

LM98640QML-SP 放射線耐性保証(RHA)、デュアル・チャンネル、14ビット、40MSPS、LVDS出力搭載のアナログ・フロント・エンド

1 特長

- 放射線耐性を強化
 - TID: 100krad(Si)
 - 単一イベント・ラッチアップ(SEL)耐性: LET = 120MeV-cm²/mg
 - 120MeV-cm²/mgまで単一イベント機能割り込み(SEFI)なし
 - SMD 5962R1820301VXC
- ADC分解能: 14ビット
- ADCサンプリング・レート: 5MSPS~40MSPS
- 入力レベル: 2.85V
- 電源電圧: 3.3Vおよび1.8V (公称値)
 - 15MSPSでチャンネルごとに125mW
 - 40MSPSでチャンネルごとに178mW
- CCDまたはCISセンサ用のCDSまたはS/H処理
 - CDSまたはS/Hのゲイン: 0dBまたは6dB
- チャンネルごとにアナログ・ゲインをプログラム可能
 - 256ステップ、範囲-3dB~18dB
- アナログ・オフセット訂正をプログラム可能
 - 密および粗DAC分解能: ±8ビット
 - 密DAC範囲: ±5mV
 - 粗DAC範囲: ±250mV
- 入力クランプ電圧をプログラム可能
- サンプル・エッジをプログラム可能: ピクセル期間の1/64
- 15MHzでのINL: ±3.5LSB
- ノイズ・フロア: -79dB
- クロストーク: -80dB
- 動作温度範囲: -55°C~125°C

2 アプリケーション

- 人工衛星の科学的アプリケーション
 - 焦平面電子機器
 - イメージング姿勢制御システム
 - 地球画像

3 概要

LM98640QML-SPは完全に統合された、高性能の14ビット、5MSPS~40MSPSの信号処理ソリューションです。シリアルLVDS出力フォーマットは、シングル・イベントの暴露時に適切に動作し、データの消失を防止します。

LM98640QML-SPには適応型電力スケール機能があり、動作周波数と必要なゲインに基づいて消費電力を最適化できます。関連二重サンプリング(CDS)を活用する革新的なアーキテクチャにより、高速な信号スループットを達成しています。この機能はCCDアレイや、サンプル・アンド・ホールド(S/H)入力(CISやCMOSの画像センサ用)に主に採用されるものです。サンプリング・エッジは、ピクセル期間の1/64の分解能にプログラム可能です。CDSとS/Hはどちらも、ゲインを0dBまたは6dBにプログラム可能です。信号パスは、2つの±8ビット・オフセット訂正DACを活用して粗および密のオフセット訂正を行い、8ビットのプログラム可能ゲイン・アンプ(PGA)を各入力について別々にプログラム可能です。その後信号は、2つのオンチップの14ビット、40MHz高性能A/Dコンバータ(ADC)に送られます。完全差動処理チャンネルによりノイズ耐性が非常に優れており、1xゲインにおいてノイズ・フロアが-79dBと、非常に低い値を実現しています。

4 改訂履歴

Revision F (October 2018) から Revision G に変更 Page

- Changed pin diagram in *Pin Configuration and Functions* section to correct typographical error 4

Revision E (December 2017) から Revision F に変更 Page

- 動作寿命テストのデルタ・パラメータ表 削除 1
- 「特長」セクションの箇条書き項目を更新し、SMDの情報を追加 1
- 「アプリケーション」セクションを更新 1
- 新しい注文可能製品を「製品情報」表に 追加 1
- エンジニアリング・サンプルの脚注 追加 1
- 「製品情報」表からLM98640-MDRおよびLM9864-MDPを 削除 1
- Updated thermal metrics 8
- Deleted 15 MHz and 25 MHz min/max spec 11
- Changed ENOB typical for subgroup 6 at 25 MHz 16
- Added minimum spec value for ENOB subgroups 4,5 at 40 MHz 16
- Changed pulses to windows 23
- Updated wording in CDS Mode CLAMP/SAMPLE Adjust section 23
- Updated wording in Input Bias and Clamping section 24

Revision D (September 2015) から Revision E に変更 Page

- 「製品情報」表を64リードから68リードに 変更 1

Revision C (April 2013) から Revision D に変更
Page

• 新しいデータシート標準に従い、「概要」、「ピン構成および機能」、「仕様」、「詳細説明」、「アプリケーションと実装」、「電源に関する推奨事項」、「レイアウト」、「デバイスおよびドキュメントのサポート」、「メカニカル、パッケージ、および注文情報」の各セクションを追加、更新、または修正	1
• Changed CLPIN I_{IH} from 44 to 100 μA	9
• Changed $\overline{SEN}$ I_{IH} from 28 to 100 μA	9
• Changed $\overline{SEN}$ I_{IL} from -70 to -100 μA	9
• Changed INCLK I_{IHL} from 36 to 100 μA	9
• Added minimum limits for t_{DSO} , t_{DSE} , t_{QSR} and t_{QHF} and deleted maximum limits	17
• Added details on register write.	34
• Changed Device Revision ID from x01 to x48	37
• Changed Device Revision ID from x01 to x48	45
• Added TID test and ELDRS-free information	46

Revision B (January 2011) から Revision C に変更

5 Pin Configuration and Functions

**68-Pin QFP
Package NBB0068D
Top View**

Pin Functions

PIN	NAME	I/O ⁽¹⁾	TYP	RES	DESCRIPTION
1	VCOM1	O	A		Common mode of ADC reference. Bypass with 0.1-μF capacitor to VSS33.
2	VDD33		P		Analog power supply. Decouple with minimum 0.1-μF capacitor to VSS33 plane.
3	VDD33		P		Analog power supply. Decouple with minimum 0.1-μF capacitor to VSS33 plane.
4	VSS33		P		Analog supply return.
5	VSS33		P		Analog supply return.
6	OS1-	I	A		Analog input signal.
7	OS1+	I	A		Sample/Hold Mode Reference Level. Bypassed with a 0.1-μF to ground in CDS mode.
8	VSS33		P		Analog supply return.
9	VCLP	O	A		Programmable Clamp Voltage output. Normally bypassed with a 0.1-μF capacitor to VSS33.
10	VSS33		P		Analog supply return.
11	OS2+	I	A		Sample/Hold Mode Reference Level. Bypassed with a 0.1-μF to ground in CDS mode.
12	OS2-	I	A		Analog input signal.
13	VSS33		P		Analog supply return.
14	VSS33		P		Analog supply return.
15	VDD33		P		Analog power supply. Decouple with minimum 0.1-μF capacitor to VSS33 plane.
16	VDD33		P		Analog power supply. Decouple with minimum 0.1-μF capacitor to VSS33 plane.
17	VCOM2	O	A		Common mode of ADC reference. Bypass with 0.1-μF capacitor to ground.
18	VREFB2	O	A		Bottom of ADC reference. Bypass with a 0.1-μF capacitor to ground.
19	VREFT2	O	A		Top of ADC reference. Bypass with a 0.1-μF capacitor to ground.
20	VSS33		P		Analog supply return.
21	VSS33		P		Analog supply return.
22	VDD33		P		Analog power supply. Decouple with minimum 0.1-μF capacitor to VSS33 plane.
23	VDD33		P		Analog power supply. Decouple with minimum 0.1-μF capacitor to VSS33 plane.
24	VSS33		P		Analog supply return.
25	SDO	O	D		Serial Interface Data Output. (Tri-State when $\overline{\text{SEN}}$ is high)
26	SDI	I	D		Serial Interface Data Input. (Tri-State when $\overline{\text{SEN}}$ is high)
27	SCLK	I	D	PD	Serial Interface shift register clock. (Tri-State when $\overline{\text{SEN}}$ is high)
28	$\overline{\text{SEN}}$	I	D	PU	Active-low chip enable for the Serial Interface.
29	NC				No Connection. Can be connected to VSS18.
30	CLPIN	I	D		Input clamp signal.
31	VSS18		P		Digital supply return.
32	VDD18		P		Digital power supply. Decouple with minimum 0.1-μF capacitor to VSS18 plane.
33	DTM1	O	D		Digital Timing Monitor. If not used, can be connected to VDD18 through a 10-kΩ resistor.
34	DTM0	O	D		Digital Timing Monitor. If not used, can be connected to VDD18 through a 10-kΩ resistor.
35	VDD18		P		Digital power supply. Decouple with minimum 0.1-μF capacitor to VSS18 plane.
36	VSS18		P		Digital supply return.
37	TXFRM+	O	D		LVDS Frame+
38	TXFRM-	O	D		LVDS Frame-
39	TXOUT3+	O	D		LVDS Data Out3+
40	TXOUT3-	O	D		LVDS Data Out3-
41	TXOUT2+	O	D		LVDS Data Out2+
42	TXOUT2-	O	D		LVDS Data Out2-
43	TXOUT1+	O	D		LVDS Data Out1+
44	TXOUT1-	O	D		LVDS Data Out1-
45	TXOUT0+	O	D		LVDS Data Out0+

