

TCAN1044A-Q1 車載用、フォルト保護機能搭載、スタンバイモード付き CAN FD トランシーバ

1 特長

- 車載アプリケーション用に AEC-Q100 (グレード 1) 認定済み
- ISO 11898-2:2016 物理層規格要件に適合
- 機能安全対応
 - 機能安全システムの設計に役立つ資料を利用可能
- Classical CAN のサポートと最適化された CAN FD 性能 (2、5、8Mbps)
 - 短く対称的な伝搬遅延時間によりタイミング マージンを強化
- TCAN1044AV の I/O 電圧範囲: 1.7V~5.5V
- 12V および 24V バッテリー アプリケーションをサポート
- レシーバの同相入力電圧: $\pm 12\text{ V}$
- 保護機能:
 - バスフォルト保護: $\pm 58\text{ V}$
 - 低電圧保護
 - TXD ドミナント タイムアウト (DTO)
 - 最小 9.2kbps のデータレート
 - サーマル シャットダウン保護 (TSD)
- 動作モード:
 - 通常モード
 - リモート ウェイクアップ要求をサポートする、低消費電力スタンバイモード
- 電源非接続時の最適化された挙動
 - バスおよびロジックピンは高インピーダンス (動作中のバス、アプリケーションに対して無負荷)
 - ホットプラグ対応: 電源オン / オフ時のバスおよび RXD 出力のグリッチフリー動作
- 8 ピン SOIC、小型フットプリント SOT-23、自動光学検査 (AOI) に適したリードレス VSON-8 パッケージ

2 アプリケーション

- 自動車および輸送システム
 - 車体制御モジュール
 - 車載ゲートウェイ
 - 先進運転支援システム (ADAS)
 - インフォテインメント

3 概要

TCAN1044A-Q1 は、ISO 11898-2:2016 高速 CAN (Controller Area Network) 仕様の物理層要件を満たす高速 CAN トランシーバです。

このトランシーバは、電磁両立性 (EMC) 認証済みであり、最高 5 メガビット/秒 (Mbps) の Classical CAN および CAN FD ネットワークに最適です。これらのデバイスを使用すると、シンプルなネットワークで最大 8Mbps の動作を実現できます。TCAN1044AV-Q1 は V_{IO} ピンによるロジックレベル変換機能を備えているため、トランシーバの I/O を 1.8V、2.5V、3.3V、5V のロジックレベルに直接接続できます。このトランシーバは、低消費電力スタンバイモードと、ISO 11898-2:2016 に規定されたウェイクアップパターン (WUP) に準拠した「CAN によるウェイク」をサポートしています。

このトランシーバは、サーマル シャットダウン (TSD)、TXD ドミナント タイムアウト (DTO)、電源低電圧検出、 $\pm 58\text{ V}$ バスフォルト保護も備えています。これらのデバイスには、電源電圧低下またはフローティングピン発生時のフェイルセーフ動作が定義されています。これらのトランシーバは、業界標準の SOIC-8 および VSON-8 パッケージで供給されるだけでなく、省スペースの小型 SOT-23 パッケージオプションもあります。

パッケージ情報

部品番号	パッケージ (1)	パッケージ サイズ (2)
TCAN1044A-Q1	SOIC (D)	4.9 mm × 6mm
	VSON (DRB)	3 mm × 3mm
	SOT-23 (DDF)	2.9 mm × 2.8mm

- 詳細については、[セクション 12](#) を参照してください。
- パッケージ サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

4 Device Comparison

表 4-1. Device Comparison Table

Part Number	Low Voltage I/O Logic Support on Pin 5	Pin 8 Mode Selection
TCAN1044A-Q1	No	Low Power Standby Mode with Remote Wake
TCAN1044AV-Q1	Yes	

5 Pin Configuration and Functions

図 5-1. DDF Package, 8-Pin SOT (Top View)

図 5-2. D Package, 8-Pin SOIC (Top View)

図 5-3. DRB Package, 8-Pin VSON (Top View)

表 5-1. Pin Functions

Pins		Type	Description
Name	No.		
TXD	1	Digital Input	CAN transmit data input; integrated pull-up
GND	2	GND	Ground connection
V _{CC}	3	Supply	5V supply voltage
RXD	4	Digital Output	CAN receive data output, tri-stated when device powered off
NC	5	—	Not internally connected; Devices without V _{IO}
V _{IO}		Supply	I/O supply voltage for devices with suffix 'V'
CANL	6	Bus IO	Low-level CAN bus input/output line
CANH	7	Bus IO	High-level CAN bus input/output line
STB	8	Digital Input	Standby input for mode control; integrated pull-up
Thermal Pad (VSON only)		—	Connect the thermal pad to any internal PCB ground plane using multiple vias for optimal thermal performance.

