

# BQ25710 SMBus Narrow VDC システム電力監視およびプロセッサ・ホット監視付き、昇降圧バッテリー充電コントローラ

## 1 特長

- BQ25700A とピン互換およびソフトウェア互換
- 1S~4S バッテリーを広範囲の入力電源から充電
  - 3.5V~24V の入力動作電圧範囲
  - USB2.0、USB 3.0、USB 3.1 (Type C)、USB Power Delivery (USB-PD) 入力電流設定に対応
  - 降圧、昇降圧、および昇圧動作間のシームレスな移行
  - ソース過負荷に対する入力電流および電圧のレギュレーション (IDPM および VDPM)
- 電力 / 電流モニタによる CPU スロットル処理
  - 包括的な PROCHOT プロファイル、IMVP8/IMVP9 準拠
  - 入力およびバッテリー電流モニタ
  - システム電力モニタ、IMVP8/IMVP9 準拠
- Narrow VDC (NVDC) パワー・パス・マネージメント機能
  - バッテリーなしまたは消耗したバッテリーでの即時オン
  - アダプタの過負荷時にバッテリーでシステムを補完
  - 補完モードでのバッテリー MOSFET の理想ダイオード動作
- バッテリーから USB ポートへ電源供給 (USB OTG)
  - 分解能 8mV の 3V~20.8V OTG
  - 分解能 50mA の最大 6.4A の出力電流制限
- システムの電力効率向上とバッテリーの高速充電に向けた、テキサス・インスツルメンツによる特許申請中のパス・スルー・モード (PTM)
- バッテリーのみをシステム電源とする場合は、Vmin アクティブ・プロテクション (VAP) モードにより、システムのピーク電力スパイク時に入力コンデンサでバッテリーを補完
- 入力電流最適化 (ICO) により最大入力電力を抽出
- 2.2μH または 1.0μH インダクタの 800kHz または 1.2MHz にプログラム可能なスイッチング周波数
- ホスト制御インターフェイスによる柔軟なシステム構成
  - SMBus ポートにより、最適なシステム性能とステータス・レポートを実現
  - EC 制御なしでハードウェア・ピンにより入力電流制限を設定
- 内蔵された ADC により電圧、電流、電力を監視
- 高精度のレギュレーションと監視
  - ±0.5% の充電電圧レギュレーション
  - ±2% の入力 / 充電電流レギュレーション
  - ±2% の入力 / 充電電流監視
  - ±4% の電力監視
- 安全

- サーマル・シャットダウン
- 入力、システム、バッテリーの過電圧保護
- 入力、MOSFET、インダクタの過電流保護
- 安全性関連の認定
  - IEC 62368-1 CB 認定
- 小さいバッテリー静止電流
- パッケージ: 32 ピン 4 × 4 WQFN

## 2 アプリケーション

- ウルトラブック、ノートブック PC、脱着可能 PC、タブレット PC、パワー・バンク
- 産業用および医療用機器
- 充電式バッテリー搭載の携帯機器

## 3 概要

このデバイスは同期整流 NVDC 昇降圧バッテリー充電コントローラであり、スペースに制約がある 1S~4S バッテリー充電機器に適した、部品数の少ない高効率のソリューションです。

### 製品情報

| 部品番号    | パッケージ (1) | 本体サイズ (公称)      |
|---------|-----------|-----------------|
| BQ25710 | WQFN (32) | 4.00mm × 4.00mm |

- (1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

## 4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

| <b>Changes from Revision A (February 2021) to Revision B (April 2023)</b>                   | <b>Page</b> |
|---------------------------------------------------------------------------------------------|-------------|
| • 安全関連認証を追加:「特長」に IEC 62368-1 CB 認証を追加.....                                                 | 1           |
| • Added bullet 2 in Power-Up from DC Source.....                                            | 24          |
| • Changed IVBUS in <a href="#">図 9-1</a> .....                                              | 27          |
| • Changed EN_PROCHOT_LPWR 01b and 10b in ChargeOption1 Register.....                        | 40          |
| • Changed ICRT_DEG 01b, 10b, and 11b and INOM_DEG 0b and 1b in ProchotOption0 Register..... | 46          |
| • Changed IDCHG_DEG and PROCHOT_PROFILE_VDPM in ProchotOption1 Register.....                | 48          |
| • Changed PROCHOT_WIDTH 11b in ProchotStatus Register.....                                  | 54          |
| • Changed list in System Voltage Regulation.....                                            | 60          |

| <b>Changes from Revision * (July 2018) to Revision A (February 2021)</b>             | <b>Page</b> |
|--------------------------------------------------------------------------------------|-------------|
| • Changed units of measure for several parameters in Electrical Characteristics..... | 10          |
| • Changed in Timing Requirements.....                                                | 19          |
| • Changed 3.25A in Input Voltage and Current Limit Setup.....                        | 25          |
| • Changed in USB On-The-Go (OTG).....                                                | 25          |
| • Added in System Short Hiccup Mode.....                                             | 31          |
| • Updated SMBus Interface.....                                                       | 32          |
| • Changed in ChargeOption0 Register.....                                             | 37          |
| • Changed in ChargeOption2 Register.....                                             | 42          |
| • Changed in ProchotOption0 Register.....                                            | 46          |
| • Changed in ProchotStatus Register.....                                             | 54          |
| • Changed in Input Current Registers.....                                            | 61          |
| • Changed in IIN_DPM Register With 10-mΩ Sense Resistor.....                         | 63          |
| • Changed in ADCIINCMPIN Register.....                                               | 70          |
| • Updated Typical Application Diagram.....                                           | 73          |
| • Updated ACP-ACN Input Filter Diagram.....                                          | 74          |
| • Updated Input Capacitor .....                                                      | 75          |
| • Updated Output Capacitor.....                                                      | 75          |

---

|                                                          |    |
|----------------------------------------------------------|----|
| • Changed in Layout Guidelines.....                      | 82 |
| • Added detailed layout reference in Layout Example..... | 83 |

---

## 5 概要 (続き)

NVDC 構成により、システムをバッテリーの電圧にレギュレートしながら、システムの最低電圧を下回らないように維持できます。バッテリーが完全に放電した場合や取り外された場合でも、システムは動作を続けられます。負荷電力が入力電源の定格を超過すると、バッテリーは補完モードに移行し、システムの故障を防止します。

BQ25710 は、USB アダプタ、高電圧 USB PD ソース、従来型のアダプタなど、広範な入力電源からバッテリーを充電します。

電源投入時に、充電器は入力電源およびバッテリーの状況に基づいてコンバータを降圧、昇圧、昇降圧型のいずれかの構成に設定します。充電器はホストの制御なしに、降圧、昇圧、昇降圧型の構成間を自動的に遷移します。

入力電源が存在しない場合、BQ25710 は 1~4 セル・バッテリーからの USB On-the-Go (OTG) 機能をサポートするため、8mV の分解能で VBUS に 3V~20.8V の可変電圧を出力できます。OTG の出力過渡電圧スルーレートは設定可能であり、USB PD 3.0 PPS 仕様に準拠しています。

バッテリーのみをシステム電源とし、USB OTG ポートに外部負荷を接続していない場合、BQ25710 は Vmin アクティブ・プロテクション (VAP) 機能をサポートするため、バッテリーから VBUS 電圧を充電して、入力デカップリング・コンデンサに蓄電できます。システムのピーク電力スパイク時には、バッテリーから大電流が引き出されるため、バッテリーからシステムへのインピーダンスによる電圧降下が大きくなります。入力コンデンサに蓄えられた電力がシステムを補完することにより、システムの電圧が最低値を下回り、システムが故障するのを防止できます。この Vmin アクティブ・プロテクション (VAP) は、SOC の高電力要求周期においてシステムのピーク電力を吸収するように設計されているため、インテルは 1S~2S バッテリー搭載プラットフォームに強く推奨しています。

BQ25710 はアダプタの電流、バッテリーの電流、システムの電力を監視します。柔軟にプログラムされる PROCHOT 出力は、必要に応じてスロットル・バックのため CPU へ直接接続されます。

## 6 Device Comparison Table

|---------------|-----|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME          | NO. |     |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ACN           | 2   | PWR | Input current sense resistor negative input. The leakage on ACP and ACN are matched. A R-C low-pass filter is required to be placed between the sense resistor and the ACN pin to suppress the high frequency noise in the input current signal. Refer to <a href="#">セクション 10</a> for ACP/ACN filter design.                                                                                                           |
| ACP           | 3   | PWR | Input current sense resistor positive input. The leakage on ACP and ACN are matched. A R-C low-pass filter is required to be placed between the sense resistor and the ACP pin to suppress the high frequency noise in the input current signal. Refer to <a href="#">セクション 10</a> for ACP/ACN filter design.                                                                                                           |
| BATDRV        | 21  | O   | P-channel battery FET (BATFET) gate driver output. It is shorted to VSYS to turn off the BATFET. It goes 10 V below VSYS to fully turn on BATFET. BATFET is in linear mode to regulate VSYS at minimum system voltage when battery is depleted. BATFET is fully on during fast charge and works as an ideal-diode in supplement mode.                                                                                   |
| BTST1         | 30  | PWR | Buck mode high side power MOSFET driver power supply. Connect a 0.047-μF capacitor between SW1 and BTST1. The bootstrap diode between REGN and BTST1 is integrated.                                                                                                                                                                                                                                                     |
| BTST2         | 25  | PWR | Boost mode high side power MOSFET driver power supply. Connect a 0.047-μF capacitor between SW2 and BTST2. The bootstrap diode between REGN and BTST2 is integrated.                                                                                                                                                                                                                                                    |
| CELL_BATPRESZ | 18  | I   | Battery cell selection pin for 1–4 cell battery setting. CELL_BATPRESZ pin is biased from VDDA. CELL_BATPRESZ pin also sets SYSOVP thresholds to 5 V for 1-cell, 12 V for 2-cell, and 19.5 V for 3-cell/4-cell. CELL_BATPRESZ pin is pulled below $V_{CELL\_BATPRESZ\_FALL}$ to indicate battery removal. The device exits LEARN mode, and disables charge. The charge voltage register REG0x15() goes back to default. |