(1) (I = Input), (O = Output), (IO = Bi-directional), (P = Power), (D = Digital), (A = Analog), (PU = Pull Up with an internal resistor), (PD = Pull Down with an internal resistor.).

Pin Functions (continued)

PIN	NAME	I/O ⁽¹⁾	TYP	RES	DESCRIPTION
46	TXOUT0-	O	D		LVDS Data Out0-
47	TXCLK+	O	D		LVDS Clock+
48	TXCLK-	O	D		LVDS Clock-
49	VSS18		P		Digital supply return.
50	VDD18		P		Digital power supply. Decouple with minimum 0.1-μF capacitor to VSS18 plane.
51	ATB0	O	A		Analog Test Bus. If not used, can be connected to VSS18 through a 10-kΩ resistor.
52	ATB1	O	A		Analog Test Bus. If not used, can be connected to VSS18 through a 10-kΩ resistor.
53	VDD18		P		Digital power supply. Decouple with minimum 0.1-μF capacitor to VSS18 plane.
54	VDD18		P		Digital power supply. Decouple with minimum 0.1-μF capacitor to VSS18 plane.
55	VSS18		P		Digital supply return.
56	VSS18		P		Digital supply return.
57	INCLK-	I	D		Clock Input. Inverting input for LVDS clocks.
58	INCLK+	I	D		Clock Input. Non-Inverting input for LVDS clocks.
59	VSS33		P		Analog supply return.
60	VDD33		P		Analog power supply. Decouple with minimum 0.1-μF capacitor to VSS33 plane.
61	VDD33		P		Analog power supply. Decouple with minimum 0.1-μF capacitor to VSS33 plane.
62	VSS33		P		Analog supply return.
63	IBIAS0	I	A		Connect with external 10-kΩ 1% resistor to IBIAS1 pin.
64	IBIAS1	I	A		Connect with external 10-kΩ 1% resistor to IBIAS0 pin.
65	VREFBG	O	A		Band gap reference output. Bypass with a 0.1-μF capacitor to VSS33. Can be overdriven with external voltage source.
66	VSS33		P		Analog supply return.
67	VREFT1	O	A		Top of ADC reference. Bypass with a 0.1-μF capacitor to VSS33.
68	VREFB1	O	A		Bottom of ADC reference. Bypass with a 0.1-μF capacitor to VSS33.
	Exp Pad		P		Exposed pad must be soldered to ground plane to ensure rated performance.

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾⁽²⁾

PARAMETER	MIN	MAX	UNIT
Supply Voltage (VDD33)		4.2	V
Supply Voltage (VDD18)		2.35	V
Voltage on any VDD33 Input Pin (Not to exceed 4.2 V)	–0.3	VDD33 + 0.3	V
Voltage on any VDD33 Output Pin (Not to exceed 4.2 V)	–0.3	VDD33 + 0.3	V
Voltage on any VDD18 Input or Output Pin (33 to 52) (Not to exceed 2.35 V)	–0.3	VDD18 + 0.3	V
Input Current at any pin other than Supply Pins ⁽³⁾		±25	mA
Package Input Current (except Supply Pins) ⁽³⁾		±50	mA
Maximum Junction Temperature (TA)		150	°C
Storage Temperature	–65	150	°C

- (1) All voltages are measured with respect to VSS = 0 V, unless otherwise specified.
- (2) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. *Recommended Operating Conditions* indicate conditions for which the device is functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the *Electrical Characteristics*. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions. Operation of the device beyond the *Recommended Operating Conditions* is not recommended.
- (3) When the input voltage (V_{IN}) at any pin exceeds the power supplies ($V_{IN} < VSS$ or $V_{IN} > VDD33$), the current at that pin should be limited to 25 mA. The 50-mA maximum package input current rating limits the number of pins that can simultaneously safely exceed the power supplies with an input current of 25 mA to two.

6.2 ESD Ratings⁽¹⁾

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽²⁾	±2500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽³⁾	±250	

- (1) Human body model is 100-pF capacitor discharged through a 1.5-k Ω resistor. Machine model is 220-pF discharged through 0 Ω .
- (2) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions. Pins listed as ±2500 V may actually have higher performance.
- (3) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions. Pins listed as ±250 V may actually have higher performance.

6.3 Recommended Operating Conditions⁽¹⁾

PARAMETER	MIN	MAX	UNIT
Operating Temperature (TA)	–55	125	°C
VDD33 ⁽²⁾⁽³⁾	3.15	3.45	V
VDD18 ⁽²⁾⁽³⁾	1.7	1.9	V
VSS33 - VSS18		100	mV

- (1) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. *Operating Ratings* indicate conditions for which the device is functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the *Electrical Characteristics*. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions. Operation of the device beyond the *Operating Ratings* is not recommended.
- (2) All voltages are measured with respect to VSS = 0 V, unless otherwise specified.
- (3) When the input voltage (V_{IN}) at any pin exceeds the power supplies ($V_{IN} < VSS$ or $V_{IN} > VDD33$), the current at that pin should be limited to 25 mA. The 50-mA maximum package input current rating limits the number of pins that can simultaneously safely exceed the power supplies with an input current of 25 mA to two.