6 Specifications

6.1 Absolute Maximum Ratings

(1) (2)

		MIN	MAX	UNIT
V_{CC}	Supply voltage	−0.3	6	V
V_{IO}	Supply voltage I/O level shifter	−0.3	6	V
V_{BUS}	CAN Bus I/O voltage	−58	58	V
V_{DIFF}	Max differential voltage between CANH and CANL	−45	45	V
V_{Logic_Input}	Logic input terminal voltage	−0.3	6	V
V_{RXD}	RXD output terminal voltage range	−0.3	6	V
$I_{O(RXD)}$	RXD output current	−8	8	mA
T_J	Junction temperature	−40	165	°C
T_{STG}	Storage temperature	−65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values, except differential I/O bus voltages, are with respect to ground terminal.

6.2 ESD Ratings

			VALUE	UNIT
V_{ESD}	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±4000	V
		HBM classification level 3A for all pins		
		HBM classification level 3B for global pins CANH and CANL with respect to GND	±10000	V
		Charged-device model (CDM), per AEC Q100-011 CDM classification level C5 for all pins	±750	V

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 ESD Ratings - IEC Specifications

			VALUE	UNIT
V_{ESD}	System level Electrostatic discharge	Unpowered contact discharge per ISO 10605 ⁽¹⁾	±8000	V
		SAE J2962-2 per ISO 10605 Powered Contact Discharge ⁽²⁾	±8000	V
		SAE J2962-2 per ISO 10605 Powered Air Discharge ⁽²⁾	±15000	V
V_{Tran}	Transient voltage per ISO 7637-2 ⁽³⁾	CAN bus terminals to GND		
		Pulse 1	−100	V
		Pulse 2a	75	V
		Pulse 3a	−150	V
		Pulse 3b	100	V
	Transient voltage per ISO 7637-3 ⁽⁴⁾	DCC slow transient pulse	±30	V

- (1) Tested according to IEC 62228-3:2019 CAN Transceivers.
- (2) Results given here are specific to the SAE J2962-2 Communication Transceivers Qualification Requirements - CAN. Testing performed by OEM approved independent third party, EMC report available upon request.
- (3) Tested according to IEC 62228-3:2019 CAN Transceivers.
- (4) Tested according to SAE J2962-2.

6.4 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	4.5	5	5.5	V
V_{IO}	Supply voltage for I/O level shifter	1.7		5.5	V

6.4 Recommended Operating Conditions (続き)

		MIN	NOM	MAX	UNIT
$I_{OH(RXD)}$	RXD terminal high-level output current, Devices with V_{IO}	-1.5			mA
$I_{OL(RXD)}$	RXD terminal low-level output current, Devices with V_{IO}			1.5	mA
$I_{OH(RXD)}$	RXD terminal high-level output current, Devices without V_{IO}	-2			mA
$I_{OL(RXD)}$	RXD terminal low-level output current, Devices without V_{IO}			2	mA
T_J	Operating junction temperature	-40		150	°C

6.5 Thermal Characteristics

THERMAL METRIC ⁽¹⁾		TCAN1044Ax-Q1			UNIT
		D (SOIC)	DDF (SOT)	DRB (VSON)	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	127.5	122	55.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	67.6	63	62.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	70.9	42.4	27.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	19.3	2.4	2.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	70.2	42.2	27.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	--	--	11.5	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.6 Supply Characteristics

