LM317L-N V_{IN}範囲が広い100mA可変電圧レギュレータ

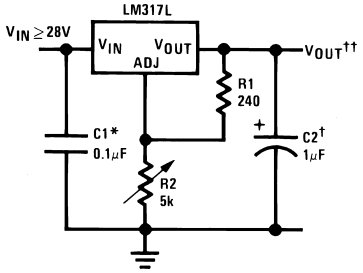

1 特長

- 可変出力電圧: 最小1.2V
- 100mAの出力電流
- 最大40VのV_{IN}に対応
- ライン・レギュレーション: 標準値0.01%/V
- 負荷レギュレーション: 標準値0.1%/A
- 出力コンデンサ不要 (†)
- 温度に対して一定の電流制限
- 多種類の電圧をそろえずに済む
- 標準的な3リード・トランジスタ・パッケージ
- 80dBのリップル除去
- 3ピンTO-92、8ピンSOIC、または6ピンDSBGAパッケージで供給
- 出力の短絡保護
- DSBGAの考慮事項については、AN-1112 (SNVA009)を参照してください。

2 アプリケーション

- 車載用LEDライティング
- バッテリ充電器
- スイッチング電源のポスト・レギュレーション
- 定電流レギュレータ
- マイクロプロセッサの電源

3 概要

LM317L-Nは可変正電圧レギュレータであり、−1.2V～37Vの出力範囲で100mAを供給できます。LM317L-Nは簡単に使用でき、2つの外付け抵抗だけで出力電圧を設定できます。ライン・レギュレーションと負荷レギュレーションのいずれも、標準的な固定レギュレータより優れています。LM317L-Nは標準の使いやすいTO-92トランジスタ・パッケージで供給されます。

LM317L-Nは完全な過負荷保護機能を備えています。電流制限、熱過負荷保護、安全領域保護も内蔵されています。デバイスが入力フィルタ・コンデンサから6インチ以上離れて配置されない限り、通常はコンデンサ不要です。6インチ以上離れて配置される場合は入力バイパスが必要です。

LM317L-Nは、フローティング・トポロジを使用して、入出力電圧差のみを監視するため、入出力電圧差の最大値を超過しない限り、数百ボルトの電源でもレギュレート可能です。LM317L-Nは、単純な可変のスイッチング・レギュレータ、またはプログラミング可能な出力レギュレータとして使用でき、さらに調整と出力との間に固定抵抗を接続することで、高精度の電流レギュレータとしても使用できます。

LM317L-Nは標準の3ピンTO-92トランジスタ・パッケージ、8ピンSOICパッケージ、および6ピンDSBGAパッケージで供給されます。LM317L-Nは、−40℃～125℃での動作が規定されています。

6 Specifications

6.1 Absolute Maximum Rating (1)(2)

	MIN	MAX	UNIT
Power dissipation	Internally Limited		
Input-output voltage differential		40	V
Operating junction temperature	−40	125	°C
Lead temperature (soldering, 4 seconds)		260	°C
Storage temperature, T_{stg}	−55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) If Military/Aerospace specified devices are required, contact the Texas Instruments Sales Office/Distributors for availability and specifications.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)	±2000	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±2000 V may actually have higher performance.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Operating temperature	−40	125	°C

6.4 Thermal Information

THERMAL METRIC (1)		LM317L-N				UNIT

6.5 Electrical Characteristics (1)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Line regulation	T_J = 25°C, 3 V ≤ (V_{IN} − V_{OUT}) ≤ 40 V, I_L ≤ 20 mA(2)		0.01	0.04	%/V
Load regulation	T_J = 25°C, 5 mA ≤ I_{OUT} ≤ I_{MAX} (2)		0.1%	0.5%	
Thermal regulation	T_J = 25°C, 10-ms Pulse		0.04	0.2	%/W
Adjustment pin current			50	100	μA
Adjustment pin current change	5 mA ≤ I_L ≤ 100 mA 3 V ≤ (V_{IN} − V_{OUT}) ≤ 40 V, P ≤ 625 mW		0.2	5	μA
Reference voltage	3 V ≤ (V_{IN} − V_{OUT}) ≤ 40 V(3) 5 mA ≤ I_{OUT} ≤ 100 mA, P ≤ 625 mW	1.2	1.25	1.3	V
Line regulation	3 V ≤ (V_{IN} − V_{OUT}) ≤ 40 V, I_L ≤ 20 mA(2)		0.02	0.07	%/V
Load regulation	5 mA ≤ I_{OUT} ≤ 100 mA(2)		0.3%	1.5%	
Temperature stability	T_{MIN} ≤ T_J ≤ T_{MAX}		0.65%		
Minimum load current	(V_{IN} − V_{OUT}) ≤ 40 V		3.5	5	mA
	3 V ≤ (V_{IN} − V_{OUT}) ≤ 15 V		1.5	2.5	
Current limit	3 V ≤ (V_{IN} − V_{OUT}) ≤ 13 V	100	200	300	mA
	(V_{IN} − V_{OUT}) = 40 V	25	50	150	
RMS output noise, % of V_{OUT}	T_J = 25°C, 10 Hz ≤ f ≤ 10 kHz		0.003%		
Ripple rejection ratio	V_{OUT} = 10 V, f = 120 Hz, C_{ADJ} = 0		65		dB
	C_{ADJ} = 10 μF	66	80		
Long-term stability	T_J = 125°C, 1000 Hours		0.3%	1%	

(1) Unless otherwise noted, these specifications apply: −25°C ≤ T_j ≤ 125°C for the LM317L-N; V_{IN} − V_{OUT} = 5 V and I_{OUT} = 40 mA. Although power dissipation is internally limited, these specifications are applicable for power dissipations up to 625 mW. I_{MAX} is 100 mA.
(2) Regulation is measured at constant junction temperature, using pulse testing with a low duty cycle. Changes in output voltage due to heating effects are covered under the specification for thermal regulation.
(3) Thermal resistance of the TO-92 package is 180°C/W junction to ambient with 0.4-inch leads from a PCB and 160°C/W junction to ambient with 0.125-inch lead length to PCB.