**表 7-1. Pin Functions (continued)**

| PIN      |     | I/O | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------|-----|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME     | NO. |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CHRG_OK  | 4   | O   | Open drain active high indicator to inform the system good power source is connected to the charger input. Connect to the pullup rail via 10-kΩ resistor. When VBUS rises above 3.5V or falls below 24.5V, CHRG_OK is HIGH after 50ms deglitch time. When VBUS falls below 3.2 V or rises above 26 V, CHRG_OK is LOW. When any fault occurs, CHRG_OK is asserted LOW.                                                                                                                                                                               |
| CMPIN    | 14  | I   | Input of independent comparator. The independent comparator compares the voltage sensed on CMPIN pin with internal reference, and its output is on CMPOUT pin. Internal reference, output polarity and deglitch time is selectable by the SMBus host. With polarity HIGH (REG0x30[6] = 1), place a resistor between CMPIN and CMPOUT to program hysteresis. With polarity LOW (REG0x30[6] = 0), the internal hysteresis is 100 mV. If the independent comparator is not in use, tie CMPIN to ground.                                                |
| CMPOUT   | 15  | O   | Open-drain output of independent comparator. Place pullup resistor from CMPOUT to pullup supply rail. Internal reference, output polarity and deglitch time are selectable by the SMBus host.                                                                                                                                                                                                                                                                                                                                                       |
| COMP2    | 17  | I   | Buck boost converter compensation pin 2. Refer to BQ2571X EVM schematic for COMP2 pin RC network.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| COMP1    | 16  | I   | Buck boost converter compensation pin 1. Refer to BQ2571X EVM schematic for COMP1 pin RC network.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| OTG/VAP  | 5   | I   | Active HIGH to enable OTG or VAP modes. When REG0x32[5]=1, pulling high OTG/VAP pin and setting REG0x32[12]=1 can enable OTG mode. When REG0x32[5]=0, pulling high OTG/VAP pin is to enable VAP mode.                                                                                                                                                                                                                                                                                                                                               |
| HIDRV1   | 31  | O   | Buck mode high side power MOSFET (Q1) driver. Connect to high side n-channel MOSFET gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| HIDRV2   | 24  | O   | Boost mode high side power MOSFET(Q4) driver. Connect to high side n-channel MOSFET gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| IADPT    | 8   | O   | The adapter current monitoring output pin. $V_{(IADPT)} = 20 \text{ or } 40 \times (V_{(ACP)} - V_{(ACN)})$ with ratio selectable in REG0x12[4]. Place a resistor from the IADPT pin to ground corresponding to the inductance in use. For a 2.2 μH inductance, the resistor is 137 kΩ. Place a 100-pF or less ceramic decoupling capacitor from IADPT pin to ground. IADPT output voltage is clamped below 3.3 V.                                                                                                                                  |
| IBAT     | 9   | O   | The battery current monitoring output pin. $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRP)} - V_{(SRN)})$ for charge current, or $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRN)} - V_{(SRP)})$ for discharge current, with ratio selectable in REG0x12[3]. Place a 100-pF or less ceramic decoupling capacitor from IBAT pin to ground. This pin can be floating if not in use. Its output voltage is clamped below 3.3 V.                                                                                                                         |
| ILIM_HIZ | 6   | I   | Input current limit setting pin. Program ILIM_HIZ voltage by connecting a resistor divider from supply rail to ILIM_HIZ pin to ground. The pin voltage is calculated as: $V_{(ILIM\_HIZ)} = 1 \text{ V} + 40 \times IDPM \times RAC$ , in which IDPM is the target input current. The input current limit used by the charger is the lower setting of ILIM_HIZ pin and REG0x3F(). When the pin voltage is below 0.4 V, the device enters Hi-Z mode with low quiescent current. When the pin voltage is above 0.8 V, the device is out of Hi-Z mode. |
| LODRV1   | 29  | O   | Buck mode low side power MOSFET (Q2) driver. Connect to low side n-channel MOSFET gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LODRV2   | 26  | O   | Boost mode low side power MOSFET (Q3) driver. Connect to low side n-channel MOSFET gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| PGND     | 27  | GND | Device power ground.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| PROCHOT  | 11  | O   | Active low open drain output of processor hot indicator. It monitors adapter input current, battery discharge current, and system voltage. After any event in the PROCHOT profile is triggered, a pulse is asserted. The minimum pulse width is adjustable in REG0x21[14:11].                                                                                                                                                                                                                                                                       |
| PSYS     | 10  | O   | Current mode system power monitor. The output current is proportional to the total power from the adapter and the battery. The gain is selectable through SMBus. Place a resistor from PSYS to ground to generate output voltage. This pin can be floating if not in use. Its output voltage is clamped below 3.3 V. Place a capacitor in parallel with the resistor for filtering.                                                                                                                                                                 |
| REGN     | 28  | PWR | 6-V linear regulator output supplied from VBUS or VSYS. The LDO is active when VBUS above $V_{VBUS\_CONVEN}$ . Connect a 2.2- or 3.3-μF ceramic capacitor from REGN to power ground. REGN pin output is for power stage gate drive.                                                                                                                                                                                                                                                                                                                 |

表 7-1. Pin Functions (continued)

| PIN         |     | I/O | DESCRIPTION                                                                                                                                                                                                                                                                                                                       |
|-------------|-----|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME        | NO. |     |                                                                                                                                                                                                                                                                                                                                   |
| SCL         | 13  | I   | SMBus clock input. Connect to clock line from the host controller or smart battery. Connect a 10-kΩ pullup resistor according to SMBus specifications.                                                                                                                                                                            |
| SDA         | 12  | I/O | SMBus open-drain data I/O. Connect to data line from the host controller or smart battery. Connect a 10-kΩ pullup resistor according to SMBus specifications.                                                                                                                                                                     |
| SRN         | 19  | PWR | Charge current sense resistor negative input. SRN pin is for battery voltage sensing as well. Connect SRN pin with optional 0.1-μF ceramic capacitor to GND for common-mode filtering. Connect a 0.1-μF ceramic capacitor from SRP to SRN to provide differential mode filtering. The leakage current on SRP and SRN are matched. |
| SRP         | 20  | PWR | Charge current sense resistor positive input. Connect SRP pin with optional 0.1-μF ceramic capacitor to GND for common-mode filtering. Connect a 0.1-μF ceramic capacitor from SRP to SRN to provide differential mode filtering. The leakage current on SRP and SRN are matched.                                                 |
| SW1         | 32  | PWR | Buck mode high side power MOSFET driver source. Connect to the source of the high side n-channel MOSFET.                                                                                                                                                                                                                          |
| SW2         | 23  | PWR | Boost mode high side power MOSFET driver source. Connect to the source of the high side n-channel MOSFET.                                                                                                                                                                                                                         |
| VBUS        | 1   | PWR | Charger input voltage. An input low pass filter of 1Ω and 0.47 μF (minimum) is recommended.                                                                                                                                                                                                                                       |
| VDDA        | 7   | PWR | Internal reference bias pin. Connect a 10-Ω resistor from REGN to VDDA and a 1-μF ceramic capacitor from VDDA to power ground.                                                                                                                                                                                                    |
| VSYS        | 22  | PWR | Charger system voltage sensing. The system voltage regulation limit is programmed in REG0x15() and REG0x3E().                                                                                                                                                                                                                     |
| Thermal pad | –   | –   | Exposed pad beneath the IC. Always solder thermal pad to the board, and have vias on the thermal pad plane connecting to power ground planes. It serves as a thermal pad to dissipate the heat.                                                                                                                                   |

## 8 Specifications

### 8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1) (2)</sup>

|                      |                                                                                                                    | MIN  | MAX | UNIT |
|----------------------|--------------------------------------------------------------------------------------------------------------------|------|-----|------|
| Voltage              | SRN, SRP, ACN, ACP, VBUS, VSYS                                                                                     | –0.3 | 30  | V    |
|                      | SW1, SW2                                                                                                           | –2   | 30  |      |
|                      | BTST1, BTST2, HIDRV1, HIDRV2, /BATDRV                                                                              | –0.3 | 36  |      |
|                      | LODRV1, LODRV2 (25nS)                                                                                              | –4   | 7   |      |
|                      | HIDRV1, HIDRV2 (25nS)                                                                                              | –4   | 36  |      |
|                      | SW1, SW2 (25nS)                                                                                                    | –4   | 30  |      |
|                      | SDA, SCL, REGN, PSYS, CHRG_OK, OTG/VAP, CELL_BATPRESZ, ILIM_HIZ, LODRV1, LODRV2, VDDA, COMP1, COMP2, CMPIN, CMPOUT | –0.3 | 7   |      |
|                      | /PROCHOT                                                                                                           | –0.3 | 5.5 |      |
|                      | IADPT, IBAT, PSYS                                                                                                  | –0.3 | 3.6 |      |
| Differential Voltage | BTST1-SW1, BTST2-SW2, HIDRV1-SW1, HIDRV2-SW2                                                                       | –0.3 | 7   | V    |
|                      | SRP-SRN, ACP-ACN                                                                                                   | –0.5 | 0.5 |      |
| Temperature          | Junction temperature range, T <sub>J</sub>                                                                         | –40  | 155 | °C   |
|                      | Storage temperature, T <sub>stg</sub>                                                                              | –40  | 155 | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to GND if not specified. Currents are positive into, negative out of the specified terminal. Consult Packaging Section of the data book for thermal limitations and considerations of packages.

