JAJSGL8C – DECEMBER 2014 – REVISED JANUARY 2024

TCA9617B レベル変換 FM+ I²C バス リピータ

1 特長

- 2 チャネルの双方向 I²C バッファ
- Standard Mode、Fast Mode (400kHz)、Fast Mode+ (1MHz) の I²C 動作をサポート
- A 側の動作電源電圧範囲：0.8V～5.5V
- B 側の動作電源電圧範囲：2.2V～5.5V
- 0.8V から 5.5V および 2.2V から 5.5V への電圧レベル変換
- フットプリントと機能において TCA9517 を代替可能
- アクティブ HIGH のリピータ イネーブル入力
- オープンドレインの I²C I/O
- 5.5V 許容の I²C およびイネーブル入力に対応
- ロックアップの発生しない動作
- 電源オフ時に高インピーダンスになる I²C バス ピン
- デバイス全体で、クロック ストレッチングと複数マスタの調停をサポート
- JESD 78、Class II 準拠で 100mA 超のラッチアップ性能
- JESD 22 を上回る ESD 保護
  - 人体モデルで 4000V
  - 荷電デバイス モデルで 1500V

2 アプリケーション

- サーバー
- ルーター (テレコム スイッチング機器)
- 産業用機器
- 多くの I²C ターゲットや長い PCB 配線を持つ製品

3 概要

TCA9617B は、BiCMOS のデュアル双方向バッファで、I²C バスおよび SMBus システム用に設計されています。混在モード アプリケーションで、低電圧 (最低 0.8V) とより高い電圧
(2.2V～5.5V) との間の双方向電圧レベル変換 (昇圧変換/降圧変換) を行います。このデバイスにより、I²C および同様のバス システムを拡張でき、レベル シフト時にも性能劣化を防ぐことができます。

TCA9617B は、I²C バス上でシリアル データ (SDA) 信号とシリアル クロック (SCL) 信号の両方をバッファするため、容量が 550pF の 2 つのバスを、I²C アプリケーション内で接続できます。このデバイスを使って電圧や容量のバスを 2 つに分離することもできます。

パッケージ情報

(Top View)

表 4-1. Pin Functions

PIN		DESCRIPTION
NAME	NO.	
VCCA	1	A-side supply voltage (0.8V to 5.5V)
SCLA	2	I^{2}C SCL line, A side. Connect to V_{CCA} through a pull-up resistor.
SDAA	3	I^{2}C SDA line, A side. Connect to V_{CCA} through a pull-up resistor.
GND	4	Supply ground
EN	5	Active-high repeater enable input. Internally connected to V_{CCB} through a weak pull-up resistor.
SDAB	6	I^{2}C SDA line, B side. Connect to V_{CCB} through a pull-up resistor.
SCLB	7	I^{2}C SCL line, B side. Connect to V_{CCB} through a pull-up resistor.
VCCB	8	B-side and device supply voltage (2.2V to 5.5V)

5 Specifications

5.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)[1]

			MIN	MAX	UNIT
V_{CCB}	Supply voltage range		−0.5	6.5	V
V_{CCA}	Supply voltage range		−0.5	6.5	V
V_I	Enable input voltage range[2]		−0.5	6.5	V
V_{IO}	I²C bus voltage range[2]		−0.5	6.5	V
I_{IK}	Input clamp current	$V_I < 0$		−50	mA
I_{OK}	Output clamp current	$V_O < 0$		−50	mA
I_O	Continuous output current			±50	mA
	Continuous current through V_{CC} or GND			±100	mA
T_{stg}	Storage temperature		−65	150	°C

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

(2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[1]	±4000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins[2]	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V_{CCA}	Supply voltage, A-side bus		0.8	V_{CCB}	V
V_{CCB}	Supply voltage, B-side bus		2.2	5.5	V
I_{OLA}	Low-level output current			30	mA
I_{OLB}	Low-level output current		0.1	30	mA
T_A	Ambient temperature		−40	85	°C

5.4 Thermal Information

THERMAL METRIC[1]		DGK	UNIT
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	171.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	77.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	107.1	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	12.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	105.3	°C/W