6.4 Thermal Information⁽¹⁾

THERMAL METRIC ⁽²⁾		LM98640QML-SP	UNIT
		NBB (CFP)	
		68 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	16.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	3.8	
$R_{\theta JB}$	Junction-to-board thermal resistance	7.6	
Ψ_{JT}	Junction-to-top characterization parameter	1.7	
Ψ_{JB}	Junction-to-board characterization parameter	7.2	
$R_{\theta JC(bottom)}$	Junction-to-case (bottom) thermal resistance	0.3	

- (1) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX} , θ_{JA} and the ambient temperature, T_A . The maximum allowable power dissipation at any temperature is $P_D = (T_{JMAX} - T_A) / \theta_{JA}$. The values for maximum power dissipation listed above will be reached only when the device is operated in a severe fault condition (e.g. when input or output pins are driven beyond the power supply voltages, or the power supply polarity is reversed). Such conditions should always be avoided.
- (2) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

LVDS CLOCK RECEIVER DC SPECIFICATIONS (INCLK+ and INCLK− Pins)									
V _{IHL}	Differential LVDS Clock High Threshold Voltage	R _L = 100 Ω V _{CM} (LVDS Input Common Mode Voltage) = 1.25 V		1, 2, 3		100	250	mV	
V _{ILL}	Differential LVDS Clock Low Threshold Voltage	R _L = 100 Ω V _{CM} (LVDS Input Common Mode Voltage) = 1.25 V		1, 2, 3	−250	−100		mV	
I _{IHL}	Differential LVDS Clock Input Current	V _{IH} = VDD33		1, 2, 3		70	100	μA	
I _{ILL}	Differential LVDS Clock Input Current	V _{IL} = VSS		1, 2, 3	−49	−34		μA	

- (1) The analog inputs are protected as shown below. Input voltage magnitudes beyond the supply rails will not damage the device, provided the current is limited per Note 2 under the [LM98640QML-SP Electrical Characteristics^{\(1\)\(2\)}](#). However, input errors will be generated if the

- input goes above VDD33 and below VSS.
- (2) When the input voltage (V_{IN}) at any pin exceeds the power supplies (V_{IN} < VSS or V_{IN} > VDD33), the current at that pin should be limited to 25 mA. The 50-mA maximum package input current rating limits the number of pins that can simultaneously safely exceed the power supplies with an input current of 25 mA to two.
- (3) Typical figures are at T_A = 25°C, and represent most likely parametric norms at the time of product characterization. The typical specifications are not ensured.

LM98640QML-SP Electrical Characteristics⁽¹⁾⁽²⁾ (continued)

7 Detailed Description

7.1 Overview

The LM98640QML-SP is a 14-bit, 5-MSPS to 40-MSPS, dual channel, complete Analog Front End (AFE) for digital imaging applications. The system block diagram of the LM98640QML-SP, shown in Figure 29 highlights the main features of the device. Each input has its own Input Bias and Clamping Network and Correlated Double Sample (CDS) amplifier (which can also be configured to operate in Sample/Hold Mode). Two ± 8 -Bit Offset DACs apply independent coarse and fine offset correction for each channel. A -3 to 18-dB Programmable Gain Amplifier (PGA) applies independent gain correction for each channel. The signals are digitized using two independent on chip high performance 14-bit, 40-MHz analog-to-digital converters. The data is finally output using a unique Serial LVDS output format that is tolerant to upsets preventing data loss.

7.2 Functional Block Diagram

Figure 13. Chip Block Diagram

Functional Block Diagram (continued)

Figure 14. Typical CCD System

7.3 Feature Description

7.3.1 Input Sampling Modes

The LM98640QML-SP provides two input sampling modes, Sample & Hold mode and Correlated Double Sample (CDS) mode. The following sections describe these two input sampling modes.

7.3.1.1 Sample & Hold Mode

In Sample/Hold mode, a Video Level signal and a Reference Level signal need to be presented to the LM98640QML-SP. The Reference Level signal must be connected to the OS_X+ pin, and the Video Level signal connected to the OS_X- pin. The output code will then be OS_X+ minus OS_X- , or the difference between the Reference Level and Video Level. A minimum code represents zero deviation between the Reference and Video Levels and a maximum code represents a 2-V deviation between the Reference and Video Levels with CDS and PGA gains of 1x.

The Reference Level signal can be either an external signal from the image sensor, or the VCLP pin can be externally connected to the OS_X+ pin. In order to fully utilize the range of the input circuitry it is desirable to cause the Black Level signal voltage to be as close to the Reference Level voltage as possible, resulting in a near zero scale output for Black Level pixels. The LM98640QML-SP provides several methods for ensuring the Black Level signal and Reference Level are matched, these are described in the [Input Bias and Clamping](#) section.

To place the LM98640QML-SP in Sample & Hold Mode from power up, first write the baseline configuration to the registers as shown in [Table 5](#). This configuration has Sample & Hold mode enabled by default. Next, the SAMPLE pulse must be properly positioned over the input signal using the CLAMP/SAMPLE Adjust.

7.3.1.1.1 Sample & Hold Mode CLAMP/SAMPLE Adjust

For accurate sampling of the input signals the LM98640QML-SP allows for full adjustment of the internal SAMPLE pulse to align it to the proper positions over the input signal. In Sample & Hold mode the SAMPLE pulse should be placed over the pixel output period of the image sensor. Only the Sample Start and Sample End Registers (0x22,0x23) need to be configured, the Clamp Start and Clamp End Registers (0x20,0x21) are not valid in Sample & Hold Mode. Internally the input clock is divided into 64 edges per clock period, the Sample Start and Sample End Registers correspond to the internal edge number the SAMPLE pulse will start and end. To adjust the SAMPLE pulse, first send the CLAMP and SAMPLE signals to the DTM pins by writing **10** to bits[4:3] of the Clock Monitor Register (0x09). This will allow the user to observe the SAMPLE pulse on pin DTM1 along with the image sensor output using an oscilloscope. Then, using the Sample Start and End Registers, adjust the SAMPLE pulse to align it over the Video Level portion of the image sensor output. To allow for settling and to reduce noise, the SAMPLE pulse should be made as wide as possible and fill the entire Video Level portion of the input signal.

Feature Description (continued)

Figure 15 shows some examples of an input waveform and where the SAMPLE pulse should be placed. Ideally the image sensor output would line up directly with the input clock at the AFE inputs, but due to trace delays in the system the image sensor output is delayed relative to the input clock. In the delayed image sensor waveform the Sample Start value is higher than the Sample End value. In this situation the SAMPLE pulse will start in one clock period and wraps around to the next. This allows the LM98640QML-SP to adjust for the delay in the image sensor waveform. Notice that edge zero of the internal clock does not line up with the rising edge of the input clock. This is due to internal delays of the clock signals. The amount of delay can be calculated from operating frequency using the following formula: $t_{DCLK} = 6.0 \text{ ns} + 3 / 64 \times T_{INCLK}$

Figure 15. S/H Mode CLAMP/SAMPLE Adjust

7.3.1.2 CDS Mode

In CDS mode, both the Reference Level and Video Level are presented to the LM98640QML-SP on the OS_X -pin. The OS_X + pin should be bypassed to ground with a $0.1\text{-}\mu\text{F}$ capacitor. The CLAMP pulse is then used to sample the Reference Level and the SAMPLE pulse is used to sample the Video Level. The output code will then be the Reference Level minus the Video Level, or the difference between the Reference Level and Video Level. A minimum code represents zero deviation between the Reference and Video Levels and a maximum code represents a 2-V deviation between the Reference and Video Levels with CDS and PGA gains of 1x.

