

SN75LVPE3410 クワッド・チャネル PCI-Express 3.0 リニア・リドライバ

1 特長

- PCIe 1.0/2.0/3.0、最高 8Gbps のインターフェイスをサポートするクワッド・チャネル・リニア・イコライザ
- 4GHz で最高 12dB の CTLE ブーストで、チャネルの到達距離を拡大
- 非常に短いレイテンシ: 70ps
- 4GHz で -17dB という優れた反射損失特性
- 小さい付加ランダム・ジッタ (PRBS データ): 60fs (代表値)
- 3.3V 単一電源
- 内部電圧レギュレータによる電源ノイズへの耐性
- 低消費電力: チャネルあたり 124mW (動作時)
- ヒートシンク不要
- ピンストラップまたは SMBus のプログラミング
- 1 つまたは複数の SN75LVPE3410 を使用して x2、x4、x8、x16 PCIe バス幅をサポート
- PCIe 用途での自動レシーバ検出
- プロトコルに依存しないリニア・リドライバにより、PCIe リンク・トレーニングをシームレスにサポート
- 商業用温度範囲: 0°C ~ 70°C
- 4.0mm × 6.0mm、40 ピン WQFN パッケージ

2 アプリケーション

- デスクトップ PC またはマザーボード
- ノート PC
- データ・ストレージ
- モジュール搭載産業用コンピュータ

3 概要

SN75LVPE3410 は、4 チャネルの低消費電力高性能リニア・リピータまたはリドライバで、PCI Express (PCIe™) Generation 1.0、2.0、3.0 をサポートするよう設計されています。

SN75LVPE3410 のレシーバは、連続時間リニア・イコライザ (CTLE) を搭載し、プログラマブルな高周波数での昇圧を実現しています。イコライザは、相互接続媒体 (例: PCB 配線) に起因する符号間干渉 (ISI) によって完全に閉じた入力アイ・パターンを開くことができます。CTLE レシーバにはリニア出力ドライバが接続されています。SN75LVPE3410 のリニアなデータ・パスは送信プリセット信号特性を維持します。リニア・リドライバは、最良の送受信イコライゼーション設定になるようにリンク・トレーニングされた受動チャネルの一部になります。このリンク・トレーニング・プロトコルの透過性は、最良の電気的リンクと最短のレイテンシをもたらします。デバイスのプログラム可能なイコライゼーションとそのリニアなデータ・パスにより、相互接続チャネル内の物理的な配置の柔軟性が最大化され、チャネル全体の性能が向上します。

プログラム可能な設定は、ソフトウェア (SMBus または I²C)、またはピン制御を使用して簡単に適用できます。

パッケージ情報

部品番号	パッケージ (1)	パッケージ・サイズ (2)
SN75LVPE3410	RNQ (WQFN, 40)	6mm × 4mm

- (1) 利用可能なパッケージについては、このデータシートの末尾にある注文情報を参照してください。
- (2) パッケージ・サイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます。

5 Pin Configuration and Functions

図 5-1. RNQ Package, 40-Pin WQFN (Top View)

表 5-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
EN_SMB	2	I, 4-level	Four-level control input used to select SMBus/I ² C or Pin control. L0: Pin mode L1: RESERVED L2: RESERVED L3: I²C or SMBus Target Mode
EQ0_ADDR0	7	I, 4-level	The 4-Level Control Input pins of SN75LVPE3410 is provided in 表 7-4. In I²C or SMBus Mode (EN_SMB = L3), the pins are used to set the I ² C or SMBus address of the device. The pin state is read on power up and decoded is provided in 表 7-5. In Pin mode (EN_SMB = L0), the pins are decoded at power up to control the CTLE boost setting as provided in 表 7-1.
EQ1_ADDR1	6	I, 4-level	
GAIN	5	I, 4-level	Sets DC gain of CTLE at power up. L0: Reserved L1: Reserved L2: 0 dB (recommended) L3: 3.5 dB
GND	EP	P	EP is the Exposed Pad at the bottom of the WQFN package. It is used as the GND return for the device. The EP should be connected to one or more ground planes through low resistance path. A via array provides a low impedance path to GND, and also improves thermal dissipation.
NC	1, 14, 15, 27, 28	—	No connect
PWDN1	21	I, 3.3 V LVC MOS	Two-level logic controlling the operating state of the redriver. The pin triggers PCIe Rx detect state machine when toggled. High: Power down for channels 0 and 1 Low: Power up, normal operation for channels 0 and 1.
PWDN2	25	I, 3.3 V LVC MOS	Two-level logic controlling the operating state of the redriver. The pin triggers PCIe Rx detect state machine when toggled. High: Power down for channels 2 and 3 Low: Power up, normal operation for channels 2 and 3.

