-Pin VQFN With Exposed Thermal Pad (Top View)

図 4-2. KTW Package, 7-Pin DDPAK/TO-263 (Top View, Legacy Chip)

表 4-1. Pin Functions

NAME	PIN		TYPE <sup>(1)</sup>	DESCRIPTION
	KTW <sup>(2)</sup> (DDPAK/ TO-263)	RGW, RGR <sup>(2)</sup> (VQFN)		
BIAS	6	10	I	Bias input voltage for error amplifier, reference, and internal control circuits.
EN	7	11	I	Enable pin. Driving this pin high enables the regulator. Driving this pin low puts the regulator into shutdown mode. This pin must not be left floating.
FB	2	16	I	This pin is the feedback connection to the center tap of an external resistor divider network that sets the output voltage. This pin must not be left floating. (Adjustable version only.)
GND	4	12	—	Ground
IN	5	5,6,7,8	I	Unregulated input to the device.
NC	—	2, 3, 4, 13, 14, 17	O	No connection. This pin can be left floating or connected to GND to allow better thermal contact to the top-side plane.
OUT	3	1, 18, 19, 20	O	Regulated output voltage. No capacitor is required on this pin for stability.
PAD/TAB	—	—	—	Solder to the ground plane for increased thermal performance.
PG	—	9	O	Power-good (PG) is an open-drain, active-high output that indicates the status of $V_{OUT}$ . When $V_{OUT}$ exceeds the PG trip threshold, the PG pin goes into a high-impedance state. When $V_{OUT}$ is below this threshold the pin is driven to a low-impedance state. Connect a pullup resistor from 10kΩ to 1MΩ from this pin to a supply up to 5.5V. The supply can be higher than the input voltage. Alternatively, the PG pin can be left floating if output monitoring is not necessary.
SNS	2	16	I	This pin is the sense connection to the load device. This pin must be connected to $V_{OUT}$ and must not be left floating. (Fixed versions only.)
SS	1	15	—	Soft-start pin. A capacitor connected on this pin to ground sets the start-up time. If this pin is left floating, the regulator output soft-start ramp time is typically 100μs.

(1) I = Input; O = Output;

(2) The RGR and KTW package are only for the legacy device.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
$V_{IN}, V_{BIAS}$	Input voltage	-0.3	6	V
$V_{EN}$	Enable voltage	-0.3	6	V
$V_{PG}$	Power good voltage	-0.3	6	V
$I_{PG}$	PG sink current	0	1.5	mA
$V_{SS}$	Soft-start voltage	-0.3	6	V
$V_{FB}$	Feedback voltage	-0.3	6	V
$V_{OUT}$	Output voltage	-0.3	$V_{IN} + 0.3$	V
$I_{OUT}$	Maximum output current	Internally limited		
	Output short-circuit duration	Indefinite		
$P_{DISS}$	Continuous total power dissipation	See Thermal Information		
$T_J$	Junction Temperature (Legacy Chip)	-40	125	°C
	Junction Temperature (New Chip)	-40	150	°C
$T_{stg}$	Storage Temperature	-55	150	

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

### 5.2 ESD Ratings

		VALUE	UNIT
$V_{ESD}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{IN}$	Input supply voltage	$V_{OUT} + V_{DO}$ ( $V_{IN}$ )	$V_{OUT} + 0.3$	5.5	V
$V_{EN}$	Enable supply voltage		$V_{IN}$	5.5	V
$V_{BIAS}$ <sup>(1)</sup>	BIAS supply voltage	$V_{OUT} + V_{DO}$ ( $V_{BIAS}$ ) <sup>(2)</sup>	$V_{OUT} + 1.6$ <sup>(2)</sup>	5.5	V
$V_{OUT}$	Output voltage	0.8		3.6	V
$I_{OUT}$	Output current	0		1.5	A
$C_{OUT}$	Output capacitor (legacy chip)	0			μF
	Output capacitor (new chip)	2.2			μF
$C_{IN}$	Input capacitor <sup>(3)</sup>	1			μF
$C_{BIAS}$	Bias capacitor	0.1	1		μF
$T_J$	Operating junction temperature	-40		125	°C

- (1) BIAS supply is required when  $V_{IN}$  is below  $V_{OUT} + V_{DO}$  ( $V_{BIAS}$ ).  
(2)  $V_{BIAS}$  has a minimum voltage of 2.7 V or  $V_{OUT} + V_{DO}$  ( $V_{BIAS}$ ), whichever is higher (new chip).  
(3) If  $V_{IN}$  and  $V_{BIAS}$  are connected to the same supply, the recommended minimum capacitor for the supply is 4.7 μF.

