

LP2981x 100mA、低ドロップアウトレギュレータ、SOT-23 パッケージ

1 特長

- 入力電圧 (V_{IN}) 範囲:
 - 従来のチップ: 2.2V ~ 16V
 - 新しいチップ: 2.5V ~ 16V
- 出力電圧 (V_{OUT}) 範囲: 1.2V ~ 5.0V
- 出力電圧 (V_{OUT}) 精度:
 - $\pm 0.75\%$ (A グレードの従来チップ)
 - $\pm 1.25\%$ (標準グレードの従来チップ)
 - $\pm 0.5\%$ (A グレードおよび標準グレードの新チップ)
- 負荷および温度に対する出力電圧 (V_{OUT}) 精度: $\pm 1\%$ (新チップ)
- 出力電流: 最大 100mA
- 低い I_Q (新チップ): 69 μ A ($I_{LOAD} = 0$ mA の場合)
- 低い I_Q (新チップ): 620 μ A ($I_{LOAD} = 100$ mA の場合)
- シャットダウン電流と温度との関係:
 - < 1 μ A (従来チップ)
 - $\leq 1.75\mu$ A (新しいチップ)
- 出力電流制限および過熱保護
- 2.2 μ F のセラミックコンデンサで安定 (新しいチップ)
- 高 PSRR (新チップ):
 - 1kHz で 75dB、1MHz で 45dB
- 動作時接合部温度: -40°C ~ +125°C
- パッケージ: 5 ピン SOT-23 (DBV)

2 アプリケーション

- 電気メーター
- マイクロインバータ
- サーバー PSU (12V 出力)
- 住宅用ブレーカ
- 単軸と多軸のサーボドライブ

代表的なアプリケーション回路

3 概要

LP2981 と LP2981A (LP2981x) は、固定出力で低ドロップアウト (LDO) の電圧レギュレータで、2.5V ~ 16V の入力電圧範囲に対応し (新しいチップのみ)、最大 100mA の負荷電流を供給できます。LP2981x は、1.2V ~ 5.0V の出力範囲をサポートしています (新しいチップ)。

さらに、LP2981x (新しいチップ) は、負荷および温度の全範囲にわたって 1% の出力精度を備えており、低電圧マイコン (MCU) およびプロセッサのニーズを満たすことができます。

新チップの広帯域の PSRR 特性は、1kHz で 75dB、1MHz で 45dB であり、上流の DC/DC コンバータのスイッチング周波数を減衰して、レギュレータ後のフィルタ処理を最小化できます。

新しいチップでは、内蔵したソフトスタートメカニズムによって、スタートアップ時の突入電流が抑制されるため、入力容量の低減が可能になります。過電流および過熱保護などの一般的な保護機能を備えています。

パッケージ情報

部品番号	パッケージ ⁽¹⁾	パッケージサイズ ⁽²⁾
LP2981x	DBV (SOT-23, 5)	2.9mm × 2.8mm

- 詳細については、[メカニカル](#)、[パッケージ](#)、および[注文情報](#)をご覧ください。
- パッケージサイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

4 Pin Configuration and Functions

図 4-1. DBV Package, 5-Pin SOT-23 (Top View)

表 4-1. Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	IN	I	Input supply pin. Use a capacitor with a value of 1 μ F or larger from this pin to ground. See the Input Capacitor section for more information.
2	GND	—	Common ground (device substrate).
3	ON/OFF	I	Enable pin for the LDO. Driving the ON/OFF pin high enables the device. Driving this pin low disables the device. High and low thresholds are listed in the Electrical Characteristics table. Tie this pin to V_{IN} if unused.
4	NC	—	Do not connect.
5	OUT	O	Output of the regulator. Use a capacitor with a value of 2.2 μ F or larger from this pin to ground ⁽¹⁾ . See the Output Capacitor section for more information.