### 8.2 ESD Ratings

|                                            |                                                                                          | VALUE | UNIT |
|--------------------------------------------|------------------------------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>              | ±2000 | V    |
|                                            | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup> | ±500  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                                            |                                                                                                                    | MIN  | MAX  | UNIT |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------|------|------|------|
| Voltage                                    | ACN, ACP, VBUS                                                                                                     | 0    | 24   | V    |
|                                            | SRN, SRP, VSYS                                                                                                     | 0    | 19.2 |      |
|                                            | SW1, SW2                                                                                                           | –2   | 24   |      |
|                                            | BTST1, BTST2, HIDRV1, HIDRV2, /BATDRV                                                                              | 0    | 30   |      |
|                                            | SDA, SCL, REGN, PSYS, CHRG_OK, OTG/VAP, CELL_BATPRESZ, ILIM_HIZ, LODRV1, LODRV2, VDDA, COMP1, COMP2, CMPIN, CMPOUT | 0    | 6.5  |      |
|                                            | /PROCHOT                                                                                                           | 0    | 5.3  |      |
|                                            | IADPT, IBAT, PSYS                                                                                                  | 0    | 3.3  |      |
| Differential Voltage                       | BTST1-SW1, BTST2-SW2, HIDRV1-SW1, HIDRV2-SW2                                                                       | 0    | 6.5  | V    |
|                                            | SRP-SRN, ACP-ACN                                                                                                   | –0.5 | 0.5  |      |
| Junction temperature range, T <sub>J</sub> |                                                                                                                    | –20  | 125  | °C   |

### 8.3 Recommended Operating Conditions (continued)

over operating free-air temperature range (unless otherwise noted)

|                                             | MIN | MAX | UNIT |
|---------------------------------------------|-----|-----|------|
| Operating free-air temperature range, $T_J$ | –40 | 85  | °C   |

### 8.4 Thermal Information

## 9 Detailed Description

### 9.1 Overview

The BQ25710 is a Narrow VDC buck-boost charger controller for portable electronics such as notebook, detachable, ultrabook, tablet and other mobile devices with rechargeable batteries. It provides seamless transition among different converter operation modes (buck, boost, or buck boost), fast transient response, and high light load efficiency.

BQ25710 supports wide range of power sources, including USB PD ports, legacy USB ports, traditional ACDC adapters, etc. It takes input voltage from 3.5 V to 24 V, and charges battery of 1-4 series. In the absence of an input source, BQ25710 supports USB On-the-Go (OTG) function from 1-4 cell battery to generate adjustable 3 V ~ 20.8 V at USB port with 8mV resolution. The OTG output voltage transition slew rate can be configurable, which complies with the USB Power Delivery 3.0 PPS specifications.

When only the battery powers the system and no external load is connected to the USB OTG port, BQ25710 provides the Vmin Active Protection (VAP) feature. In the VAP operation, BQ25710 first charges up the voltage of the input decoupling capacitors at VBUS to store a certain amount of energy. During the system peak power spike, the huge current drawn from the battery introduces a larger voltage drop across the impedance from the battery to the system. Then the energy stored in the input capacitors will supplement the system, to prevent the system voltage from drooping below the minimum system voltage and leading the system to black screen. This VAP is designed to absorb system power peaks during the periods of high demand to improve the system turbo performance, which is highly recommended by Intel for the platforms with 1S~2S battery.

BQ25710 features Dynamic Power Management (DPM) to limit the input power and avoid AC adapter overloading. During battery charging, as the system power increases, the charging current will reduce to maintain total input current below adapter rating. If system power demand temporarily exceeds adapter rating, BQ25710 supports NVDC architecture to allow battery discharge energy to supplement system power. For details, refer to [セクション 9.6.5.1](#).

In order to be compliant with an Intel IMVP8 / IMVP9 compliant system, BQ25710 includes PSYS function to monitor the total platform power from adapter and battery. Besides PSYS, it provides both an independent input current buffer (IADPT) and a battery current buffer (IBAT) with highly accurate current sense amplifiers. If the platform power exceeds the available power from adapter and battery, a PROCHOT signal is asserted to CPU so that the CPU optimizes its performance to the power available to the system.

The SMBus controls input current, charge current and charge voltage registers with high resolution, high accuracy regulation limits. It also sets the PROCHOT timing and threshold profile to meet system requirements.

## 9.2 Functional Block Diagram

## 9.3 Feature Description

### 9.3.1 Power-Up from Battery Without DC Source

If only battery is present and the voltage is above  $V_{VBAT\_UVLOZ}$ , the BATFET turns on and connects battery to system. By default, the charger is in low power mode ( $REG0x12[15] = 1$ ) with lowest quiescent current. The LDO stays off. When device moves to performance mode ( $REG0x12[15] = 0$ ), The host can enable IBAT buffer through SMBus to monitor discharge current. The PSYS, PROCHOT or independent comparator also can be enabled by the host through the SMBus commands. In performance mode, the REGN LDO is always available to provide an accurate reference for the other features.

### 9.3.2 Vmin Active Protection (VAP) when Battery only Mode

In VAP mode operation, the buck-boost charger delivers the energy from the battery to charge the voltage of the input decoupling capacitors (VBUS) as high as possible (like 20V). The system peak power pulse for a 2S1P or 1S2P system can be as high as 100W if the SoC and motherboard systems spikes coincide. These spikes are expected to be very rare, but possible. During these high power spikes, the charger is expected to supplement the battery (drawing the power from the charger's input decoupling capacitors) to prevent the system voltage from drooping. VAP allows the SoC to set much higher peak power levels to the SoC, thus provides for much better Turbo performance.

Follows the steps below to enter VAP operation.:

1. Set the voltage limit to charge VBUS in  $REG0x3B()$ .
2. Set the current limit to charge VBUS in  $REG0x3C()$  and  $REG0x34[15:10]$ .
3. Set the system voltage regulation point in  $REG0x3E[13:8]$ , when the input cap supplements battery, the VSYS\_MIN regulation loop will maintain VSYS at this regulation point.
4. Set the PROCHOT\_VSYS\_TH1 threshold to trigger the VAP discharging VBUS in  $REG0x33[7:4]$ .
5. Set the PROCHOT\_VSYS\_TH2 threshold to assert /PROCHOT active low signal to throttle SoC in  $REG0x33[3:2]$ .
6. Enable the VAP mode by setting  $REG0x32[5] = 0$ ,  $REG0x32[12] = 0$ , and pulling the OTG/VAP pin to high.

To exit VAP mode, the host should write either  $REG0x32[5] = 1$  or pull low the OTG/VAP pin to low.

Any regular fault conditions of the charger in VAP mode will reset  $REG0x32[5] = 1$ , and the charger will exit VAP mode automatically.

### 9.3.3 Power-Up From DC Source

When an input source plugs in, the charger checks the input source voltage to turn on LDO and all the bias circuits. It sets the input current limit before the converter starts.

The power-up sequence from DC source is as follows:

1. 50 ms after VBUS above  $V_{VBUS\_CONVEN}$ , enable 6 V LDO and CHRG\_OK goes HIGH
2. VBUS qualification is executed 50 ms after VBUS first rises above  $V_{VBUS\_UVLOZ}$ . If

$V_{VBUS\_UVLOZ} < VBUS < V_{VBUS\_CONVEN}$  then charger fails VBUS qualification, and the charger will re-qualify VBUS every 2s.

3. Input voltage and current limit setup
4. Battery CELL configuration
5. 150 ms after VBUS above  $V_{VBUS\_CONVEN}$ , converter powers up.

#### 9.3.3.1 CHRG\_OK Indicator

CHRG\_OK is an active HIGH open drain indicator. It indicates the charger is in normal operation when the following conditions are valid:

- VBUS is above  $V_{VBUS\_CONVEN}$
- VBUS is below  $V_{ACOV}$
- No MOSFET/inductor, or over-voltage, over-current, thermal shutdown fault

### 9.3.3.2 Input Voltage and Current Limit Setup

After CHRG\_OK goes HIGH, the charger sets default input current limit in REG0x3F() to 3.25 A. The actual input current limit being adopted by the device is the lower setting of REG0x3F() and pin.

Charger initiates a VBUS voltage measurement without any load (VBUS at no load) right before the converter is enabled. The default VINDPM threshold is VBUS at no load – 1.28 V.

After input current and voltage limits are set, the charger device is ready to power up. The host can always program the input current and voltage limit after the charger being powered up, based on the input source type.

### 9.3.3.3 Battery Cell Configuration

CELL\_BATPRESZ pin is biased with a resistor divider from REGN to CELL\_BATPRESZ to GND. After VDDA LDO is activated, the device detects the battery configuration through CELL\_BATPRESZ pin bias voltage. Refer to 表 9-1 for cell setting thresholds.

**表 9-1. Battery Cell Configuration**

| CELL COUNT | PIN VOLTAGE w.r.t. VDDA | BATTERY VOLTAGE (REG0x15) | SYSOVP |
|------------|-------------------------|---------------------------|--------|
| 4S         | 75%                     | 16.800 V                  | 19.5 V |
| 3S         | 55%                     | 12.592 V                  | 19.5 V |
| 2S         | 40%                     | 8.400 V                   | 12 V   |
| 1S         | 25%                     | 4.192 V                   | 5 V    |

### 9.3.3.4 Device Hi-Z State

The charger enters Hi-Z mode when ILIM\_HIZ pin voltage is below 0.4 V or REG0x32[15] is set to 1. During Hi-Z mode, the input source is present, and the charger is in the low quiescent current mode with REGN LDO enabled.