## 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS742				UNIT
		RGW (VQFN) (legacy chip)	RGW (VQFN) (new chip)	RGR (VQFN)	KTW (DDPAK/ TO-263)	
		20 PINS	20 PINS	20 PINS	7 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	35.4	34.7	44.2	47.2	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	32.4	31	50.3	63.7	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	14.7	13.5	19.6	19.5	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.4	1.4	0.7	4.2	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	14.8	13.5	17.8	19.4	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	3.9	3.6	4.3	3.3	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

## 5.5 Electrical Characteristics

at V<sub>EN</sub> = 1.1 V, V<sub>IN</sub> = V<sub>OUT</sub> + 0.3 V, C<sub>BIAS</sub> = 0.1 μF, C<sub>IN</sub> = C<sub>OUT</sub> = 10 μF, I<sub>OUT</sub> = 50 mA, V<sub>BIAS</sub> = 5.0 V, and T<sub>J</sub> = –40°C to 125°C, (unless otherwise noted); typical values are at T<sub>J</sub> = 25°C

		$V_{PG} = 5.25\text{ V}$ , $V_{OUT} > V_{IT}$ (New Chip)		0.001	0.05	
$T_J$	Operating junction temperature		-40		125	$^\circ\text{C}$
$T_{SD}$	Thermal shutdown temperature	Shutdown, temperature increasing (Legacy Chip)		155		$^\circ\text{C}$
		Shutdown, temperature increasing (New Chip)		165		
		Reset, temperature decreasing		140		

- (1) For adjustable devices tested at 0.8V, resistor tolerance is not taken into account.
- (2) Dropout is defined as the voltage from the input to  $V_{OUT}$  when  $V_{OUT}$  is 2% below nominal.
- (3)  $I_{FB}$  current flow is out of the device.

### 5.6 Typical Characteristics

at  $T_J = 25^\circ\text{C}$ ,  $V_{OUT} = 1.5\text{V}$ ,  $V_{IN} = V_{OUT(NOM)} + 0.3\text{V}$ ,  $V_{BIAS} = 3.3\text{V}$  (legacy chip),  $V_{BIAS} = 5.0\text{V}$  (new chip),  $I_{OUT} = 50\text{mA}$ ,  $V_{EN} = V_{IN}$ ,  $C_{IN} = 1\mu\text{F}$ ,  $C_{BIAS} = 4.7\mu\text{F}$ ,  $C_{SS} = 0.01\mu\text{F}$  (legacy chip), and  $C_{OUT} = 10\mu\text{F}$  (unless otherwise noted)

## 6 Detailed Description

### 6.1 Overview

The TPS742 belongs to a family of generation ultra-low dropout regulators that feature soft-start and tracking capabilities. These regulators use a low current bias input to power all internal control circuitry, allowing the NMOS pass transistor to regulate very low input and output voltages.

The use of an NMOS-pass transistor offers several critical advantages for many applications. Unlike a PMOS topology device, the output capacitor has little effect on loop stability. This architecture allows the TPS742 devices to be stable with any output capacitor  $\geq 2.2\mu\text{F}$ . Transient response is also superior to PMOS topologies, particularly for low  $V_{\text{IN}}$  applications.

The TPS742 devices feature a programmable voltage-controlled soft-start circuit that provides a smooth, monotonic start-up and limits start-up inrush currents that can be caused by large capacitive loads. A power-good (PG) output is available to allow supply monitoring and sequencing of other supplies. An enable (EN) pin with hysteresis and deglitch allows slow-ramping signals to be used for sequencing the device. The low  $V_{\text{IN}}$  and  $V_{\text{OUT}}$  capability allows for inexpensive, easy-to-design, and efficient linear regulation between the multiple supply voltages often present in processor intensive systems.

図 6-1. Legacy Chip Functional Block Diagram

6-2. New Chip Functional Block Diagram

## 6.3 Feature Description

### 6.3.1 Enable and Shutdown

The enable (EN) pin is active high and is compatible with standard digital signaling levels.  $V_{EN}$  less than 0.4 V turns the regulator off and  $V_{EN}$  greater than 1.1 V turns the regulator on. Unlike many regulators, the enable circuitry has hysteresis and deglitching for use with relatively slow-ramping analog signals. This configuration allows the TPS742 devices to be enabled by connecting the output of another supply to the EN pin. The enable circuitry typically has 50 mV of hysteresis and a deglitch circuit to help avoid ON and OFF cycling because of small glitches in the  $V_{EN}$  signal.

The enable threshold is typically 0.8 V and varies with temperature and process variations. Temperature variation is approximately  $-1$  mV/°C; therefore, process variation accounts for most of the variation in the enable threshold. If precise turnon timing is required, then use a fast rise-time signal to enable the TPS742 devices.

If not used, EN can be connected to either IN or BIAS. If EN is connected to IN, then connect EN as closely as possible to the largest capacitance on the input to prevent voltage droops on that line from triggering the enable circuit.