- (1) The nominal output capacitance must be greater than 1 μ F. Throughout this document, the nominal derating on these capacitors is 50%. Make sure that the effective capacitance at the pin is greater than 1 μ F.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾ (2)

		MIN	MAX	UNIT
V_{IN}	Continuous input voltage range (for legacy chip)	-0.3	16	V
	Continuous input voltage range (for new chip)	-0.3	18	
V_{OUT}	Output voltage range (for legacy chip)	-0.3	9	
	Output voltage range (for new chip)	-0.3	$V_{IN} + 0.3$ or 9 (whichever is smaller)	
$V_{ON/OFF}$	ON/OFF pin voltage range (for legacy chip)	-0.3	16	
	ON/OFF pin voltage range (for new chip)	-0.3	18	
$V_{IN} - V_{OUT}$	Input-output voltage (for legacy chip)	-0.3	16	
	Input-output voltage (for new chip)	-0.3	18	
Current	Maximum output current	Internally limited		mA
Temperature	Operating junction, T_J	-55	150	°C
	Storage, T_{stg}	-65	150	

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltages with respect to GND.

5.2 ESD Ratings

			VALUE (Legacy Chip)	VALUE (New Chip)	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	±3000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	±1000	
		Machine model (MM)	±100	N/A	

- (1) JEDEC document JEP155 states that 2-kV HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 500-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT	
V _{IN}	Supply input voltage (for legacy chip)	2.2		16	V	
	Supply input voltage (for new chip)	2.5		16		
V _{IN} – V _{OUT}	Input-output differential (for legacy chip)	0.7		11		
	Input-output differential (for new chip)	0		16		
V _{OUT}	Output voltage (for new chip)	1.2		5		
V _{ON/OFF}	Enable voltage (for legacy chip)	0		V _{IN}		
	Enable voltage (for new chip)	0		16		
I _{OUT}	Output current	0		100		mA
C _{IN} ⁽¹⁾	Input capacitor		1			μF
C _{OUT}	Output capacitor (for legacy chip) ⁽⁴⁾	3.3				
	Output capacitance (for new chip) ⁽¹⁾	1	2.2	200		
C _{OUT} ESR ⁽²⁾	Output capacitor ESR (for new chip) ⁽³⁾	0		1	Ω	
T _J	Operating junction temperature	–40		125	°C	

- (1) All capacitor values are assumed to derate to 50% of the nominal capacitor value. Maintain an effective output capacitance of 1 μF minimum for stability.
 (2) Details related to supported ESR range for the legacy chip are available in sections [Recommended Capacitors for the Legacy Chip](#) and [Output Capacitor](#).
 (3) Maximum supported ESR range for new chip is 1Ω. For output capacitor with higher ESR values, place a low ESR MLCC capacitor.
 (4) Details related to minimum required output capacitor for legacy chip are available in section [Output Capacitor](#).

5.4 Thermal Information

THERMAL METRIC ⁽¹⁾		Legacy Chip ⁽²⁾	New Chip ⁽²⁾	UNIT
		DBV (SOT23-5)	DBV (SOT23-5)	
		5 PINS	5 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	205.2	178.6	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	11.83	77.9	°C/W
R _{θJB}	Junction-to-board thermal resistance	37.7	47.2	°C/W
ψ _{JT}	Junction-to-top characterization parameter	12.2	15.9	°C/W
ψ _{JB}	Junction-to-board characterization parameter	33.8	46.9	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.
 (2) Thermal performance results are based on the JEDEC standard of 2s2p PCB configuration. These thermal metric parameters can be further improved by 35-55% based on thermally optimized PCB layout designs. See the analysis of the [Impact of board layout on LDO thermal performance](#) application report.

5.5 Electrical Characteristics

specified at $T_J = 25\text{ }^\circ\text{C}$, $V_{IN} = V_{OUT(nom)} + 1.0\text{ V}$ or $V_{IN} = 2.5\text{ V}$ (whichever is greater), $I_{OUT} = 1\text{ mA}$, $V_{ON/OFF} = 2\text{ V}$, $C_{IN} = 1.0\text{ }\mu\text{F}$, and $C_{OUT} = 2.2\text{ }\mu\text{F}$ (unless otherwise noted)

6 Detailed Description

6.1 Overview

The LP2981 and LP2981A (LP2981x) are fixed-output, high PSRR, low-dropout regulators that offer exceptional, cost-effective performance for both portable and non-portable applications. The new chip has an output tolerance of $\pm 1\%$ across load and temperature variation. The new chip is capable of delivering 100mA of continuous load current.

