TLV906xS コスト重視システム向け 10MHz、RRIO、CMOS オペアンプ

1 特長

- レール ツー レール入出力
- 低い入力オフセット電圧:±0.3mV
- ユニティ ゲイン帯域幅:10MHz
- 低い広帯域ノイズ:10nV/√Hz
- 低い入力バイアス電流:0.5pA
- 低い静止電流:538µA
- ユニティ ゲイン安定
- 内部 RFI および EMI フィルタ
- 最低 1.8V の電源電圧で動作
- 抵抗性の開ループ出力インピーダンスにより、大きな容量性負荷でも簡単に安定
- シャットダウン バージョン:TLV906xS
- 拡張温度範囲:-40℃～125℃

2 アプリケーション

- 電動アシスト自転車
- 煙感知器
- HVAC:暖房、換気、空調
- モーター制御:AC 誘導モーター
- 冷蔵庫
- ウェアラブル機器
- ノート PC
- 洗濯機
- センサ シグナル コンディショニング
- パワー モジュール
- バーコード スキャナ
- アクティブ フィルタ
- ローサイド電流センシング

3 概要

TLV9061 (シングル)、TLV9062 (デュアル)、TLV9064 (クワッド) は、レール ツー レールの入力および出力スイング機能を備えたシングル / デュアル / クワッド低電圧 (1.8V～5.5V) オペアンプです。

これらのデバイスは、低電圧での動作、小さな占有面積、大きな容量性負荷の駆動が必要なアプリケーション向けの、コスト効率の優れた選択肢です。

TLV906x の容量性負荷駆動能力は 100pF ですが、開ループ出力インピーダンスは抵抗性なので、大きい容量性の負荷でも簡単に安定できます。これらのオペアンプは低電圧 (1.8V～5.5V) で動作し、OPAx316 および TLVx316 デバイスと同様の性能仕様を満たすよう、特別に設計されています。

TLV906xS デバイスにはシャットダウン モードが備わっており、標準消費電流 1µA 未満で、アンプをスタンバイ モードに切り替えることができます。

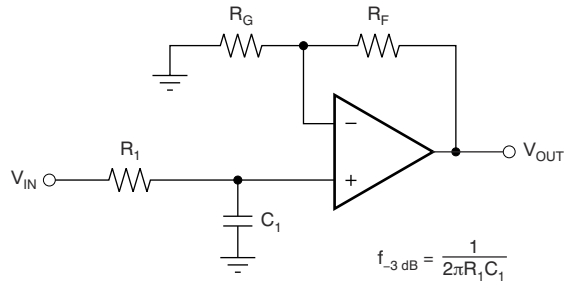
TLV906xS ファミリはユニティ ゲイン安定で、RFI および EMI 除去フィルタが内蔵され、オーバードライブ状況で位相反転が発生しないため、システムの設計を簡素化するため役立ちます。

すべてのチャネル バリエーション (シングル、デュアル、クワッド) で、X2SON、X2QFN などのマイクロサイズ パッケージと、SOIC、MSOP、SOT-23、TSSOP などの業界標準パッケージが利用可能です。

製品情報

部品番号 (3)	パッケージ (1)	本体サイズ (公称)(4)
TLV9061	DBV (SOT-23、5)	2.90mm × 1.60mm
	DCK (SC70、5)	2.00mm × 1.25mm
	DRL (SOT-553、5)(2)	1.60mm × 1.20mm
	DPW (X2SON、5)	0.80mm × 0.80mm
TLV9061S	DBV (SOT-23、6)	2.90mm × 1.60mm
	DRY (USON、6)	1.45mm × 1.00mm
TLV9062	D (SOIC、8)	4.90mm × 3.90mm
	PW (TSSOP、8)	3.00mm × 4.40mm
	DGK (VSSOP、8)	3.00mm × 3.00mm
	DDF (SOT-23、8)	2.90mm × 1.60mm
	DSG (WSON、8)	2.00mm × 2.00mm
TLV9062S	DGS (VSSOP、10)	3.00mm × 3.00mm
	RUG (X2QFN、10)	2.00mm × 1.50mm
	YCK (DSBGA、9)	1.00 mm × 1.00mm
TLV9064	D (SOIC、14)	8.65mm × 3.90mm
	PW (TSSOP、14)	5.00mm × 4.40mm
	RTE (WQFN、16)	3.00mm × 3.00mm
	RUC (X2QFN、14)	2.00mm × 2.00mm
TLV9064S	RTE (WQFN、16)	3.00mm × 3.00mm