表 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
RSVD1	8	—	RESERVED. Can be left unconnected or pulled up to VDD with 4.7k resistor.
RSVD2	22	—	RESERVED. The pin must be pulled high to VDD with external 4.7k resistor.
RSVD3	24	—	Reserved use for TI. The pin must be left floating (NC).
RX_DET	26	I, 4-level	The RX_DET pin controls the receiver detect function. Depending on the input level, a 50 Ω or >50 kΩ termination to the power rail is enabled. More information is provided in 表 7-3.
RX0N	30	I	Inverting differential inputs to the equalizer. An on-chip, 100 Ω termination resistor connects RXP to RXN. Channel 0.
RX0P	29	I	Non-inverting differential inputs to the equalizer. An on-chip, 100 Ω termination resistor connects RXP to RXN. Channel 0.
RX1N	33	I	Inverting differential inputs to the equalizer. An on-chip, 100 Ω termination resistor connects RXP to RXN. Channel 1.
RX1P	32	I	Non-inverting differential inputs to the equalizer. An on-chip, 100 Ω termination resistor connects RXP to RXN. Channel 1.
RX2N	37	I	Inverting differential inputs to the equalizer. An on-chip, 100 Ω termination resistor connects RXP to RXN. Channel 2.
RX2P	36	I	Non-inverting differential inputs to the equalizer. An on-chip, 100 Ω termination resistor connects RXP to RXN. Channel 2.
RX3N	40	I	Inverting differential inputs to the equalizer. An on-chip, 100 Ω termination resistor connects RXP to RXN. Channel 3.
RX3P	39	I	Non-inverting differential inputs to the equalizer. An on-chip, 100 Ω termination resistor connects RXP to RXN. Channel 3.
SCL	3	I/O, 3.3 V LVCMOS, open drain	SMBus / I ² C clock input / open-drain output. External 1 kΩ to 5 kΩ pullup resistor is required as per SMBus / I ² C interface standard. This pin is 3.3 V tolerant.
SDA	4	I/O, 3.3 V LVCMOS, open drain	SMBus / I ² C data input / open-drain clock output. External 1 kΩ to 5 kΩ pullup resistor is required as per SMBus interface standard. This pin is 3.3 V tolerant.
TX0N	19	O	Inverting 50 Ω driver outputs. Compatible with AC-coupled differential inputs. Also used for RX detection at power up. Channel 0.
TX0P	20	O	Non-inverting 50 Ω driver outputs. Compatible with AC-coupled differential inputs. Also used for RX detection at power up. Channel 0.
TX1N	16	O	Inverting 50 Ω driver outputs. Compatible with AC-coupled differential inputs. Also used for RX detection at power up. Channel 1.
TX1P	17	O	Non-inverting 50 Ω driver outputs. Compatible with AC-coupled differential inputs. Also used for RX detection at power up. Channel 1.
TX2N	12	O	Inverting 50 Ω driver outputs. Compatible with AC-coupled differential inputs. Also used for RX detection at power up. Channel 2.
TX2P	13	O	Non-inverting 50 Ω driver outputs. Compatible with AC-coupled differential inputs. Also used for RX detection at power up. Channel 2.
TX3N	9	O	Inverting 50 Ω driver outputs. Compatible with AC-coupled differential inputs. Also used for RX detection at power up. Channel 3.
TX3P	10	O	Non-inverting 50 Ω driver outputs. Compatible with AC-coupled differential inputs. Also used for RX detection at power up. Channel 3.
VDD	31, 34, 35, 38	P	Power supply pins. VDD = 3.3 V ±10%. The VDD pins on this device should be connected through a low-resistance path to the board VDD plane. Typical supply decoupling consists of a 0.1 μF capacitor per VDD pin and one 1.0 μF bulk capacitor per device.
VOD	23	I, 4-level	Sets TX VOD setting at power up. L0: –6 dB L1: –3.5 dB L2: 0 dB (recommended) L3: –1.5 dB

表 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
VREG	11, 18	P	Internal voltage regulator output. Must add decoupling caps of 0.1 μ F near each pin. The regulator is only for internal use. Do not use to power any external components. Do not route the signal beyond the decoupling capacitors on board.