This device features integrated overcurrent protection, thermal shutdown and output enable. The new chip has a built-in soft-start mechanism for controlled inrush current and provide internal output pulldown mechanism. This device delivers excellent line and load transient performance. The operating ambient temperature range of the devices is -40°C to $+125^{\circ}\text{C}$.

6.2 Functional Block Diagrams

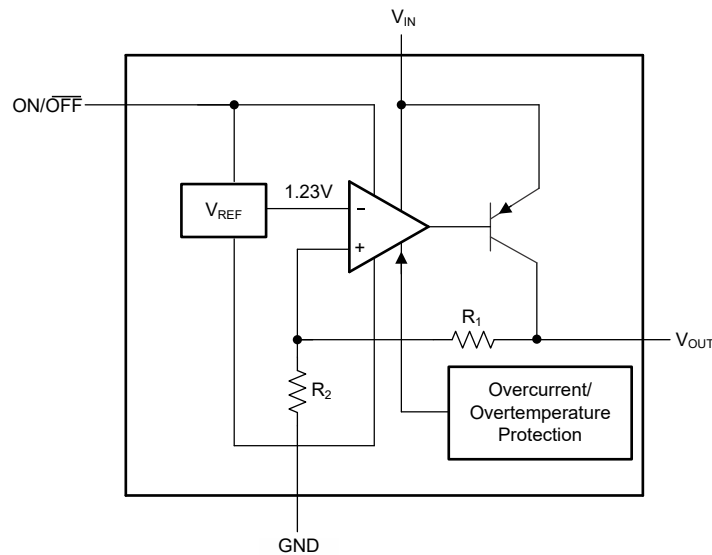

図 6-1. Functional Block Diagram (Legacy Chip)

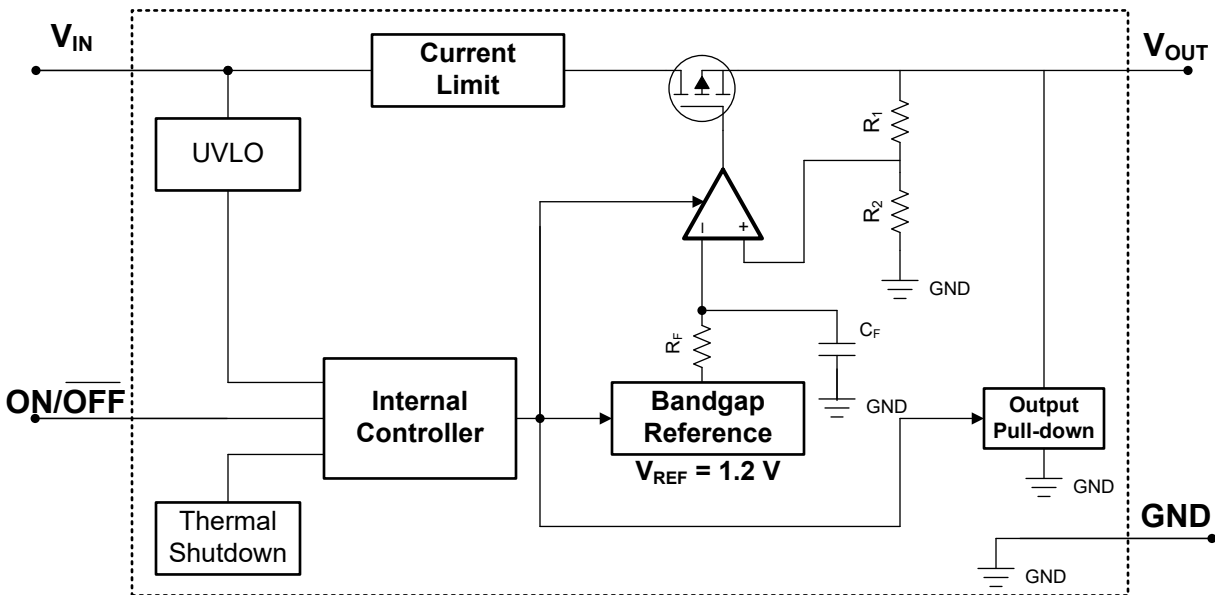

図 6-2. Functional Block Diagram (New Chip)