Over recommended operating conditions with $T_J = -40^{\circ}\text{C}$ to 150°C (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{CC}	Supply current Normal mode	Dominant	STB = 0 V, TXD = 0 V R _L = 60 Ω, C _L = open See Figure 7-1		45	70	mA
			STB = 0 V, TXD = 0 V R _L = 50 Ω, C _L = open See Figure 7-1		49	80	mA
		Recessive	STB = 0 V, TXD = V _{CC} or V _{IO} R _L = 50 Ω, C _L = open See Figure 7-1		4.5	7.5	mA
		Dominant with bus fault	STB = 0 V, TXD = 0 V CANH = CANL = ±25 V R _L = open, C _L = open See Figure 7-1			130	mA
	Supply current Standby mode Devices with V _{IO}		STB = TXD = V _{IO} R _L = 50 Ω, C _L = open See Figure 7-1			1.5	μA
	Supply current Standby mode Devices without V _{IO}		STB = TXD = V _{CC} R _L = 50 Ω, C _L = open See Figure 7-1			15	μA
I _{IO}	I/O supply current Normal mode	Dominant	STB = 0 V, TXD = 0 V RXD floating		125	300	μA
	I/O supply current Normal mode	Recessive	STB = 0 V, TXD = 0 V RXD floating		25	48	μA
	I/O supply current Standby mode		STB = V _{IO} , TXD = 0 V RXD floating		8.5	14	μA
UV _{CC}	Rising undervoltage detection on V _{CC} for protected mode				4.2	4.4	V
	Falling undervoltage detection on V _{CC} for protected mode			3.5	4	4.25	V
V _{HYS(UVCC)}	Hysteresis voltage on UV _{CC}				200		mV
UV _{VIO}	Rising undervoltage detection on V _{IO} (Devices with V _{IO})				1.56	1.65	V
	Falling undervoltage detection on V _{IO} (Devices with V _{IO})			1.4	1.51	1.59	V
V _{HYS(UVIO)}	Hysteresis voltage on UV _{IO}				40		mV

6.7 Dissipation Ratings

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P _D	Average power dissipation Normal mode	V _{CC} = 5 V, V _{IO} = 1.8 V, T _J = 27°C, R _L = 60 Ω, C _{L_RXD} = 15 pF TXD input = 250 kHz 50% duty cycle square wave		95		mW
		V _{CC} = 5 V, V _{IO} = 3.3 V, T _J = 27°C, R _L = 60 Ω, C _{L_RXD} = 15 pF TXD input = 250 kHz 50% duty cycle square wave		95		mW
		V _{CC} = 5 V, V _{IO} = 5 V, T _J = 27°C, R _L = 60 Ω, C _{L_RXD} = 15 pF TXD input = 250 kHz 50% duty cycle square wave		95		mW
		V _{CC} = 5.5 V, V _{IO} = 1.8 V, T _J = 150°C, R _L = 60Ω, C _{L_RXD} = 15 pF TXD input = 2.5 MHz 50% duty cycle square wave		120		mW
		V _{CC} = 5.5 V, V _{IO} = 3.3 V, T _J = 150°C, R _L = 60 Ω, C _{L_RXD} = 15 pF TXD input = 2.5 MHz 50% duty cycle square wave		120		mW
		V _{CC} = 5.5 V, V _{IO} = 5 V, T _J = 150°C, R _L = 60 Ω, C _{L_RXD} = 15 pF TXD input = 2.5 MHz 50% duty cycle square wave		120		mW
T _{TSD}	Thermal shutdown temperature		175	195	210	°C
T _{TSD(HYS)}	Thermal shutdown hysteresis			12		

6.8 Electrical Characteristics

Over recommended operating conditions with T_J = -40°C to 150°C (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
Driver Electrical Characteristics							
V _{O(DOM)}	Dominant output voltage Normal mode	CANH	STB = 0 V, TXD = 0 V 50 Ω ≤ R _L ≤ 65 Ω, C _L = open, R _{CM} = open	2.75		4.5	V
		CANL	See 7-2 and 8-3	0.5		2.25	V
V _{O(REC)}	Recessive output voltage Normal mode	CANH and CANL	STB = 0 V, TXD = V _{IO} R _L = open (no load), R _{CM} = open See 7-2 and 8-3	2	0.5 V _{CC}	3	V

8 Detailed Description

8.1 Overview

The TCAN1044A(V)-Q1 devices meet or exceed the specifications of the ISO 11898-2:2016 high speed CAN (Controller Area Network) physical layer standard. The devices have been certified to the requirements of ISO 11898-2:2016 physical layer requirements according to the GIFT/ICT high speed CAN test specification. The transceivers provide a number of different protection features for the stringent automotive system requirements while also supporting CAN FD data rates up to 8Mbps.