(1) 供給されているすべてのパッケージについては、セクション 10 を参照してください。
(2) このパッケージはプレビューのみです。
(3) 製品比較表を参照してください。
(4) 本体サイズ (長さ×幅) は公称値であり、ピンは含まれません。



$$\frac{V_{OUT}}{V_{IN}} = \left(1 + \frac{R_F}{R_G}\right)\left(\frac{1}{1 + sR_1C_1}\right)$$

5 Specifications

5.1 Absolute Maximum Ratings

over operating ambient temperature (unless otherwise noted)(1)

			MIN	MAX	UNIT
Supply voltage [(V+) – (V–)]			0	6	V
Signal input pins	Voltage(2)	Common-mode	(V–) – 0.5	(V+) + 0.5	V
		Differential		(V+) – (V–) + 0.2	V
	Current(2)		–10	10	mA
Output short-circuit(3)			Continuous		mA
Temperature	Specified, T_A		–40	125	°C
	Junction, T_J			150	
	Storage, T_{stg}		–65	150	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Input pins are diode-clamped to the power-supply rails. Current limit input signals that can swing more than 0.5V beyond the supply rails to 10mA or less.
(3) Short-circuit to ground, one amplifier per package.

5.2 ESD Ratings

		VALUE	UNIT
TLV9061 PACKAGES			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±1500	
ALL OTHER PACKAGES			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±4000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±1500	

(1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_S	Supply voltage (V_S = [V+] – [V–])	1.8	5.5	V
V_I	Input voltage range	(V–) – 0.1	(V+) + 0.1	V
V_O	Output voltage range	V–	V+	V
V_{SHDN_IH}	High level input voltage at shutdown pin (amplifier enabled)	1.1	V+	V
V_{SHDN_IL}	Low level input voltage at shutdown pin (amplifier disabled)	V–	0.2	V
T_A	Specified temperature	–40	125	°C