6.3 Feature Description

6.3.1 Output Enable

The ON/OFF pin for the device is an active-high pin. The output voltage is enabled when the voltage of the ON/OFF pin is greater than the high-level input voltage of the ON/OFF pin and disabled when the ON/OFF pin voltage is less than the low-level input voltage of the ON/OFF pin. If independent control of the output voltage is not needed, connect the ON/OFF pin to the input of the device.

For the legacy chip, apply a signal with a slew rate of $\geq 40\text{mV}/\mu\text{s}$. A slow slew rate can cause the shutdown function to operate incorrectly.

For the new chip, there are no slew rate restrictions. Also, the new chip devices have an internal pulldown circuit that activates when the device is disabled by pulling the ON/OFF pin voltage lower than the low-level input voltage of the ON/OFF pin to actively discharge the output voltage.

6.3.2 Dropout Voltage

Dropout voltage (V_{DO}) is defined as the input voltage minus the output voltage ($V_{\text{IN}} - V_{\text{OUT}}$) at the rated output current (I_{RATED}), where the pass transistor is fully on. I_{RATED} is the maximum I_{OUT} listed in the [Recommended Operating Conditions](#) table. The pass transistor is in the ohmic or triode region of operation, and acts as a switch. The dropout voltage indirectly specifies a minimum input voltage greater than the nominal programmed output voltage at which the output voltage is expected to stay in regulation. If the input voltage falls to less than the nominal output regulation, then the output voltage falls as well.

For a CMOS regulator, the dropout voltage is determined by the drain-source on-state resistance ($R_{\text{DS(ON)}}$) of the pass transistor. Therefore, if the linear regulator operates at less than the rated current, the dropout voltage for that current scales accordingly. The following equation calculates the $R_{\text{DS(ON)}}$ of the device.

$$R_{\text{DS(ON)}} = \frac{V_{\text{DO}}}{I_{\text{RATED}}} \quad (1)$$

6.3.3 Current Limit

6.3.3.1 Current Limit (Legacy Chip)

The internal current-limit circuit is used to protect the LP2981x against high-load current faults or shorting events. This device is not designed to operate in a steady-state current limit. During a current-limit event, the device sources constant current. Therefore, the output voltage falls when load impedance decreases. If a current limit occurs and the resulting output voltage is low, excessive power can be dissipated across the LDOs resulting in a thermal shutdown of the output. A foldback feature limits the short-circuit current to protect the regulator from damage under all load conditions. If V_{OUT} is forced below 0V before ON/OFF goes high and the load current required exceeds the foldback current limit, the device can not start up correctly.

6.3.3.2 Current Limit (New Chip)

This device has an internal current limit circuit that protects the regulator during transient high-load current faults or shorting events. The current limit is a brick-wall scheme. In a high-load current fault, the brick-wall scheme limits the output current to the current limit (I_{CL}). I_{CL} is listed in the [Electrical Characteristics](#) table.

The output voltage is not regulated when the device is in current limit. When a current limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in brick-wall current limit, the pass transistor dissipates power $[(V_{\text{IN}} - V_{\text{OUT}}) \times I_{\text{CL}}]$. If thermal shutdown is triggered, the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the output current fault condition continues, the device cycles between current limit and thermal shutdown. For more information on current limits, see the [Know Your Limits application note](#).

☒ 6-3 shows a diagram of the current limit.

図 6-3. Current Limit

6.3.4 Undervoltage Lockout (UVLO)

For the new chip, the device has an independent undervoltage lockout (UVLO) circuit that monitors the input voltage, allowing a controlled and consistent turn on and off of the output voltage. To prevent the device from turning off if the input drops during turn on, the UVLO has hysteresis as specified in the [Electrical Characteristics](#) table.

