

SNx52x0 USB ポート過渡電流サプレッサ

1 特長

- サブミクロンの 3V または 5V 回路をノイズ過渡から保護するように設計
- 以下を上回るポート ESD 保護性能:
 - 人体モデルで 15kV
 - マシン・モデルで 2kV
- WCSP チップ・スケール・パッケージで提供
- スタンドオフ電圧: 6V (最小値)
- 低電流リーク: 1μA 以下 (6V の場合)
- 低キャパシタンス: 35pF (標準値)

2 アプリケーション

- USB フルスピード・ホスト、ハブ、ペリフェラル
- ポート

3 概要

SN65220 デバイスはデュアル、SN65240 および SN75240 デバイスはクワッドの単方向過渡電圧サプレッサ (TVS) です。これらのデバイスは、USB (Universal Serial Bus) ロー / フルスピード・ポートに対する電氣的ノイズ過渡保護を提供します。入力容量が 35pF であるため、ハイスピード USB 2.0 アプリケーションには適していません。

ケーブル接続されたすべての I/O は、各種ノイズ源からの電氣的ノイズの過渡現象にさらされる可能性があります。このようなノイズ過渡は、十分な大きさで持続時間を持つ場合、USB トランシーバまたは USB ASIC に損傷を与える可能性があります。

SN65220、SN65240、SN75240 デバイスの ESD 性能は、IEC61000-4-2 に従ってシステム・レベルで測定されています。しかし、システム設計はこれらの試験の結果に影響を及ぼします。高水準の適合性を達成するには、入念な基板設計およびレイアウト技術が必要です。

製品情報 (1)

部品番号	パッケージ	本体サイズ (公称)
SN65220	SOT-23 (6)	2.90mm × 1.60mm
	DSBGA (4)	0.925mm × 0.925mm
SN65240 SN75240	PDIP (8)	9.09mm × 6.35mm
	TSSOP (8)	3.00mm × 4.40mm

7.5 Electrical Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{lk}	Leakage current	$V_I = 6\text{ V}$ at A, B, C, or D terminals			1 μA
$V_{(BR)}$	Breakdown voltage	$V_I = 1\text{ mA}$ at A, B, C, or D terminals			6.5 7 8 V
C_{IN}	Input capacitance to ground	$V_I = 0.4 \sin(4E6\pi t) + 0.5\text{ V}$			35 pF

7.6 Typical Characteristics

$T_A = 25^\circ\text{C}$ unless otherwise noted.

FIG 7-1. Transient-Voltage-Suppressor Current vs Voltage

8 Parameter Measurement Information

FIG 8-1. Measurement of Leakage Current

FIG 8-2. Measurement of Breakdown Voltage

9 Detailed Description

9.1 Overview

The SN65220, SN65240, and SN75240 devices integrate multiple unidirectional transient voltage suppressors (TVS). [Figure 9-1](#) shows the equivalent circuit diagram of a single TVS diode.

For positive transient voltages, only the Q1 transistor determines the switching characteristic. When the input voltage reaches the Zener voltage, V_Z , Zener diode D1 conducts; therefore, allowing for the base-emitter voltage, V_{BE} , to increase. At $V_{IN} = V_Z + V_{BE}$, the transistor starts conducting. From then on, its on-resistance decreases linearly with increasing input voltage.

For negative transient voltages, only diode D2 determines the switching characteristic. Here, switching occurs when the input voltage exceeds the diode forward voltage, V_{FW} .

Figure 9-1. TVS Structure and Current — Voltage Characteristic

9.2 Functional Block Diagram

9.3 Feature Description

The SN65220, SN65240, and SN75240 family of unidirectional transient voltage suppressors provide transient protection to Universal Serial Bus low and full-speed ports. These TVS diodes provide a minimum breakdown voltage of 6.5-V to protect USB transceivers and USB ASICs typically implemented in 3-V or 5-V digital CMOS technology.

9.4 Device Functional Modes

TVS diodes possess two functional modes, a high-impedance and a conducting mode.

During normal operating conditions, that is in the absence of high voltage transients, the breakdown voltage of TVS diodes is not exceeded and the devices remain high-impedance.