7 Detailed Description

7.1 Overview

In operation, the LM317L-N develops a nominal 1.25-V reference voltage, V_{REF}, between the output and adjustment terminal. The reference voltage is impressed across program resistor R1 and, because the voltage is constant, a constant current I_1 then flows through the output set resistor R2, giving an output voltage of:

$$V_{OUT} = V_{REF}\left(1 + \frac{R2}{R1}\right) + I_{ADJ}(R2) \quad (1)$$

Because the 100-μA current from the adjustment terminal represents an error term, the LM317L-N was designed to minimize I_{ADJ} and make it very constant with line and load changes. To do this, all quiescent operating current is returned to the output establishing a minimum load current requirement. If there is insufficient load on the output, the output will rise.

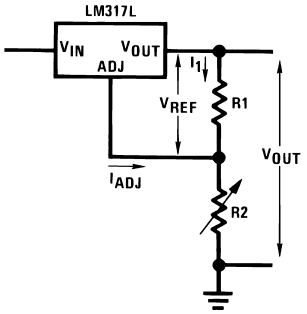

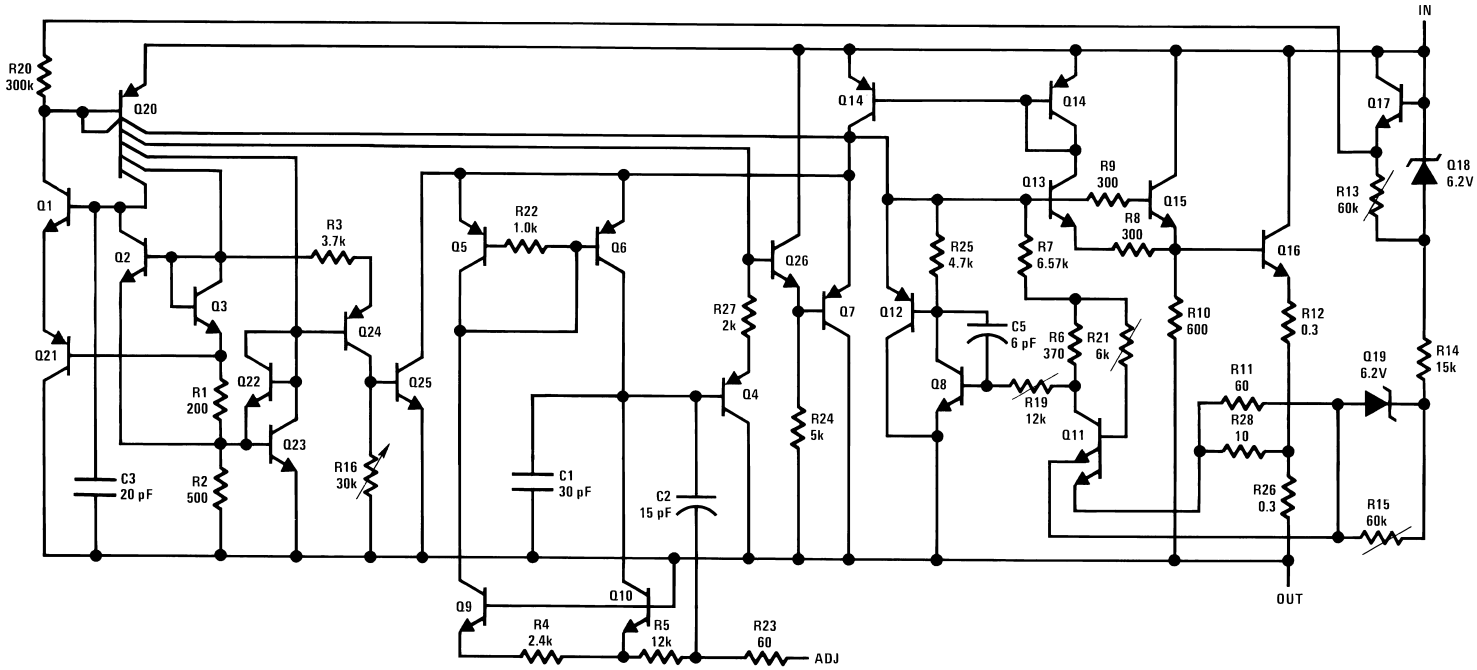

Figure 13. Typical Application Circuit for Adjustable Regulator

Copyright © 2000–2018, Texas Instruments Incorporated

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Load Regulation

The LM317L-N is capable of providing extremely good load regulation but a few precautions are needed to obtain maximum performance. The current set resistor connected between the adjustment terminal and the output terminal (usually 240 Ω) must be tied directly to the output of the regulator rather than near the load. This eliminates line drops from appearing effectively in series with the reference and degrading regulation. For example, a 15-V regulator with 0.05-Ω resistance between the regulator and load will have a load regulation due to line resistance of 0.05 Ω × I_L. If the set resistor is connected near the load the effective line resistance will be 0.05 Ω (1 + R2/R1) or in this case, 11.5 times worse.

Figure 14 shows the effect of resistance between the regulator and 240-Ω set resistor.

With the TO-92 package, it is easy to minimize the resistance from the case to the set resistor, by using two separate leads to the output pin. The ground of R2 can be returned near the ground of the load to provide remote ground-sensing and improve load regulation.

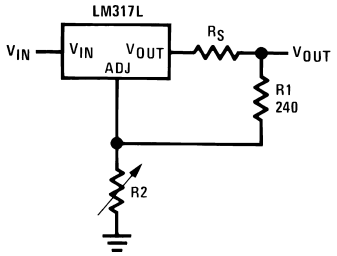

Figure 14. Regulator With Line Resistance in Output Lead

7.4 Device Functional Modes

7.4.1 External Capacitors

An input bypass capacitor is recommended in case the regulator is more than 6 inches away from the usual large filter capacitor. A 0.1-μF disc or 1-μF solid tantalum on the input is suitable input bypassing for almost all applications. The device is more sensitive to the absence of input bypassing when adjustment or output capacitors are used, but the above values will eliminate the possibility of problems.

The adjustment terminal can be bypassed to ground on the LM317L-N to improve ripple rejection and noise. This bypass capacitor prevents ripple and noise from being amplified as the output voltage is increased. With a 10-μF bypass capacitor 80-dB ripple rejection is obtainable at any output level. Increases over 10-μF do not appreciably improve the ripple rejection at frequencies above 120 Hz. If the bypass capacitor is used, it is sometimes necessary to include protection diodes to prevent the capacitor from discharging through internal low current paths and damaging the device.