6.3.5 Thermal Shutdown

The device contains a thermal shutdown protection circuit to disable the device when the junction temperature (T_J) of the pass transistor rises to $T_{SD(shutdown)}$ (typical). Thermal shutdown hysteresis makes sure that the device resets (turns on) when the temperature falls to $T_{SD(reset)}$ (typical). Thermal shutdown circuit specifications are defined in the [Electrical Characteristics](#).

The thermal time-constant of the semiconductor die is fairly short, thus the device can cycle on and off when thermal shutdown is reached until power dissipation is reduced. Power dissipation during start up can be high from large $V_{IN} - V_{OUT}$ voltage drops across the device or from high inrush currents charging large output capacitors. Under some conditions, the thermal shutdown protection disables the device before start-up completes.

For reliable operation, limit the junction temperature to the maximum listed in the [Recommended Operating Conditions](#) table. Operation above this maximum temperature causes the device to exceed operational specifications. Although the internal protection circuitry of the device is designed to protect against thermal overall conditions, this circuitry is not intended to replace proper heat sinking. Continuously running the device into thermal shutdown or above the maximum recommended junction temperature reduces long-term reliability.

6.3.6 Output Pulldown

The new chip has an output pulldown circuit. The output pulldown activates in the following conditions:

- When the device is disabled ($V_{ON/OFF} < V_{ON/OFF(LOW)}$)
- If $1.0V < V_{IN} < V_{UVLO}$

Do not rely on the output pulldown circuit for discharging a large amount of output capacitance after the input supply has collapsed because reverse current can flow from the output to the input. This reverse current flow can cause damage to the device. See the [Reverse Current](#) section for more details.

6.4 Device Functional Modes

表 6-1 shows the conditions that lead to the different modes of operation. See the [Electrical Characteristics](#) table for parameter values.

表 6-1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER			
	V_{IN}	$V_{ON/OFF}$	I_{OUT}	T_J
Normal operation	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > V_{IN(min)}$	$V_{ON/OFF} > V_{ON/OFF(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Dropout operation	$V_{IN(min)} < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{ON/OFF} > V_{ON/OFF(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Disabled (any true condition disables the device)	$V_{IN} < V_{UVLO}$	$V_{ON/OFF} < V_{ON/OFF(LOW)}$	Not applicable	$T_J > T_{SD(shutdown)}$

6.4.1 Normal Operation

The device regulates to the nominal output voltage when the following conditions are met:

- The input voltage is greater than the nominal output voltage plus the dropout voltage ($V_{OUT(nom)} + V_{DO}$)
- The output current is less than the current limit ($I_{OUT} < I_{CL}$)
- The device junction temperature is less than the thermal shutdown temperature ($T_J < T_{SD}$)
- The ON/OFF voltage has previously exceeded the ON/OFF rising threshold voltage and has not yet decreased to less than the enable falling threshold

6.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this mode, the output voltage tracks the input voltage. During this mode, the transient performance of the device becomes significantly degraded because the pass transistor is in the ohmic or triode region, and acts as a switch. Line or load transients in dropout can result in large output-voltage deviations.

When the device is in a steady dropout state (defined as when the device is in dropout, $V_{IN} < V_{OUT(NOM)} + V_{DO}$, directly after being in a normal regulation state, but *not* during start up), the pass transistor is driven into the ohmic or triode region. When the input voltage returns to a value greater than or equal to the nominal output voltage plus the dropout voltage ($V_{OUT(NOM)} + V_{DO}$), the output voltage can overshoot for a short period of time while the device pulls the pass transistor back into the linear region.

6.4.3 Disabled

The output of the device can be shutdown by forcing the voltage of the ON/OFF pin to less than the maximum ON/OFF pin low-level input voltage (see the [Electrical Characteristics](#) table). When disabled, the pass transistor is turned off, internal circuits are shutdown, and the output voltage is actively discharged to ground by an internal discharge circuit from the output to ground.