To place the LM98640QML-SP in CDS Mode from power up, first write the baseline configuration to the registers as shown in Table 5. Then ensure S/H mode is disabled by clearing bit[7] of the Sample & Hold Register (0x06), then enable CDS mode by setting bit[0] of the Main Configuration Register (0x00). Next the CLAMP and SAMPLE pulses need to be positioned correctly over the reference and video levels respectively using the CLAMP/SAMPLE Adjust.

7.3.1.2.1 CDS Mode Bimodal Offset

In CDS mode, the input sampling amplifier has two physical paths through which a particular pixel will be sampled. These two sampling paths are a requirement in the Correlated Double Sampling architecture. The sampling of the one pixel will travel the first path (arbitrarily called an even pixel), and the sampling of the next pixel will travel the second path (called an odd pixel). The sampling will continue in an even/odd/even/odd fashion for all pixels processed in a particular channel. Due to slight variances in the sampling paths (most

Feature Description (continued)

commonly a difference in switched capacitor matching), the processing of identical pixels through the two different paths may result in a small offset in ADC output data between the two paths. To correct this, a simple digital offset can be applied in post processing to either the even pixel data or the odd pixel data. To simplify this action, the LM98640QML-SP will indicate (with the TXFRM signal) whether the pixel traveled the even path or the odd path. For all "Odd" pixels, the TXFRM signal is high for three TXCLK periods. For "Even" pixels, the TXFRM signal is high for two TXCLK periods. In Sample and Hold Mode there is only one sampling path, therefore there is no need to indicate an even or odd pixel. As a result, the TXFRM signal is the same for every pixel in Sample and Hold mode (i.e. high for three TXCLK periods).

7.3.1.2.2 CDS Mode CLAMP/SAMPLE Adjust

In CDS mode, the LM98640QML-SP utilizes two input networks, alternating between them every pixel, to increase throughput speeds. Because of this, there are two sets of CLAMP and SAMPLE windows defined in [Table 8](#), one for even pixels and one for odd. Sample Start and Sample End Registers (0x22,0x23) along with the Clamp Start and Clamp End Registers (0x20,0x21) control both the even and odd CLAMP and SAMPLE pulses. To adjust the CLAMP and SAMPLE pulses, first send the CLAMP_{ODD} and SAMPLE_{ODD} signals to the DTM pins by writing **10** to bits[4:3] of the Clock Monitor Register (0x09). This will allow the user to observe the CLAMP_{ODD} and SAMPLE_{ODD} pulses on pins DTM0 and DTM1 along with the image sensor output using an oscilloscope. The CLAMP and SAMPLE pulses will only be shown for every other pixel because of the even odd architecture, but the positions of the even CLAMP and SAMPLE pulses will be identically defined to that of the odd CLAMP and SAMPLE; however, odd and even path mismatch could result in a slightly different position of the pulses. Then, using the Clamp Start/End and Sample Start/End registers, adjust the positions of the CLAMP and SAMPLE pulses to align them over the Reference and Video Levels of the input signal. To allow for settling and to reduce noise, the CLAMP and SAMPLE pulses should be made as wide as possible and placed near the far edge of their respective input levels.

The following figure shows some examples of input CCD waveforms and placement of the CLAMP and SAMPLE positions for each. Ideally the CCD output would line up directly with the input clock at the AFE inputs, but due to trace delays in the system the CCD output is delayed relative to the input clock. In the Delayed CCD waveform the Sample Start/End Register values are lower than the Clamp Start/End Register Values. In this situation the sample pulse is not generated until the next clock period, which allows it to be correctly placed in the Video Level of the input signal. Notice that edge zero of the internal clock does not line up with the rising edge of the input clock. This is due to internal delays of the clock signals. The amount of delay can be calculated from operating frequency using the following formula: $t_{DCLK} = 6.0 \text{ ns} + 3 / 64 \times T_{INCLK}$

Feature Description (continued)

Figure 16. CDS Mode CLAMP/SAMPLE Adjust

7.3.2 Input Bias and Clamping

The inputs to the LM98640QML-SP are typically AC coupled in Correlated Double Sampling Mode (CDS Mode) because of the switching between two signals. In Sample and Hold Mode (S/H Mode), DC coupling or AC coupling is possible depending on the signal type. The circuit of [Figure 17](#) shows the input structure of the LM98640QML-SP. The DC bias point for the LM98640QML-SP side of the AC coupling capacitor can be set using an external DC bias resistor network, by using the CLPIN configuration, or by using the BITCLP configuration. A typical CCD waveform is shown in [Figure 18](#). Also shown in [Figure 18](#) is an internal signal "CLAMP" which can be used to "gate" the CLPIN signal so that it only occurs during the "pedestal" portion of the CCD pixel waveform.

Feature Description (continued)

7.3.2.1 Sample and Hold Mode Biasing

Proper DC biasing of the CCD waveform in Sample and Hold mode is critical for realizing optimal operating conditions. In Sample/Hold Mode, the DC bias point of the input pin is typically set by actuating the input clamp switch (see [Figure 17](#)) during optical black pixels which connects the input pins to the VCLP pin DC voltage. The signal controlling this switch is CLPIN. CLPIN is an external signal connected on the CLPIN pin.

Actuating the input clamp will force the average value of the CCD waveform to be centered around the VCLP DC voltage. During Optical Black Pixels, the CCD output has roughly three components. The first component of the pixel is a “Reset Noise” peak followed by the Reset (or Pedestal) Level voltage, then finally the Black Level voltage signal. Taking the average of these signal components will result in a final “clamped” DC bias point that is close to the Black Level signal voltage.

To provide a more precise DC bias point (i.e. a voltage closer to the Black Level voltage), the CLPIN pulse can be “gated” by the internally generated CLAMP clock. This resulting $CLPIN_{GATED}$ signal is the logical “AND” of the CLAMP and CLPIN signals as shown in [Figure 18](#). By using the $CLPIN_{GATED}$ signal, the higher Reset Noise peak will not be included in the clamping period and only the Pedestal Level components of the CCD waveform will be centered around VCLP.

Figure 19. Sample and Hold Mode Simplified Input Diagram

In Sample and Hold Mode, the impedance of the analog input pins is dominated by the switched capacitance of the CDS/Sample and Hold amplifier. The amplifier switched capacitance, shown as C_S in [Figure 19](#), and internal parasitic capacitances can be estimated by a single capacitor switched between the analog input and the VCLP reference pin for Sample and Hold mode. During each pixel cycle, the modeled capacitor, C_{SH} , is charged to the $OSX+$ minus $OSX-$ voltage then discharged. The average input current at the $OSX-$ pin can be calculated knowing the input signal amplitude and the frequency of the pixel.

Figure 20. Equivalent Input Switched Capacitance S/H Mode

Feature Description (continued)

7.3.2.2 CDS Mode Biasing

Correlated Double Sampling mode does not require as precise a DC bias point as does Sample and Hold mode. This is due mainly to the nature of CDS itself, that is, the Video Signal voltage is referenced to the Reset Level voltage instead of the static DC VCLP voltage. The common mode voltage of these two points on the CCD waveform have little bearing on the resulting differential result. However, the DC bias point does need to be established to ensure the CCD waveform's common mode voltage is within rated operating ranges.