### 9.3.4 USB On-The-Go (OTG)

The device supports USB OTG operation to deliver power from the battery to other portable devices through USB port. The OTG mode output voltage is set in REG0x3B(). The OTG mode output current is set in REG0x3C(). The OTG operation can be enabled if the conditions are valid:

- Valid battery voltage is set REG0x15(), the battery voltage should not trip the BATOVP threshold, otherwise, the converter will stop switching.
- OTG output voltage is set in REG0x3B() and REG0x32[2], if REG0x32[2] = 0, the VOTG digital DAC is offset by 1.28V to achieve higher range from 4.28V~20.8V, if REG0x32[2] = 1, the VOTG digital DAC is from 3V to 19.52V.
- OTG output current is set in REG0x3C().
- EN\_OTG pin is HIGH, REG0x32[12] = 1 and REG0x32[5] = 1.
- VBUS is below  $V_{VBUS\_CONVENZ}$ .
- 10 ms after the above conditions are valid, converter starts and VBUS ramps up to target voltage. CHRG\_OK pin goes HIGH if REG0x12[11] = 1.

### 9.3.5 Converter Operation

The charger employs a synchronous buck-boost converter that allows charging from a standard 5-V or a high-voltage power source. The charger operates in buck, buck-boost and boost mode. The buck-boost can operate uninterruptedly and continuously across the three operation modes.

**表 9-2. MOSFET Operation**

| MODE | BUCK      | BUCK-BOOST | BOOST     |
|------|-----------|------------|-----------|
| Q1   | Switching | Switching  | ON        |
| Q2   | Switching | Switching  | OFF       |
| Q3   | OFF       | Switching  | Switching |

**表 9-2. MOSFET Operation (continued)**

| MODE | BUCK | BUCK-BOOST | BOOST     |
|------|------|------------|-----------|
| Q4   | ON   | Switching  | Switching |

**9.3.5.1 Inductance Detection Through IADPT Pin**

The charger reads the inductance value through the resistance tied to IADPT pin before the converter starts up. The resistances recommended for 1μH, 2.2μH and 3.3μH inductance are 93kΩ, 137kΩ and 169kΩ, respectively. A surface mount chip resistor with ±3% or better tolerance must to be used for an accurate inductance detection.

**表 9-3. Inductor Detection Through IADPT Resistance**

| INDUCTOR IN USE | RESISTOR ON IADPT PIN |
|-----------------|-----------------------|
| 1 μH            | 93 kΩ                 |
| 2.2 μH          | 137 kΩ                |
| 3.3 μH          | 169 kΩ                |

**9.3.5.2 Continuous Conduction Mode (CCM)**

With sufficient charge or system current, the inductor current does not cross 0 A, which is defined as CCM. The controller starts a new cycle with ramp coming up from 200 mV. As long as the error amplifier output voltage is above the ramp voltage, the high-side MOSFET (HSFET) stays on. When the ramp voltage exceeds error amplifier output voltage, HSFET turns off and low-side MOSFET (LSFET) turns on. At the end of the cycle, ramp gets reset and LSFET turns off, ready for the next cycle. There is always break-before-make logic during transition to prevent cross-conduction and shoot-through. During the dead time when both MOSFETs are off, the body-diode of the low-side power MOSFET conducts the inductor current.

During CCM, the inductor current always flows and creates a fixed two-pole system. Having the LSFET turn-on when the HSFET is off keeps the power dissipation low and allows safe charging at high currents.

**9.3.5.3 Pulse Frequency Modulation (PFM)**

In order to improve converter light-load efficiency, BQ25710 switches to PFM operation at light load. The effective switching frequency will decrease accordingly when system load decreases. The minimum frequency can be limit to 25 kHz when the OOA feature is enabled (ChargeOption0() bit[10]=1).

**9.3.6 Current and Power Monitor****9.3.6.1 High-Accuracy Current Sense Amplifier (IADPT and IBAT)**

As an industry standard, a high-accuracy current sense amplifier (CSA) is used to monitor the charger input current during forward charging mode, or output current during OTG mode (IADPT) and the battery charge/discharge current (IBAT). IADPT voltage is 20× or 40× the differential voltage across ACP and ACN. IBAT voltage is 8×/16× (during charging), or 8×/16× (during discharging) of the differential across SRP and SRN. After input voltage or battery voltage is above UVLO, IADPT output becomes valid. To lower the voltage on current monitoring, a resistor divider from CSA output to GND can be used and accuracy over temperature can still be achieved.

- $V_{(IADPT)} = 20 \text{ or } 40 \times (V_{(ACP)} - V_{(ACN)})$  during forward mode, or  $20 \text{ or } 40 \times (V_{(ACN)} - V_{(ACP)})$  during reverse OTG mode.
- $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRP)} - V_{(SRN)})$  for battery charging current.
- $V_{(IBAT)} = 8 \text{ or } 16 \times (V_{(SRN)} - V_{(SRP)})$  for battery discharging current.

A maximum 100-pF capacitor is recommended to connect on the output for decoupling high-frequency noise. An additional RC filter is optional, if additional filtering is desired. Note that adding filtering also adds additional response delay. The CSA output voltage is clamped at 3.3 V.

**9.3.6.2 High-Accuracy Power Sense Amplifier (PSYS)**

The charger monitors total system power. During forward mode, the input adapter powers system. During reverse OTG mode, the battery powers the system and VBUS output. The ratio of PSYS pin output current and

total system power,  $K_{PSYS}$ , can be programmed in REG0x30[9] with default 1  $\mu\text{A/W}$ . The input and charge sense resistors (RAC and RSR) are selected in REG0x30[11:10]. PSYS voltage can be calculated with 式 1, where  $I_{IN} > 0$   $I_{BAT} < 0$  when the charger is in forward charging with an adapter connected, and  $I_{BAT} > 0$  when the battery is in discharging mode.

$$V_{PSYS} = R_{PSYS} \times K_{PSYS} (V_{ACP} \times I_{IN} + V_{BAT} \times I_{BAT}) \quad (1)$$

For proper PSYS functionality, RAC and RSR values are limited to 10 m $\Omega$  and 20 m $\Omega$ .

To minimize the quiescent current, the PSYS function is disabled by default. It can be enabled by setting REG0x30[12] = 1.

### 9.3.7 Input Source Dynamic Power Manage

Refer to セクション 9.6.6.

### 9.3.8 Two-Level Adapter Current Limit (Peak Power Mode)

Usually adapter can supply current higher than DC rating for a few milliseconds to tens of milliseconds. The charger employs two-level input current limit, or peak power mode, to fully utilize the overloading capability and minimize battery discharge during CPU turbo mode. Peak power mode is enabled in REG0x31[13:12]. The DC current limit, or  $I_{LIM1}$ , is the same as adapter DC current, set in REG0x3F(). The overloading current, or  $I_{LIM2}$ , is set in REG0x33[15:11], as a percentage of  $I_{LIM1}$ .

When the charger detects input current surge and battery discharge due to load transient (both the adapter and battery support the system together), or when the charger detects the system voltage starts to drop due to load transient (only the adapter supports the system), the charger will first apply  $I_{LIM2}$  for  $T_{OVLD}$  in REG0x31[15:14], and then  $I_{LIM1}$  for up to  $T_{MAX} - T_{OVLD}$  time.  $T_{MAX}$  is programmed in REG0x31[9:8]. After  $T_{MAX}$ , if the load is still high, another peak power cycle starts. Charging is disabled during  $T_{MAX}$ ; once  $T_{MAX}$  expires, charging continues. If  $T_{OVLD}$  is programmed to be equal to  $T_{MAX}$ , then peak power mode is always on.

9-1. Two-Level Adapter Current Limit Timing Diagram

### 9.3.9 Processor Hot Indication

When CPU is running turbo mode, the system peak power may exceed available power from adapter and battery together. The adapter current and battery discharge peak current, or system voltage drop is an indication that system power is too high. The charger processor hot function monitors these events, and  $\overline{\text{PROCHOT}}$  pulse is asserted if the system power is too high. Once CPU receives  $\overline{\text{PROCHOT}}$  pulse from charger, it slows down to reduce system power. The events monitored by the processor hot function includes:

- ICRIT: adapter peak current, as 110% of  $I_{\text{LIM2}}$
- INOM: adapter average current (110% of input current limit)
- IDCHG: battery discharge current
- VSYS: system voltage on VSYS
- Adapter Removal: upon adapter removal (CHRG\_OK pin HIGH to LOW)
- Battery Removal: upon battery removal (CELL\_BATPRESZ pin goes LOW)
- CMPOUT: Independent comparator output (CMPOUT pin HIGH to LOW)
- VDPM: VBUS lower than 80%/90%/100% of VINDPM threshold.
- EXIT\_VAP: Every time when the charger exits VAP mode.

The threshold of ICRIT, IDCHG, VSYS or VDPM, and the deglitch time of ICRIT, INOM, IDCHG or CMPOUT are programmable through SMBus. Except the  $\overline{\text{PROCHOT\_EXIT\_VAP}}$  is always enabled, the other triggering events can be individually enabled in REG0x34[7:0]. When any enabled event in  $\overline{\text{PROCHOT}}$  profile is triggered,  $\overline{\text{PROCHOT}}$  is asserted low for a single pulse with minimal width programmable in REG0x21[13:12]. At the end of the single pulse, if the  $\overline{\text{PROCHOT}}$  event is still active, the pulse gets extended until the event is removed.

If the  $\overline{\text{PROCHOT}}$  pulse extension mode is enabled by setting REG0x21[14] = 1, the  $\overline{\text{PROCHOT}}$  pin will be kept as low until host writes REG0x21[11]21[11] = 0, even if the triggering event has been removed.