### 6.3.2 Power-Good (VQFN Packages Only)

The power-good (PG) pin is an open-drain output and can be connected to any 5.5 V or lower rail through an external pullup resistor. This pin requires at least 1.1 V on  $V_{BIAS}$  to have a valid output. The PG output is high-impedance when  $V_{OUT}$  is greater than  $V_{IT} + V_{HYS}$ . If  $V_{OUT}$  drops below  $V_{IT}$  or if  $V_{BIAS}$  drops less than 1.9 V, the open-drain output turns on and pulls the PG output low. The PG pin also asserts when the device is disabled. The recommended operating condition of PG pin sink current is up to 1 mA, so the pullup resistor for PG must be in the range of 10 k $\Omega$  to 1 M $\Omega$ . PG is only provided on the VQFN packages. If output voltage monitoring is not needed, then the PG pin can be left floating.

### 6.3.3 Internal Current Limit

The TPS742 family features a factory-trimmed, accurate current limit that is flat over temperature and supply voltage. The current limit allows the device to supply surges of up to 1.8 A and maintain regulation. The current limit responds in about 10  $\mu$ s to reduce the current during a short circuit fault. Recovery from a short circuit condition is well-controlled and results in very little output overshoot when the load is removed. See [Figure 5-41](#) in the [Typical Characteristics](#) section for a graph of  $I_{OUT}$  versus  $V_{OUT}$  performance.

The internal current limit protection circuitry of the TPS742 family of devices is designed to protect against overload conditions. The circuitry is not intended to allow operation above the rated current of the device. Continuously running the TPS742 devices above the rated current degrades device reliability.

## 6.4 Device Functional Modes

### 6.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage and bias voltage are both at least at the respective minimum specifications.
- The enable voltage has previously exceeded the enable rising threshold voltage and has not decreased below the enable falling threshold.
- The output current is less than the current limit.
- The device junction temperature is less than the maximum specified junction temperature.
- The device is not operating in dropout.

### 6.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this condition, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass transistor is in a triode state and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

### 6.4.3 Disabled

The device is disabled under the following conditions:

- The input or bias voltages are below the respective minimum specifications.
- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.

表 6-1 shows the conditions that lead to the different modes of operation.

**表 6-1. Device Functional Mode Comparison**

OPERATING MODE	PARAMETER				
	$V_{IN}$	$V_{EN}$	$V_{BIAS}$	$I_{OUT}$	$T_J$
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}(V_{IN})$	$V_{EN} > V_{EN(high)}$	$V_{BIAS} \geq V_{OUT} + 1.4\text{ V}$	$I_{OUT} < I_{CL}$	$T_J < 125^\circ\text{C}$
Dropout mode	$V_{IN} < V_{OUT(nom)} + V_{DO}(V_{IN})$	$V_{EN} > V_{EN(high)}$	$V_{BIAS} < V_{OUT} + 1.4\text{ V}$	—	$T_J < 125^\circ\text{C}$
Disabled mode (any true condition disables the device)	$V_{IN} < V_{IN(min)}$	$V_{EN} < V_{EN(low)}$	$V_{BIAS} < V_{BIAS(min)}$	—	$T_J > 155^\circ\text{C}$

## 7 Application and Implementation

### 注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 7.1 Application Information

#### 7.1.1 Input, Output, and Bias Capacitor Requirements

The TPS742 family does not require any output capacitor for stability. If an output capacitor is needed, the device is designed to be stable for all available types and values of output capacitance. The device is also stable with multiple capacitors in parallel, which can be of any type or value.

The capacitance required on the IN and BIAS pins is strongly dependent on the input supply source impedance. To counteract any inductance in the input, the minimum recommended capacitor for  $V_{IN}$  and  $V_{BIAS}$  is 1  $\mu$ F. If  $V_{IN}$  and  $V_{BIAS}$  are connected to the same supply, the recommended minimum capacitor for  $V_{BIAS}$  is 4.7  $\mu$ F. Use good quality, low ESR capacitors on the input; ceramic X5R and X7R capacitors are preferred. Place these capacitors as close to the pins as possible for optimum performance.

#### 7.1.2 Transient Response

The TPS742 family of devices were designed to have transient response within 5% for most applications without any output capacitor. In some cases, the transient response can be limited by the transient response of the input supply. This limitation is especially true in applications where the difference between the input and output is less than 300 mV. In this case, adding additional input capacitance improves the transient response much more than just adding additional output capacitance. With a solid input supply, adding additional output capacitance reduces undershoot and overshoot during a transient at the expense of a slightly longer  $V_{OUT}$  recovery time. See [Figure 5-35](#) in the *Typical Characteristics* section. Because the TPS742 devices are stable without an output capacitor, many applications can allow for little or no capacitance at the LDO output. For these applications, local bypass capacitance for the device under power can be sufficient to meet the transient requirements of the application. This design reduces the total solution cost by avoiding the need to use expensive high-value capacitors at the LDO output.