(1) I = input, O = output, P = power

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
VDD _{ABSMAX}	Supply Voltage (VDD)	−0.5	4.0	V
VIO _{CMOS,ABSMAX}	3.3 V LVCMOS and Open Drain I/O voltage	−0.5	4.0	V
VIO _{4LVL,ABSMAX}	4-level Input I/O voltage	−0.5	2.75	V
VIO _{HS-RX,ABSMAX}	High-speed I/O voltage (RXnP, RXnN)	−0.5	3.2	V
VIO _{HS-TX,ABSMAX}	High-speed I/O voltage (TXnP, TXnN)	−0.5	2.75	V
T _{J,ABSMAX}	Junction temperature		150	°C
T _{stg}	Storage temperature range	−65	150	°C

- (1) Operation outside the *Absolute Maximum Rating* may cause permanent device damage. *Absolute Maximum Rating* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Condition*. If used outside the *Recommended Operating Condition* but within the *Absolute Maximum Rating*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±2 kV may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
VDD	Supply voltage, VDD to GND	DC plus AC power should not exceed these limits	3.0	3.3	3.6	V
N _{VDD}	Supply noise tolerance	Supply noise, DC to <50 Hz, sinusoidal ¹			250	mVpp
		Supply noise, 50 Hz to 10 MHz, sinusoidal ¹			20	mVpp
		Supply noise, >10 MHz, sinusoidal ¹			10	mVpp
T _{RampVDD}	VDD supply ramp time	From 0 V to 3.0 V	0.150		100	ms
T _A	Operating ambient temperature		0		70	°C
PW _{LVCMOS}	Minimum pulse width required for the device to detect a valid signal on LVCMOS inputs	PWDN1/2	200			µs
VDD _{SMBUS}	SMBus SDA and SCL Open Drain Termination Voltage	Supply voltage for open drain pull-up resistor			3.6	V
F _{SMBus}	SMBus clock (SCL) frequency in SMBus target mode		10		400	kHz
VID _{LAUNCH}	Source differential launch amplitude		800		1200	mVpp
DR	Data rate	SN75LVPE3410	1		8	Gbps

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		SN75LVPE3410	UNIT
		RNQ, 40 Pins	
R _{θJA} -High K	Junction-to-ambient thermal resistance	31.1	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	21.4	°C/W
R _{θJB}	Junction-to-board thermal resistance	12.1	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.3	°C/W
ψ _{JB}	Junction-to-board characterization parameter	12.1	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	4.1	°C/W

(1) For more information about traditional and new thermal metrics, see the [IC Package Thermal Metrics application report](#).