If the  $\overline{\text{PROCHOT\_VDPM}}$  or  $\overline{\text{PROCHOT\_EXIT\_VAP}}$  is triggered,  $\overline{\text{PROCHOT}}$  pin will always stay low until the host clears it, no matter the  $\overline{\text{PROCHOT}}$  is in one pulse mod or in extended mode.

**9-2. PROCHOT Profile**

### 9.3.9.1 PROCHOT During Low Power Mode

During low power mode (REG0x12[15] = 1), the charger offers a low power PROCHOT function with very low quiescent current consumption (~150uA), which uses the independent comparator to monitor the system voltage, and assert PROCHOT to CPU if the system power is too high.

Below lists the register setting to enable PROCHOT monitoring system voltage in low power mode.

- REG0x12[15] = 1 to enable charger low power mode.
- REG0x34[7:0] = 00h
- REG0x30[6:4] = 100
- Independent comparator threshold is always 1.2 V
- When REG0x30[13] = 1, charger monitors system voltage. Connect CMPIN to voltage proportional to system. PROCHOT triggers from HIGH to LOW when CMPIN voltage rises above 1.2 V.

图 9-3. PROCHOT Low Power Mode Implementation

### 9.3.9.2 PROCHOT Status

REG0x21[8:0] reports which event in the profile triggers  $\overline{\text{PROCHOT}}$  if the corresponding bit is set to 1. The status bit can be reset back to 0 after it is read by host, when the current  $\overline{\text{PROCHOT}}$  event is not active any more.

Assume there are two  $\overline{\text{PROCHOT}}$  events, event A and event B. Event A triggers  $\overline{\text{PROCHOT}}$  first, but event B is also active. Both status bits will be HIGH. At the end of the 10 ms  $\overline{\text{PROCHOT}}$  pulse, if any of the  $\overline{\text{PROCHOT}}$  event is still active (either A or B), the  $\overline{\text{PROCHOT}}$  pulse is extended.

### 9.3.10 Device Protection

#### 9.3.10.1 Watchdog Timer

The charger includes watchdog timer to terminate charging if the charger does not receive a write MaxChargeVoltage() or write ChargeCurrent() command within 175 s (adjustable via REG0x12[14:13]). When watchdog timeout occurs, all register values are kept unchanged except ChargeCurrent() resets to zero. Battery charging is suspended. Write MaxChargeVoltage() or write ChargeCurrent() commands must be re-sent to reset watchdog timer and resume charging. Writing REG0x12[14:13] = 00 to disable watchdog timer also resumes charging.

#### 9.3.10.2 Input Overvoltage Protection (ACOV)

The charger has fixed ACOV voltage. When VBUS pin voltage is higher than ACOV, it is considered as adapter over voltage. CHRG\_OK will be pulled low, and converter will be disabled. As system falls below battery voltage, BATFET will be turned on. When VBUS pin voltage falls below ACOV, it is considered as adapter voltage returns back to normal voltage. CHRG\_OK is pulled high by external pull up resistor. The converter resumes if enable conditions are valid.

#### 9.3.10.3 Input Overcurrent Protection (ACOC)

If the input current exceeds the  $1.33\times$  or  $2\times$  (REG0x31[2]) of  $I_{\text{LIM2\_VTH}}$  (REG0x33[15:11]) set point, converter stops switching. After 300 ms, converter starts switching again.

#### **9.3.10.4 System Overvoltage Protection (SYSOVP)**

When the converter starts up, BQ25710 reads CELL pin configuration and sets MaxChargeVoltage() and SYSOVP threshold (1s – 5 V, 2s – 12 V, 3s/4s – 19.5 V). Before REGx15() is written by the host, the battery configuration will change with CELL pin voltage. When SYSOVP happens, the device latches off the converter. REG0x20[4] is set to 1. The user can clear latch-off by either writing 0 to the SYSOVP bit or removing and plugging in the adapter again. After latch-off is cleared, the converter starts again.

#### **9.3.10.5 Battery Overvoltage Protection (BATOVP)**

Battery over-voltage may happen when battery is removed during charging or the user plugs in a wrong battery. The BATOVP threshold is 104% (1 s) or 102% (2 s to 4 s) of regulation voltage set in REG0x15().

#### **9.3.10.6 Battery Short**

If BAT voltage falls below SYSMIN during charging, the maximum current is limited to 384 mA.

#### **9.3.10.7 System Short Hiccup Mode**

VSYS pin is monitoring the system voltage, when Vsys is lower than 2.4V, after 2ms deglitch time, the charger will be shut down for 500ms. The charger will restart for 10ms and measure Vsys again, if it is still lower than 2.4V, the charger will be shut down again. This hiccup mode will be tried continuously, if the charger restart is failed for 7 times in 90 second, the charger will be latched off. REG0x20[3] will be set to 1 to report a system short fault. The charger only can be enabled again once the host writes REG0x20[3]= 0.

The charger system short hiccup mode can be disabled by writing REG0x12[6]= 1.

#### **9.3.10.8 Thermal Shutdown (TSHUT)**

The WQFN package has low thermal impedance, which provides good thermal conduction from the silicon to the ambient, to keep junction temperatures low. As added level of protection, the charger converter turns off for self-protection whenever the junction temperature exceeds the 155°C. The charger stays off until the junction temperature falls below 135°C. During thermal shut down, the LDO current limit is reduced to 16 mA and REGN LDO stays off. When the temperature falls below 135°C, charge can be resumed with soft start.

### **9.4 Device Functional Modes**

#### **9.4.1 Forward Mode**

When input source is connected to VBUS, BQ25710 is in forward mode to regulate system and charge battery.

##### **9.4.1.1 System Voltage Regulation with Narrow VDC Architecture**

BQ25710 employs Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by MinSystemVoltage(). Even with a deeply depleted battery, the system is regulated above the minimum system voltage.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode).

As the battery voltage rises above the minimum system voltage, BATFET is fully on when charging or in supplement mode and the voltage difference between the system and battery is the VDS of BATFET. System voltage is regulated 160 mV above battery voltage when BATFET is off (no charging or no supplement current).

The BATDRV pin is only able to drive a battery MOSFET with Ciss lower than 5nF. The Ciss in the range of 1nF~3nF is recommended.

See [セクション 9.6.5.1](#) for details on system voltage regulation and register programming.

##### **9.4.1.2 Battery Charging**

BQ25710 charges 1-4 cell battery in constant current (CC), and constant voltage (CV) mode. Based on CELL\_BATPREZ pin setting, the charger sets default battery voltage 4.2V/cell to ChargeVoltage(), or REG0x15(). According to battery capacity, the host programs appropriate charge current to ChargeCurrent(), or REG0x14(). When battery is full or battery is not in good condition to charge, host terminates charge by setting REG0x12[0] to 1, or setting ChargeCurrent() to zero.

See [セクション 9.3](#) for details on register programming.

### 9.4.2 USB On-The-Go

BQ25710 supports USB OTG functionality to deliver power from the battery to other portable devices through USB port (reverse mode). The OTG output voltage is compliant with USB PD specification, including 5 V, 9 V, 15 V, and 20 V. The output current regulation is compliant with USB type C specification, including 500 mA, 1.5 A, 3 A and 5 A.

Similar to forward operation, the device switches from PWM operation to PFM operation at light load to improve efficiency.

### 9.4.3 Pass Through Mode (PTM)

When the system is in the sleep mode or light load condition, the charger can be operated in the pass through mode to improve the light load efficiency. In TI patented pass through mode (PTM), the Buck and Boost high side FETs are both turned on, while the Buck and Boost low side FETs are both turned off. The input power is directly passed through the charger to the system. The switching losses of MOSFETs and the inductor core loss are saved.

Device will be transition from normal Buck-Boost operation to PTM operation by:

- Set REG0x31[7] = 0, to disable the EN\_EXITILIM.
- Set REG0x30[8] = 1.
- Set REG0x30[2] = 1.
- Ground ILIM\_HIZ pin.

Device will transition out of PTM mode with host control by:

- Set REG0x30[2] = 0.
- Pull ILIM\_HIZ pin to high.
- Device exits PTM to buck-boost operation if tripping VINDPM.
- Device exits PTM to buck-boost operation under fault conditions

## 9.5 Programming

The charger supports battery-charger commands that use either Write-Word or Read-Word protocols, as summarized in [セクション 9.5.1.1](#). The SMBus address is 12h. The ManufacturerID and DeviceID registers are assigned identify the charger device. The ManufacturerID register command always returns 40h.

### 9.5.1 SMBus Interface

The BQ25710 device operates as a slave, receiving control inputs from the embedded controller host through the SMBus interface. The BQ25710 device uses a simplified subset of the commands documented in *System Management Bus Specification V1.1*, which can be downloaded from [www.smbus.org](http://www.smbus.org). The BQ25710 device uses the SMBus read-word and write-word protocols (shown in [表 9-4](#) and [表 9-5](#)) to communicate with the smart battery. The device performs only as a SMBus slave device with address 0b00010010 (0x12H) and does not initiate communication on the bus. In addition, the device has two identification registers, a 16-bit device ID register (0xFFH) and a 16-bit manufacturer ID register (0xFEH).

SMBus communication starts when VCC is above  $V_{(UVLO)}$ .

The data (SDA) and clock (SCL) pins have Schmitt-trigger inputs that can accommodate slow edges. Choose pullup resistors (10 kΩ) for SDA and SCL to achieve rise times according to the SMBus specifications. Communication starts when the master signals a start condition, which is a high-to-low transition on SDA, while SCL is high. When the master has finished communicating, the master issues a stop condition, which is a low-to-high transition on SDA, while SCL is high. The bus is then free for another transmission. [図 9-4](#) and [図 9-5](#) show the timing diagram for signals on the SMBus interface. The address byte, command byte, and data bytes are transmitted between the start and stop conditions. The SDA state changes only while SCL is low, except for the start and stop conditions. Data is transmitted in 8-bit bytes and is sampled on the rising edge of SCL. Nine clock cycles are required to transfer each byte in or out of the device because either the master or the slave

acknowledges the receipt of the correct byte during the ninth clock cycle. The BQ25710 supports the charger commands listed in 表 9-4.