#### 7.1.3 Dropout Voltage

The TPS742 family of devices offers industry-leading dropout performance, making this family well-suited for high-current low  $V_{IN}$ /low  $V_{OUT}$  applications. The extremely low dropout of the TPS742 allows the device to be used in place of a DC/DC converter and still achieve good efficiency. This efficiency allows the user to rethink the power architecture of applications to achieve the smallest, simplest, and lowest cost solution.

There are two different specifications for dropout voltage with the TPS742 devices. The first specification (illustrated in [Figure 7-1](#)) is referred to as  $V_{IN}$  Dropout, and is for users who wish to apply an external bias voltage to achieve low dropout. This specification assumes that  $V_{BIAS}$  is at least 1.62 V above  $V_{OUT}$ , which is the case for  $V_{BIAS}$  when powered by a 3.3-V rail with 5% tolerance and with  $V_{OUT} = 1.5$  V. If  $V_{BIAS}$  is higher than  $3.3$  V  $\times$  0.95 or  $V_{OUT}$  is less than 1.5 V,  $V_{IN}$  dropout is less than specified.

図 7-1. Typical Application of the TPS742 Using an Auxiliary Bias Rail

The second specification (shown in 図 7-2) is referred to as  $V_{BIAS}$  Dropout, and is for users who wish to tie IN and BIAS together. This option allows the device to be used in applications where an auxiliary bias voltage is not available or low dropout is not required. Dropout is limited by BIAS in these applications because  $V_{BIAS}$  provides the gate drive to the pass transistor and therefore must be 1.4 V above  $V_{OUT}$ . Because of this usage, IN and BIAS tied together easily consume huge power. Pay attention not to exceed the power rating of the device package.

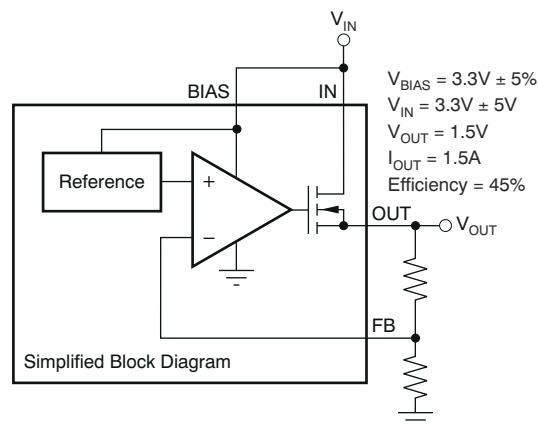

図 7-2. Typical Application of the TPS742 Without an Auxiliary Bias

#### 7.1.4 Output Noise

The TPS742 devices provide low-output noise when a soft-start capacitor is used. When the device reaches the end of the soft-start cycle, the soft-start capacitor serves as a filter for the internal reference. By using a 0.001- $\mu$ F soft-start capacitor, the output noise is reduced by half and is typically 30  $\mu$ V<sub>RMS</sub> for a 1.2-V output (10 Hz to 100 kHz). Because most of the output noise is generated by the internal reference, the noise is a function of the set output voltage. The RMS noise with a 0.001- $\mu$ F soft-start capacitor is given in 式 1.

$$V_N (\mu\text{V}_{\text{RMS}}) = 25 \left( \frac{\mu\text{V}_{\text{RMS}}}{V} \right) \times V_{\text{OUT}} (V) \quad (1)$$

The low-output noise of the TPS742 makes the device a good choice for powering transceivers, PLLs, or other noise-sensitive circuitry.

### 7.1.5 Programmable Soft-Start

The TPS742 devices feature a programmable, monotonic, voltage-controlled soft start that is set with an external capacitor ( $C_{SS}$ ). This feature is important for many applications, because power-up initialization problems are eliminated when powering FPGAs, DSPs, or other processors. The controlled voltage ramp of the output also reduces peak inrush current during start-up, minimizing start-up transients to the input power bus.

To achieve a linear and monotonic soft-start, the TPS742 error amplifier tracks the voltage ramp of the external soft-start capacitor until the voltage exceeds the internal reference. The soft-start ramp time depends on the soft-start charging current ( $I_{SS}$ ), soft-start capacitance ( $C_{SS}$ ), and the internal reference voltage ( $V_{REF}$ ), and can be calculated using 式 2:

$$t_{SS} = \frac{(V_{REF} \times C_{SS})}{I_{SS}} \quad (2)$$

If large output capacitors are used, the device current limit ( $I_{CL}$ ) and the output capacitor can set the start-up time. In this case, the start-up time is given by 式 3:

$$t_{SSCL} = \frac{(V_{OUT(NOM)} \times C_{OUT})}{I_{CL(MIN)}} \quad (3)$$

$V_{OUT(NOM)}$  is the nominal set output voltage as set by the user,  $C_{OUT}$  is the output capacitance, and  $I_{CL(MIN)}$  is the minimum current limit for the device. In applications where monotonic start-up is required, the soft-start time given by 式 2 must be set to be greater than 式 3.

