3 概要

この 4 ビット非反転バストランシーバは、設定可能な 2 本の独立した電源レールを使用します。A ポートは V_{CCA} に追従するように設計されています。V_{CCA} ピンには、1.1V ～3.6V の電源電圧を入力できます。B ポートは、V_{CCB} に追従する設計になっています。V_{CCB} ピンには、1.1V～3.6V の電源電圧を入力できます。SN74AVC4T774 は、V_{CCA}/V_{CCB} を 1.4V～3.6V に設定して動作させるように最適化されています。最低 1.2V の V_{CCA}/V_{CCB} で動作します。これにより、1.2V、1.5V、1.8V、2.5V、3.3V の任意の電圧ノード間での自在な低電圧双方向変換が可能です。

SN74AVC4T774 は、データ バス間の非同期通信用に設計されています。方向制御 (DIR) 入力および出力イネーブル ($\overline{OE}$) 入力のロジック レベルに応じて、B ポート出力もしくは A ポート出力のいずれかがアクティブになるか、または、両方の出力ポートが高インピーダンス モードになります。本デバイスは、B ポート出力がアクティブになったた場合、A バスから B バスにデータを転送し、A ポート出力がアクティブになった場合、B バスから A バスにデータを転送します。A ポートと B ポートの入力回路はどちらも常にアクティブであるため、これらのポートには論理 High または Low レベルを印加して、I_{CC} と I_{CCZ} が過剰に流れないようにする必要があります。

SN74AVC4T774 は、制御ピン (DIR1、DIR2、DIR3、DIR4、$\overline{OE}$) が V_{CCA} から電源を供給されるように設計されています。このデバイスは、I_{off} を使用する部分的パワーダウン アプリケーション用の動作が完全に規定されています。I_{off} 回路で出力をディセーブルすることにより、電源切断時にデバイスに電流が逆流して損傷するのを回避できます。V_{CC} 絶縁機能は、どちらかの VCC 入力が GND レベルになると、両方のポートを確実に高インピーダンス状態にします。

電源投入または電源切断時に高インピーダンス状態を確保するため、$\overline{OE}$ はプルアップ抵抗経由で V_{CCA} に接続する必要があります。この抵抗の最小値は、ドライバの電流シンク能力によって決定されます。このデバイスは CMOS 入力であるため、それらの入力をフローティングにできないことは非常に重要です。入力が High (V_{CC}) 状態と Low (GND) 状態のどちらかに駆動されない場合、I_{CC} 電流の期待値よりも大きい電流が流れてしまう可能性があります。フローティングにされた入力は、静電容量、基板レイアウト、パッケージのインダクタンス、周囲の環境など、多くの要因の影響を受けて特定の電位に落ち着くため、リーク電流を最小化するには、これらの入力が誤ったスイッチング状態にならないように、これらの入力を High と Low のどちらかのレベルに接続します。

7 Detailed Description

7.1 Overview

The SN74AVC4T774 is a 4-bit, dual-supply, noninverting, bi-directional voltage level translation. Pins An and control pins (DIR1, DIR2, DIR3, DIR4 and $\overline{OE}$) are support by V_{CCA} and pins Bn are support by V_{CCB}. The A port is able to accept I/O voltages ranging from 1.1V to 3.6V, while the B port can accept I/O voltages from 1.1V to 3.6V. A high on DIR allows data transmission from An to Bn and a low on DIR allows data transmission from B to A when $\overline{OE}$ is set to low. When $\overline{OE}$ is set to high, both An and Bn are in the high-impedance state.

図 7-1. Logic Diagram (Positive Logic)

7.3 Feature Description

7.3.1 Fully Configurable Dual-Rail Design Allows Each Port to Operate Over the Full 1.1V to 3.6V Power-Supply Range

Both V_{CCA} and V_{CCB} can be supplied at any voltage between 1.1V and 3.6V making the device suitable for translating between any of the low-voltage nodes (1.2V, 1.8V, 2.5V and 3.3V).

7.3.2 Support High-Speed Translation

SN74AVC4T774 can support high data rate application. The translated signal data rate can be up to 380Mbps when signal is translated from 1.8V to 3.3V.

7.3.3 I_{off} Supports Partial-Power-Down Mode Operation

I_{off} prevents backflow current by disabling I/O output circuits when device is in partial-power-down mode.

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The SN74AVC4T774 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The device is designed for use in applications where a push-pull driver is connected to the data I/Os. The max data rate can be up to 380Mbps when the device translate signal is from 1.8V to 3.3V.