The TCAN1044A(V)-Q1 support the following CAN and CAN FD standards:

- Physical layer:
 - ISO 11898-2:2016 High speed medium access unit
 - ISO 11898-5:2007 High speed medium access unit with low-power mode
 - SAE J2284-1: High Speed CAN (HSC) for Vehicle Applications at 125kbps
 - SAE J2284-2: High Speed CAN (HSC) for Vehicle Applications at 250kbps
 - SAE J2284-3: High Speed CAN (HSC) for Vehicle Applications at 500kbps
 - SAE J2284-4: High-Speed CAN (HSC) for Vehicle Applications at 500kbps with CAN FD Data at 2Mbps
 - SAE J2284-5: High-Speed CAN (HSC) for Vehicle Applications at 500kbps with CAN FD Data at 5Mbps
- EMC Requirements
 - IEC 62228-3 EMC evaluation of transceivers - CAN transceivers
 - VeLIO (Vehicle LAN Interoperability and Optimization) CAN and CAN-FD Transceiver Requirements
 - SAE J2962-2 Communication Transceivers Qualification Requirements – CAN
- Conformance test requirements:
 - ISO 16845-2 Road vehicles – Controller area network (CAN) conformance test plan Part 2: High-speed medium access unit conformance test plan

8.2 Functional Block Diagram

図 8-1. Block Diagram

8.3 Feature Description

8.3.1 Pin Description

8.3.1.1 TXD

The TXD input is a logic-level signal, referenced to either V_{CC} or V_{IO} from a CAN controller to the transceiver.

8.3.1.2 GND

GND is the ground pin of the transceiver. The pin must be connected to the PCB ground.

8.3.1.3 V_{CC}

V_{CC} provides the 5-V power supply to the CAN transceiver.

8.3.1.4 RXD

RXD is the logic-level signal, referenced to either V_{CC} or V_{IO} , from the TCAN1044A-Q1 to a CAN controller. This pin is only driven once V_{IO} is present.

8.3.1.5 V_{IO}

The V_{IO} pin provides the digital I/O voltage to match the CAN controller voltage thus avoiding the requirement for a level shifter. It supports voltages from 1.7 V to 5.5 V providing the widest range of controller support.

8.3.1.6 CANH and CANL

The CANH and CANL pins are the CAN high and CAN low differential bus pins. These pins are internally connected to the CAN transmitter, receiver and the low-power wake-up receiver.

8.3.1.7 STB (Standby)

The STB pin is an input pin used for mode control of the transceiver. The STB pin can be supplied from either the system processor or from a static system voltage source. If normal mode is the only intended mode of operation, the STB pin can be tied directly to GND.

8.3.2 CAN Bus States

The CAN bus has two logical states during operation: recessive and dominant. See [Figure 8-2](#) and [Figure 8-3](#).

A dominant bus state occurs when the bus is driven differentially and corresponds to a logic low on the TXD and RXD pins. A recessive bus state occurs when the bus is biased to $V_{CC}/2$ via the high-resistance internal input resistors (R_{IN}) of the receiver and corresponds to a logic high on the TXD and RXD pins.

A dominant state overwrites the recessive state during arbitration. Multiple CAN nodes may be transmitting a dominant bit at the same time during arbitration, and in this case the differential voltage of the bus is greater than the differential voltage of a single driver.

The TCAN1044A(V)-Q1 transceiver implements a low-power standby (STB) mode which enables a third bus state where the bus pins are weakly biased to ground via the high resistance internal resistors of the receiver. See [Figure 8-2](#) and [Figure 8-3](#).

Figure 8-2. Bus States

A. A - Normal Mode B - Standby Mode

図 8-3. Simplified Recessive Common Mode Bias Unit and Receiver

8.3.3 TXD Dominant Timeout (DTO)

During normal mode, the only mode where the CAN driver is active, the TXD DTO circuit prevents the local node from blocking network communication in the event of a hardware or software failure where TXD is held dominant longer than the timeout period t_{TXD_DTO} . The TXD DTO circuit is triggered by a falling edge on TXD. If no rising edge is seen before the timeout period of the circuit, t_{TXD_DTO} , the CAN driver is disabled. This frees the bus for communication between other nodes on the network. The CAN driver is reactivated when a recessive signal is seen on the TXD pin, thus clearing the dominant time out. The receiver remains active and biased to $V_{CC}/2$ and the RXD output reflects the activity on the CAN bus during the TXD DTO fault.