Figure 21. CDS Mode Simplified Input Diagram

The CDS mode biasing can be performed in the same way as described in the [Sample and Hold Mode Biasing](#) section, or, an external resistor divider can be placed across the OSX+ input to provide the DC bias voltage. In CDS Mode the OSX+ pins should each be decoupled with 0.1-μF capacitors to ground.

Figure 22. CDS Mode Input Bias Current

Unlike in Sample and Hold Mode, the input bias current in CDS Mode is relatively small. Due to the architecture of CDS switching, the average charge loss or gain on the input node is ideally zero over the duration of a pixel. This results in a much lower input bias current, whose main source is parasitic impedances and leakage currents. As a result of the lower input bias current in CDS Mode, maintaining the DC Bias point the input node over the length of a line will require a much smaller AC input coupling capacitor.

Feature Description (continued)

7.3.2.3 VCLP DAC

The VCLP pin can be used to provide the reference level for incoming signals in Sample and Hold Mode. The pin is driven by the VCLP DAC, the VCLP DAC has five bits and has an approximate range of 2.9 V. The VCLP DAC is controlled by the VCLP Control Register (0x04), and programmable through the serial interface.

7.3.3 Programmable Gain

The LM98640QML-SP provides two independent gain stages. The first stage is in the input CDS/SH circuit. The second is in the form of a Programmable Gain Amplifier (PGA).

7.3.3.1 CDS/SH Stage Gain

The CDS/SH gain is programmable to either 0-dB or 6-dB gain. The load presented to the user in 6-dB mode is roughly twice the switched load of 0-dB mode. The CDS/SH gain settings affect both channels. The CDS/SH gain bit is located in bit 2 of the Main Configuration register, and programmable through the serial interface.

7.3.3.2 PGA Gain Plots

The PGA has an 8-bit resolution with a gain range of –3 dB to 18 dB. [Figure 23](#) below shows a plot for the gain. Each channel has a independent PGA controlled by registers CH1 PGA and CH2 PGA, and programmable through the serial interface.

Figure 23. PGA Gain vs PGA Gain Code

Feature Description (continued)

7.3.4 Programmable Analog Offset Correction

The LM98640QML-SP provides two analog DACs per channel to provide flexibility in offset control. Each channel has a Coarse DAC and Fine DAC which have ± 8 -bit resolutions (8 bit + Sign). The two DACs can be used independently or as Coarse/Fine configuration. The Coarse DAC provides a sufficient range with moderate step sizes, while the Fine DAC is for designs which need a finely tuned offset. The correction voltage is applied to the "Video" level for both Sample & Hold and CDS input modes. Because of the DACs location in the signal path, the correction range lowers as CDS gain increases, and the output referred correction steps and ranges increase with PGA gain. [Table 1](#) provides the range and step size of each DAC.

Table 1. Analog Offset DAC Specifications

	CDS/SH GAIN	RANGE ⁽¹⁾	STEP SIZE ⁽¹⁾	OUTPUT ADC CODES
Coarse DAC	1x	± 250 mV	1 mV	± 2048
	2x	± 125 mV	500 μ V	± 2048
Fine DAC	1x	± 5 mV	20 μ V	± 41
	2x	± 2.5 mV	10 μ V	± 41

(1) Referred to Input

To use the Offset Correction DACs, the Coarse DAC and Fine DAC must be enabled using bits[6:5] of the Main Configuration Register (0x00). Then the desired correction value should be entered into the CDAC or FDAC register of the appropriate channel. The Offset Correction DACs use a signed binary format which is summarized in [Table 2](#).

Table 2. Analog Offset Correction DAC Format

CDAC / FDAC INPUT VALUE	CDAC CORRECTION (CODES)	FDAC CORRECTION (CODES)
1 1111 1111	+2048	+41
1 0111 1111	+1024	+20
0 1111 1111	0	0
0 0111 1111	-1024	-20
0 0000 0000	-2048	-41

7.3.5 Analog to Digital Converter

The LM98640QML-SP has a 14-bit Analog to Digital Converts (ADC) for each channel. Each ADC has maximum and minimum conversion rate of 40 MSPS and 5 MSPS per channel respectively. The DNL performance is ± 0.5 LSB and ± 2 LSB for a 14-bit out. The noise floor is -79 dB at 2 V with a programmable gain of 0 dB. If an out of range pixel is presented to the ADC, the ADC will return to full compliance within two cycles of the pixel clock.

7.3.6 LVDS Output

7.3.6.1 LVDS Output Voltage

The LM98640QML-SP output data is presented in LVDS format. [Table 3](#) shows the available LVDS differential output voltage (VOD) settings and its associated offset voltage (VOS).

Table 3. LVDS Differential Output Voltage Settings

VOD	VOS
250 mV	1.2 V
300 mV	1.2 V
350 mV	1.1 V
400 mV	1.1 V

7.3.6.2 LVDS Output Modes

The LM98640QML-SP has a unique serial LVDS output format to protect data transfer during DLL upsets. The format provides a buffer on either side of the data word, this is accomplished by clocking a 14-bit word using a 16-bit clock rate. In the event of an upset that affects the DLL the output clock period could fluctuate; with no buffer for the data word this fluctuation could cause the loss of one or more of the data word bits, but because the LM98640QML-SP provides the buffer the fluctuation does not cause any data loss. The data can also be sent out in two modes: Dual or Quad Lane. The following sections describe these two modes.

7.3.6.3 TXFRM Output

The LM98640QML-SP output includes a frame signal (TXFRM) that should be used to locate the beginning and end of a particular pixel's serial data word. The rising edge of TXFRM is coincident with the pixel's leading bit transition (TXOUT MSB). This TXFRM rising edge can be detected by the capturing FPGA or ASIC to mark the start of the serial data word.

In CDS mode, the input sampling amplifier has two physical paths through which a particular pixel will be sampled. These two sampling paths are a requirement in the Correlated Double Sampling architecture. The sampling of the one pixel will travel the first path (arbitrarily called an even pixel), and the sampling of the next pixel will travel the second path (called an odd pixel). The sampling will continue in an even/odd/even/odd fashion for all pixels processed in a particular channel. Due to slight variances in the sampling paths (most commonly a difference in switched capacitor matching), the processing of identical pixels through the two different paths may result in a small offset in ADC output data between the two paths. To correct this, a simple digital offset can be applied in post processing to either the even pixel data or the odd pixel data. To simplify this action, the LM98640QML-SP will indicate (with the TXFRM signal) whether the pixel traveled the even path or the odd path. For all "Odd" pixels, the TXFRM signal is high for three TXCLK periods. For "Even" pixels, the TXFRM signal is high for two TXCLK periods. In Sample and Hold Mode there is only one sampling path, therefore there is no need to indicate an even or odd pixel. As a result, the TXFRM signal is the same for every pixel in Sample and Hold mode (i.e. high for three TXCLK periods).