6.5 DC Electrical Characteristics

over operating free-air temperature and voltage range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power						
I _{ACTIVE}	Device current consumption when all four channels are active	All four channels enabled with VOD = L2, PWDN1, 2 = L		150	200	mA
I _{ACTIVE-HALF}	Device current consumption when two channels are active	Two channels enabled with VOD = L2, PWDN1 or PWDN2 = L		85	112	mA
I _{STBY}	Device current consumption in standby power mode	All four channels disabled, PWDN1, 2 = H		22	33	mA
V _{REG}	Internal regulator output			2.5		V
Control IO						
V _{IH}	High level input voltage	SDA, SCL, PWDN1, PWDN2 pins	2.1			V
V _{IL}	Low level input voltage	SDA, SCL, PWDN1, PWDN2 pins			1.08	V
V _{OH}	High level output voltage	R _{pull-up} = 100 kΩ (SDA, SCL pins)	2			V
V _{OL}	Low level output voltage	I _{OL} = -4 mA (SDA, SCL pins)			0.4	V
I _{IH}	Input high leakage current	V _{Input} = VDD, (SCL, SDA, PWDN1, PWDN2 pins)			10	μA
I _{IL}	Input low leakage current	V _{Input} = 0 V, (SCL, SDA, PWDN1, PWDN2 pins)	-10			μA
C _{IN-CTRL}	Input capacitance			1.5		pF
4 Level IOs (EQ0_ADDR0, EQ1_ADDR1, EN_SMB, RX_DET, VOD, GAIN pins)						
I _{IH_4L}	Input high leakage current, 4 level IOs	VIN = 2.5 V			10	μA
I _{IL_4L}	Input low leakage current, 4 level IOs	VIN = GND	-150			μA
Receiver						
Z _{RX-DC}	Rx DC Single-Ended Impedance			50		Ω
Z _{RX-DIFF-DC}	Rx DC Differential Impedance			100		Ω
Transmitter						
Z _{TX-DIFF-DC}	DC Differential Tx Impedance	Impedance of Tx during active signaling, VID, diff = 1Vpp			120	Ω
V _{TX-DC-CM}	Tx DC common mode Voltage			0.75		V
I _{TX-SHORT}	Tx Short Circuit Current	Total current the Tx can supply when shorted to GND			90	mA

6.6 High Speed Electrical Characteristics

over operating free-air temperature and voltage range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Receiver						
RL _{RX-DIFF}	Input differential return loss with minimal channel in TI evaluation board	50 MHz to 1.25 GHz		-22		dB
		1.25 GHz to 2.5 GHz		-19		dB
		2.5 GHz to 4.0 GHz		-17		dB
RL _{RX-CM}	Input common-mode return loss with minimal channel in TI evaluation board	50 MHz to 2.5 GHz		-18		dB
		2.5 GHz to 4.0 GHz		-13		dB
XT _{RX}	Receive-side pair-to-pair isolation	Minimum pair-to-pair isolation (SDD21) between two adjacent receiver pairs from 10 MHz to 4 GHz.		-50		dB
GAIN	CTLE block DC gain	Ratio at GAIN = L3 and GAIN = L2, with low frequency CK		3.0		dB
Transmitter						
VOD _{L0-L2}	Ratio of VOD gain L0 to L2	GAIN = L2, with low frequency CK		-6		dB
VOD _{L1-L2}	Ratio of VOD gain L1 to L2	GAIN = L2, with low frequency CK		-3.5		dB
VOD _{L3-L2}	Ratio of VOD gain L3 to L2	GAIN = L2, with low frequency CK		-1.5		dB
RL _{TX-DIFF}	Output differential return loss with minimal channel in TI evaluation board	50 MHz to 1.25 GHz		-22		dB
		1.25 GHz to 2.5 GHz		-20		dB
		2.5 GHz to 4.0 GHz		-18		dB
RL _{TX-CM}	Output Common-mode return loss with minimal channel in TI evaluation board	50 MHz to 2.5 GHz		-13		dB
		2.5 GHz to 4.0 GHz		-15		dB
XT _{TX}	Transmit-side pair-to-pair isolation	Minimum pair-to-pair isolation (SDD21) between two adjacent transmitter pairs from 10 MHz to 4 GHz.		-50		dB
Device Datapath						
T _{PLHD/PHLD}	Input-to-output latency (propagation delay) through a channel	Measured by observing propagation delay during either Low-to-High or High-to-Low transition		70	90	ps
L _{TX-SKEW}	Lane-to-Lane Output Skew	Measured between any two lanes within a single transmitter			20	ps
EQGAIN _{4G}	High-frequency EQ boost at 4 GHz	Measured with maximum CTLE setting and maximum BW setting (EQ1 = L3, EQ0 = L3). Boost is defined as the gain at 4 GHz relative to 100 MHz.		12		dB
DCGAIN _{VAR, max}	Maximum AC/DC gain variation	VOD=L2, GAIN=L2, min EQ setting	-2.5		2.5	dB
LINEARITY	The output AC/DC linearity	VOD = L2.		800		mVpp