In general, the best type of capacitors to use is solid tantalum. *Solid tantalum capacitors have low impedance even at high frequencies.* Depending upon capacitor construction, it takes about 25 μF in aluminum electrolytic to equal 1-μF solid tantalum at high frequencies. Ceramic capacitors are also good at high frequencies; but some types have a large decrease in capacitance at frequencies around 0.5 MHz. For this reason, a 0.01-μF disc may seem to work better than a 0.1-μF disc as a bypass.

Although the LM317L-N is stable with no output capacitors, like any feedback circuit, certain values of external capacitance can cause excessive ringing. This occurs with values between 500 pF and 5000 pF. A 1-μF solid tantalum (or 25-μF aluminum electrolytic) on the output swamps this effect and insures stability.

7.4.2 Protection Diodes

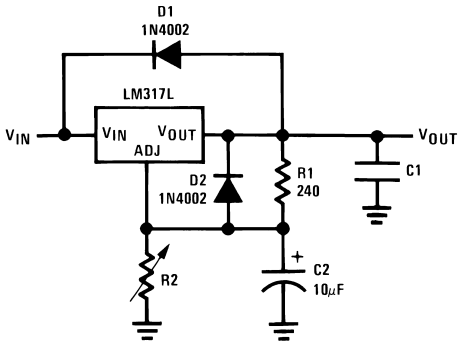

When external capacitors are used with *any* IC regulator it is sometimes necessary to add protection diodes to prevent the capacitors from discharging through low current points into the regulator. Most 10-μF capacitors have low enough internal series resistance to deliver 20-A spikes when shorted. Although the surge is short, there is enough energy to damage parts of the IC.

Copyright © 2000–2018, Texas Instruments Incorporated

Device Functional Modes (continued)

When an output capacitor is connected to a regulator and the input is shorted, the output capacitor will discharge into the output of the regulator. The discharge current depends on the value of the capacitor, the output voltage of the regulator, and the rate of decrease of V_{IN}. In the LM317L-N, this discharge path is through a large junction that is able to sustain a 2-A surge with no problem. This is not true of other types of positive regulators. For output capacitors of 25 μF or less, the ballast resistors and output structure of the LM317L-N limit the peak current to a low enough level so that there is no need to use a protection diode.

The bypass capacitor on the adjustment terminal can discharge through a low current junction. Discharge occurs when *either* the input or output is shorted. Internal to the LM317L-N is a 50-Ω resistor which limits the peak discharge current. No protection is needed for output voltages of 25 V or less and 10-μF capacitance. Figure 15 shows an LM317L-N with protection diodes included for use with outputs greater than 25 V and high values of output capacitance.

$$V_{OUT} = V_{REF}\left(1 + \frac{R2}{R1}\right) + I_{ADJ}(R2)$$

D1 protects against C1
D2 protects against C2

Figure 15. Regulator With Protection Diodes

7.4.3 DSBGA Light Sensitivity

Exposing the LM317L-N DSBGA package to bright sunlight may cause the V_{REF} to drop. In a normal office environment of fluorescent lighting the output is not affected. The LM317 DSBGA does not sustain permanent damage from light exposure. Removing the light source causes V_{REF} of the LM317L-N to recover to the proper value.

8 Application and Implementation

NOTE

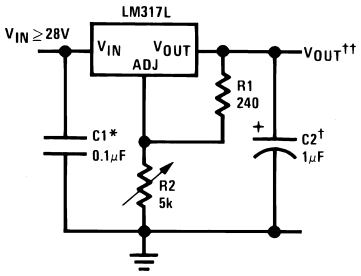

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LM317L-N is a versatile, high-performance, linear regulator with 1% output-voltage accuracy. An output capacitor can be added to further improve transient response, and the ADJ pin can be bypassed to achieve very high ripple-rejection ratios. Its functionality can be used in many different applications that require high performance regulation, such as battery chargers, constant-current regulators, and microprocessor supplies.

8.2 Typical Applications

8.2.1 1.25-V to 25-V Adjustable Regulator

Full output current not available at high input-output voltages
†Optional—improves transient response
*Needed if device is more than 6 inches from filter capacitors
$^{\dagger\dagger}V_{OUT} = 1.25V\left(1 + \frac{R2}{R1}\right) + I_{ADJ}(R_2)$

Figure 16. 1.25-V to 25-V Adjustable Regulator

8.2.1.1 Design Requirements

The device component count is very minimal, employing two resistors as part of a voltage-divider circuit and an output capacitor for load regulation. An input capacitor is needed if the device is more than 6 inches from filter capacitors. An optional bypass capacitor across R2 can also be used to improve PSRR.

8.2.1.2 Detailed Design Procedure

The output voltage is set based on the selection of the two resistors, R1 and R2, as shown in Figure 16. For details on capacitor selection, see *External Capacitors*.

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.1.3 Application Curve

As shown in Figure 17, V_{OUT} rises with V_{IN} minus some dropout voltage. This dropout voltage during start-up will vary with R_{OUT}.

V_{OUT} = 5 V

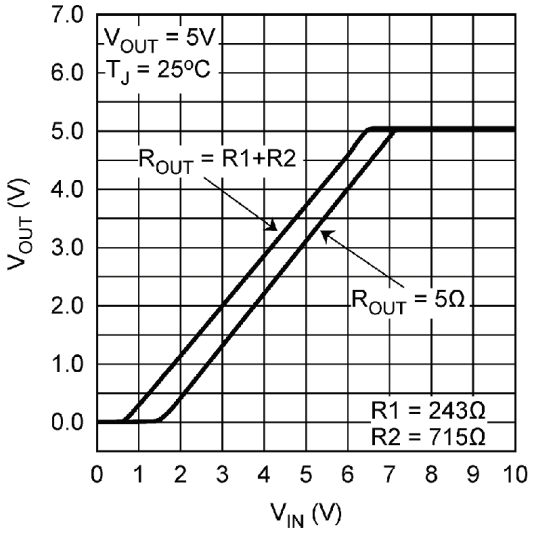

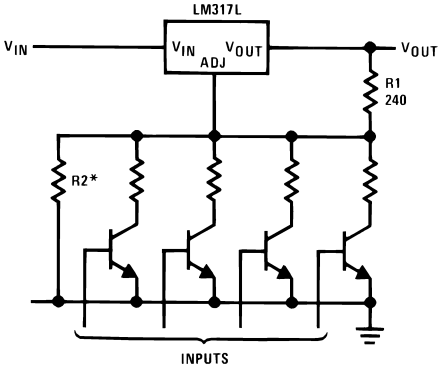

Figure 17. V_{OUT} vs V_{IN}

8.2.2 Digitally-Selected Outputs

Figure 18 demonstrates a digitally-selectable output voltage. In its default state, all transistors are off and the output voltage is set based on R1 and R2. By driving certain transistors, the associated resistor is connected in parallel to R2, modifying the output voltage of the regulator.