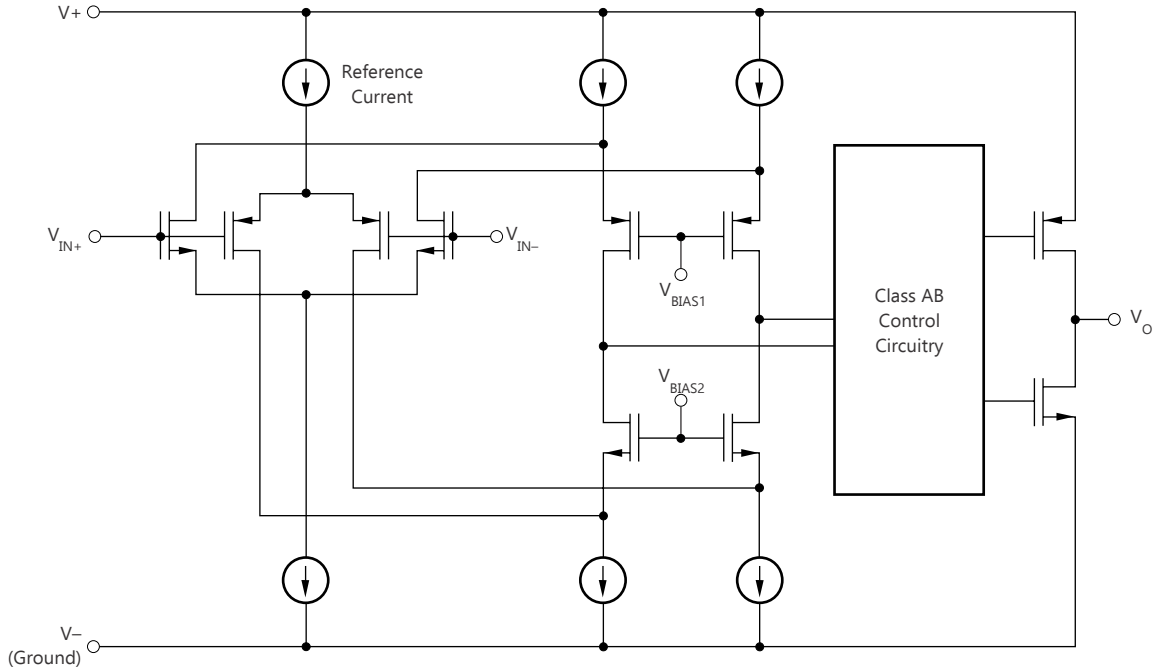
6 Detailed Description

6.1 Overview

The TLV906x devices are a family of low-power, rail-to-rail input and output op amps. These devices operate from 1.8V to 5.5V, are unity-gain stable, and are designed for a wide range of general-purpose applications. The input common-mode voltage range includes both rails and allows the TLV906x series to be used in virtually any single-supply application. Rail-to-rail input and output swing significantly increases dynamic range, especially in low-supply applications. The high bandwidth enables this family to drive the sample-hold circuitry of analog-to-digital converters (ADCs).

6.2 Functional Block Diagram



6.3 Feature Description

6.3.1 Rail-to-Rail Input

The input common-mode voltage range of the TLV906x family extends 100mV beyond the supply rails for the full supply voltage range of 1.8V to 5.5V. This performance is achieved with a complementary input stage: an N-channel input differential pair in parallel with a P-channel differential pair, as shown in the *Functional Block Diagram*. The N-channel pair is active for input voltages close to the positive rail, typically (V+) – 1.4V to 200mV above the positive supply, whereas the P-channel pair is active for inputs from 200mV below the negative supply to approximately (V+) – 1.4V. There is a small transition region, typically (V+) – 1.2V to (V+) – 1V, in which both pairs are on. This 200-mV transition region can vary up to 200mV with process variation. Thus, the transition region (with both stages on) can range from (V+) – 1.4V to (V+) – 1.2V on the low end, and up to (V+) – 1V to (V+) – 0.8V on the high end. Within this transition region, PSRR, CMRR, offset voltage, offset drift, and THD can degrade compared to device operation outside this region.

6.3.2 Rail-to-Rail Output

Designed as a low-power, low-voltage operational amplifier, the TLV906x series delivers a robust output drive capability. A class AB output stage with common-source transistors achieves full rail-to-rail output swing capability. For resistive loads of 10kΩ, the output swings to within 15mV of either supply rail, regardless of the applied power-supply voltage. Different load conditions change the ability of the amplifier to swing close to the rails.

6.3.3 EMI Rejection

The TLV906x uses integrated electromagnetic interference (EMI) filtering to reduce the effects of EMI from sources such as wireless communications and densely-populated boards with a mix of analog signal chain and digital components. EMI immunity can be improved with circuit design techniques; the TLV906x benefits from these design improvements. Texas Instruments has developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10MHz to 6GHz. 図 6-1 shows the results of this testing on the TLV906x. 表 6-1 lists the EMIRR IN+ values for the TLV906x at particular frequencies commonly encountered in real-world applications. See *EMI Rejection Ratio of Operational Amplifiers* application note for more information.

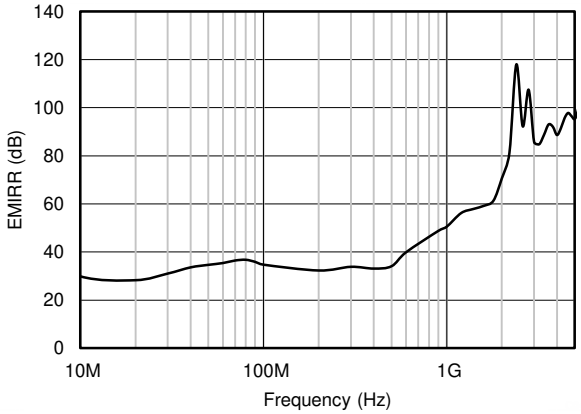


図 6-1. EMIRR Testing

表 6-1. TLV906x EMIRR IN+ For Frequencies of Interest

FREQUENCY	APPLICATION or ALLOCATION	EMIRR IN+
400MHz	Mobile radio, mobile satellite, space operation, weather, radar, ultra-high frequency (UHF) applications	59.5dB
900MHz	Global system for mobile communications (GSM) applications, radio communication, navigation, GPS (to 1.6GHz), GSM, aeronautical mobile, UHF applications	68.9dB
1.8 GHz	GSM applications, mobile personal communications, broadband, satellite, L-band (1GHz to 2GHz)	77.8dB