6.7 SMBUS/I²C Timing Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Target Mode						
T _{SDA-HD}	Data hold time		0			ns
T _{SDA-SU}	Data setup time		100			ns
T _{SDA-R}	SDA rise time, read operation	Pull-up resistor = 1 kΩ, Cb = 50 pF		120		ns
T _{SDA-F}	SDA fall time, read operation	Pull-up resistor = 1 kΩ, Cb = 50 pF		10		ns

6.8 Typical Characteristics

Figure 6-1. Typical EQ Boost vs Frequency for 8 (Out of Available 16) EQ Indices

Figure 6-2. EQ Boost vs Frequency with EQ Index 15 (Maximum Setting) for Different Supply Voltage and Temperature Settings

Figure 6-3. Typical Input (RX) Differential Return Loss vs Frequency in TI Evaluation Board with ≈ 2 dB input and ≈ 2 dB Output Loss

Figure 6-4. Typical Input (RX) Common Mode Return Loss vs Frequency in TI Evaluation Board with ≈ 2 dB Input and ≈ 2 dB Output Loss

Figure 6-5. Typical Output (TX) Differential Return Loss vs Frequency in TI Evaluation Board with ≈ 2 dB Input and ≈ 2 dB Output Loss

Figure 6-6. Typical Output (TX) Common Mode Return Loss vs Frequency in TI Evaluation Board with ≈ 2 dB Input and ≈ 2 dB Output Loss

7 Detailed Description

7.1 Overview

The SN75LVPE3410 is a four-channel multi-rate linear repeater with integrated signal conditioning. The four channels operate independently from one another. Each channel includes a continuous-time linear equalizer (CTLE) and a linear output driver, which together compensate for a lossy transmission channel between the source transmitter and the final receiver. The linearity of the data path is specifically designed to preserve any transmit equalization while keeping receiver equalization effective.

The SN75LVPE3410 can be configured two different ways:

Pin Mode – device control configuration is done solely by strap pins. Pin mode is expected to be good enough for many system implementation needs.

SMBus/I²C Target Mode - provides most flexibility. Requires a SMBus/I²C controller device to configure SN75LVPE3410 through writing to its target address.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Linear Equalization

The SN75LVPE3410 receivers feature a continuous-time linear equalizer (CTLE) that applies high-frequency boost and low-frequency attenuation to help equalize the frequency-dependent insertion loss effects of the passive channel. 表 7-1 shows available equalization boost through EQ0_ADDR0 and EQ1_ADDR1 control pins, when in Pin Control mode (EN_SMB = L0).

表 7-1. Equalization Control Settings

EQUALIZATION SETTING			TYPICAL EQ BOOST
INDEX	EQ1_ADDR1	EQ0_ADDR0	at 4 GHz
0	L0	L0	–0.3
1	L0	L1	0.4
2	L0	L2	3.3
3	L0	L3	3.8
4	L1	L0	4.9
5	L1	L1	5.2
6	L1	L2	5.4
7	L1	L3	6.5
8	L2	L0	6.7
9	L2	L1	7.7
10	L2	L2	8.7
11	L2	L3	9.1
12	L3	L0	9.4
13	L3	L1	10.3
14	L3	L2	10.6
15	L3	L3	11.8

The equalization of the device can also be set by writing to SMBus/I²C registers in target mode.

7.3.2 DC Gain

The VOD or GAIN pins can be used to set the overall data-path DC (low frequency) gain of the SN75LVPE3410. For more information, see the [Pin Configuration and Functions](#) section.

表 7-2 provides how DC gain of the overall data-paths can be set using GAIN and VOD pins, when in Pin Control mode (EN_SMB = L0).

表 7-2. DC Gain Settings

Desired DC Gain (dB)	GAIN	VOD
+3.5	L3	L2
0	L2	L2
–1.5	L2	L3
–3.5	L2	L1
–6	L2	L0

It is advised that the DC gain and equalization of the SN75LVPE3410 are set so that the signal swing at DC and high frequency does not exceed the DC and AC linearity ranges of the devices, respectively. For most PCIe systems the default DC gain setting 0 dB (GAIN and VOD pins floating) would be sufficient. A DC attenuation, however, can be utilized to apply extra equalization when needed, keeping the data-path linear.