*Sets maximum V_{OUT}

Figure 18. Digitally-Selected Outputs

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.3 High Gain Amplifier

This application uses the LM395 Power Transistor to amplify the input voltage. The LM317L connected to R2 produces a constant current of 1.2V/R2 through the BJT. By altering the base current entering the LM395, the effective resistance can be changed resulting in an appropriate voltage fluctuation at the output.

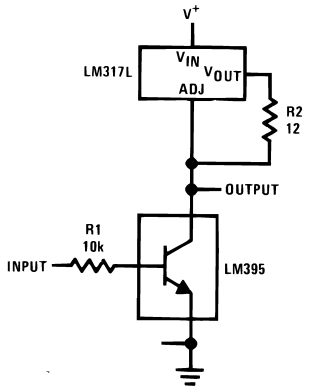

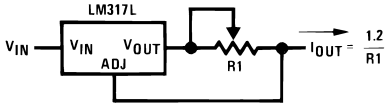

Figure 19. High Gain Amplifier

8.2.4 Adjustable Current Limiter

This application will limit the output current to the I_{OUT} in the diagram. The current limit is determined by adjusting the resistance between the V_{OUT} and V_{ADJ} pins. The 1.2-V reference voltage across R1 generates the maximum current.

$12 \le R1 \le 240$

Figure 20. Adjustable Current Limiter

8.2.5 Precision Current Limiter

This application will limit the output current to the I_{OUT} in the diagram. An initial reference current is generated based on the resistance between the V_{OUT} and V_{ADJ} pins. In the case of Figure 21, 1.25 V across 1 kΩ plus half of the 500-Ω resistor results in 1 mA of current, producing 1.5 V total across the two resistors in series. This voltage also appears across R1, making the maximum current the sum of the branch currents.

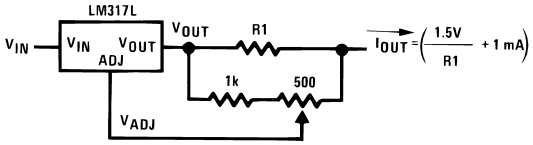

Figure 21. Precision Current Limiter

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.6 Slow Turnon 15-V Regulator

An application of LM317L-N includes a PNP transistor with a capacitor to implement slow turnon functionality (see Figure 22). As V_{IN} rises, the PNP sinks current from the ADJ rail. The output voltage at start-up is the addition of the 1.25-V reference plus the drop across the base to emitter. While this is happening, the capacitor begins to charge and eventually opens the PNP. At this point, the device functions normally, regulating the output at 15 V. A diode is placed between C1 and V_{OUT} to provide a path for the capacitor to discharge. Such controlled turnon is useful for limiting the in-rush current.

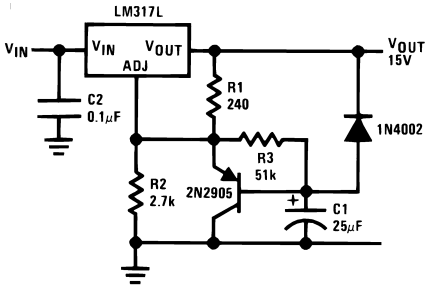

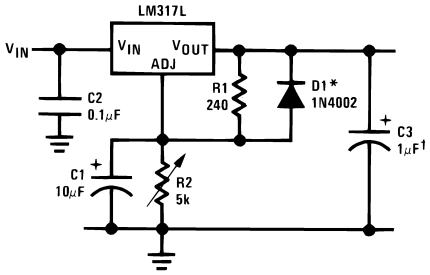

Figure 22. Slow Turnon 15-V Regulator

8.2.7 Adjustable Regulator With Improved Ripple Rejection

To improve ripple rejection, a capacitor is used to bypass the ADJ pin to GND (see Figure 23). This is used to smooth output ripple by cleaning the feedback path and stopping unnecessary noise from being fed back into the device, propagating the noise.

†Solid tantalum
*Discharges C1 if output is shorted to ground

Figure 23. Adjustable Regulator With Improved Ripple Rejection

8.2.8 High Stability 10-V Regulator

This application will regulate to an output voltage of 10 V and will remain stable even with input voltage transients. The LM329 is a precision Zener reference diode that helps maintain stability.

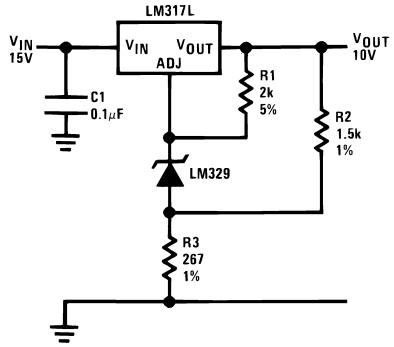

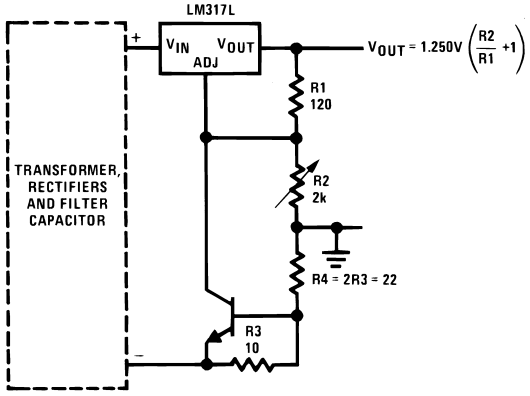

Figure 24. High Stability 10-V Regulator

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.9 Adjustable Regulator With Current Limiter

This application regulates to an output voltage set by the ratio of R2 and R1 and limits the output current using R3 as shown in Figure 25.