The minimum dominant TXD time allowed by the TXD DTO circuit limits the minimum possible transmitted data rate of the device. The CAN protocol allows a maximum of eleven successive dominant bits (on TXD) for the worst case, where five successive dominant bits are followed immediately by an error frame. The minimum transmitted data rate may be calculated using 式 1.

$$\text{Minimum Data Rate} = 11 \text{ bits} / t_{TXD_DTO} = 11 \text{ bits} / 1.2 \text{ ms} = 9.2 \text{ kbps} \quad (1)$$

図 8-4. Example Timing Diagram for TXD Dominant Timeout

8.3.4 CAN Bus short-circuit current limiting

The TCAN1044A(V)-Q1 has several protection features that limit the short-circuit current when a CAN bus line is shorted. These include CAN driver current limiting in the dominant and recessive states and TXD dominant state timeout which prevents permanently having the higher short-circuit current of a dominant state in case of a system fault. During CAN communication the bus switches between the dominant and recessive states, thus the short-circuit current may be viewed as either the current during each bus state or as a DC average current. When selecting termination resistors or a common-mode choke for the CAN design the average power rating, $I_{OS(AVG)}$, should be used. The percentage dominant is limited by the TXD DTO and the CAN protocol which has forced state changes and recessive bits due to bit stuffing, control fields, and interframe space. These ensure there is a minimum amount of recessive time on the bus even if the data field contains a high percentage of dominant bits.

The average short-circuit current of the bus depends on the ratio of recessive to dominant bits and their respective short-circuit currents. The average short-circuit current may be calculated using 式 2.

$$I_{OS(AVG)} = \% \text{ Transmit} \times [(\% \text{ REC_Bits} \times I_{OS(SS_REC)}) + (\% \text{ DOM_Bits} \times I_{OS(SS_DOM)})] + [\% \text{ Receive} \times I_{OS(SS_REC)}] \quad (2)$$

Where:

- $I_{OS(AVG)}$ is the average short-circuit current
- % Transmit is the percentage the node is transmitting CAN messages
- % Receive is the percentage the node is receiving CAN messages
- % REC_Bits is the percentage of recessive bits in the transmitted CAN messages
- % DOM_Bits is the percentage of dominant bits in the transmitted CAN messages
- $I_{OS(SS_REC)}$ is the recessive steady state short-circuit current
- $I_{OS(SS_DOM)}$ is the dominant steady state short-circuit current

This short circuit current and the possible fault cases of the network should be taken into consideration when sizing the power supply used to generate the transceivers V_{CC} supply.

8.3.5 Thermal Shutdown (TSD)

If the junction temperature of the TCAN1044A(V)-Q1 exceeds the thermal shutdown threshold, T_{TSD} , the device turns off the CAN driver circuitry and blocks the TXD to bus transmission path. The shutdown condition is cleared when the junction temperature of the device drops below T_{TSD} . The CAN bus pins are biased to $V_{CC}/2$ during a TSD fault and the receiver to RXD path remains operational. The TCAN1044A(V)-Q1 TSD circuit includes hysteresis which prevents the CAN driver output from oscillating during a TSD fault.

8.3.6 Undervoltage Lockout

The supply pins, V_{CC} and V_{IO} , have undervoltage detection that places the device into a protected state. This protects the bus during an undervoltage event on either supply pin.

表 8-1. Undervoltage Lockout - TCAN1044A-Q1

V_{CC}	DEVICE STATE	BUS	RXD PIN
$> UV_{VCC}$	Normal	Per TXD	Mirrors bus
$< UV_{VCC}$	Protected	High impedance	High impedance

表 8-2. Undervoltage Lockout - TCAN1044AV-Q1

V_{CC}	V_{IO}	DEVICE STATE	BUS	RXD PIN
$> UV_{VCC}$	$> UV_{VIO}$	Normal	Per TXD	Mirrors bus
$< UV_{VCC}$	$> UV_{VIO}$	STB = High: Standby Mode	Weak biased to GND	V_{IO} : Remote wake request See Remote Wake Request via Wake-Up Pattern (WUP) in Standby Mode
		STB = Low: Protected Mode	High impedance	Recessive
$> UV_{VCC}$	$< UV_{VIO}$	Protected	High impedance	High impedance

表 8-2. Undervoltage Lockout - TCAN1044AV-Q1 (続き)

V _{CC}	V _{IO}	DEVICE STATE	BUS	RXD PIN
< UV _{VCC}	< UV _{VIO}	Protected	High impedance	High impedance

Once the undervoltage condition is cleared and t_{MODE} has expired the TCAN1044A-Q1 will transition to normal mode and the host controller can send and receive CAN traffic again

8.3.7 Unpowered Device

The TCAN1044A(V)-Q1 is designed to be a passive or no load to the CAN bus if the device is unpowered. The bus pins were designed to have low leakage currents when the device is unpowered, so the pins do not load the bus. This is critical if some nodes of the network are unpowered while the rest of the of network remains operational.