7 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

7.1 Application Information

The LP2981x is a linear voltage regulator operating from 2.5V to 16V (new chip) on the input and regulates voltages between 1.2V to 5V with $\pm 1\%$ accuracy (across line, load and temperature) and 100mA maximum output current.

Successfully implementing an LDO in an application depends on the application requirements. If the requirements are simply input voltage and output voltage, compliance specifications (such as internal power dissipation or stability) must be verified to provide a solid design. If timing, start-up, noise, power supply rejection ratio (PSRR), or any other transient specification is required, then the design becomes more challenging.

7.1.1 Recommended Capacitor Types

7.1.1.1 Recommended Capacitors (Legacy Chip)

7.1.1.1.1 Tantalum Capacitors

For the legacy chip, tantalum capacitors are the best choice for use at the output of the LDO. Most good quality tantalums can be used with the device (legacy chip), but check the manufacturer data sheet to verify that the ESR is in range. At lower temperatures, as ESR increases, a capacitor with ESR, near the upper limit for stability at room temperature can cause instability. For very low temperature applications, output tantalum capacitors can be used in parallel configuration to prevent the ESR from going up too high.

7.1.1.1.2 Ceramic Capacitors

For the legacy chip, ceramic capacitors are not recommended for use at the output of the LDO. This recommendation is because the ESR of a ceramic can be low enough to go below the minimum stable value for the LP2981x (legacy chip). A measured 2.2 μ F ceramic capacitor is verified to have an ESR of approximately 15m Ω , which is low enough to cause oscillations. If a ceramic capacitor is used on the output, a 1 Ω resistor is required to be placed in series with the capacitor.

7.1.1.1.3 Aluminum Capacitors

For the legacy chip, aluminum electrolytics are not typically suggested for use with the LDO, because of the large physical size. These aluminum capacitors must meet the same ESR requirements over the operating temperature range, more difficult because of the steep increase at cold temperature. An aluminum electrolytic can exhibit an ESR increase of as much as 50x when going from +20°C to -40°C. Also, some aluminum electrolytics are not operational below -25°C because the electrolyte can freeze.

7.1.1.2 Recommended Capacitors (New Chip)

The new chip is designed to be stable using low equivalent series resistance (ESR) ceramic capacitors at the input and output. Multilayer ceramic capacitors have become the industry standard for these types of applications and are recommended, but must be used with good judgment. Ceramic capacitors that employ X7R-, X5R-, and C0G-rated dielectric materials provide relatively good capacitive stability across temperature, whereas using Y5V-rated capacitors is discouraged because of large variations in capacitance.

Maximum supported ESR range across complete temperature (-40°C to 125°C) and load current range (0mA–50mA) is less than 1 Ω . If adding to an existing implementation, where different types of capacitors with higher ESR are used, place a low ESR MLCC capacitor with a 100nF value as close as possible to the device output pin (V_{OUT}).

Regardless of the ceramic capacitor type selected, the effective capacitance varies with operating voltage and temperature. Generally, expect the effective capacitance to decrease by as much as 50%. The input and output capacitors listed in the [Recommended Operating Conditions](#) table account for an effective capacitance of approximately 50% of the nominal value.

7.1.2 Input and Output Capacitor Requirements

7.1.2.1 Input Capacitor

For the legacy chip, an input capacitor (C_{IN}) $\geq 1\mu\text{F}$ is required (the amount of capacitance can be increased without limit). Any good-quality tantalum or ceramic capacitor can be used. The capacitor must be located no more than half an inch from the input pin and returned to a clean analog ground.

For the new chip, although an input capacitor is not required for stability, good analog design practice is to connect a capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. Use an input capacitor if the source impedance is more than 0.5Ω . A higher value capacitor can be necessary if large, fast rise-time load or line transients are anticipated or if the device is located several inches from the input power source.

7.1.2.2 Output Capacitor

7.1.2.2.1 Output Capacitor (Legacy Chip)

The output capacitor must meet both the requirement for minimum amount of capacitance and equivalent series resistance (ESR) value. Curves are provided that show the allowable ESR range as a function of load current for various output voltages and capacitor values (see [Figure 7-3](#), [Figure 7-4](#), [Figure 7-5](#), and [Figure 7-6](#)).