7.3.3 Receiver Detect State Machine

The SN75LVPE3410 deploys an RX detect state machine that governs the RX detection cycle as defined in the PCI express specifications. At power up, after a manually triggered event through PWDN1 and PWDN2 pins (in pin mode), or writing to the relevant I²C / SMBus register, the redriver determines whether or not a valid PCI express termination is present at the far end of the link. The RX_DET pin of SN75LVPE3410 provides additional flexibility for system designers to appropriately set the device in the desired mode as provided in [表 7-3](#).

If all four channels of SN75LVPE3410 are used for same PCI express link, the PRWDN1 and PWDN2 pin can be shorted and driven together in a system (for example, by PCIE connector PRSNTx# or fundamental reset PERST# signal).

表 7-3. Receiver Detect State Machine Settings

PWDN1 and PWDN2	RXDET	COMMENTS
L	L0	PCI Express RX detection state machine is enabled. RX detection is asserted after 2x valid detections. Pre Detect: Hi-Z, Post Detect: 50 Ω.
L	L1	PCI Express RX detection state machine is enabled. RX detection is asserted after 3x valid detections. Pre Detect: Hi-Z, Post Detect: 50 Ω.
L	L2 (Float)	PCI Express RX detection state machine is enabled. RX detection is asserted after 1x valid detection. Pre Detect: Hi-Z, Post Detect: 50 Ω.
L	L3	PCI Express RX detection state machine is disabled. Recommended for non PCI Express interface use case where the SN75LVPE3410 is used as buffer with equalization. Always 50 Ω.
H	X	Manual reset, input is high impedance.

7.4 Device Functional Modes

7.4.1 Active PCIe Mode

The device is in normal operation with PCIe state machine enabled by RX_DET = L0/L1/L2. In this mode PWDN1/PWDN2 pins are driven low in a system (for example, by PCIE connector PRSNTx# or fundamental reset PERST# signal). In this mode, the SN75LVPE3410 redrivers and equalizes PCIe RX or TX signals to provide better signal integrity.

7.4.2 Active Buffer Mode

The device is in normal operation with PCIe state machine disabled by RX_DET = L3. This mode is recommended for non-PCIe use cases. In this mode the device is working as a buffer to provide linear equalization to improve signal integrity.

7.4.3 Standby Mode

The device is in standby mode invoked by PWDN1/PWDN2 = H. In this mode, the device is in standby mode conserving power.

7.5 Programming

7.5.1 Control and Configuration Interface

7.5.1.1 Pin Mode

The SN75LVPE3410 can be fully configured through GPIO/Pin-strap pins. In this mode the device uses 2-level and 4-level pins for device control and signal integrity optimum settings. For control pin definitions, see [Pin Configuration and Functions](#).

7.5.1.1.1 Four-Level Control Inputs

The SN75LVPE3410 has six (GAIN, VOD, EQ1_ADDR1, EQ0_ADDR0, EN_SMB, and RX_DET) 4-level inputs pins that are used to control the device. These 4-level inputs use a resistor divider to help set the four levels and provide a wider range of control settings. External resistors must be of 10% tolerance or better.

表 7-4. 4-Level Control Pin Settings

LEVEL	SETTING
L0	1 kΩ to GND
L1	13 kΩ to GND
L2	F (Float)
L3	59 kΩ to GND

7.5.1.2 SMBUS/I²C Register Control Interface

If EN_SMB = L3 (SMBus / I²C control mode), the SN75LVPE3410 is configured through a standard I²C or SMBus interface that may operate up to 400 kHz. The target address of the SN75LVPE3410 is determined by the pin strap settings on the EQ1_ADDR1 and EQ0_ADDR0 pins. The device can be configured for best signal integrity and power settings in the system using the I²C or SMBus interface. The sixteen possible target addresses (8-bit) for the SN75LVPE3410 are provided in 表 7-5.