The logic pins also have low leakage currents when the device is unpowered, so the pins do not load other circuits which may remain powered.

8.3.8 Floating pins

The TCAN1044A(V)-Q1 has internal pull-ups on critical pins which place the device into known states if the pin floats. This internal bias should not be relied upon by design though, especially in noisy environments, but instead should be considered a failsafe protection feature.

When a CAN controller supporting open-drain outputs is used an adequate external pull-up resistor must be chosen. This ensures that the TXD output of the CAN controller maintains acceptable bit time to the input of the CAN transceiver. See 表 8-3 for details on pin bias conditions.

表 8-3. Pin Bias

Pin	Pull-up or Pull-down	Comment
TXD	Pull-up	Weakly biases TXD towards recessive to prevent bus blockage or TXD DTO triggering
STB	Pull-up	Weakly biases STB towards low-power standby mode to prevent excessive system power

8.4 Device Functional Modes

8.4.1 Operating Modes

The TCAN1044A(V)-Q1 has two main operating modes; normal mode and standby mode. Operating mode selection is made by applying a high or low level to the STB pin.

表 8-4. Operating Modes

STB	Device Mode	Driver	Receiver	RXD Pin
High	Low current standby mode with bus wake-up	Disabled	Low-power receiver and bus monitor enable	High (recessive) until valid WUP is received See Remote Wake Request via Wake-Up Pattern (WUP) in Standby Mode
Low	Normal Mode	Enabled	Enabled	Mirrors bus state

8.4.2 Normal Mode

This is the normal operating mode of the TCAN1044A(V)-Q1. The CAN driver and receiver are fully operational and CAN communication is bi-directional.

The driver is translating a digital input on the TXD input to a differential output on the CANH and CANL bus pins.

The receiver is translating the differential signal from CANH and CANL to a digital output on the RXD output.

8.4.3 Standby Mode

This is the low-power mode of the TCAN1044A(V)-Q1. The CAN driver and main receiver are switched off and bi-directional CAN communication is not possible. The low-power receiver and bus monitor circuits are enabled to allow for RXD wake-up requests via the CAN bus. A wake-up request is output to RXD as shown in [Figure 8-5](#). The local CAN protocol controller should monitor RXD for transitions (high-to-low) and reactivate the device to normal mode by pulling the STB pin low. The CAN bus pins are weakly pulled to GND in this mode; see [Figure 8-2](#) and [Figure 8-3](#).

In standby mode, only the V_{IO} supply is required therefore the V_{CC} may be switched off for additional system level current savings.

8.4.3.1 Remote Wake Request via Wake-Up Pattern (WUP) in Standby Mode

The TCAN1044A(V)-Q1 supports a remote wake-up request that is used to indicate to the host controller that the bus is active and the node should return to normal operation.

The device uses the multiple filtered dominant wake-up pattern (WUP) from the ISO 11898-2:2016 standard to qualify bus activity. Once a valid WUP has been received, the wake request is indicated to the controller by a falling edge and low period corresponding to a filtered dominant on the RXD output of the TCAN1044A(V)-Q1.

The WUP consists of a filtered dominant pulse, followed by a filtered recessive pulse, and finally by a second filtered dominant pulse. The first filtered dominant initiates the WUP, and the bus monitor then waits on a filtered recessive; other bus traffic does not reset the bus monitor. Once a filtered recessive is received the bus monitor is waiting for a filtered dominant and again, other bus traffic does not reset the bus monitor. Immediately upon reception of the second filtered dominant the bus monitor recognizes the WUP and drives the RXD output low every time an additional filtered dominant signal is received from the bus.

For a dominant or recessive to be considered filtered, the bus must be in that state for more than the t_{WK_FILTER} time. Due to variability in t_{WK_FILTER} the following scenarios are applicable. Bus state times less than $t_{WK_FILTER(MIN)}$ are never detected as part of a WUP and thus no wake request is generated. Bus state times between $t_{WK_FILTER(MIN)}$ and $t_{WK_FILTER(MAX)}$ may be detected as part of a WUP and a wake-up request may be generated. Bus state times greater than $t_{WK_FILTER(MAX)}$ are always detected as part of a WUP, and thus a wake request is always generated. See [Figure 8-5](#) for the timing diagram of the wake-up pattern.