The maximum recommended soft-start capacitor is 0.015 $\mu$ F. Larger soft-start capacitors can be used and do not damage the device; however, the soft-start capacitor discharge circuit is not always able to fully discharge the soft-start capacitor when enabled. Soft-start capacitors larger than 0.015 $\mu$ F can be a problem in applications where the user must rapidly pulse the enable pin and still requires the device to soft-start from ground.  $C_{SS}$  must be low-leakage; X7R, X5R, or C0G dielectric materials are preferred. See 表 7-1 for suggested soft-start capacitor values.

**表 7-1. Standard Capacitor Values for Programming the Soft-Start Time**

$C_{SS}$	SOFT-START TIME <sup>(1)</sup> (Legacy Chip)	SOFT-START TIME <sup>(2)</sup> (New Chip)
Open	0.1ms	0.25ms
470pF	0.5ms	0.7ms
1000pF	1ms	1.5ms
4700pF	5ms	7ms
0.01 $\mu$ F	10ms	15ms
0.015 $\mu$ F	16ms	22.6ms

(1) See 式 4.

(2) See 式 5.

$$t_{SS}(s) = \frac{V_{REF} \times C_{SS}}{I_{SS}} = \frac{0.8V \times C_{SS}(F)}{0.73\mu A} \quad (4)$$

$$t_{SS}(s) = 0.8 \times C_{SS}(F) \div 530nA \quad (5)$$

where:

- $t_{SS}(s)$  = Soft-start time in seconds

### 7.1.6 Sequencing Requirements

The device can have  $V_{IN}$ ,  $V_{BIAS}$ , and  $V_{EN}$  sequenced in any order without causing damage to the device. However, for the soft-start function to work as intended, certain sequencing rules must be applied. Enabling the device after  $V_{IN}$  and  $V_{BIAS}$  are present is preferred, and can be accomplished using a digital output from a processor or supply supervisor. An analog signal from an external RC circuit, as shown in [Figure 7-3](#), can also be used as long as the delay time is long enough for  $V_{IN}$  and  $V_{BIAS}$  to be present.

**Figure 7-3. Soft-Start Delay Using an RC Circuit on Enable**

If a signal is not available to enable the device after  $V_{IN}$  and  $V_{BIAS}$ , simply connecting  $EN$  to  $IN$  is acceptable for most applications as long as  $V_{IN}$  is greater than 1.1 V and the ramp rate of  $V_{IN}$  and  $V_{BIAS}$  is faster than the set soft-start ramp rate. If the ramp rate of the input sources is slower than the set soft-start time, the output tracks the slower supply minus the dropout voltage until the set output voltage is reached. If  $EN$  is connected to  $BIAS$ , the device does soft-start as programmed provided that  $V_{IN}$  is present before  $V_{BIAS}$ . If  $V_{BIAS}$  and  $V_{EN}$  are present before  $V_{IN}$  is applied and the set soft-start time has expired then  $V_{OUT}$  tracks  $V_{IN}$ .

#### 注

When  $V_{BIAS}$  and  $V_{EN}$  are present and  $V_{IN}$  is not supplied, this device outputs approximately 50  $\mu\text{A}$  of current from  $OUT$ . Although this condition does not cause any damage to the device, the output current can charge up the  $OUT$  node if total resistance between  $OUT$  and  $GND$  (including external feedback resistors) is greater than 10  $k\Omega$ .

## 7.2 Typical Applications

図 7-4 is a typical application circuit for the TPS742 adjustable output device.

$R_1$  and  $R_2$  can be calculated for any output voltage using the formula shown in 図 7-4. See 表 7-2 for sample resistor values of common output voltages. To achieve the maximum accuracy specifications,  $R_2$  must be  $\leq 4.99$  k $\Omega$ .

図 7-4. Typical Application Circuit for the TPS742

表 7-2. Standard 1% Resistor Values for Programming the Output Voltage  
(See 式 6)

$R_1$ (k $\Omega$ )	$R_2$ (k $\Omega$ )	$V_{OUT}$ (V)
Short	Open	0.8
0.619	4.99	0.9
1.13	4.53	1
1.37	4.42	1.05
1.87	4.99	1.1
2.49	4.99	1.2
4.12	4.75	1.5
3.57	2.87	1.8
3.57	1.69	2.5
3.57	1.15	3.3

$$V_{OUT} = 0.8 \times (1 + R1/R2) \quad (6)$$

### 注

When  $V_{BIAS}$  and  $V_{EN}$  are present and  $V_{IN}$  is not supplied, this device outputs approximately 50  $\mu$ A of current from OUT. Although this condition does not cause any damage to the device, the output current can charge up the OUT node if total resistance between OUT and GND (including external feedback resistors) is greater than 10 k $\Omega$ .