7.3.6.3.1 Output Mode 1 - Dual Lane

In Dual Lane mode each input channel has its own data output presented at 16x the pixel clock rate. A frame signal (TXFRM) is output at the pixel clock rate with the rising edge occurring coincident with the transition of the MSB of the data. In Sample/Hold Modes of operation, the falling edge is coincident with the transition of bit 7 of the data. In CDS Mode, the falling edge of TXFRM toggles between the transition of bit 9 and bit 7 of the data. A differential clock is also output with transitions aligned with the center of the data eye. Data rates for Dual Lane mode range from 80 Mbps, with a 5-MHz clock, up to 640 Mbps, with a 40-MHz clock.

Figure 24. Dual Lane LVDS Output Timing Diagram

7.3.6.3.2 Output Mode 2 - Quad Lane

In Quad Lane mode each input channel is split into two data lanes which are presented at 8x the pixel rate. The MSBs (bits 13 through 7) will be presented to one channel while the LSBs (bits 6 through 0) will be presented to the other. A frame signal is run at the pixel clock rate with the rising edge coincident with the transition of the MSB of the data and the falling edge coincident with the transition of bits 10 and 3 of the data lanes for an odd output value, and coincident with the transition of bits 11 and 4 for a even output value. A differential clock is also output with rising edge transitions aligned within each data eye. Data rates for Quad Lane mode range from 40 Mbps, with a 5-MHz clock, up to 320 Mbps, with a 40-MHz clock.

Figure 25. Quad Lane LVDS Data Output Timing Diagram

7.3.7 Clock Receiver

A differential clock receiver is used to generate all clock signals on the LM98640QML-SP. The clock input should be externally terminated with 100 Ω between the input clock pins. The clock may be DC or AC coupled to the AFE.

7.3.8 Power Trimming

The LM98640QML-SP provides an adaptive power scaling feature that allows the user to optimize power consumption based on the maximum operating frequency and the maximum amount of gain required. The power scaling mode is selectable through the PGA Power Trimming and ADC Power Trimming registers (0x02,0x03). The settings in these registers are common for both channels PGA and ADC. Using these registers the user can control the current of the two stages of the PGA, and the current for the two levels of the ADC. The following table provides a set of baseline configurations for various operating frequencies and gain ranges.

These configurations should be treated as baseline values and can be tuned to your specific application.

OPERATING FREQUENCY	1-4x MAX PGA GAIN	1-8x MAX PGA GAIN
5 - 15 MSPS	PGA Power Trimming = 0x00 ADC Power Trimming = 0x00	PGA Power Trimming = 0x01 ADC Power Trimming = 0x00
15 - 25 MSPS	PGA Power Trimming = 0x01 ADC Power Trimming = 0x00	PGA Power Trimming = 0x09 ADC Power Trimming = 0x00
25 - 40 MSPS	PGA Power Trimming = 0x01 ADC Power Trimming = 0x08	PGA Power Trimming = 0x09 ADC Power Trimming = 0x08

7.4 Device Functional Mode

7.4.1 Powerdown Modes

The LM98640QML-SP provides several ways to save power when the device is not in normal usage mode. Using the Powerdown Control Register (0x01) the part can be placed into Powerdown Mode, or Single Channel Mode. In Powerdown Mode (Powerdown Control, bit[7]) the following blocks are placed in a Powerdown mode: VCLP, Channel 1 and 2 Reference Buffers, Channel 1 and 2 PGA OpAmps, and Channel 1 and 2 Amplifiers. Powerdown Mode will override all other Powerdown Control Register bits. To place the part in Single Channel Mode each block of the unused channel can be powered down using their respective control bits (Powerdown Control, bits[5:0]). If an external reference clamp is used the VCLP block can be powered down during any Power mode. For applications operating at a low enough frequency additional power can be saved by powering down one channel reference buffer, then externally tie both channel's reference pins together.

7.4.2 LVDS Test Modes

The LVDS test modes present programmable data patterns to the input of the LVDS serializer block. The type of pattern is selectable through the Test Pattern Control register. Once the LVDS test mode is enabled the patterns are output indefinitely. [Table 4](#) below shows the available test pattern modes.

Table 4. Test Pattern Modes

TEST PATTERN CONTROL[6:4]	TEST MODE
000	Fixed Code
001	Horizontal Gradient
010	Vertical Gradient
011	Lattice Pattern
100	Strip Pattern
101	LVDS Test Pattern (Synchronous)
110	LVDS Test Pattern (Asynchronous)
111	Reserved

Each pattern consists of a Start Period and Valid Pixel region. During the Start Period the output is the minimum code (0x0000). The Valid Pixel region contains the selected Test Pattern Mode output. The length (in pixels) of the Start period is set using the Test Pattern Start register, and the width of the Valid Pixel region is set using the Test Pattern Width register.

To start the test pattern generation, enable Test Mode using bit[1] of the Test and Scan Register (0x3D). Then load all parameters for the desired test pattern into the registers, and set Pattern Enable bit of the Test Pattern Control Register (0x34). Changing pattern parameters after the Pattern Enable bit is set may result in undesired output. The pattern will start at the next leading edge of CLPIN.

7.4.2.1 Test Mode 0 - Fixed Pattern

This test mode provides an LVDS output with a fixed value output during the valid pixel region. The fixed value is set via the Test Pattern Value registers. The Test Pattern Value register is split into two registers the upper 6 bits of the test code in first register, and the lower 8 bits of the test code in the second.

7.4.2.2 Test Mode 1 - Horizontal Gradient

This mode provides LVDS data that progresses horizontally from dark to light output values. This mode is highly variable, allowing control over the starting value of the gradient, the width of the gradient, and the increment rate of the gradient. The starting value can be set in the Test Pattern Value register, the width (in number of pixels) of each gradient step is set via Test Pattern Pitch register, and increment rate (in LSBs) is set via the Test Pattern Step register. When the LVDS Horizontal Gradient test pattern is selected, the ramp begins immediately and counts to the maximum value, and then repeats throughout the entire Valid Pixel region.

7.4.2.3 Test Mode 2 - Vertical Gradient

This mode is similar to the Horizontal Gradient, only the gradient is in the vertical direction. See the Horizontal Gradient mode description for details.

7.4.2.4 Test Mode 3 - Lattice Pattern

This mode provides LVDS data that creates a lattice grid. The lattice is made of dark lines on a light background. The line output value is set by Test Pattern Step register, and background value is set by Test Pattern Value register. The number of pixels & lines in the lattice is set via Test Pattern Pitch register.

7.4.2.5 Test Mode 4 - Stripe Pattern

This mode provides LVDS data that creates a vertical stripe pattern. The stripe pattern is made of dark and light lines. The output value of the dark portion is set via Test Pattern Step register, and the light portion is set via Test Pattern Value register. The stripe width in pixels is set via Test Pattern Pitch register.

7.4.2.6 Test Mode 5 - LVDS Test Pattern (Synchronous)

This mode provides an LVDS output with a fixed value repeated continuously. The pattern starts at the leading edge of CLPIN. The fixed value is set via the Test Pattern Value registers. The Test Pattern Value register is split into two registers the upper 8 bits of the test code in first register, and the lower 8 bits of the test code in the second. This is useful for system debugging of the LVDS link and receiver circuitry.