- Minimum C_{OUT} : $3.3\mu\text{F}$ (can be increased without limit to improve transient response stability margin)
- ESR range: See [Figure 7-3](#), [Figure 7-4](#), [Figure 7-5](#), and [Figure 7-6](#).

Both the minimum capacitance and ESR requirement must be met over the entire operating temperature range. Depending on the type of capacitor used, both of these parameters can vary significantly with temperature (see the [Recommended Capacitors \(Legacy Chip\)](#) section).

7.1.2.2.2 Output Capacitor (New Chip)

Dynamic device performance is improved by using an output capacitor. Use an output capacitor, preferably ceramic capacitors, within the range (both capacitance and max ESR) specified in the [Recommended Operating Conditions](#) table for stability.

7.1.3 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi (Ψ) thermal metrics to estimate the junction temperatures of the linear regulator when in-circuit on a typical PCB board application. These metrics are not thermal resistance parameters and instead offer a practical and relative way to estimate junction temperature. These psi metrics are determined to be significantly independent of the copper area available for heat-spreading. The [Thermal Information](#) table lists the primary thermal metrics, which are the junction-to-top characterization parameter (ψ_{JT}) and junction-to-board characterization parameter (ψ_{JB}). These parameters provide two methods for calculating the junction temperature (T_J), as described in the following equations. Use the junction-to-top characterization parameter (ψ_{JT}) with the temperature at the top-center of the device package (T_T) to calculate the junction temperature. Use the junction-to-board characterization parameter (ψ_{JB}) with the PCB surface temperature 1mm from the device package (T_B) to calculate the junction temperature.

$$T_J = T_T + \psi_{JT} \times P_D \quad (2)$$

where:

- P_D is the dissipated power
- T_T is the temperature at the center-top of the device package

$$T_J = T_B + \psi_{JB} \times P_D \quad (3)$$

where:

- T_B is the PCB surface temperature measured 1mm from the device package and centered on the package edge

For detailed information on the thermal metrics and how to use these metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

7.1.4 Power Dissipation (P_D)

Circuit reliability requires consideration of the device power dissipation, location of the circuit on the printed circuit board (PCB), and correct sizing of the thermal plane. The PCB area around the regulator must have few or no other heat-generating devices that cause added thermal stress.

To first-order approximation, power dissipation in the regulator depends on the input-to-output voltage difference and load conditions. The following equation calculates power dissipation (P_D).

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (4)$$

注

Power dissipation can be minimized, and therefore greater efficiency can be achieved, by correct selection of the system voltage rails. For the lowest power dissipation use the minimum input voltage required for correct output regulation.

For devices with a thermal pad, the primary heat conduction path for the device package is through the thermal pad to the PCB. Solder the thermal pad to a copper pad area under the device. This pad area must contain an array of plated vias that conduct heat to additional copper planes for increased heat dissipation.

The maximum power dissipation determines the maximum allowable ambient temperature (T_A) for the device. According to the following equation, power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the combined PCB and device package and the temperature of the ambient air (T_A).

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (5)$$

Thermal resistance ($R_{\theta JA}$) is highly dependent on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The junction-to-ambient thermal resistance listed in the [Thermal Information](#) table is determined by the JEDEC standard PCB and copper-spreading area, and is used as a relative measure of package thermal performance. As mentioned in the [An empirical analysis of the impact of board layout on LDO thermal performance](#) application note, $R_{\theta JA}$ can be improved by 35% to 55% compared to the [Thermal Information](#) table value with the PCB board layout optimization.

7.1.5 Reverse Current

Excessive reverse current can damage this device. Reverse current flows through the intrinsic body diode of the pass transistor instead of the normal conducting channel. At high magnitudes, this current flow degrades the long-term reliability of the device.

Conditions where reverse current can occur are outlined in this section, all of which can exceed the absolute maximum rating of $V_{OUT} \leq V_{IN} + 0.3 \text{ V}$.