The pattern and t_{WK_FILTER} time used for the WUP prevents noise and bus stuck dominant faults from causing false wake-up requests while allowing any valid message to initiate a wake-up request.

The ISO 11898-2:2016 standard has defined times for a short and long wake-up filter time. The t_{WK_FILTER} timing for the device has been picked to be within the minimum and maximum values of both filter ranges. This timing has been chosen such that a single bit time at 500 kbps, or two back-to-back bit times at 1 Mbps triggers the filter in either bus state. Any CAN frame at 500 kbps or less would contain a valid WUP.

For an additional layer of robustness and to prevent false wake-ups, the device implements a wake-up timeout feature. For a remote wake-up event to successfully occur, the entire WUP must be received within the timeout value $t \leq t_{WK_TIMEOUT}$. If not, the internal logic is reset and the transceiver remains in its current state without waking up. The full pattern must then be transmitted again, conforming to the constraints mentioned in this section. See [Figure 8-5](#) for the timing diagram of the wake-up pattern with wake timeout feature.

図 8-5. Wake-Up Pattern (WUP) with $t_{WK_TIMEOUT}$

8.4.4 Driver and Receiver Function

The TCAN1044A-Q1 logic I/Os support CMOS levels with respect to either V_{CC} for 5V systems (TCAN1044A-Q1) or V_{IO} for compatibility with MCUs that support 1.8V, 2.5V, 3.3V, or 5V systems (TCAN1044AV-Q1).

表 8-5. Driver Function Table

Device Mode	TXD Input ⁽¹⁾	Bus Outputs		Driven Bus State ⁽²⁾
		CANH	CANL	
Normal	Low	High	Low	Dominant
	High or open	High impedance	High impedance	Biased recessive
Standby	X	High impedance	High impedance	Biased to ground

(1) X = irrelevant

(2) For bus state and bias see 図 8-2 and 図 8-3

表 8-6. Receiver Function Table Normal and Standby Mode

Device Mode	CAN Differential Inputs $V_{ID} = V_{CANH} - V_{CANL}$	Bus State	RXD Pin
Normal	$V_{ID} \geq 0.9V$	Dominant	Low
	$0.5V < V_{ID} < 0.9V$	Undefined	Undefined
	$V_{ID} \leq 0.5V$	Recessive	High
Standby	$V_{ID} \geq 1.15V$	Dominant	High Low if a remote wake event occurred See 図 8-5
	$0.4V < V_{ID} < 1.15V$	Undefined	
	$V_{ID} \leq 0.4V$	Recessive	
Any	Open ($V_{ID} \approx 0V$)	Open	High

9.1 Application Information

9.2 Typical Application

The TCAN1044A(V)-Q1 transceiver can be used in applications with a host controller or FPGA that includes the link layer portion of the CAN protocol. [図 9-1](#) shows a typical configuration for 5V controller applications. The bus termination is shown for illustrative purposes.

図 9-1. Transceiver Application Using 5V IO Connections

9.2.1 Design Requirements

9.2.1.1 CAN Termination

Termination may be a single 120Ω resistor at each end of the bus, either on the cable or in a terminating node. If filtering and stabilization of the common-mode voltage of the bus is desired then split termination may be used, see [図 9-2](#). Split termination improves the electromagnetic emissions behavior of the network by filtering higher-frequency common-mode noise that may be present on the differential signal lines.

図 9-2. CAN Bus Termination Concepts

9.2.2 Detailed Design Procedures

9.2.2.1 Bus Loading, Length and Number of Nodes

A typical CAN application may have a maximum bus length of 40 meters and maximum stub length of 0.3m. However, with careful design, users can have longer cables, longer stub lengths, and many more nodes to a bus. A high number of nodes requires a transceiver with high input impedance such as the TCAN1044A(V)-Q1

Many CAN organizations and standards have scaled the use of CAN for applications outside the original ISO 11898-2 standard. They made system level trade off decisions for data rate, cable length, and parasitic loading of the bus. Examples of these CAN systems level specifications are ARINC 825, CANopen, DeviceNet, SAE J2284, SAE J1939, and NMEA 2000.