### 7.2.1 Design Requirements

The design goals are  $V_{IN} = 1.8$  V,  $V_{OUT} = 1.5$  V, and  $I_{OUT} = 1$  A (maximum). The design optimizes transient response and meets a 1-ms start-up time with a start-up dominated by the soft-start feature. The input supply comes from a supply on the same circuit board. The available system rails for  $V_{BIAS}$  are 2.7 V, 3.3 V, and 5 V.

The design space consists of  $C_{IN}$ ,  $C_{OUT}$ ,  $C_{BIAS}$ ,  $C_{SS}$ ,  $V_{BIAS}$ ,  $R_1$ ,  $R_2$ , and  $R_3$ , and the circuit is from 図 7-4.

This example uses a  $V_{IN}$  of 1.8 V, with a  $V_{BIAS}$  of 2.5 V.

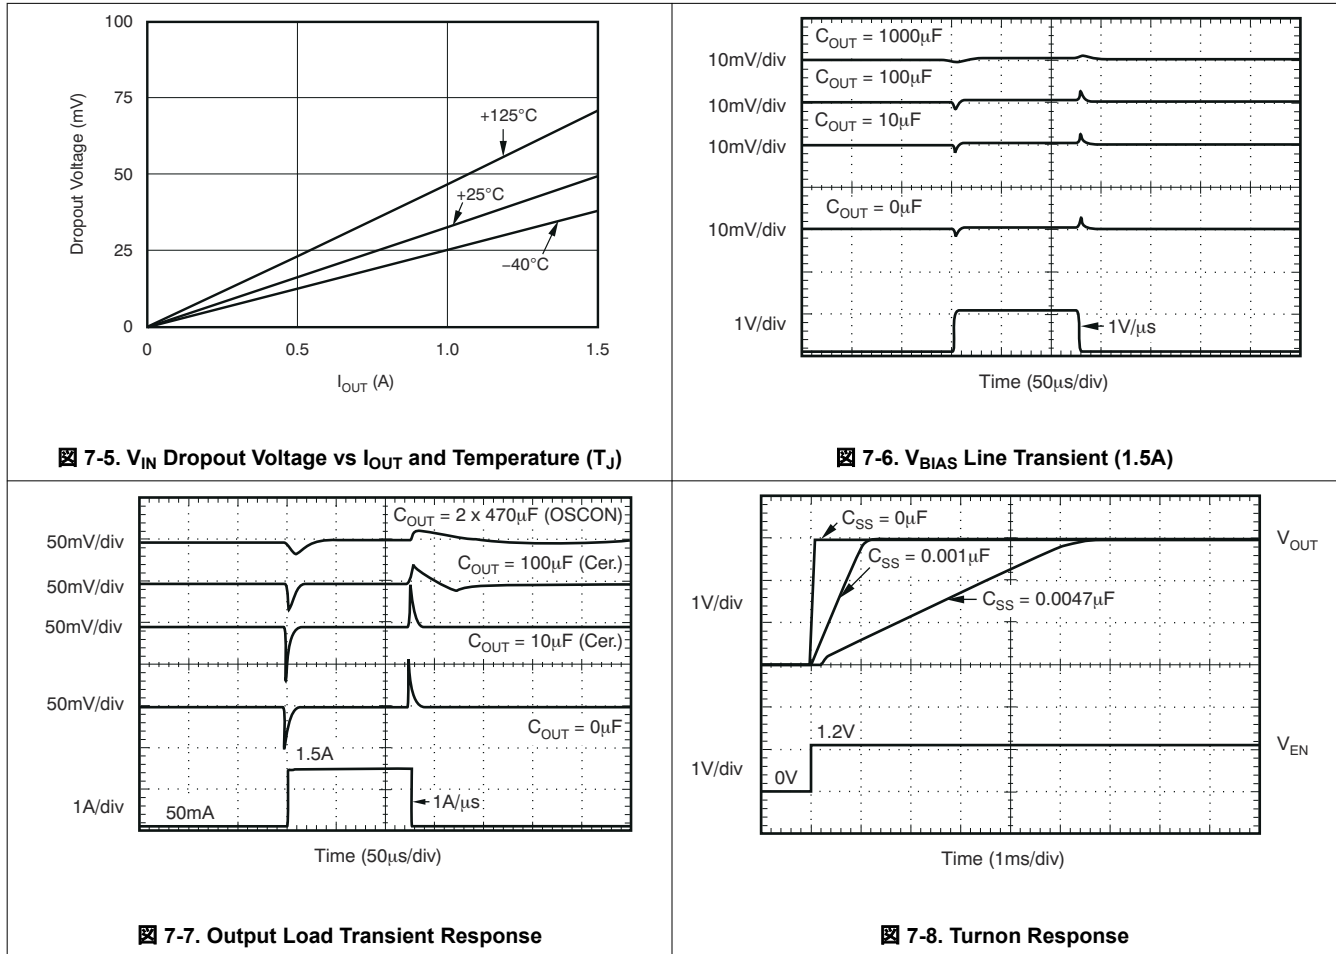

### 7.2.2 Detailed Design Procedure

This is assuming the table for the standard capacitor values is put back in as 表 6-1.