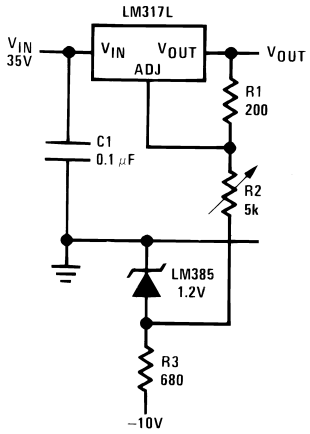

Short circuit current is approximately 600 mV/R3, or 60 mA (compared to LM317L-NZ's 200-mA current limit). At 25-mA output only 3/4 V of drop occurs in R3 and R4.

Figure 25. Adjustable Regulator With Current Limiter

8.2.10 0-V to 30-V Regulator

This application regulates the output voltage from 0 V to 30 V using the resistor divider at the output. The adjustment pin reference voltage is 1.25 V so select the resistor divider that provides the needed output voltage.

Full output current not available at high input-output voltages

Figure 26. 0-V to 30-V Regulator

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.11 Regulator With 15-mA Short-Circuit Current

This application regulates to a 10-V output with a 15-mA short-circuit current. The output voltage is set by the resistor divider at the output and the PNP is required to set the short-circuit current.

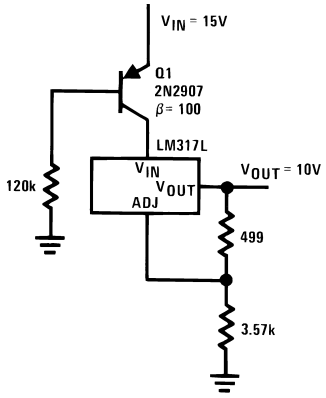

Figure 27. Regulator With 15-mA Short-Circuit Current

8.2.12 Power Follower

This application provides an output voltage that follows the input voltage while providing a current gain. The LM395 is a power transistor that operates as an emitter follower and provides a short-circuit current limit while the LM317 acts as a constant-current load.

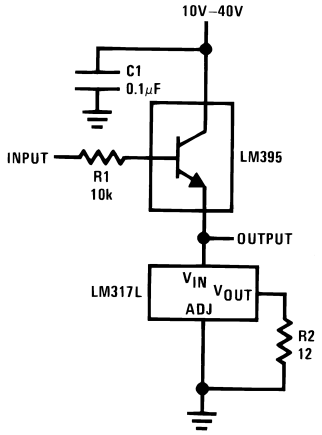

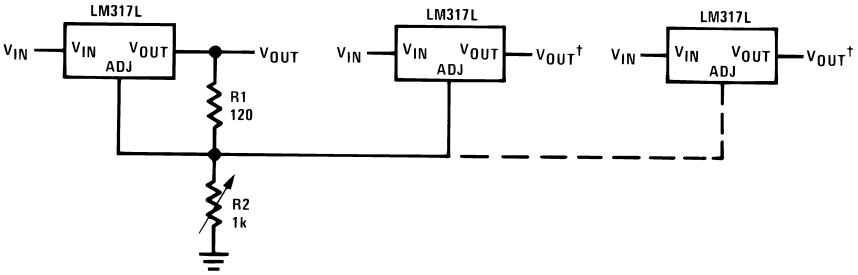

Figure 28. Power Follower

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.13 Adjusting Multiple On-Card Regulators With Single Control

Figure 29 shows how multiple LM317L-N regulators can be controlled by setting one resistor. Because each device maintains the reference voltage of about 1.25 V between its V_{OUT} and ADJ pins, we can connect each ADJ rail to a single resistor, setting the same output voltage across all devices. This allows for independent outputs, each responding to its corresponding input only. Designers must also consider that by the nature of the circuit, changes to R1 and R2 will affect all regulators.

*All outputs within ± 100 mV
†Minimum load −5 mA

Figure 29. Adjusting Multiple On-Card Regulators With Single Control*

8.2.14 100-mA Current Regulator

This application regulates the output current to maximum of 100 mA as shown in Figure 30.

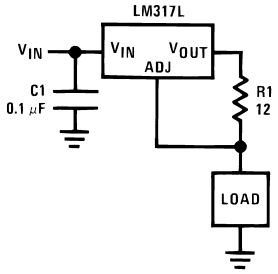

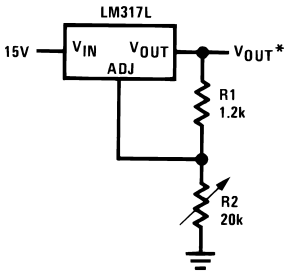

Figure 30. 100-mA Current Regulator

8.2.15 1.2-V to 12-V Regulator With Minimum Program Current

This application regulates the output voltage between 1.2 V and 12 V depending on the resistor divider at the output while allowing minimum programmable load current down to 2 mA as shown in Figure 31.

*Minimum load current ≈ 2 mA

Figure 31. 1.2-V to 12-V Regulator With Minimum Program Current

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.16 50-mA Constant Current Battery Charger for Nickel-Cadmium Batteries

This application provides a 50-mA constant current at the output which can be used as a constant current battery charger for Nickel-Cadmium batteries. The resistor at the output sets the output current value.

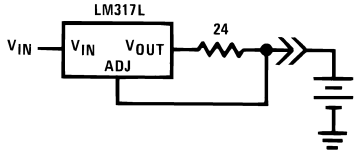

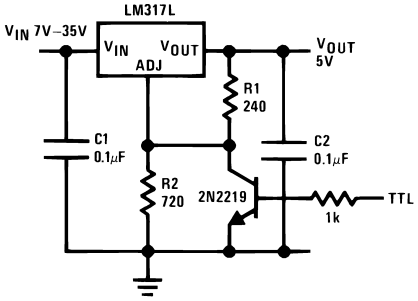

Figure 32. 50-mA Constant Current Battery Charger for Nickel-Cadmium Batteries

8.2.17 5-V Logic Regulator With Electronic Shutdown

Figure 33 shows a variation of the 5-V output regulator application uses the LM317L-N, along with an NPN transistor, to provide shutdown control. The NPN will either block or sink the current from the ADJ pin by responding to the TTL pin logic. When TTL is pulled high, the NPN is on and pulls the ADJ pin to GND, and the LM317L-N outputs about 1.25 V. When TTL is pulled low, the NPN is off and the regulator outputs according to the programmed adjustable voltage.