表 7-5. SMBUS/I²C Target Address Settings

EQ1_ADDR1 PIN LEVEL	EQ0_ADDR0 PIN LEVEL	8-BIT WRITE ADDRESS (HEX)	7-BIT ADDRESS (HEX)
L0	L0	0x30	0x18
L0	L1	0x32	0x19
L0	L2	0x34	0x1A
L0	L3	0x36	0x1B
L1	L0	0x38	0x1C
L1	L1	0x3A	0x1D
L1	L2	0x3C	0x1E
L1	L3	0x3E	0x1F
L2	L0	0x40	0x20
L2	L1	0x42	0x21
L2	L2	0x44	0x22

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The SN75LVPE3410 is a high-speed linear repeater which extends the reach of differential channels impaired by loss from transmission media like PCBs and cables. It can be deployed in a variety of different systems. The following sections outline typical applications and their associated design considerations.

8.2 Typical Applications

The SN75LVPE3410 is a PCI Express linear redriver that can also be configured as interface agnostic redriver by disabling its RX detect feature. The device can be used in wide range of interfaces including PCI Express, SAS and SATA.

図 8-1. PCI Express x2, x4, x8, and x16 Use Cases Using SN75LVPE3410

The SN75LVPE3410 is a protocol agnostic 4-channel linear redriver with PCI Express receiver-detect capability. Its protocol agnostic nature allows it to be used in PCI Express x2, x4, x8, and x16 applications. [Figure 8-1](#) shows how a number of SN75LVPE3410 devices can be used to obtain signal conditioning for PCI Express buses of varying widths. Note all four channels of the SN75LVPE3410 flow in same direction. Therefore, if the device is used for x2 configuration, careful layout consideration is needed. In x2 configuration, the two-channel grouping can be used for PCIe receiver detect. PWDN1 pin puts channels 1 and 2, and PWDN2 pin puts channels 3 and 4 into standby.

8.2.1 PCIe x4 Lane Configuration

The SN75LVPE3410 can be used in server or motherboard applications to boost transmit and receive signals to increase the reach of the host or root complex processor to PCI Express slots or connectors. The following design recommendations can be used in any lane configuration. [Figure 8-2](#) shows a simplified schematic for x4 configuration.

Figure 8-2. Simplified Schematic for PCIe x4 Lane Configuration

8.2.1.1 Design Requirements

As with any high-speed design, there are many factors which influence the overall performance. The following list indicates critical areas for consideration during design.

- Use 85 Ω impedance traces when interfacing with PCIe CEM connectors. Length matching on the P and N traces should be done on the single-ended segments of the differential pair.
- Use a uniform trace width and trace spacing for differential pairs.
- Place AC-coupling capacitors near to the receiver end of each channel segment to minimize reflections.
- AC-coupling capacitors of 220 nF are recommended, set the maximum body size to 0402, and add a cutout void on the GND plane below the landing pad of the capacitor to reduce parasitic capacitance to GND.
- Back-drill connector vias and signal vias to minimize stub length.
- Use reference plane vias to ensure a low inductance path for the return current.

8.2.1.2 Detailed Design Procedure

In PCIe Gen 3.0 applications, the specification requires Rx-Tx link training to establish and optimize signal conditioning settings at 8 Gbps, respectively. In link training, the Rx partner requests a series of FIR – pre-shoot and de-emphasis coefficients (10 Presets) from the Tx partner. The Rx partner includes 7-levels (6 dB to 12 dB) of CTLE followed by a single tap DFE. The link training would pre-condition the signal, with an equalized link between the root-complex and endpoint.

Note that there is no link training in PCIe Gen 1.0 (2.5 Gbps) or PCIe Gen 2.0 (5.0 Gbps) applications. The SN75LVPE3410 is placed in between the Tx and Rx. It helps extend the PCB trace reach distance by boosting the attenuated signals with its equalization, which allows the user to recover the signal by the downstream Rx more easily.

For operation in Gen 3.0 links, the SN75LVPE3410 transmit outputs are designed to pass the Tx Preset signaling onto the Rx for the PCIe Gen 3.0 link to train and optimize the equalization settings. The suggested setting for the SN75LVPE3410 are VOD = 0 dB and DC GAIN = 0 dB. Adjustments to the EQ setting should be performed based on the channel loss to optimize the eye opening in the Rx partner. The available EQ gain settings are provided in [表 7-1](#).

The Tx equalization presets or CTLE and DFE coefficients in the Rx can also be adjusted to further improve the eye opening.