Using 表 7-2, R1 is selected to be 4.12 kΩ for  $V_{OUT} = 1.5\text{ V}$  and R2 is 4.75 kΩ. Using 表 6-1,  $C_{SS}$  is 1000 pF for a 1-ms typical start-up time. For optimal performance, 5-V rail for a Bias supply is used. And R3 of 100 kΩ is selected as the PG bus is used by other devices with additional 100-kΩ pullup resistors.

A  $C_{IN}$  of 10 μF is used for better transient performance on the input supply, a  $C_{BIAS}$  of 1 μF is used to verify that the Bias supply is solid, and a  $C_{OUT}$  of 1 μF is used to provide some local capacitance on the output.

### 7.2.3 Application Curves

## 7.3 Power Supply Recommendations

The TPS742 devices are designed to operate from an input voltage from 1.1V to 5.5V, provided the bias rail is at least 1.4V higher than the input supply. The bias rail and the input supply must both provide adequate headroom and current for the device to operate normally.

Connect a low-output impedance power supply directly to the IN pin of the TPS742 devices. This supply must have at least 1μF of capacitance near the IN pin for stability. A supply with similar requirements must also be connected directly to the bias rail with a separate 1μF or larger capacitor.

If the IN pin is tied to the bias pin, a minimum 4.7μF of capacitance is needed for stability.

To increase the overall PSRR of the solution at higher frequencies, use a pi-filter or ferrite bead before the input capacitor.

## 7.4 Layout

### 7.4.1 Layout Guidelines

An optimal layout can greatly improve transient performance, PSRR, and noise. To minimize the voltage droop on the input of the device during load transients, connect the capacitance on IN and BIAS as close as possible to the device. This capacitance also minimizes the effects of parasitic inductance and resistance of the input source and can therefore improve stability. To achieve optimal transient performance and accuracy, connect the top side of R<sub>1</sub> in [Figure 7-4](#) as close as possible to the load. If BIAS is connected to IN, TI recommends connecting BIAS as close to the sense point of the input supply as possible. This connection minimizes the voltage droop on BIAS during transient conditions and can improve the turnon response.

#### 7.4.1.1 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 160°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is enabled. Depending on power dissipation, thermal resistance, and ambient temperature the thermal protection circuit can cycle ON and OFF. This cycling limits the dissipation of the regulator, protecting the regulator from damage as a result of overheating.

Activation of the thermal protection circuit indicates excessive power dissipation or inadequate heatsinking. For reliable operation, limit junction temperature to 125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection must trigger at least 40°C above the maximum expected ambient condition of the application. This condition produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS742 devices is designed to protect against overload conditions. This circuitry is not intended to replace proper heatsinking. Continuously running the TPS742 devices into thermal shutdown degrades device reliability.

#### 7.4.1.2 Thermal Considerations

Using the thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$ , in the [Thermal Information](#) table, the junction temperature can be estimated with corresponding formulas (given in [Equation 7](#)). For backwards compatibility, an older  $\theta_{JC, Top}$  parameter is listed as well.

$$\begin{aligned} \Psi_{JT}: T_J &= T_T + \Psi_{JT} \cdot P_D \\ \Psi_{JB}: T_J &= T_B + \Psi_{JB} \cdot P_D \end{aligned} \tag{7}$$

where

- P<sub>D</sub> is the power dissipation given by P<sub>D</sub> = (V<sub>IN</sub> – V<sub>OUT</sub>) × I<sub>OUT</sub>
- T<sub>T</sub> is the temperature at the center-top of the IC package
- T<sub>B</sub> is the PCB temperature measured 1mm away from the IC package *on the PCB surface* (as [Figure 7-9](#) shows).

#### 注

Both T<sub>T</sub> and T<sub>B</sub> can be measured on actual application boards using a thermo-gun (an infrared thermometer).

For more information about measuring T<sub>T</sub> and T<sub>B</sub>, see the [Using New Thermal Metrics](#) application note, available for download at [www.ti.com](http://www.ti.com).

(a) Example RGW (QFN) Package Measurement

(b) Example KTW (DDPAK) Package Measurement

- A.  $T_T$  is measured at the center of both the X- and Y-dimensional axes.
- B.  $T_B$  is measured **below** the package lead **on the PCB surface**.

図 7-9. Measuring Points for  $T_T$  and  $T_B$

Compared with  $\theta_{JA}$ , the new thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$  are less independent of board size, but the metrics do have a small dependency. Figure 7-10 shows characteristic performance of  $\Psi_{JT}$  and  $\Psi_{JB}$  versus board size.