(1)   For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

5.5 Electrical Characteristics

V_{CCB} = 2.2V to 5.5V, GND = 0V, T_A = –40°C to 85°C (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CCB}	MIN	TYP[1]	MAX	UNIT
V_{IK}	Input clamp voltage	I_I = -18mA	2.2V to 5.5V	-1.2		0	V
V_{OL}	Low-level output voltage	SDAB, SCLB	I_{OL} = 100µA or 30mA, V_{ILA} = 0V	2.2V to 5.5V	0.48	0.53	0.58	V
		SDAA, SCLA	I_{OL} = 30mA			0.1	0.23	
V_{IH}	High-level input voltage	SDAA, SCLA		2.2V to 5.5V	0.7 × V_{CCA}		5.5	V
		SDAB, SCLB			0.7 × V_{CCA}		5.5	
		EN			0.7 × V_{CCB}		5.5	
V_{IL}	Low-level input voltage	SDAA, SCLA		2.2V to 5.5V			0.3 × V_{CCA}	V
		SDAB, SCLB					0.4	
		EN					0.3 × V_{CCB}	
I_{CCA}	Quiescent supply current for V_{CCA}		Both channels low, SDAA = SCLA = GND and I_{OLB} =100µA, or SDAA = SCLA = open and SDAB = SCLB = GND	2.2V to 5.5V			13	µA
I_{CCB}	Quiescent supply current		Both Channels high, SDAA = SCLA = VCCA B-side pulled up to VCCB with pull-up resistors	2.2V to 5.5V		4.5	7	mA
			Both channels low, SDAA = SCLA = GND, I_{OLB} = 100µA	5.5V		5.7	8.1

5.6 Timing Requirements

V_{CCA} = 0.8V to 5.5V, V_{CCB} = 2.2V to 5.5V, GND = 0V, TA = –40°C to 85°C (unless otherwise noted)[1] [2] [3]

PARAMETER		FROM (INPUT)	TO (OUTPUT)	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PLH}	Propagation delay	SDAB, SCLB	SDAA, SCLA		35		90	ns
t_{PLH}	Propagation delay	SDAA, SCLA	SDAB, SCLB	$V_{CCB} \leq 3V$	50		137	ns
t_{PLH}	Propagation delay	SDAA, SCLA	SDAB, SCLB	$V_{CCB} > 3V$	59		250	ns
t_{PHL}	Propagation delay	SDAB, SCLB	SDAA, SCLA		32		144	ns
t_{PHL}	Propagation delay	SDAA, SCLA	SDAB, SCLB		28		140	ns
t_{TLH} [4]	Transition time	B side	30%	70%			88	ns
		A side					37	
t_{THL}	Transition time	B side	70%	30%		5.40	32	ns
		A side				1.40	40	
$t_{su,en}$ [5]	Setup time, EN high before Start condition					100		ns

(1) Times are specified with loads of 240 Ω ±1% and 400 pF ±10% on B-side and 240 Ω ±1% and 200 pF ±10% on A-side. Different load resistance and capacitance alter the rise time, thereby changing the propagation delay and transition times.
(2) Times are specified with A-side signals pulled up to V_{CCA} and B-side signals pulled up to V_{CCB}.
(3) Typical values were measured with V_{CCA} = 0.9 V and V_{CCB} = 2.5 V at T_A = 25°C, unless otherwise noted.
(4) T_{TLH} is determined by the pull-up resistance and load capacitance
(5) EN should change state only when the global bus and the repeater port are in an idle state

5.7 Typical Characteristics

V_{CCA} = 0.9V V_{CCB} = 2.2V

6 Detailed Description

6.1 Overview

The TCA9617B is a BiCMOS dual bidirectional buffer intended for I^{2}C bus and SMBus systems. As with the standard I^{2}C system, pull-up resistors are required to provide the logic high levels on the buffered bus. The TCA9617B has standard open-drain configuration of the I^{2}C bus. The size of these pull-up resistors depends on the system, but each side of the repeater must have a pull-up resistor. The device is designed to work with Standard mode, Fast mode and Fast Mode+ I^{2}C devices. The SCL and SDA lines shall be at high-impedance when either one of the supplies is powered off.

The TCA9617B B-side drivers operate from 2.2V to 5.5V. The output low level for this internal buffer is approximately 0.5V, but the input voltage must be below V_{IL} when the output is externally driven low. The higher-voltage low signal is called a buffered low. When the B-side I/O is driven low internally, the low is not recognized as a low by the input. This feature prevents a lockup condition from occurring when the input low condition is released. This type of design on the B side prevents TCA9617B from being used in series with another TCA9617B B-side or other buffers that incorporate a static or dynamic offset voltage. This is because these devices do not recognize buffered low signals as a valid low and do not propagate the signal as a buffered low again.

The TCA9617B A-side drivers operate from 0.8V to 5.5V and do not have the buffered low feature (or the static offset voltage). This means that a low signal on the B side translates to a nearly 0V low on the A side, which accommodates smaller voltage swings of low-voltage logic. The output pull-down on the A side drives a hard low, and the input level is set to 30% of V_{CCA} to accommodate the need for a lower low level in systems where the low-voltage-side supply voltage is as low as 0.8V.

