

# TLV1704-SEP 2.2V~24V、宇宙向け強化プラスチックの耐放射線マイクロパワー クワッド コンパレータ

## 1 特長

- VID V62/18613
- 耐放射線
  - 単一イベント ラッチアップ (SEL) 耐性: 125°C で 43MeV-cm<sup>2</sup>/mg まで
  - 30krad(Si) まで ELDRS フリー
  - すべてのウェハー ロットについて、30krad(Si) までの吸収線量 (TID) RLAT
- 宇宙向け強化プラスチック
  - 管理されたベースライン
  - 金線
  - NiPdAu リード仕上げ
  - 単一のアセンブリ / テスト施設
  - 単一の製造施設
  - 軍用温度範囲 (-55°C~125°C) を供給可能
  - 長期にわたる製品ライフ サイクル
  - 製品変更通知期間の延長
  - 製品のトレーサビリティ
  - モールド コンパウンドの改良による低いガス放出
- 電源電圧範囲: 2.2V~24V
- 低い静止電流: 55μA (コンパレータあたり)
- 入力同相範囲に両レールを含む
- 小さい伝搬遅延: 560ns
- 低い入力オフセット電圧: 300μV
- オープン コレクタ出力:
  - 電源電圧に関係なく負電源を最大 24V 上回る
- 小型パッケージ:
  - クワッド: TSSOP-14

## 2 アプリケーション

- コマンドとデータの処理 (C&DH)
- 航空機のcockpit・ディスプレイ
- 飛行制御ユニット
- 衛星用電源システム (EPS)

## 3 概要

TLV1704-SEP (クワッド) デバイスは広い電源電圧範囲、レール ツー レール入力、小さい静止電流、短い伝搬遅延が特長です。これらの機能はすべて業界標準の TSSOP-14 プラスチック パッケージで提供されているため、これらのデバイスは、サイズ、重量、設計の柔軟性が重要なアプリケーションに適しています。

オープン コレクタ出力により、TLV1704-SEP の電源電圧に関係なく、負電源を最大 24V 上回る電圧レールまで出力をレベルシフトすることができます。同様に、出力を互いに接続して 1 つの ALERT 信号を形成できます。

このデバイスはマイクロパワー コンパレータです。低い入力オフセット電圧、小さい入力バイアス電流、小さい消費電流、オープン コレクタ構成により、TLV1704-SEP デバイスは電圧監視、電流センシング、ゼロクロス検出などのシステム診断に最適です。

### 製品情報

| 部品番号             | グレード (1)        | パッケージ (2)  |
|------------------|-----------------|------------|
| TLV1704AMPWTPSEP | 30krad(Si) RLAT | TSSOP (14) |
| TLV1704AMPWPSEP  |                 |            |

- (1) 利用可能なパッケージについては、データシートの末尾にあるパッケージ オプションについての付録を参照してください。
- (2) パッケージ サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

## 4 Pin Configuration and Functions

**図 4-1. TLV1704-SEP PW Package  
14-Pin TSSOP  
Top View**

**表 4-1. Pin Functions**

| PIN  |     | I/O | DESCRIPTION                      |
|------|-----|-----|----------------------------------|
| NAME | NO. |     |                                  |
| IN+  | —   | I   | Noninverting input.              |
| 1IN+ | 5   | I   | Noninverting input, channel 1.   |
| 2IN+ | 7   | I   | Noninverting input, channel 2.   |
| 3IN+ | 9   | I   | Noninverting input, channel 3.   |
| 4IN+ | 11  | I   | Noninverting input, channel 4.   |
| IN–  | —   | I   | Inverting input.                 |
| 1IN– | 4   | I   | Inverting input, channel 1.      |
| 2IN– | 6   | I   | Inverting input, channel 2.      |
| 3IN– | 8   | I   | Inverting input, channel 3.      |
| 4IN– | 10  | I   | Inverting input, channel 4.      |
| OUT  | —   | O   | Output.                          |
| 1OUT | 2   | O   | Output, channel 1.               |
| 2OUT | 1   | O   | Output, channel 2.               |
| 3OUT | 14  | O   | Output, channel 3.               |
| 4OUT | 13  | O   | Output, channel 4.               |
| V+   | 3   | —   | Positive (highest) power supply. |
| V–   | 12  | —   | Negative (lowest) power supply.  |