### 9.5.1.2 Timing Diagrams

A = Start condition

B = MSB of address clocked into slave

C = LSB of address clocked into slave

D = R/W bit clocked into slave

E = Slave pulls SMBDATA line low

F = ACKNOWLEDGE bit clocked into master

G = MSB of data clocked into slave

H = LSB of data clocked into slave

I = Slave pulls SMBDATA line low

J = Acknowledge clocked into master

K = Acknowledge clock pulse

L = Stop condition, data executed by slave

M = New start condition

When the REG0x34h[7:0] are set to be disabled, the **PROCHOT** event associated with that bit will not be reported in the **PROCHOT** status register REG0x21h[7:0] any more, and the **PROCHOT** pin will not be pulled low any more if the event happens.

The ADC registers are read in the following order: VBAT, VSYS, ICHG, IDCHG, IIN, PSYS, VBUS, CMPIN. ADC is disabled in low power mode. Before enabling ADC, low power mode should be disabled first.

### 9.6.3 ChargeCurrent Register (SMBus address = 14h) [reset = 0000h]

To set the charge current, write a 16-bit ChargeCurrent() command (REG0x14h()) using the data format listed in [Figure 9-15](#), [Table 9-25](#), and [Table 9-26](#).

With 10-mΩ sense resistor, the charger provides charge current range of 64 mA to 8.128 A, with a 64-mA step resolution. Upon POR, ChargeCurrent() is 0 A. Any conditions for CHRG\_OK low except ACOV will reset ChargeCurrent() to zero. CELL\_BATPRESZ going LOW (battery removal) will reset the ChargeCurrent() register to 0 A.

Charge current is not reset in ACOC, TSHUT, power path latch off (REG0x30[1]), and SYSOVP.

A 0.1-μF capacitor between SRP and SRN for differential mode filtering is recommended; an optional 0.1-μF capacitor between SRN and ground, and an optional 0.1-μF capacitor between SRP and ground for common mode filtering. Meanwhile, the capacitance on SRP should not be higher than 0.1 μF in order to properly sense the voltage across SRP and SRN for cycle-by-cycle current detection.

The SRP and SRN pins are used to sense voltage drop across RSR with default value of 10 mΩ. However, resistors of other values can also be used. For a larger sense resistor, a larger sense voltage is given, and a higher regulation accuracy; but, at the expense of higher conduction loss. A current sensing resistor value no more than 20 mΩ is suggested.

### 9.6.3.1 Battery Precharge Current Clamp

During precharge, BATFET works in linear mode or LDO mode (default REG0x12[2] = 1). For 2-4 cell battery, the system is regulated at minimum system voltage in REG0x3E() and the precharge current is clamped at 384 mA. For 1 cell battery, the precharge to fast charge threshold is 3 V, and the precharge current is clamped at 384 mA. However, the BATFET stays in LDO mode operation until battery voltage is above minimum system voltage (~3.6 V). During battery voltage from 3 V to 3.6 V, the fast charge current is clamped at 2 A.

#### 9.6.4 MaxChargeVoltage Register (SMBus address = 15h) [reset value based on CELL\_BATPRESZ pin setting]

To set the output charge voltage, write a 16-bit ChargeVoltage register command (REG0x15()) using the data format listed in 图 9-16, 表 9-27, and 表 9-28. The charger provides charge voltage range from 1.024 V to 19.200 V, with 8-mV step resolution. Any write below 1.024 V or above 19.200 V is ignored.

Upon POR, REG0x15() is by default set as 4200 mV for 1 s, 8400 mV for 2 s, 12600 mV for 3 s or 16800 mV for 4 s. After CHRГ\_OK goes high, the charge will start when the host writes the charging current to REG0x14(), the default charging voltage is used if REG0x15() is not programmed. If the battery is different from 4.2 V/cell, the host has to write to REG0x15() before REG0x14() for correct battery voltage setting. Writing REG0x15() to 0 will set REG0x15() to the default value based on CELL\_BATPRESZ pin, and force REG0x14() to zero to disable charge.

The SRN pin senses the battery voltage for voltage regulation and should be connected as close to the battery as possible, and directly place a decoupling capacitor (0.1  $\mu$ F recommended) as close to the device as possible to decouple high frequency noise.

#### 9.6.5.1 System Voltage Regulation

The device employs Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by REG0x3E(). Even with a deeply depleted battery, the system is regulated above the minimum system voltage with BATFET.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode), and the system is regulated above the minimum system voltage setting. As the battery voltage rises above the minimum system voltage, BATFET is fully on when charging or in supplement mode and the voltage difference

between the system and battery is the VDS of BATFET. System voltage is regulated 160 mV above battery voltage when BATFET is off (no charging or no supplement current).

When BATFET is removed, the system node VSYS is shorted to SRP. Before the converter starts operation, LDO mode needs to be disabled. The following sequence is required to configure charger without BATFET.

1. Before adapter plugs in, put the charger into HIZ mode. (either pull pin 6 ILIM\_HIZ to ground, or set REG0x32[15] to 1)
2. Set 0x12[2] to 0 to disable LDO mode.
3. Set 0x30[0] to 0 to disable auto-wakeup mode.
4. Check if battery voltage is properly programmed (REG0x15)
5. Set precharge/charge current (REG0x14)
6. Put the device out of HIZ mode. (Release ILIM\_HIZ from ground and set REG0x32[15]=0).

In order to prevent any accidental SW mistakes, the host sets low input current limit (a few hundred milliamps) when device is out of HIZ.

### 9.6.6 Input Current and Input Voltage Registers for Dynamic Power Management

The charger supports Dynamic Power Management (DPM). Normally, the input power source provides power for the system load or to charge the battery. When the input current exceeds the input current setting, or the input voltage falls below the input voltage setting, the charger decreases the charge current to provide priority to the system load. As the system current rises, the available charge current drops accordingly towards zero. If the system load keeps increasing after the charge current drops down to zero, the system voltage starts to drop. As the system voltage drops below the battery voltage, the battery will discharge to supply the heavy system load.

#### 9.6.6.1 Input Current Registers

To set the maximum input current limit, write a 16-bit IIN\_HOST register command (REG0x3F()) using the data format listed in 表 9-31 and 表 9-32. When using a 10-mΩ sense resistor, the charger provides an input-current limit range of 50 mA to 6400 mA, with 50-mA resolution. The default current limit is 3.25 A. Due to the USB current setting requirement, the register setting specifies the maximum current instead of the typical current. Upon adapter removal, the input current limit is reset to the default value of 3.25 A. With code 0, the input current limit is 50 mA.

The ACP and ACN pins are used to sense  $R_{AC}$  with the default value of 10 mΩ. For a 20-mΩ sense resistor, a larger sense voltage is given and a higher regulation accuracy, but at the expense of higher conduction loss.

Instead of using the internal DPM loop, the user can build up an external input current regulation loop and have the feedback signal on the ILIM\_HIZ pin.

$$V_{ILIM\_HIZ} = 1V + 40 \times (V_{ACP} - V_{ACN}) = 1 + 40 \times I_{DPM} \times R_{AC} \quad (2)$$

In order to disable ILIM\_HIZ pin, the host can write to 0x31[7] to disable ILIM\_HIZ pin, or pull ILIM\_HIZ pin above 4.0 V.

### 9.6.6.1.1 IIN\_HOST Register With 10-mΩ Sense Resistor (SMBus address = 3Fh) [reset = 4100h]

With code 0, the input current limit readback is 50 mA.

**图 9-18. IIN\_HOST Register With 10-mΩ Sense Resistor (SMBus address = 3Fh) [reset = 4100h]**

#### 9.6.6.1.2 IIN\_DPM Register With 10-mΩ Sense Resistor (SMBus address = 022h) [reset = 4100h]

IIN\_DPM register reflects the actual input current limit programmed in the register, either from host or from ICO.

After ICO, the current limit used by DPM regulation may differ from the IIN\_HOST register settings. The actual DPM limit is reported in REG0x22(). With code 0, the input current limit read-back is 50 mA.

### 9.6.6.1.3 InputVoltage Register (SMBus address = 3Dh) [reset = VBUS-1.28V]

To set the input voltage limit, write a 16-bit InputVoltage register command (REG0x3D()) using the data format listed in [图 9-20](#), [表 9-35](#), and [表 9-36](#).

If the input voltage drops more than the InputVoltage register allows, the device enters DPM and reduces the charge current. The default offset voltage is 1.28 V below the no-load VBUS voltage. The DC offset is 3.2 V (0000000).

**图 9-20. InputVoltage Register (SMBus address = 3Dh) [reset = VBUS-1.28V]**

### 9.6.7 OTGVoltage Register (SMBus address = 3Bh) [reset = 0000h]

To set the OTG output voltage limit, write to REG0x3B() using the data format listed in 図 9-21, 表 9-37, and 表 9-38.

The DAC is clamped in digital core at minimal 3V and maximum 20.8V. Any register writing lower than the minimal or higher than the maximum will be ignored. When REG0x32[2] = 1, there is no DAC offset. When REG0x32[2] = 0 the DAC is offset by 1.28V

## 10 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

## 10.1 Application Information

The BQ2571xEVM-017 evaluation module (EVM) is a complete charger module for evaluating the BQ25710. The application curves were taken using the BQ2571xEVM-017. Refer to the [EVM User's Guide](#) for EVM information.