- If the device has a large C_{OUT} and the input supply collapses with little or no load current
- The output is biased when the input supply is not established
- The output is biased above the input supply

If reverse current flow is expected in the application, use external protection to protect the device. Reverse current is not limited in the device, so external limiting is required if extended reverse voltage operation is anticipated.

☒ 7-1 shows one approach for protecting the device.

☒ 7-1. Example Circuit for Reverse Current Protection Using a Schottky Diode

7.2 Typical Application

- A. Minimum C_{OUT} value for stability (can be increased without limit for improved stability and transient response).
- B. ON/OFF must be actively terminated. Connect to V_{IN} if shutdown feature is not used.
- C. For the new chip, pin 4 (NC) is not internally connected.

☒ 7-2. LP2981x Typical Application

7.2.1 Design Requirements

表 7-1 lists the parameters for this application.

表 7-1. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	12 V \pm 10%, provided by an external regulator
Output voltage	3.3 V \pm 1%
Output current	100 mA (maximum), 1 mA (minimum)
RMS noise, 300 Hz to 50 kHz	< 1 mV _{RMS}
PSRR at 1 kHz	> 40 dB

7.2.2 Detailed Design Procedure

7.2.2.1 ON and OFF Input Operation

The LP2981x is shut off by pulling the ON/OFF input low, and turned on by driving the input high. If this feature is not to be used, the ON/OFF input must be tied to V_{IN} to keep the regulator on at all times (the ON/OFF input must **not** be left floating).

For proper operation, the signal source used to drive the ON/OFF input must be able to swing above and below the specified turn-on or turn-off voltage thresholds which specify an ON or OFF state (see the [Electrical Characteristics](#)).

The ON/OFF signal can come from either a totem-pole output, or an open-collector output with pullup resistor to the LP2981 and LP2891A input voltage or another logic supply. The high-level voltage can exceed the LP2981 and LP2891A input voltage, but must remain within the ratings list in the [Absolute Maximum Ratings](#) for the ON/OFF pin.

7.2.3 Application Curves

図 7-6. 3.0V, 10 μ F ESR Curves (Legacy Chip)

7.2.3 Application Curves (continued)

7.3 Power Supply Recommendations

The LP2981x is designed to operate from an input voltage supply range between 2.5V and 16V (for the new chip). The input voltage range provides adequate headroom for the device to have a regulated output. This input supply must be well regulated. If the input supply is noisy, additional input capacitors with low ESR can help improve the output noise performance.

7.4 Layout

7.4.1 Layout Guidelines

For best overall performance, place all circuit components on the same side of the printed-circuit board and as near as practical to the respective LDO pin connections. Place ground return connections to the input and output capacitors, and to the LDO ground pin as close to each other as possible, connected by a wide, component-side, copper surface. The use of vias and long traces to create LDO circuit connections is strongly discouraged and negatively affects system performance. This grounding and layout scheme minimizes inductive parasitics, and thereby reduces load-current transients, minimizes noise, and increases circuit stability. A ground reference plane is also recommended and is either embedded in the PCB or located on the bottom side of the PCB opposite the components. This reference plane serves to assure accuracy of the output voltage, shield noise, and behaves similar to a thermal plane to spread (or sink) heat from the LDO device. In most applications, this ground plane is necessary to meet thermal requirements.

8 Device and Documentation Support

8.1 Device Nomenclature

表 8-1. Available Options

PRODUCT ⁽¹⁾	V _{OUT}
LP2981c-xyyyz	c is the accuracy specification for the legacy chip (A or blank). See the Electrical Characteristics for more information. This character is insignificant for the new chip. yyy is the package designator (DBV = SOT-23). z is the reel designator size. See the Package Addendum for more information on package quantity. xx is the nominal output voltage (for example, 33 = 3.3V; 50 = 5.0V). This device ships with either the legacy chip (CSO: DLN or GF8) or the new chip (CSO: RFB), which uses the latest manufacturing flow. The reel packaging label provides CSO information to distinguish which chip is used. Device performance for new and legacy chips is denoted throughout the document.

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

EXAMPLE BOARD LAYOUT

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4214839/K 08/2024

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4214839/K 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

重要なお知らせと免責事項

TI は、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、