Looking at Figure 7-10, the RGW package thermal performance has negligible dependency on board size. The KTW package, however, does have a measurable dependency on board size. This dependency exists because the package shape is not point-symmetric to an IC center. In the KTW package, for example (see Figure 7-9), silicon is not beneath the measuring point of  $T_T$ , which is the center of the X and Y dimension, so that  $\Psi_{JT}$  has a dependency. Also, because of that non-point-symmetry, device heat distribution on the PCB is not point-symmetric, either, so that  $\Psi_{JB}$  has a dependency.

Figure 7-10.  $\Psi_{JT}$  and  $\Psi_{JB}$  vs Board Size

For a more detailed discussion of why TI does not recommend using  $\theta_{JC,Top}$  to determine thermal characteristics, refer to the [Using New Thermal Metrics application note](#), available for download at [www.ti.com](http://www.ti.com). Also, refer to the [IC Package Thermal Metrics application note](#) (also available on the TI website) for further information.

## 8 Device and Documentation Support

### 8.1 Device Support

#### 8.1.1 Development Support

##### 8.1.1.1 Evaluation Modules

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the TPS744. The [TPS74201EVM-118 evaluation module](#) (and [related user guide](#)) can be requested at the Texas Instruments website through the product folders or purchased directly from the [TI eStore](#).

##### 8.1.1.2 Spice Models

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. A SPICE model for the TPS744 is available through the product folders under *Tools & Software*.

### 8.2 Documentation Support

#### 8.2.1 Related Documentation

For related documentation see the following:

- Texas Instruments, [6A Current-Sharing Dual LDO design guide](#)
- Texas Instruments, [Using New Thermal Metrics application note](#)

#### 8.2.2 Device Nomenclature

表 8-1. Device Nomenclature

PRODUCT <sup>(1)</sup>	V <sub>OUT</sub>
TPS74201yyyzM3	<p><b>yyy</b> is the package designator.  <b>z</b> is the package quantity.  <b>M3</b> is a suffix designator for devices that only use the latest manufacturing flow (CSO: RFB). Devices without this suffix can ship with the legacy chip (CSO: DLN) or the new chip (CSO: RFB). The reel packaging label provides CSO information to distinguish which chip is being used. Device performance for new and legacy chips is denoted throughout the document.</p>

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder on [www.ti.com](http://www.ti.com).

### 8.3 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、[www.tij.co.jp](http://www.tij.co.jp) のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

### 8.4 サポート・リソース

[テキサス・インスツルメンツ E2E™ サポート・フォーラム](#)は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの[使用条件](#)を参照してください。

### 8.5 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.  
 すべての商標は、それぞれの所有者に帰属します。

## 8.6 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

## 8.7 用語集

[テキサス・インスツルメンツ用語集](#) この用語集には、用語や略語の一覧および定義が記載されています。

## 9 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision O (October 2024) to Revision P (February 2025)	Page
• Added curves for the new chip.....	8
• Added new chip information to <i>Standard Capacitor Values for Programming the Soft-Start Time</i> table.....	21

Changes from Revision N (November 2016) to Revision O (October 2024)	Page
• ドキュメント全体にわたって表、図、相互参照の採番方法を更新.....	1
• 現在のファミリのフォーマットに合わせてドキュメント全体を変更.....	1
• ドキュメントに M3 デバイスを追加.....	1
• 「従来のシリコン」と「新しいシリコン」の情報を区別するため、ドキュメント全体にデバイスの言い回しを追加.....	1
• 「製品情報」の表を「パッケージ情報」に変更最後の文を削除.....	1

## 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## 重要なお知らせと免責事項

テキサス・インスツルメンツは、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、テキサス・インスツルメンツ製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した テキサス・インスツルメンツ製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている テキサス・インスツルメンツ製品を使用するアプリケーションの開発の目的でのみ、テキサス・インスツルメンツはその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。テキサス・インスツルメンツや第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、テキサス・インスツルメンツおよびその代理人を完全に補償するものとし、テキサス・インスツルメンツは一切の責任を拒否します。

テキサス・インスツルメンツの製品は、[テキサス・インスツルメンツの販売条件](#)、または [ti.com](https://www.ti.com) やかかる テキサス・インスツルメンツ製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。テキサス・インスツルメンツがこれらのリソースを提供することは、適用されるテキサス・インスツルメンツの保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、テキサス・インスツルメンツはそれらに異議を唱え、拒否します。

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## KTW (R-PSFM-G7)

## PLASTIC FLANGE-MOUNT

- NOTES: A. All linear dimensions are in inches (millimeters).  
 B. This drawing is subject to change without notice.  
 $\triangle C$ . Lead width and height dimensions apply to the plated lead.  
 D. Leads are not allowed above the Datum B.  
 E. Stand-off height is measured from lead tip with reference to Datum B.  
 $\triangle F$ . Lead width dimension does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed the maximum dimension by more than 0.003".  
 G. Cross-hatch indicates exposed metal surface.  
 $\triangle H$ . Falls within JEDEC MO-169 with the exception of the dimensions indicated.