In the presence of high-voltage transients the breakdown voltage is exceeded. The TVS diodes then conduct and become low-impedance. In this mode excessive transient energy is shunted directly to local circuit ground, preventing USB transceivers from electrical damage.

10 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

10.1 Application Information

The USB has become a popular solution to connect PC peripherals. The USB allows devices to be hot-plugged in and out of the existing PC system without rebooting or turning off the PC. Because frequent human interaction with the USB system occurs as a result of its attractive hot-plugging ability, there is the possibility for large ESD strikes and damage to crucial system elements. The ESD protection included on the existing hardware is typically in the 2-kV to 4-kV range for the human body model (HBD) and 200-V to 300-V for the machine model (MM). The ESD voltage levels found in a normal USB operating environment can exceed these levels. The SN75240, SN65240, and SN65220 devices will increase the robustness of the existing USB hardware to ESD strikes common to the environment in which USB is likely to be used.

10.2 Typical Application

図 10-1 shows a typical USB system and application of the SN75240, SN65240, and SN65220 devices. Connections to pin A from the D+ data line, pin B from the D– data line, and the device grounds from the GND line that already exists are necessary to increase the amount of ESD protection provided to the USB port.

The design of the suppressor gives it very low maximum current leakage of 1 μ A, a very low typical capacitance of 35 pF, and a standoff voltage minimum of 6 V. Because of these levels, the SN75240, SN65240, and SN65220 devices will provide added protection to the USB system hardware during ESD events without introducing the high capacitance and current leakage levels typical of external transient voltage suppressors. The addition of an SN75240, SN65240, or SN65220 device is beneficial to both full-speed and low-speed USB 1.1 bandwidth standards.

図 10-1. Typical Application Schematic for ESD Protection of USB Transceivers

10.2.1 Design Requirements

For this design example, use the parameters listed in 表 10-1 as design parameters.

表 10-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Minimum breakdown voltage (TVS)	6.5 V
Maximum supply voltage (USB transceiver)	5.5 V
Typical junction capacitance (TVS)	35 pF
Maximum data rate (USB transceiver)	12 Mbps

10.2.2 Detailed Design Procedure

To effectively protect USB transceivers, use TVS diodes with breakdown voltages close to 6 V, such as the SN65220, SN65240, or SN75220 devices.

Because of the TVS junction capacitance of 35 pF, apply these TVS diodes only to USB transceivers with full-speed capability that is 12 Mbps maximum.

Place the TVS diodes as close to the board connector as possible to prevent transient energies from entering further board space.

Connect the TVS diode between the data lines (D+, D–) and local circuit ground (GND).

Because noise transient represents high-speed frequencies, ensure low-inductance return paths for the transient currents by providing a solid ground plane and using two VIAs connecting the TVS terminals to ground.

10.2.3 Application Curve

图 10-2. HBM Curve

11 Power Supply Recommendations

Unlike other semiconductor components that require a supply voltage to operate, the SN65220, SN65240, and SN75240 transient suppressors are combinations of multiple p-n diodes, activated by transient voltages. Therefore, these transient suppressors do not require external voltage supplies.

12 Layout

12.1 Layout Guidelines

The multiple ground pins provided lower the connection resistance to ground. In order to improve circuit operation, a connection to all ground pins must be provided on the system printed circuit board. Without proper device connection to ground, the speed and protection capability of the device will be degraded.

- The ground termination pads should be connected directly to a ground plane on the board for optimum performance. A single trace ground conductor will not provide an effective path for fast rise-time transient events including ESD due to parasitic inductance.
- Nominal inductive values of a PCB trace are approximately 20 nH/cm. This value may seem small, but an apparent *short length* of trace may be sufficient to produce significant $L(di/dt)$ effects with fast rise-time ESD spikes.
- Mount the TVS as close as possible to the I/O socket to reduce radiation originating from the transient as it is routed to ground.

注

Direct connective paths of the traces are taken to the suppressor mounting pads to minimize parasitic inductance in the surge-current conductive path, thus minimizing $L(di/dt)$ effects.

TI E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

13.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