The A side of two or more TCA9617B can be connected together to allow a star topology, with the A side on the common bus. Also, the A side can be connected directly to any other buffer with static or dynamic offset voltage. Multiple TCA9617B can be connected in series, A side to B side, with no buildup in offset voltage with only time-of-flight delays to consider.

The TCA9617B includes a power-up circuit that keeps the output drivers turned off until V_{CCB} is above 2V and V_{CCA} is above 0.7V. V_{CCA} is only used to provide references for the A-side input comparators and the power-good-detect circuit. The TCA9617B internal circuitry and all I/Os are powered by the V_{CCB} pin.

After power up and with the EN high, the A side falling below 30% of V_{CCA} turns on the corresponding B-side driver (either SDA or SCL) and drives the B-side down momentarily to 0V before settling to approximately 0.5V. When the A-side rises above 30% of V_{CCA}, the B-side pull-down driver is turned off and the external pull-up resistor pulls the pin high. If the B side falls first and goes below 0.4V, the A-side driver is turned on and drives the A-side to 0V. When the B-side rises above 0.45V, the A-side pull-down driver is turned off and the external pull-up resistor pulls the pin high.

6.3 Feature Description

6.3.1 Bidirectional Level Translation

The TCA9617B can provide bidirectional voltage level translation (up-translation and down-translation) between low voltages (down to 0.8V) and higher voltages (2.2V to 5.5V) in mixed-mode applications.

6.3.2 Low to High Transition Characteristics

図 6-2 depicts the offset voltage on the B side of the device. As shown in 図 6-2 the target releases and the B-side rises, and rises to 0.5V and stays there until the A-side rises above 30% of V_{CCA}. This effect can cause the low level signal to have a *pedestal*. Once the voltage on the A-side crosses 30% of V_{CCA}, the B-side begins to rise to V_{CCB}.

Due to nature of the B-side pedestal and the static offset voltage, there is a slight overshoot as the B-side rises from being externally driven low to the 0.5V offset. The TCA9617B is designed to control this behavior provided the system is designed with rise times greater than 20ns. Therefore; care must be taken to limit the pull-up strength when devices with rise time accelerators are present on the B side. Excessive overshoot on the B-side pedestal can cause devices with rise time accelerators to trip prematurely if the overshoot is more than accelerator thresholds.

6.3.3 High-to-Low Transition Characteristics

When the A side of the bus is driven to 30% of V_{CCA}, the B side driver turns on. This drives the B-side to 0V for a short period (see 図 6-2), and then the B-side rises to the static offset voltage of 0.5V (V_{OL} of TCA9617B). This effect, called an inverted pedestal, allows the B-side to drive to logic low much faster than driving to the static offset. Driving to the static offset voltage requires that the fall time be slowed to prevent ringing.
図 6-1. Bus A (0.8V to 5.5V Bus) Waveform
図 6-2. Bus B (2.2V to 5.5V Bus) Waveform

6.4 Device Functional Modes

The TCA9617B has an active-high enable (EN) input with an internal pull-up to V_{CCB}, which allows the user to select when the repeater is active. This can be used to separate a misbehaving target on power-up reset. The EN must never change state during an I²C operation. Disabling during a bus operation can hang the bus. Enabling part way through the bus cycles can confuse the I²C parts being enabled. The EN input must change state only when the global bus and repeater port are in the idle state to prevent system failures.

INPUT EN	FUNCTION
L	Outputs disabled
H	SDAA = SDAB SCLA = SCLB

7 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

7.1 Application Information

A typical application is shown in 図 7-1. In this example, the system controller is running on a 0.9V I^{2}C bus, and the target is connected to a 2.5V bus. Both buses are running at 400kHz. Decoupling capacitors are required, but are not shown in 図 7-6 for simplicity.

The TCA9617B is 5V tolerant so no additional circuits are required to translate between 0.8V to 5.5V bus voltages and 2.7V to 5.5V bus voltages.

When the A side of the TCA9617B is pulled low by a driver on the I^{2}C bus, a comparator detects the falling edge when the signal level goes below 30% of V_{CCA} and cause the internal driver on the B side to turn on. The B-side is first pulled down to 0V, and then settles to 0.5V. When the B side of the TCA9617B falls below 0.4V, the TCA9617B detects the falling edge, turn on the internal driver on the A side and pull the A-side pin down to ground.

On the B-side bus of the TCA9617B, the clock and data lines has a positive offset from ground equal to the V_{OL} of the TCA9617B. After the eighth clock pulse, the data line is pulled to the V_{OL} of the target device, which is close to ground in this example. At the end of the acknowledge, the level rises only to the low level set by the driver of the TCA9617B for a short delay (approximately 0.5V), while the A-side bus rises above 30% of V_{CCA} and then continues high.