## 10.2 Typical Application

### 10-1. Application Diagram

### 10.2.1 Design Requirements

| DESIGN PARAMETER                      | EXAMPLE VALUE                  |
|---------------------------------------|--------------------------------|
| Input Voltage <sup>(2)</sup>          | 3.5 V < Adapter Voltage < 24 V |
| Input Current Limit <sup>(2)</sup>    | 3.2 A for 65 W adapter         |
| Battery Charge Voltage <sup>(1)</sup> | 8400 mV for 2s battery         |
| Battery Charge Current <sup>(1)</sup> | 3072 mA for 2s battery         |

| DESIGN PARAMETER                      | EXAMPLE VALUE          |
|---------------------------------------|------------------------|
| Minimum System Voltage <sup>(1)</sup> | 6144 mV for 2s battery |

(1) Refer to battery specification for settings.

(2) Refer to adapter specification for settings for Input Voltage and Input Current Limit.

## 10.2.2 Detailed Design Procedure

The parameters are configurable using the evaluation software. The simplified application circuit (see [Figure 10-1](#), as the application diagram) shows the minimum component requirements. Inductor, capacitor, and MOSFET selection are explained in the rest of this section. Refer to the [EVM User's Guide](#) for the complete application schematic.

### 10.2.2.1 ACP-ACN Input Filter

The BQ25710 has average current mode control. The input current sensing through ACP/ACN is critical to recover inductor current ripple. Parasitic inductance on board will generate high frequency ringing on ACP-ACN which overwhelms converter sensed inductor current information, so it is difficult to manage parasitic inductance created based on different PCB layout. Bigger parasitic inductance will generate bigger sense current ringing which will cause the average current control loop to go into oscillation.

For real system board condition, we suggest to use below circuit design to get best result and filter noise induced from different PCB parasitic factor. With time constant of filter from 47 nsec to 200 nsec, the filtering on ringing is effective and in the meantime, the delay of on the sensed signal is small and therefore poses no concern for average current mode control.

**Figure 10-2. ACN-ACP Input Filter**

### 10.2.2.2 Inductor Selection

The BQ25710 has two selectable fixed switching frequency. Higher switching frequency allows the use of smaller inductor and capacitor values. Inductor saturation current should be higher than the charging current ( $I_{CHG}$ ) plus half the ripple current ( $I_{RIPPLE}$ ):

$$I_{SAT} \geq I_{CHG} + (1/2) I_{RIPPLE} \quad (3)$$

The inductor ripple current in buck operation depends on input voltage ( $V_{IN}$ ), duty cycle ( $D_{BUCK} = V_{OUT}/V_{IN}$ ), switching frequency ( $f_s$ ) and inductance ( $L$ ):

$$I_{RIPPLE\_BUCK} = \frac{V_{IN} \times D \times (1 - D)}{f_s \times L} \quad (4)$$

During boost operation, the duty cycle is:

$$D_{BOOST} = 1 - (V_{IN}/V_{BAT})$$

The maximum inductor ripple current happens with  $D = 0.5$  or close to 0.5. For example, the battery charging voltage range is from 9 V to 12.6 V for 3-cell battery pack. For 20-V adapter voltage, 10-V battery voltage gives the maximum inductor ripple current. Another example is 4-cell battery, the battery voltage range is from 12 V to 16.8 V, and 12-V battery voltage gives the maximum inductor ripple current.

Usually inductor ripple is designed in the range of (20 – 40%) maximum charging current as a trade-off between inductor size and efficiency for a practical design.

### 10.2.2.3 Input Capacitor

Input capacitor should have enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the charging current (plus system current there is any system load) when duty cycle is 0.5 in buck mode. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current occurs where the duty cycle is closest to 50% and can be estimated by 式 5:

$$I_{CIN} = I_{CHG} \times \sqrt{D \times (1 - D)} \quad (5)$$

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed in front of  $R_{AC}$  current sensing and as close as possible to the power stage half bridge MOSFETs. Capacitance after  $R_{AC}$  before power stage half bridge should be limited to  $10 \text{ nF} + 1 \text{ nF}$  referring to 图 10-2. Because too large capacitance after  $R_{AC}$  could filter out  $R_{AC}$  current sensing ripple information. Voltage rating of the capacitor must be higher than normal input voltage level, 25-V rating or higher capacitor is preferred for 19-V to 20-V input voltage. The minimum input effective capacitance recommendation is shown in 表 10-1.

Ceramic capacitors (MLCC) show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the input capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high input voltages and small capacitor packages. See the manufacturer's datasheet about the derating performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required effective capacitance value at the operating point. Considering the 25 V 0603 package MLCC capacitance derating under 19-V to 20-V input voltage, the recommended practical capacitors configuration can also be found in 表 10-1. Tantalum capacitors (POSCAP) can avoid dc-bias effect and temperature variation effect which is recommended for 90 W to 130 W higher power application.

**表 10-1. Minimum Input Capacitance Requirement**

| INPUT CAPACITORS VS TOTAL INPUT POWER            | 65W                                 | 90W                                 | 130W                                                                             |
|--------------------------------------------------|-------------------------------------|-------------------------------------|----------------------------------------------------------------------------------|
| Minimum effective input capacitance              | 4 $\mu\text{F}$                     | 6 $\mu\text{F}$                     | 13 $\mu\text{F}$                                                                 |
| Minimum practical input capacitors configuration | 4*10 $\mu\text{F}$ (0603 25 V MLCC) | 6*10 $\mu\text{F}$ (0603 25 V MLCC) | 3*10 $\mu\text{F}$ (0603 25 V MLCC)<br>1* 10 $\mu\text{F}$ (25 V to 35 V POSCAP) |

### 10.2.2.4 Output Capacitor

Output capacitor also should have enough ripple current rating to absorb output switching ripple current. To get good loop stability, the resonant frequency of the output inductor and output capacitor should be designed between 10 kHz and 20 kHz. The preferred ceramic capacitor is 25-V X7R or X5R for output capacitor. Minimum 7 pcs of 10- $\mu\text{F}$  0603 package capacitor is suggested to be placed as close as possible to Q3&Q4 half bridge (between Q4 drain and Q3 source terminal). Total minimum output effective capacitance along VSYS distribution line is 50  $\mu\text{F}$  refers to 表 10-2. Recommend to place minimum 20- $\mu\text{F}$  MLCC capacitors after the charge current sense resistor for best stability.

Ceramic capacitors show a dc-bias effect. This effect reduces the effective capacitance when a dc-bias voltage is applied across a ceramic capacitor, as on the output capacitor of a charger. The effect may lead to a significant capacitance drop, especially for high output voltages and small capacitor packages. See the manufacturer's data sheet about the derating performance with a dc bias voltage applied. It may be necessary to choose a higher voltage rating or nominal capacitance value in order to get the required capacitance value at the

operating point. Considering the 25-V 0603 package MLCC capacitance derating under 21-V to 23-V output voltage, the recommended practical capacitors configuration at VSYS output terminal can also be found in 表 10-2. Tantalum capacitors (POSCAP) can avoid dc-bias effect and temperature variation effect which are recommended to be used along VSYS output distribution line to meet total minimum effective output capacitance requirement.

**表 10-2. Minimum Output Capacitance Requirement**

| OUTPUT CAPACITORS VS TOTAL INPUT POWER                    | 65W                             | 90W                             | 130W                            |
|-----------------------------------------------------------|---------------------------------|---------------------------------|---------------------------------|
| Minimum Effective Output Capacitance                      | 50 $\mu$ F                      | 50 $\mu$ F                      | 50 $\mu$ F                      |
| Minimum output capacitors at charger VSYS output terminal | 7*10 $\mu$ F (0603 25 V MLCC)   | 9*10 $\mu$ F (0603 25 V MLCC)   | 9*10 $\mu$ F (0603 25 V MLCC)   |
| Additional output capacitors along VSYS distribution line | 2*22 $\mu$ F (25 V~35 V POSCAP) | 2*22 $\mu$ F (25 V~35 V POSCAP) | 2*22 $\mu$ F (25 V~35 V POSCAP) |

### 10.2.2.5 Power MOSFETs Selection

Four external N-channel MOSFETs are used for a synchronous switching battery charger. The gate drivers are internally integrated into the IC with 6 V of gate drive voltage. 30 V or higher voltage rating MOSFETs are preferred for 19 V - 20 V input voltage.

Figure-of-merit (FOM) is usually used for selecting proper MOSFET based on a tradeoff between the conduction loss and switching loss. For the top side MOSFET, FOM is defined as the product of a MOSFET's on-resistance,  $R_{DS(ON)}$ , and the gate-to-drain charge,  $Q_{GD}$ . For the bottom side MOSFET, FOM is defined as the product of the MOSFET's on-resistance,  $R_{DS(ON)}$ , and the total gate charge,  $Q_G$ .

$$FOM_{top} = R_{DS(on)} \times Q_{GD}; FOM_{bottom} = R_{DS(on)} \times Q_G \quad (6)$$

The lower the FOM value, the lower the total power loss. Usually lower  $R_{DS(ON)}$  has higher cost with the same package size.