7.4.2.7 Test Mode 6 - LVDS Test Pattern (Asynchronous)

This mode provides an LVDS output with a fixed value repeated continuously. The pattern starts asynchronously without CLPIN. The fixed value is set via the Test Pattern Value registers. The Test Pattern Value register is split into two registers the upper 8 bits of the test code in first register, and the lower 8 bits of the test code in the second. This is useful for system debugging of the LVDS link and receiver circuitry.

7.4.2.8 Pseudo Random Number Mode

This mode provides LVDS data produced from the following polynomial:

$$P(x) = X^{14} + X^{13} + X^{11} + X^9 + 1$$

To start the Pseudo Random Number mode, set the Test Mode bit of the Test and Scan Register. Then load the seed value in the Test Pattern Value register, and set the Pseudo Random Enable bit of the Test Pattern Control register. The pattern will start outputting after the next leading edge of CLPIN.

7.5 Programming

7.5.1 Serial Interface

A serial interface is used to write and read the configuration registers. The interface is a four wire interface using SCLK, $\overline{\text{SEN}}$, SDI, and SDO connections. The serial interface clock (SCLK) must be less than the main input clock (INCLK) for INCLK speeds of less than 20 MHz, for INCLK speeds greater than 20-MHz SCLK must remain below 20 MHz. The main input clock (INCLK) to the LM98640QML-SP must be active during all Serial Interface commands. The Serial Interface pins are high impedance while $\overline{\text{SEN}}$ is high, this allows multiple slave devices to be used with a single master device.

After power-up, all configuration registers must be written, using the serial interface, to place the part in a valid state.

Default registers must be written to the baseline values.

Be sure to set the INCLK Range (2x05) and Sample & Hold (0x06) registers for the sample rate being used.

Write the Clock Monitor (0x09) register after the Test & Scan Control (3x0D) register.

7.5.2 Writing to the Serial Registers

To write to the serial registers using the four wire interface, the timing diagram shown in [Figure 26](#) must be met. First, $\overline{\text{SEN}}$ is toggled low. At the rising edge of the first clock, the master should assume control of the SDI pin and begin issuing the write command. The write command is built of a "write" bit (0), device address bit (0), six bit register address, and eight bit register value to be written. SDI is clocked into the LM98640QML-SP at the rising edge of SCLK. The LM98640QML-SP assumes control of the SDO pin during the first eight clocks of the cycle. During this period, data is clocked out of the device at the rising edge of SCLK. The eight bit value clocked out is the contents of the previously addressed register, regardless if the previous command was a read or a write. When $\overline{\text{SEN}}$ toggles high, the register is written to, and the LM98640QML-SP now functions with this new data.

7.5.3 Reading the Serial Registers

To read to the serial registers using the four wire interface, the timing diagram shown in [Figure 27](#) must be met. Reading the registers takes two cycles. To start the first cycle, $\overline{\text{SEN}}$ is toggled low. At the rising edge of the first clock, the master should assume control of the SDI pin and begin issuing the read command. The read command is built of a "read" bit (1), device address bit (0), six bit register address, and eight "don't care" bits. SDI is clocked into the LM98640QML-SP at the rising edge of SCLK. $\overline{\text{SEN}}$ is toggled high for a delay of at least t_{SENW} (see [Figure 28](#)). The second cycle begins when $\overline{\text{SEN}}$ is toggled low. The LM98640QML-SP assumes control of the SDO pin during the first eight clocks of the cycle. During this period, data is clocked out of the device at the rising edge of SCLK. The eight bit value clocked out is the contents of the previously addressed register. The next command can be sent on the SDI pin simultaneously during this second cycle. When $\overline{\text{SEN}}$ toggles high, the register is not written to, but its contents are staged to be outputted at the beginning of the next command.

Table 9. Register Definitions - Digital Configuration

ADDRESS (BINARY)	REGISTER TITLE	BASLINE (BINARY)	BIT(s)	DESCRIPTION
11 0000	Test Pattern Start	0000 0000	[15:8]	Upper 8 bits of the Test Pattern start value. Specifies the number of pixels after the leading edge of CLPIN to the Valid Pixel region.
11 0001	Test Pattern Start	0000 0000	[7:0]	Lower 8 bits of the Test Pattern start value. Specifies the number of pixels after the leading edge of CLPIN to the Valid Pixel region.
11 0010	Test Pattern Width	0000 0000	[15:8]	Upper 8 bits of the Test Pattern Width value. Specifies, in number of pixels, the width of the Valid Pixel region.
11 0011	Test Pattern Width	0000 0000	[7:0]	Lower 8 bits of the Test Pattern Width value. Specifies, in number of pixels, the width of the Valid Pixel region.
11 0100	Test Pattern Control	0000 0000	[7:0] Test Pattern Control Register. [7] Programmable Pattern Switch 0 Disabled. Normal LVDS output operation. 1 Enabled. AFE outputs LVDS test patterns. [6:4] Test Pattern Mode 000 Fixed Code 001 Horizontal Gradient Scan (Main Scan) 010 Vertical Gradient Scan (Sub Scan) 011 Grid Scan (Lattice Pattern) 100 Strip Pattern 101 LVDS Test Pattern. (Synchronous to CLPIN) 110 LVDS Test Pattern. (Asynchronous) 111 Not Used. [3] Pseudo Random Pattern Enable. Overrides Programmable Patter Switch setting (bit 7). Normally only one should be on. [2] Load Seed Enable. When set, the seed value in the Test Pattern Value Register is loaded in the LFSR at the leading edge of CLPIN. [1:0] Test Pattern Output Channel Select. 00 Both Channels 01 Channel 1 10 Channel 2 11 Not Used	
11 0101	Test Pattern Pitch	0000 0000	[7:0]	Test Pattern pitch, specifies number of pixels for H Gradient pattern and Stripe pattern, or number of lines in the V Gradient pattern, or specifies pixels & lines in the Lattice pattern.
11 0110	Test Pattern Step	0000 0000	[7:0]	Test Pattern Step Code. Specifies step size in LSB codes the pattern is incremented in H Gradient and V Gradient pattern. In Lattice and Stripe pattern it specifies the code during the lower step.
11 0111	Test Pattern Channel Offset	0000 0000	[7:0] Test Pattern Channel Offset Register. [7:4] Not Used. [3:0] Test Pattern Channel Offset. This specifies the number of lines the pattern on Channel 2 is delayed from Channel 1. This offset is maintained throughout the pattern.	
11 1000	Test Pattern Value	0000 0000	[15:8]	Upper 8 bits of Test Pattern Value Register. Specifies the upper 8 bits of the test value code during Fixed Pattern and LVDS test, initial value during H Gradient & V Gradient pattern, and higher value in the Lattice and Stripe Pattern.