Although the TCA9617B has a single application, the device can exist in multiple configurations. 図 7-1 shows the standard configuration for the TCA9617B. Multiple TCA9617Bs can be connected either in star configuration (図 7-4) or in series configuration (図 7-5). The design requirements, detailed design procedure, and application curves in セクション 7.2.1 are valid for all three configurations.

7.2 Typical Application
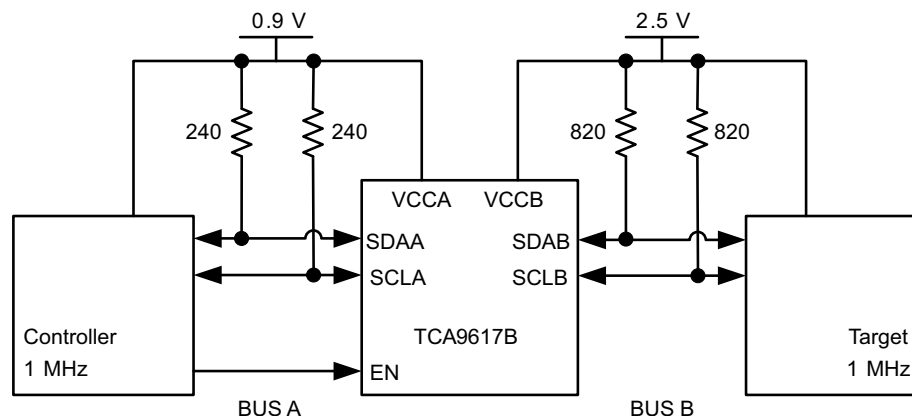

7.2.1 Standard Application

図 7-1. Bidirectional Voltage Level Translator

7.2.1.1 Design Requirements

For the level-translating application, the following must be true:

- V_{CCA} = 0.8V to 5.5V
- V_{CCB} = 2.2V to 5.5V
- $V_{CCA} \leq V_{CCB}$
- $I_{OL} > I_O$

7.2.1.2 Detailed Design Procedure

7.2.1.2.1 Pullup Resistor Sizing

For the TCA9617B to function correctly, all devices on the B-side must be able to pull the B-side below the voltage input low contention level (0.4V). This means that the V_{OL} of any device on the B-side must be below 0.4V for proper operation.

The V_{OL} of a device can be adjusted by changing the I_{OL} through the device which is set by the pull-up resistor value. The pull-up resistor on the B-side must be carefully selected to make sure the logic levels are transferred correctly to the A-side.

The B-side pull-up resistor sizing must also make sure that the rise time is greater than 20ns. Shorter rise times increase the pedestal overshoot shown in 図 7-2.