8-3 shows an example for SN75LVPE3410 Typical Connection Schematic.

8-3. SN75LVPE3410 Typical Connection Schematic

8.2.1.3 Application Curves

The SN75LVPE3410 is a linear redriver that can be used to extend channel reach of a PCIe link. Normally, PCIe-compliant TX and RX are equipped with signal-conditioning functions and can handle channel losses of up to 22 dB at 4 GHz. With the SN75LVPE3410, the total channel loss between a PCIe root complex and an end point can be up to 32 dB at 4 GHz.

图 8-4. Test Setup to Demonstrate PCIe 3.0 Link Reach Extension Using SN75LVPE3410 - (a) Baseline Setup, (b) With Redriver

图 8-4 shows a test setup to demonstrate reach extension capability of SN75LVPE3410 as PCIe 3.0 redriver. 表 8-1 provides the test results. As can be seen SN75LVPE3410 provide reach extension such a way that a PCIe 3.0 link with 34 dB total loss passes sigtest compliance requirements. 图 8-5 shows eye diagram from PCIe 3.0 sigtest tool.

表 8-1. PCIe 3.0 Link Reach Extension Using SN75LVPE3410

Setup	Total Link Loss	Minimum Eye Width	Composite Eye Height	PCIe 3.0 Sigtest Result
Baseline setup - no redriver	22 dB	62 ps	88 mV	Pass
Link with redriver	34 dB	37 ps	141 mV	Pass

图 8-5. PCIe 3.0 Sigtest Eye Diagram with 34 dB Total Loss Using SN75LVPE3410

8.3 Power Supply Recommendations

Follow these general guidelines when designing the power supply:

1. The power supply should be designed to provide the operating conditions outlined in the *Recommended Operating Conditions* for DC voltage, AC noise, and start-up ramp time.
2. The SN75LVPE3410 does not require any special power supply filtering, such as ferrite beads, provided that the recommended operating conditions are met. Only standard supply decoupling is required. Typical supply decoupling consists of a 0.1 μF capacitor per VDD pin, one 1.0 μF bulk capacitor per device, and one 10 μF bulk capacitor per power bus that delivers power to one or more SN75LVPE3410 devices. The local decoupling (0.1 μF) capacitors must be connected as close to the VDD pins as possible and with minimal path to the SN75LVPE3410 ground pad.

8.4 Layout

8.4.1 Layout Guidelines

The following guidelines should be followed when designing the layout:

1. Decoupling capacitors should be placed as close to the VDD pins as possible. Placing the decoupling capacitors directly underneath the device is recommended if the board design permits.
2. High-speed differential signals TXnP/TXnN and RXnP/RXnN should be tightly coupled, skew matched, and impedance controlled.
3. Vias should be avoided when possible on the high-speed differential signals. When vias must be used, take care to minimize the via stub, either by transitioning through most/all layers or by back drilling.
4. GND relief can be used (but is not required) beneath the high-speed differential signal pads to improve signal integrity by counteracting the pad capacitance.
5. GND vias should be placed directly beneath the device connecting the GND plane attached to the device to the GND planes on other layers. This has the added benefit of improving thermal conductivity from the device to the board.

8.4.2 Layout Example

*W is a trace width. S is a gap between adjacent traces.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

WQFN - 0.8 mm max height

The drawing consists of three views: a top view, a side view, and a detail view of the pin index area.

- Top View:** Shows the overall footprint of the connector. The total width is 6.1 (5.9). The total height is 4.1 (3.9). The pin index area is defined by a 4.7±0.1 wide section with 2X 4.4 spacing. The pin pitch is 0.4 (0.2 TYP). The pin 1 ID (optional) is 0.05 (0.03). The exposed thermal pad is 2.7±0.1 wide. The pin 1 ID is 0.05 (0.03).
- Side View:** Shows the profile of the connector. The total height is 0.8 MAX. The pin height is 0.05 (0.00). The seating plane is indicated. The pin 1 ID is 0.05 (0.03).
- Detail View:** Shows the pin index area with a 4.7±0.1 wide section and 2X 4.4 spacing. The pin pitch is 0.4 (0.2 TYP). The pin 1 ID is 0.05 (0.03).

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