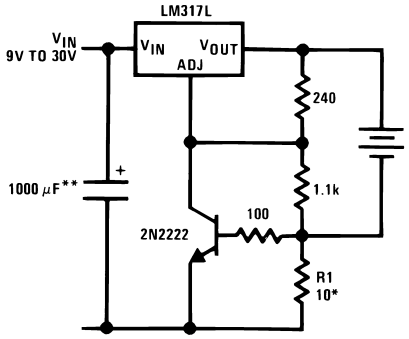

*Minimum output ≈ 1.2 V

Figure 33. 5-V Logic Regulator With Electronic Shutdown*

8.2.18 Current-Limited 6-V Charger

The current in a battery charger application is limited by switching between constant-current and constant-voltage states (see Figure 34). When the battery pulls low current, the drop across the 1-Ω resistor is not substantial and the NPN remains off. A constant voltage is seen across the battery, as regulated by the resistor divider. When current through the battery rises past peak current, the 1 Ω provides enough voltage to turn the transistor on, pulling ADJ close to ground. This results in limiting the maximum current to the battery.

*Sets peak current, I_{PEAK} = 0.6 V/R1
**1000 μF is recommended to filter out any input transients.

Figure 34. Current Limited 6-V Charger

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.19 Short Circuit-Protected 80-V Supply

This application provides a 80-V output voltage from 0 mA to 20 mA as shown in Figure 35. The Triad provides an AC to DC conversion and the short-circuit protection is provided by the fuse. The output voltage can be adjusted by adjusting the resistor divider at the output.

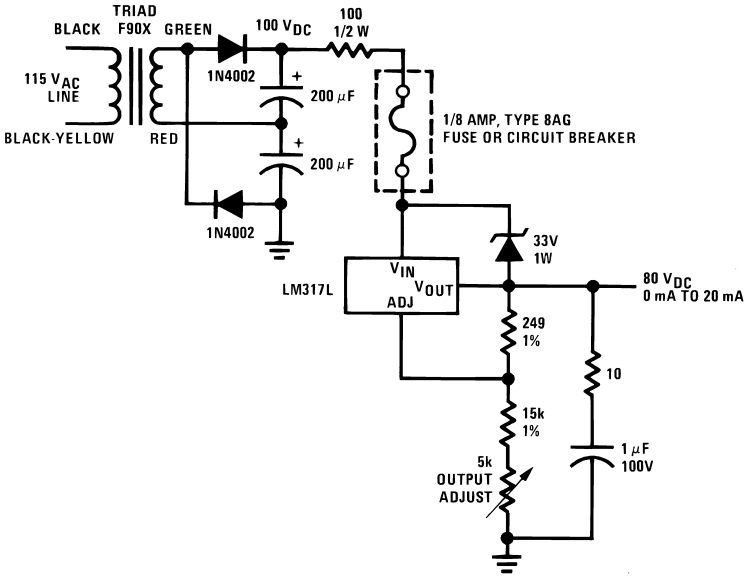

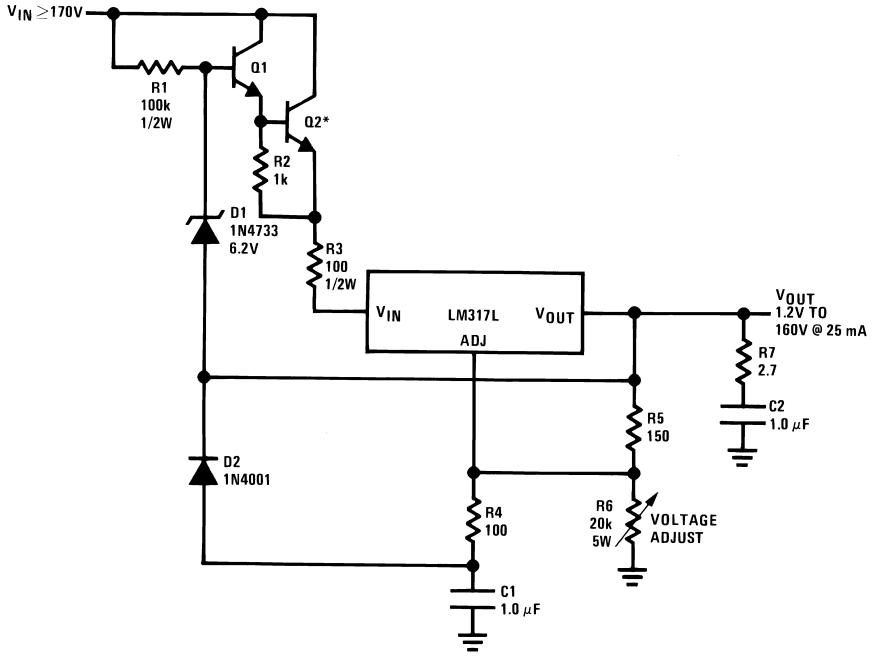

Figure 35. Short Circuit-Protected 80-V Supply

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.20 Basic High-Voltage Regulator

This application regulates the output voltage from 1.2 V to 160 V at 25 mA as shown in Figure 36. The output voltage is set by the resistor divider at the output. The Darlington pair transistor configuration provides a current gain from the input source to the LM317.

Typical Applications (continued)

8.2.21 Precision High-Voltage Regulator

This application regulates the output voltage from 8 V to 160 V at 25 mA as shown in Figure 37. The Zener diode connected from the adjust pin to V_{OUT} provides better precision than the basic high-voltage regulator.

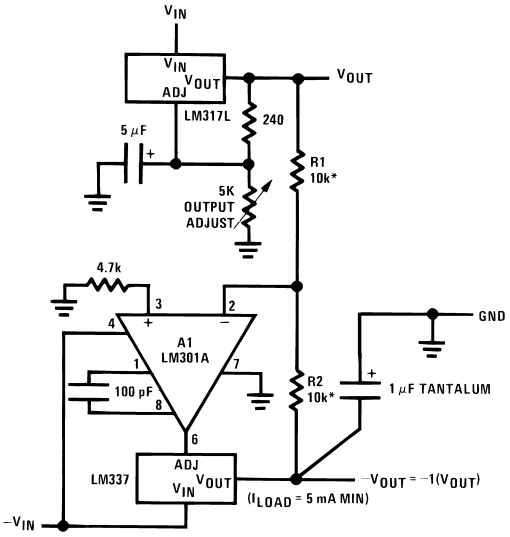

Q1, Q2: NSD134 or similar
C1, C2: 1 μF, 200-V mylar**
*Heat sink
**Mylar is a registered trademark of DuPont Co.