7.2.1.3 Application Curves
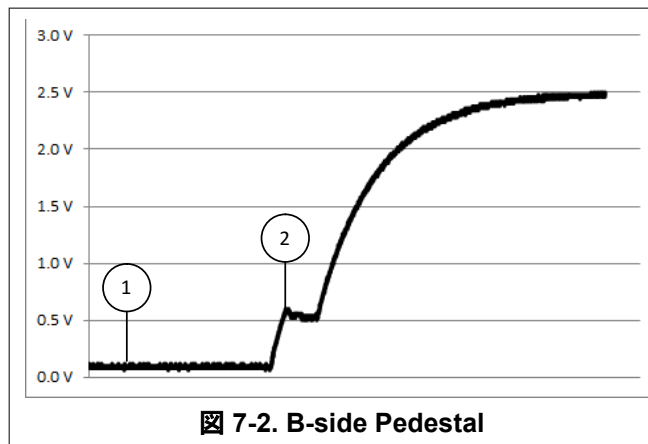

図 7-2. B-side Pedestal
図 7-3. B-side Inverted Pedestal

English Data Sheet: SCPS259

7.2.2 Star Application

Multiple A sides can be connected in a star configuration, allowing all nodes to communicate with each other.
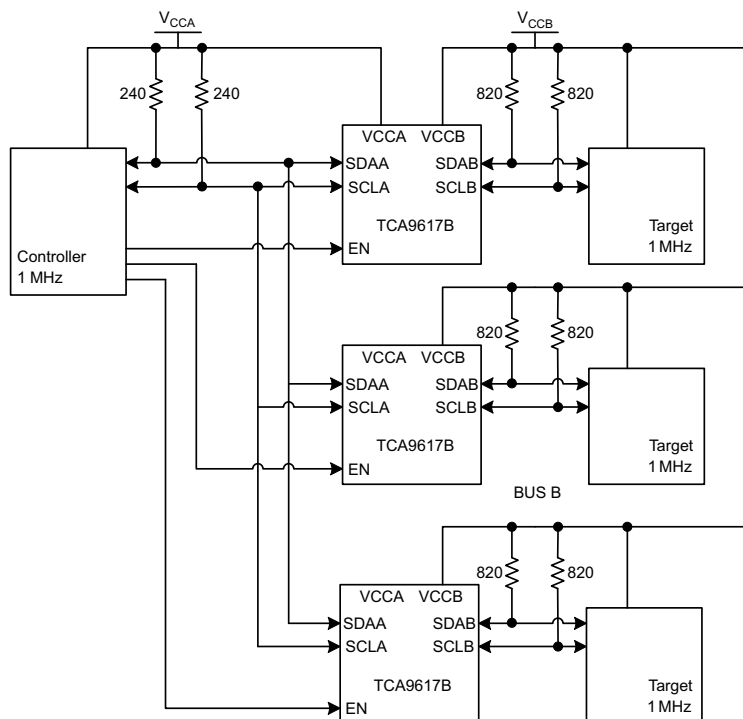

図 7-4. Typical Star Application

7.2.2.1 Design Requirements

7.2.2.2 Detailed Design Procedure

Refer to セクション 7.2.1.2.

7.2.2.3 Application Curves

Refer to セクション 7.2.1.3.

7.2.3 Series Application

Multiple TCA9617Bs can be connected in series as long as the A side is connected to the B side. I^{2}C bus target devices can be connected to any of the bus segments. The number of devices that can be connected in series is limited by repeater delay/time-of-flight considerations on the maximum bus speed requirements.
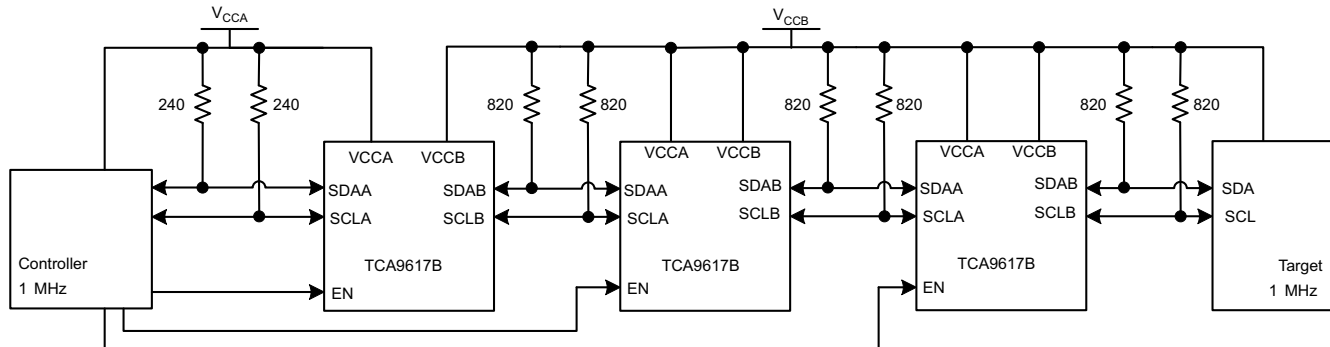

図 7-5. Typical Series Application

7.2.3.1 Design Requirements

Refer to *セクション 7.2.1.1*.

7.2.3.2 Detailed Design Procedure

Refer to *セクション 7.2.1.2*.

7.2.3.3 Application Curves

Refer to *セクション 7.2.1.3*.

7.3 Power Supply Recommendations

For VCCA, an 0.8V to 5.5V power supply is required. For VCCB, a 2.2V to 5.5V power supply is required.

Standard decoupling capacitors are recommended. These capacitors typically range from 0.1µF to 1µF, but the value of the capacitance depends on the frequencies of noise from the power supply.

Product Folder Links: *TCA9617B*

English Data Sheet: *SCPS259*

7.4 Layout

7.4.1 Layout Guidelines

The recommended decoupling capacitors must be placed as close to the VCCA and VCCB pins of the TCA9617B as possible.

お客様がいかなる追加条項または代替条項を提案した場合でも、テキサス・インスツルメンツはそれらに異議を唱え、拒否します。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TCA9617BDGKR	ACTIVE	VSSOP	DGK	8	2500	RoHS & Green	NIPDAUAG	SN	Level-1-260C-UNLIM	-40 to 85	ZBOK	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate
    design recommendations.
12. Board assembly site may have different recommendations for stencil design.