A CAN network system design is a series of tradeoffs. In the ISO 11898-2:2016 specification the driver differential output is specified with a bus load that can range from 50Ω to 65Ω where the differential output must be greater than 1.5V. The TCAN1044A(V)-Q1 family is specified to meet the 1.5V requirement down to 50Ω and is specified to meet 1.4V differential output at 45Ω bus load. The differential input resistance of the TCAN1044A(V)-Q1 is a minimum of 40kΩ. If 100 TCAN1044A(V)-Q1 transceivers are in parallel on a bus, this is equivalent to a 400-Ω differential load in parallel with the nominal 60Ω bus termination which gives a total bus load of approximately 52Ω. Therefore, the TCAN1044A(V)-Q1 family theoretically supports over 100 transceivers on a single bus segment. However, for a CAN network design margin must be given for signal loss across the system and cabling, parasitic loadings, timing, network imbalances, ground offsets, and signal integrity. Thus a practical maximum number of nodes is often lower. Bus length may also be extended beyond 40 meters by careful system design and data rate tradeoffs. For example, CANopen network design guidelines allow the network to be up to 1km with changes in the termination resistance, cabling, less than 64 nodes and significantly lowered data rate.

This flexibility in CAN network design is one of the key strengths of the various extensions and additional standards that have been built on the original ISO 11898-2 CAN standard. However, when using this flexibility the CAN network system designer must take the responsibility of good network design to ensure robust network operation.

Please refer to the application report [SLLA270: Controller Area Network Physical layer requirements](#). This document discusses in detail all system design physical layer parameters.

図 9-3. Typical CAN Bus

9.3 System Examples

The TCAN1044AV-Q1 CAN transceiver is typically used in applications with a host controller or FPGA that includes the link layer portion of the CAN protocol. A 1.8V, 2.5V, or 3.3V application is shown in 図 9-4. The bus termination is shown for illustrative purposes.

図 9-4. Typical Transceiver Application Using 1.8V, 2.5V, 3.3V IO Connections

9.4 Power Supply Recommendations

The TCAN1044A-Q1 transceiver is designed to operate with a main V_{CC} input voltage supply range between 4.5V and 5.5V.

The TCAN1044AV-Q1 implements an IO level shifting supply input, V_{IO} , designed for a range between 1.8V and 5.5V.

Both the V_{CC} and V_{IO} inputs must be well regulated. In addition to the power supply filtering a decoupling capacitance, typically 100nF, should be placed near the CAN transceiver's main V_{CC} and V_{IO} supply pins.

9.5 Layout

Robust and reliable CAN node design may require special layout techniques depending on the application and design requirements. Since transient disturbances have high frequency content and a wide bandwidth, high-frequency layout techniques should be applied during PCB design.

9.5.1 Layout Guidelines

- Place the protection and filtering circuitry close to the bus connector, J1, to prevent transients, ESD, and noise from propagating onto the board. This layout example shows an optional transient voltage suppression (TVS) diode, D1, which may be implemented if the system-level requirements exceed the specified rating of the transceiver. This example also shows optional bus filter capacitors C4 and C5.
- Design the bus protection components in the direction of the signal path. Do not force the transient current to divert from the signal path to reach the protection device.
- Decoupling capacitors should be placed as close as possible to the supply pins V_{CC} and V_{IO} of transceiver.
- Use at least two vias for supply and ground connections of bypass capacitors and protection devices to minimize trace and via inductance.

注

High-frequency current follows the path of least impedance and not the path of least resistance.

- This layout example shows how split termination could be implemented on the CAN node. The termination is split into two resistors, R2 and R3, with the center or split tap of the termination connected to ground via capacitor C3. Split termination provides common mode filtering for the bus. See [セクション 9.2.1.1](#), [セクション 8.3.4](#), and [式 2](#) for information on termination concepts and power ratings needed for the termination resistor(s).

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

SOT-23-THIN - 1.1 mm max height

PLASTIC SMALL OUTLINE

4222047/E 07/2024

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

2. This drawing is subject to change without notice.

3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.

EXAMPLE BOARD LAYOUT

DDF0008A

SOT-23-THIN - 1.1 mm max height

PLASTIC SMALL OUTLINE

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4222047/E 07/2024

NOTES: (continued)

4. Publication IPC-7351 may have alternate designs.
5. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DDF0008A

SOT-23-THIN - 1.1 mm max height

PLASTIC SMALL OUTLINE

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4222047/E 07/2024

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
7. Board assembly site may have different recommendations for stencil design.

PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:8X

SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

DRB 8

GENERIC PACKAGE VIEW

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4203482/L

4225036/A 06/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 20X

SOLDER MASK DETAILS

4225036/A 06/2019

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD
81% PRINTED COVERAGE BY AREA
SCALE: 20X

4225036/A 06/2019

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