The top-side MOSFET loss includes conduction loss and switching loss. It is a function of duty cycle ( $D=V_{OUT}/V_{IN}$ ), charging current ( $I_{CHG}$ ), MOSFET's on-resistance ( $R_{DS(ON)}$ ), input voltage ( $V_{IN}$ ), switching frequency ( $f_s$ ), turn on time ( $t_{on}$ ) and turn off time ( $t_{off}$ ):

$$P_{top} = D \times I_{CHG}^2 \times R_{DS(on)} + \frac{1}{2} \times V_{IN} \times I_{CHG} \times (t_{on} + t_{off}) \times f_s \quad (7)$$

The first item represents the conduction loss. Usually MOSFET  $R_{DS(ON)}$  increases by 50% with 100°C junction temperature rise. The second term represents the switching loss. The MOSFET turn-on and turn-off times are given by:

$$t_{on} = \frac{Q_{SW}}{I_{on}}, t_{off} = \frac{Q_{SW}}{I_{off}} \quad (8)$$

where  $Q_{SW}$  is the switching charge,  $I_{on}$  is the turn-on gate driving current and  $I_{off}$  is the turn-off gate driving current. If the switching charge is not given in MOSFET datasheet, it can be estimated by gate-to-drain charge ( $Q_{GD}$ ) and gate-to-source charge ( $Q_{GS}$ ):

$$Q_{SW} = Q_{GD} + \frac{1}{2} \times Q_{GS} \quad (9)$$

Gate driving current can be estimated by REGN voltage ( $V_{REGN}$ ), MOSFET plateau voltage ( $V_{plt}$ ), total turn-on gate resistance ( $R_{on}$ ) and turn-off gate resistance ( $R_{off}$ ) of the gate driver:

$$I_{on} = \frac{V_{REGN} - V_{plt}}{R_{on}}, \quad I_{off} = \frac{V_{plt}}{R_{off}} \quad (10)$$

The conduction loss of the bottom-side MOSFET is calculated with the following equation when it operates in synchronous continuous conduction mode:

$$P_{bottom} = (1 - D) \times I_{CHG}^2 \times R_{DS(on)} \quad (11)$$

When charger operates in non-synchronous mode, the bottom-side MOSFET is off. As a result all the freewheeling current goes through the body-diode of the bottom-side MOSFET. The body diode power loss depends on its forward voltage drop ( $V_F$ ), non-synchronous mode charging current ( $I_{NONSYN}$ ), and duty cycle ( $D$ ).

$$P_D = V_F \times I_{NONSYN} \times (1 - D) \quad (12)$$

The maximum charging current in non-synchronous mode can be up to 0.25 A for a 10-mΩ charging current sensing resistor or 0.5 A if battery voltage is below 2.5 V. The minimum duty cycle happens at lowest battery voltage. Choose the bottom-side MOSFET with either an internal Schottky or body diode capable of carrying the maximum non-synchronous mode charging current.

### 10.2.3 Application Curves

VBUS = 20 V, VSYS = 10 V, ISYS = 200 mA

 **10-7. PFM Operation**

 **10-8. PWM Operation**

VBUS = 5 V, VBAT = 10 V

 **10-9. Switching During Boost Mode**

VBUS = 12 V, VBAT = 12 V

 **10-10. Switching During Buck Boost Mode**

VBUS = 12 V/3.3 A, 3-cell, VSYS = 9 V, Without battery

 **10-11. System Regulation in Buck Mode**

VBUS = 9 V/3.3 A, 3-cell, VSYS = 9 V, Without battery

 **10-12. System Regulation in Buck Boost Mode**

VBUS = 5 V/3.3 A, 3-cell, VSYS = 9 V, Without battery

**10-13. System Regulation in Boost Mode**

VBUS = 20 V/3.3 V, VBAT = 7.5 V

**10-14. Input Current Regulation in Buck Mode**

VBUS = 5 V/3.3 V, VBAT = 7.5 V

**10-15. Input Current in Boost Mode**

VBUS = 5 V

**10-16. OTG Power Up from 8 V Battery**

VBAT = 10 V, VBUS 5 V to 20 V, IOTG = 500 mA

**10-17. OTG Voltage Ramp Up**

**10-18. OTG Power Off**

VBAT = 10 V, VBUS = 20 V

 10-19. OTG Load Transient

## 11 Power Supply Recommendations

The valid adapter range is from 3.5 V ( $V_{VBUS\_CONVEN}$ ) to 24 V (ACOV) with at least 500-mA current rating. When CHRG\_OK goes HIGH, the system is powered from adapter through the charger. When adapter is removed, the system is connected to battery through BATFET. Typically the battery depletion threshold should be greater than the minimum system voltage so that the battery capacity can be fully utilized for maximum battery life.

## 12 Layout

### 12.1 Layout Guidelines

Proper layout of the components to minimize high frequency current path loop (see [セクション 12.2](#)) is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Here is a PCB layout priority list for proper layout.

**表 12-1. PCB Layout Guidelines**

| RULES | COMPONENTS         | FUNCTION           | IMPACT                                                     | GUIDELINES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------|--------------------|--------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     |                    | PCB layer stack up | Thermal, efficiency, signal integrity                      | Multi-layer PCB is suggested. Allocate at least one ground layer. The BQ257XXEVM uses a 4-layer PCB (top layer, ground layer, signal layer and bottom layer).                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2     | CBUS, RAC, Q1, Q2  | Input loop         | High frequency noise, ripple                               | VBUS capacitors, RAC, Q1 and Q2 form a small loop 1. It is best to put them on the same side. Connect them with large copper to reduce the parasitic resistance. Move part of CBUS to the other side of PCB for high density design. After RAC before Q1 and Q2 power stage recommend to put 10 nF + 1 nF (0402 package) decoupling capacitors as close as possible to IC to decoupling switching loop high frequency noise.                                                                                                                                                  |
| 3     | RAC, Q1, L1, Q4    | Current path       | Efficiency                                                 | The current path from VBUS to VSYS, through RAC, Q1, L1, Q4, has low impedance. Pay attention to via resistance if they are not on the same side. The number of vias can be estimated as 1 to 2A/via for a 10-mil via with 1 oz. copper thickness.                                                                                                                                                                                                                                                                                                                            |
| 4     | CSYS, Q3, Q4       | Output loop        | High frequency noise, ripple                               | VSYS capacitors, Q3 and Q4 form a small loop 2. It is best to put them on the same side. Connect them with large copper to reduce the parasitic resistance. Move part of CSYS to the other side of PCB for high density design.                                                                                                                                                                                                                                                                                                                                               |
| 5     | QBAT, RSR          | Current path       | Efficiency, battery voltage detection                      | Place QBAT and RSR near the battery terminal. The current path from VBAT to VSYS, through RSR and QBAT, has low impedance. Pay attention to via resistance if they are not on the same side. The device detects the battery voltage through SRN near battery terminal.                                                                                                                                                                                                                                                                                                        |
| 6     | Q1, Q2, L1, Q3, Q4 | Power stage        | Thermal, efficiency                                        | Place Q1, Q2, L1, Q3 and Q4 next to each other. Allow enough copper area for thermal dissipation. The copper area is suggested to be 2x to 4x of the pad size. Multiple thermal vias can be used to connect more copper layers together and dissipate more heat.                                                                                                                                                                                                                                                                                                              |
| 7     | RAC, RSR           | Current sense      | Regulation accuracy                                        | Use Kelvin-sensing technique for RAC and RSR current sense resistors. Connect the current sense traces to the center of the pads, and run current sense traces as differential pairs.                                                                                                                                                                                                                                                                                                                                                                                         |
| 8     | Small capacitors   | IC bypass caps     | Noise, jittering, ripple                                   | Place VBUS cap, VCC cap, REGN caps near IC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 9     | BST capacitors     | HS gate drive      | High frequency noise, ripple                               | Place HS MOSFET boost strap circuit capacitor close to IC and on the same side of PCB board. Capacitors SW1/2 nodes are recommended to use wide copper polygon to connect to power stage and capacitors BST1/2 node are recommended to use at least 8mil trace to connected to IC BST1/2 pins.                                                                                                                                                                                                                                                                                |
| 10    |                    | Ground partition   | Measurement accuracy, regulation accuracy, jitters, ripple | Separate analog ground(AGND) and power grounds(PGND) is preferred. PGND should be used for all power stage related ground net. AGND should be used for all sensing, compensation and control network ground for example ACP/ACN/COMP1/COMP2/COMPIN/CMPOUT/IADPT/IBAT/PSYS. Connect all analog grounds to a dedicated low-impedance copper plane, which is tied to the power ground underneath the IC exposed pad. If possible, use dedicated COMP1, COMP2 AGND traces. Connect analog ground and power ground together using power pad as the single ground connection point. |

## 12.2 Layout Example

### 12.2.1 Layout Example Reference Top View

Based on the above layout guidelines, the buck-boost charger layout example top view is shown below including all the key power components.

12-1. Buck-Boost Charger Layout Reference Example Top View

### 12.2.2 Inner Layer Layout and Routing Example

For both input sensing resistor and charging current sensing resistor, differential sensing and routing method are suggested and highlighted in below figure. Use wide trace for gate drive traces, minimum 15 mil trace width. Connect all analog grounds to a dedicated low-impedance copper plane, which is tied to the power ground underneath the IC exposed pad. Suggest using dedicated COMP1, COMP2 analog ground traces shown in below figure.

12-2. Buck-Boost Charger Gate Drive/Current Sensing/AGND Signal Layer Routing Example

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

\*All dimensions are nominal

| Device      | Package Type | Package Drawing | Pins | SPQ  | Reel Diameter (mm) | Reel Width W1 (mm) | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) | Pin1 Quadrant |
|-------------|--------------|-----------------|------|------|--------------------|--------------------|---------|---------|---------|---------|--------|---------------|
| BQ25710RSNR | QFN          | RSN             | 32   | 3000 | 330.0              | 12.4               | 4.25    | 4.25    | 1.15    | 8.0     | 12.0   | Q2            |
| BQ25710RSNT | QFN          | RSN             | 32   | 250  | 180.0              | 12.4               | 4.25    | 4.25    | 1.15    | 8.0     | 12.0   | Q2            |

## TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

| Device      | Package Type | Package Drawing | Pins | SPQ  | Length (mm) | Width (mm) | Height (mm) |
|-------------|--------------|-----------------|------|------|-------------|------------|-------------|
| BQ25710RSNR | QFN          | RSN             | 32   | 3000 | 367.0       | 367.0      | 35.0        |

# PACKAGE OUTLINE

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).

5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN