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                                       |                        | MIN              | MAX              | UNIT |
|---------------------------------------|------------------------|------------------|------------------|------|
| Supply voltage                        |                        |                  | 24               | V    |
| Signal input pins                     | Voltage <sup>(2)</sup> | $(V_{S-}) - 0.5$ | $(V_{S+}) + 0.5$ | V    |
|                                       | Current <sup>(2)</sup> |                  | ±10              | mA   |
| Output short-circuit <sup>(3)</sup>   |                        | Continuous       |                  | mA   |
| Operating Junction temperature, $T_J$ |                        | –55              | 125              | °C   |
| Storage temperature, $T_{stg}$        |                        | –65              | 150              | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input pins are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails must be current limited to 10mA or less.
- (3) Short-circuit to ground; one comparator per package.

### 5.2 ESD Ratings

|                                     |                                                         | VALUE | UNIT |
|-------------------------------------|---------------------------------------------------------|-------|------|
| $V_{(ESD)}$ Electrostatic discharge | Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup> | ±1000 | V    |
|                                     | Charged-device model (CDM), per AEC Q100-011            | ±1000 |      |

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                                            | MIN | NOM | MAX | UNIT |
|--------------------------------------------|-----|-----|-----|------|
| Supply voltage $V_S = (V_{S+}) - (V_{S-})$ | 2.2 |     | 24  | V    |
| Specified temperature                      | –55 |     | 125 | °C   |

### 5.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |                                              | TLV1704-SEP | UNIT |
|-------------------------------|----------------------------------------------|-------------|------|
|                               |                                              | PW (TSSOP)  |      |
|                               |                                              | 14 PINS     |      |
| $R_{\theta JA}$               | Junction-to-ambient thermal resistance       | 128.1       | °C/W |
| $R_{\theta JC(top)}$          | Junction-to-case (top) thermal resistance    | 56.5        | °C/W |
| $R_{\theta JB}$               | Junction-to-board thermal resistance         | 69.9        | °C/W |
| $\Psi_{JT}$                   | Junction-to-top characterization parameter   | 9.1         | °C/W |
| $\Psi_{JB}$                   | Junction-to-board characterization parameter | 69.3        | °C/W |
| $R_{\theta JC(bot)}$          | Junction-to-case (bottom) thermal resistance | N/A         | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 5.5 Electrical Characteristics

at  $T_A = -55^\circ\text{C}$  to  $125^\circ\text{C}$ ,  $V_S = 2.2\text{V}$  to  $24\text{V}$ ,  $C_L = 15\text{pF}$ ,  $R_{PULLUP} = 5.1\text{k}\Omega$ ,  $V_{CM} = V_S / 2$ , and  $V_S = V_{PULLUP}$  (unless otherwise noted)

| PARAMETER            |                                 | TEST CONDITIONS                                                     | MIN                           | TYP  | MAX  | UNIT  |
|----------------------|---------------------------------|---------------------------------------------------------------------|-------------------------------|------|------|-------|

## 6 Detailed Description

### 6.1 Overview

The TLV1704-SEP comparator features rail-to-rail input and output on supply voltages as high as 24V. The rail-to-rail input stage enables detection of signals close to the supply and ground. The open-collector configuration allows the device to be used in wired-OR configurations, such as a window comparator. A low supply current of 55µA per channel with small, space-saving packages, makes these comparators versatile for use in a wide range of applications, from portable to industrial.

### 6.2 Functional Block Diagram

## 6.3 Feature Description

### 6.3.1 Comparator Inputs

The TLV1704-SEP device is a rail-to-rail input comparator, with an input common-mode range that includes the supply rails. The TLV1704-SEP device is designed to prevent phase inversion when the input pins exceed the supply voltage. 図 6-1 shows the TLV1704-SEP device response when input voltages exceed the supply, resulting in no phase inversion.

図 6-1. No Phase Inversion: Comparator Response to Input Voltage (Propagation Delay Included)

## 6.4 Device Functional Modes

### 6.4.1 Setting Reference Voltage

Using a stable reference is important when setting the transition point for the TLV1704-SEP device. The REF3333, as shown in 図 6-2, provides a 3.3V reference voltage with low drift and only 3.9μA of quiescent current.