Figure 37. Precision High-Voltage Regulator

8.2.22 Tracking Regulator

This application regulates to an output voltage set by the output resistor divider and also uses the LM301A operational amplifier to provide a negative voltage that tracks the output voltage.

A1 = LM301A, LM307, or LF13741 only
R1, R2 = matched resistors with good TC tracking

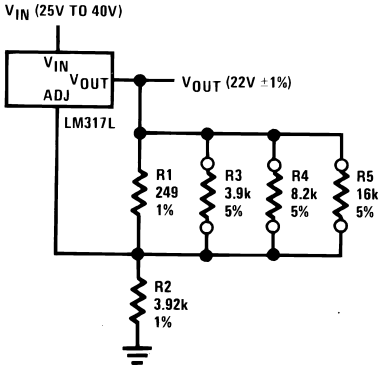

Figure 38. Tracking Regulator

Copyright © 2000–2018, Texas Instruments Incorporated

Typical Applications (continued)

8.2.23 Regulator With Trimmable Output Voltage

This application provides an output voltage set by the output resistor divider that can be finely tuned to ±1% by removing output resistors. See the trim procedure in Figure 39.

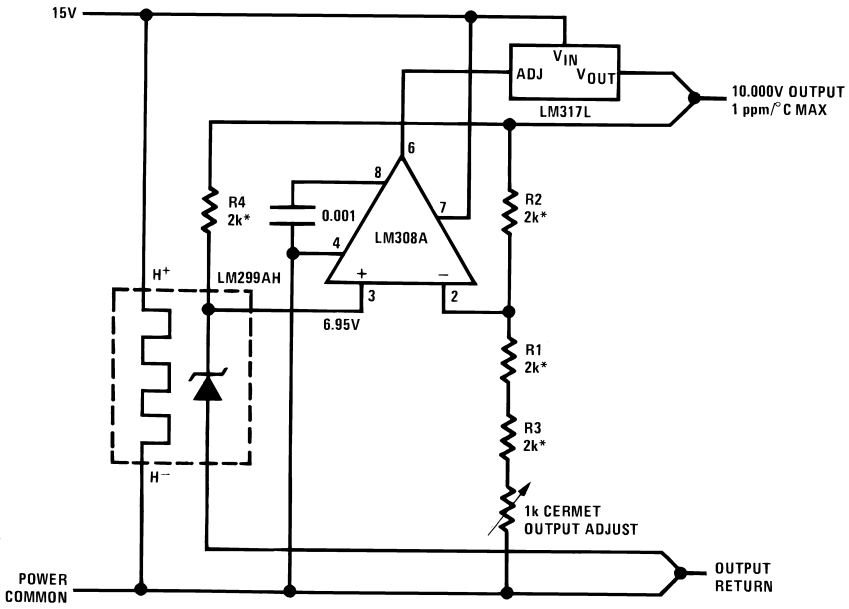

Trim Procedure:
— If V_{OUT} is 23.08 V or higher, cut out R3 (if lower, don't cut it out).
— Then if V_{OUT} is 22.47 V or higher, cut out R4 (if lower, don't).
— Then if V_{OUT} is 22.16 V or higher, cut out R5 (if lower, don't).
This will trim the output to well within ±1% of 22.00 V_{DC}, without any of the expense or uncertainty of a trim pot (see LB-46). This technique can be used at any output voltage level.

Figure 39. Regulator With Trimmable Output Voltage

8.2.24 Precision Reference With Short-Circuit Proof Output

This application provides a precise output voltage with short-circuit protection. The precision results from using the LM308A operational amplifier connected between the adjust pin and output voltage pin as a comparator with the LM299AH precision reference.

Typical Applications (continued)

8.2.25 Fully-Protected (Bulletproof) Lamp Driver

This application drives a lamp using a programmable gain instrumentation amplifier at the output.

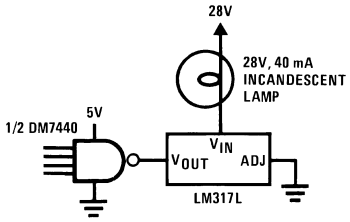

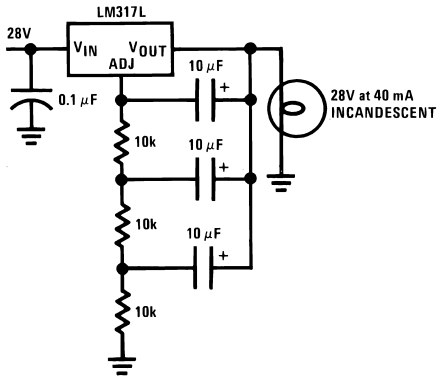

Figure 41. Fully-Protected (Bulletproof) Lamp Driver

8.2.26 Lamp Flasher

This application uses a combination of capacitors and resistors connected between the output voltage pin and the adjust pin to cause the lamp connected at the output voltage pin to flash.

Output rate—4 flashes per second at 10% duty cycle

Figure 42. Lamp Flasher

9 Power Supply Recommendations

The input supply to the LM317L-N must be kept at a voltage level lower than the maximum input-to-output differential voltage of 40 V. When possible, the minimum dropout voltage must also be met with extra headroom to keep the LM317L-N in regulation. TI recommends using an input capacitor, especially when the input pin is located more than 6 inches away from the power supply source. For more information regarding capacitor selection, see *External Capacitors*.

10 Layout

10.1 Layout Guidelines

Some layout guidelines should be followed to ensure proper regulation of the output voltage with minimum noise. Traces carrying the load current must be wide to reduce the amount of parasitic trace inductance and the feedback loop from V_{OUT} to ADJ should be kept as short as possible. To improve PSRR, a bypass capacitor can be placed at the ADJ pin and must be located as close as possible to the IC. In cases when V_{IN} shorts to ground, an external diode should be placed from V_{OUT} to V_{IN} to divert the surge current from the output capacitor and protect the IC. Similarly, in cases when a large bypass capacitor is placed at the ADJ pin and V_{OUT} shorts to ground, an external diode should be placed from ADJ to V_{OUT} to provide a path for the bypass capacitor to discharge. These diodes must be placed close to the corresponding IC pins to increase their effectiveness.

10.2 Layout Examples

Layout Examples (continued)

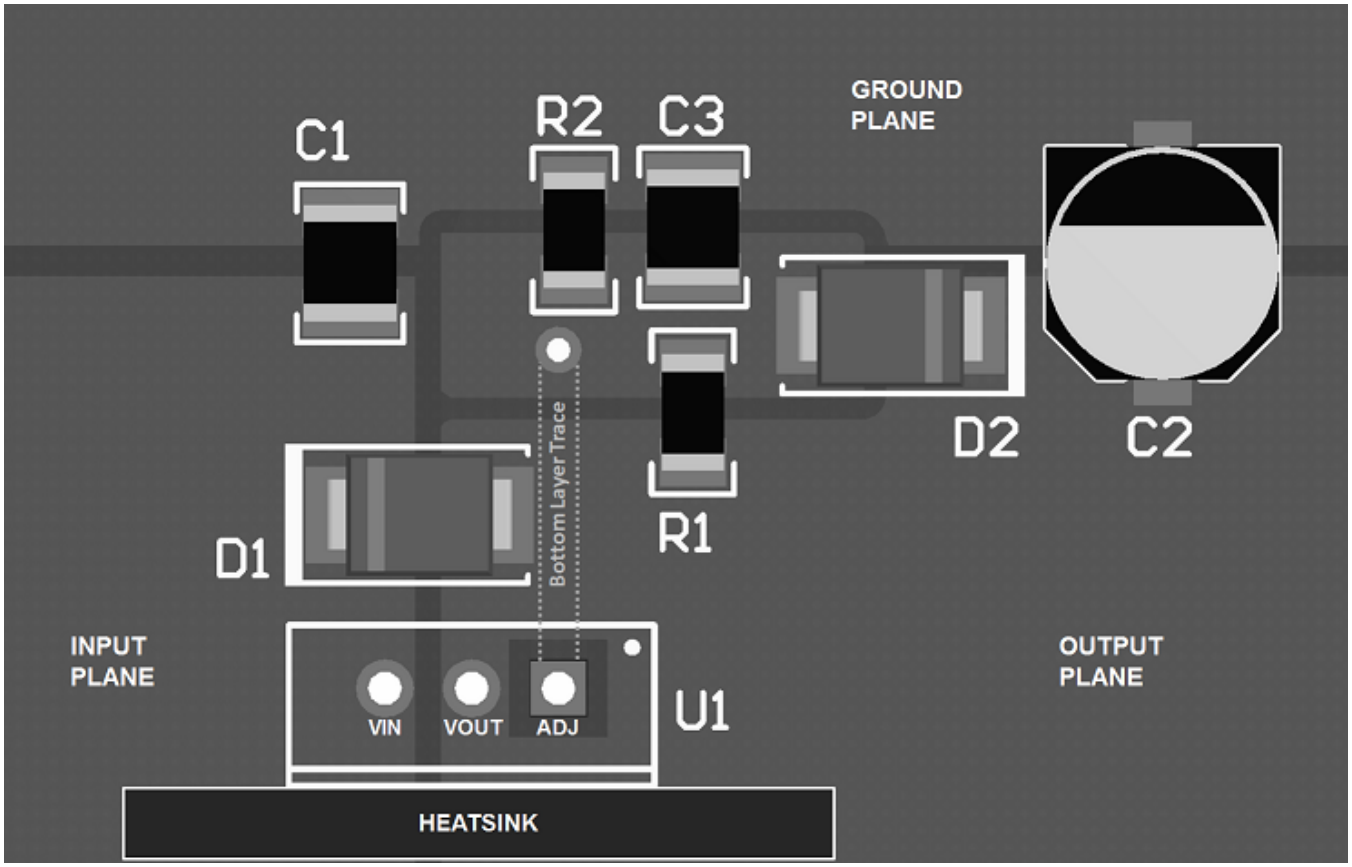

Figure 44. Layout Example (TO-220)

10.3 Thermal Considerations

When power is dissipated in an IC, a temperature gradient occurs across the IC chip affecting the individual IC circuit components. With an IC regulator, this gradient can be especially severe since power dissipation is large. Thermal regulation is the effect of these temperature gradients on output voltage (in percentage output change) per watt of power change in a specified time. Thermal regulation error is independent of electrical regulation or temperature coefficient, and occurs within 5 ms to 50 ms after a change in power dissipation. Thermal regulation depends on IC layout as well as electrical design. The thermal regulation of a voltage regulator is defined as the percentage change of V_{OUT}, per watt, within the first 10 ms after a step of power is applied. The LM317L-N specification is 0.2%/W, maximum.

In Figure 12, a typical output of the LM317L-N changes only 7 mV (or 0.07% of V_{OUT} = −10 V) when a 1-W pulse is applied for 10 ms. This performance is thus well inside the specification limit of 0.2%/W × 1 W = 0.2% maximum. When the 1-W pulse is ended, the thermal regulation again shows a 7-mV change as the gradients across the LM317L-N chip die out.

NOTE

The load regulation error of about 14 mV (0.14%) is additional to the thermal regulation error.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

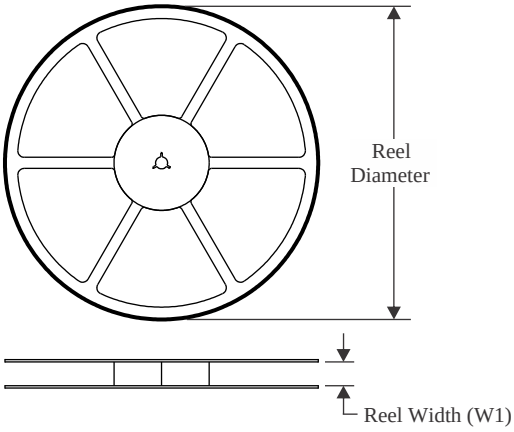

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