Table 9. Register Definitions - Digital Configuration (continued)

ADDRESS (BINARY)	REGISTER TITLE	BASELINE (BINARY)	BIT(s)	DESCRIPTION
11 1001	Test Pattern Value	0000 0000	[7:0]	Lower 6 bits of Test Pattern Value Register. Specifies the lower 6 bits of the test code value during Fixed Pattern and LVDS test, initial value during H Gradient & V Gradient pattern, and higher value in the Lattice and Stripe Pattern.
11 1100	Digital Configuration	0000 0000	[7:0] [7:1] [0]	Serial Communication Configuration Register. Not Used. Micro-Wire Automatic Read Disable. 0 Read data is always sent out on SDO during the first 8 SCLK cycles. The register is selected by the register address in the previous cycle. (read or write) 1 Automatic read is disabled. To read from a register two cycles need to be initiated by the master, first cycle should be a read with the correct register address and second can be a dummy read or read from another address or a write cycle, and the data is sent first 8 SCLK of the second cycle. After a write command SDO remains in Tri-State during first 8 SCLK.
11 1101	Test & Scan Control	0000 0000	[7:0] [7:6] [5] [4] [3] [2] [1] [0]	Test & Scan Control Register Not Used. Test Pattern Voting Switch. 0 Enable. Circuit Redundancy Voting is active. 1 Disable. First redundancy block output is used. Micro-wire Voting Switch. 0 Enable. Circuit Redundancy Voting is active. 1 Disable. First Micro-wire block output is used. Not Used. Test Reset. Resets the test block when High, normal test block function when Low. This bit is not self-clearing. Test Mode Enable. 0 Disable. 1 Enable. Needed to run Test Pattern functions. Not Used.
11 1110	Device ID	0100 1000	[7:0]	Device Revision ID. Engineering samples might be x01 or x47.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

Careful consideration should be given to environmental conditions when using a product in a radiation environment.

8.1.1 Total Ionizing Dose

Testing and qualification of this product is done according to MIL-STD-883, Test Method 1019.

This product is on Texas Instruments' CMOS9X process, a CMOS process shown to be ELDRS-Free. ELDRS report for the process is available upon request.

Radiation lot acceptance testing (RLAT) is performed at high dose rate. On some lots the room temperature anneal test is used, with anneal times up to 6 weeks. An RLAT report to the wafer level is available for each lot.

8.1.2 Single Event Latch-Up and Functional Interrupt

One time single event latch-up (SEL) and single event functional interrupt (SEFI) testing was preformed according to EIA/JEDEC Standard, EIA/JEDEC57. SEL testing was conducted with the junction temperature at 125°C. The linear energy transfer threshold (LETth) shown in the features list on the front page is the maximum LET tested. A test report is available upon request.

8.1.3 Single Event Effects

A report on single event upset (SEU) is available upon request.

9 Layout

9.1 Layout Guidelines

9.1.1 Power Planes

Power for the LM98640QML-SP should be provided through a broad plane which is located on one layer adjacent to the ground plane(s). Placing the power and ground planes on adjacent layers will provide low impedance decoupling of the AFE supplies, especially at higher frequencies. The output of a linear regulator should feed into the power plane through a low impedance multi-via connection. The power plane should be split into individual power peninsulas near the AFE. Each peninsula should feed a particular power bus on the AFE, with decoupling for that power bus connecting the peninsula to the ground plane near each power/ground pin pair. Using this technique can be difficult on many printed circuit CAD tools. To work around this, 0-Ω resistors can be used to connect the power source net to the individual nets for the different AFE power buses. As a final step, the 0-Ω resistors can be removed and the plane and peninsulas can be connected manually after all other error checking is completed.

9.1.2 Bypass Capacitors

The general recommendation is to have one 100-nF capacitor for each power/ground pin pair. The capacitors should be surface mount multi-layer ceramic chip capacitors.

9.1.3 Ground Plane

Grounding should be done using continuous full ground planes to minimize the impedance for all ground return paths, and provide the shortest possible image/return path for all signal traces.

9.1.4 Thermal Management

The exposed pad on bottom of the package is attached to the back of the die to act as a heat sink. Connecting this pad to the PCB ground planes with a low thermal resistance path is the best way to remove heat from the AFE. This pad should also be connected to the ground planes through low impedance path for electrical purposes.

10 デバイスおよびドキュメントのサポート

10.1 デバイス・サポート

10.1.1 開発サポート

10.1.1.1 評価ボード

LM98640CVALは柔軟な評価ボードで、LM98640の多くの種類の動作オプションについて構成可能です。LM98640CVALは、**WaveVison 5 Data Capture**基板で駆動できます。この基板を駆動するソフトウェアは、Windows XPでのみ動作します。

10.1.1.2 レジスタのプログラミング用ソフトウェア

LM98640CVALの**ツール・フォルダ**で、グラフィカル・ユーザー・インターフェイス(GUI)をダウンロードできます。各種の構成モードについて、レジスタの設定を検証するために使用できます。このソフトウェアは、Windows XPでのみ動作します。

10.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、**ti.com**のデバイス製品フォルダを開いてください。右上の隅にある「通知を受け取る」をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取れます。変更の詳細については、修正されたドキュメントに含まれている改訂履歴をご覧ください。

10.3 コミュニティ・リソース

以下のリンクから、TIのコミュニティ・リソースにアクセスできます。リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらはTIの仕様を構成するものではなく、必ずしもTIの見解を反映したものではありません。**TIの使用条件**を参照してください。

TI E2E™のオンライン・コミュニティ TIの高信頼性製品を対象とした、エンジニア相互(E2E)コミュニティです。エンジニア間の共同作業を促進するために開設されたものです。**e2e.ti.com**では、他のエンジニアに質問し、知識を共有し、アイデアを検討して、問題解決に役立てることができます。

10.4 輸出管理に関する注意事項

受取人は、直接または間接に、ソフトウェアを含む(米国、EUおよびその他の輸出管理規制で定められた)任意の製品または技術データ、他に適用される国による規制で制限され機密保持契約(締結されている場合)に基づいて開示者から受領した管理対象製品、または当該のテクノロジーの直接の産物について、米国法またはその他に適用される法律で当該の輸出または再輸出が制限または禁止されている仕向地に、当該の法律によって必要とされている範囲について米国商務省および権限を有するその他の政府機関による事前の許可を受けることなく、故意に輸出または再輸出しないことに合意します。

10.5 商標

All trademarks are the property of their respective owners.

10.6 静電気放電に関する注意事項

これらのデバイスは、限定的なESD(静電破壊)保護機能を内蔵しています。保存時または取り扱い時は、MOSゲートに対する静電破壊を防止するために、リード線同士をショートさせておくか、デバイスを導電フォームに入れる必要があります。

10.7 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

11 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。この情報は、そのデバイスについて利用可能な最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

11.1 エンジニアリング・サンプル

エンジニアリング・サンプルを注文できます。これらは、注文可能な製品名の中で「MPR」と記載されています(付録のパッケージ情報を参照)。エンジニアリング(MPR)サンプルは、室温においてのみデータシートの性能仕様を満たしており、完全なスペースの製造フローやテストは行われていません。エンジニアリング・サンプルは、室温での性能には影響しないテスト、たとえば放射線や信頼性テストなどに不合格となったQCI不適合品の可能性があります。

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TI は、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含みいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、TI は一切の責任を拒否します。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、[TI の総合的な品質ガイドライン](#)、[ti.com](#) または TI 製品などに関連して提供される他の適用条件に従い提供されます。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。TI がカスタム、またはカスタマー仕様として明示的に指定していない限り、TI の製品は標準的なカタログに掲載される汎用機器です。

お客様がいかなる追加条項または代替条項を提案する場合も、TI はそれらに異議を唱え、拒否します。