図 6-2. Reference Voltage for the TLV1704-SEP

## 7 Application and Implementation

### 注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 7.1 Application Information

The TLV1704-SEP device can be used in a wide variety of applications, such as zero crossing detectors, window comparators, over and undervoltage detectors, and high-side voltage sense circuits.

### 7.2 Typical Application

Comparators are used to differentiate between two different signal levels. For example, a comparator differentiates between an overtemperature and normal-temperature condition. However, noise or signal variation at the comparison threshold causes multiple transitions. This application example sets upper and lower hysteresis thresholds to eliminate the multiple transitions caused by noise.

図 7-1. Comparator Schematic With Hysteresis

#### 7.2.1 Design Requirements

The design requirements are as follows:

- Supply voltage: 5V
- Input: 0V to 5V
- Lower threshold ( $V_L$ ) = 2.3V  $\pm$  0.1V
- Upper threshold ( $V_H$ ) = 2.7V  $\pm$  0.1V
- $V_H - V_L = 2.4V \pm 0.1V$
- Low-power consumption

### 7.2.2 Detailed Design Procedure

Make a small change to the comparator circuit to add hysteresis. Hysteresis uses two different threshold voltages to avoid the multiple transitions introduced in the previous circuit. The input signal must exceed the upper threshold (VH) to transition low, or below the lower threshold (VL) to transition high.

✎ 7-1 illustrates hysteresis on a comparator. Resistor Rh sets the hysteresis level. An open-collector output stage requires a pullup resistor (Rp). The pullup resistor creates a voltage divider at the comparator output that introduces an error when the output is at logic high. This error can be minimized if  $R_h > 100 R_p$ .

When the output is at a logic high (5V), Rh is in parallel with Rx (ignoring Rp). This configuration drives more current into Ry, and raises the threshold voltage (VH) to 2.7V. The input signal must drive above VH = 2.7V to cause the output to transition to logic low (0V).

When the output is at logic low (0V), Rh is in parallel with Ry. This configuration reduces the current into Ry, and reduces the threshold voltage to 2.3V. The input signal must drive below VL = 2.3V to cause the output to transition to logic high (5V).

For more details on this design and other alternative devices that can be used in place of the TLV1702, refer to Precision Design [TIPD144](#), *Comparator with Hysteresis Reference Design*.

### 7.2.3 Application Curve

✎ 7-2 shows the upper and lower thresholds for hysteresis. The upper threshold is 2.76V and the lower threshold is 2.34V, both of which are close to the design target.

図 7-2. TLV1701 Upper and Lower Threshold With Hysteresis

## 7.3 Power Supply Recommendations

The TLV1704-SEP device is specified for operation from 2.2V to 24V; many specifications apply from –55°C to 125°C. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the [セクション 5.7](#) section.

#### 注意

Supply voltages larger than 40V can permanently damage the device; see the [セクション 5.1](#).

Place 0.1µF bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement; see the [セクション 7.4.1](#) section.

## 7.4 Layout

### 7.4.1 Layout Guidelines

Comparators are very sensitive to input noise. For best results, maintain the following layout guidelines:

- Use a printed-circuit board (PCB) with a good, unbroken low-inductance ground plane. Proper grounding (use of ground plane) helps maintain specified performance of the TLV1704-SEP device.
- To minimize supply noise, place a decoupling capacitor (0.1  $\mu$ F ceramic, surface-mount capacitor) as close as possible to  $V_S$  as shown in [Figure 7-3](#).
- On the inputs and the output, keep lead lengths as short as possible to avoid unwanted parasitic feedback around the comparator. Keep inputs away from the output.
- Solder the device directly to the PCB rather than using a socket.
- For slow-moving input signals, take care to prevent parasitic feedback. A small capacitor (1000pF or less) placed between the inputs can help eliminate oscillations in the transition region. This capacitor causes some degradation to propagation delay when the impedance is low. Run the topside ground plane between the output and inputs.
- Run the ground pin ground trace under the device up to the bypass capacitor, shielding the inputs from the outputs.

### 7.4.2 Layout Example

**Figure 7-3. Comparator Board Layout**

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