8.2 Typical Application

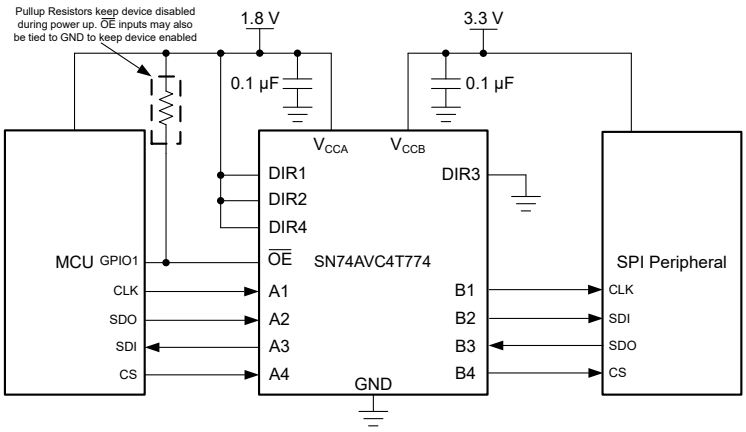

図 8-1. Typical Application of the SN74AVC4T774

8.2.1 Design Requirements

For this design example, use the parameters listed in 表 8-1.

表 8-1. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
Input Voltage Range	1.1V to 3.6V
Output Voltage Range	1.1V to 3.6V

8.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
  - Use the supply voltage of the device that is driving the SN74AVC4T774 device to determine the input voltage range. For a valid logic high, the value must exceed the V_{IH} of the input port. For a valid logic low, the value must be less than the V_{IL} of the input port.
- Output voltage range
  - Use the supply voltage of the device that the SN74AVC4T774 device is driving to determine the output voltage range.

8.2.3 Application Curve

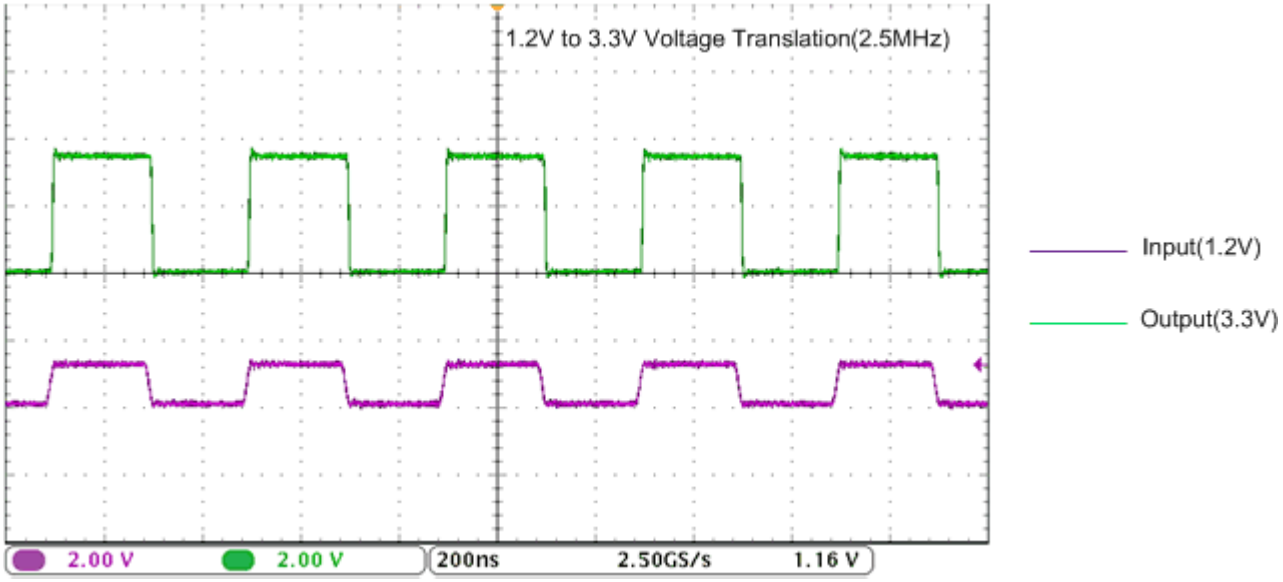

図 8-2. Translation Up (1.2 V to 3.3 V) at 2.5 MHz

8.3 Power Supply Recommendations

The SN74AVC4T774 device uses two separate configurable power-supply rails, V_{CCA} and V_{CCB}. V_{CCA} accepts any supply voltage from 1.1V to 3.6V and V_{CCB} accepts any supply voltage from 1.1V to 3.6V. The A port and B port are designed to track V_{CCA} and V_{CCB} respectively allowing for low-voltage, bi-directional translation between any of the 1.2V, 1.5V, 1.8V, 2.5V and 3.3V voltage nodes.

The output-enable $\overline{OE}$ input circuit is designed so that it is supplied by V_{CCA} and when the $\overline{OE}$ input is high, all outputs are placed in the high-impedance state. To ensure the high-impedance state of the outputs during power-up or power-down, the $\overline{OE}$ input pin must be tied to V_{CCA} through a pullup resistor and must not be enabled until V_{CCA} and V_{CCB} are fully ramped and stable. The minimum value of the pullup resistor to V_{CCA} is determined by the current-sinking capability of the driver.

8.4 Layout

8.4.1 Layout Guidelines

For reliability of the device, following common printed-circuit board layout guidelines are recommended:

- Bypass capacitors should be used on power supplies.
- Short trace lengths should be used to avoid excessive loading.
- Placing pads on the signal paths for loading capacitors or pullup resistors to help adjust rise and fall times of signals depending on the system requirements

Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.