表 6-1. TLV906x EMIRR IN+ For Frequencies of Interest (続き)

FREQUENCY	APPLICATION or ALLOCATION	EMIRR IN+
2.4GHz	802.11b, 802.11g, 802.11n, Bluetooth®, mobile personal communications, industrial, scientific and medical (ISM) radio band, amateur radio and satellite, S-band (2GHz to 4GHz)	78.0dB
3.6GHz	Radiolocation, aero communication and navigation, satellite, mobile, S-band	88.8dB
5GHz	802.11a, 802.11n, aero communication and navigation, mobile communication, space and satellite operation, C-band (4GHz to 8GHz)	87.6dB

6.3.4 Overload Recovery

Overload recovery is defined as the time required for the operational amplifier output to recover from a saturated state to a linear state. The output devices of the operational amplifier enter a saturation region when the output voltage exceeds the rated operating voltage, because of the high input voltage or the high gain. After the device enters the saturation region, the charge carriers in the output devices require time to return to the linear state. After the charge carriers return to the linear state, the device begins to slew at the specified slew rate. Therefore, the propagation delay (in case of an overload condition) is the sum of the overload recovery time and the slew time. The overload recovery time for the TLV906x family is approximately 200ns.

6.3.5 Shutdown Function

The TLV906xS devices feature $\overline{\text{SHDN}}$ pins that disable the op amp, placing the op amp into a low-power standby mode. In this mode, the op amp typically consumes less than 1µA. The $\overline{\text{SHDN}}$ pins are active-low, meaning that shutdown mode is enabled when the input to the $\overline{\text{SHDN}}$ pin is a valid logic low.

The $\overline{\text{SHDN}}$ pins are referenced to the negative supply voltage of the op amp. The threshold of the shutdown feature lies around 800mV (typical) and does not change with respect to the supply voltage. Hysteresis has been included in the switching threshold to ensure smooth switching characteristics. To ensure optimal shutdown behavior, the $\overline{\text{SHDN}}$ pins should be driven with valid logic signals. A valid logic low is defined as a voltage between V– and V– + 0.2V. A valid logic high is defined as a voltage between V– + 1.2V and V+. The shutdown pin must either be connected to a valid high or a low voltage or driven, and not left as an open circuit. There is ***no*** internal pull-up to enable the amplifier.

The $\overline{\text{SHDN}}$ pins are high-impedance CMOS inputs. Dual op amp versions are independently controlled, and quad op amp versions are controlled in pairs with logic inputs. For battery-operated applications, this feature may be used to greatly reduce the average current and extend battery life. The enable time is 10µs for full shutdown of all channels; disable time is 6µs. When disabled, the output assumes a high-impedance state. This architecture allows the TLV906xS to operate as a gated amplifier (or to have the device output multiplexed onto a common analog output bus). Shutdown time (t_{OFF}) depends on loading conditions and increases as load resistance increases. To ensure shutdown (disable) within a specific shutdown time, the specified 10kΩ load to midsupply (V_S / 2) is required. If using the TLV906xS without a load, the resulting turnoff time is significantly increased.

6.4 Device Functional Modes

The TLV906x family are operational when the power-supply voltage is between 1.8V (±0.9V) and 5.5V (±2.75V). The TLV906xS devices feature a shutdown mode and are shut down when a valid logic low is applied to the shutdown pin.

7 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

7.1 Application Information

The TLV906x family features 10MHz bandwidth and 6.5V/µs slew rate with only 538µA of supply current per channel, providing good AC-performance at very low power consumption. DC applications are well served with a very low input noise voltage of 10nV/√ Hz at 10kHz, low input bias current, and a typical input offset voltage of 0.3mV.

7.2 Typical Applications

7.2.1 Typical Low-Side Current Sense Application

図 7-1 shows the TLV906x configured in a low-side current-sensing application.

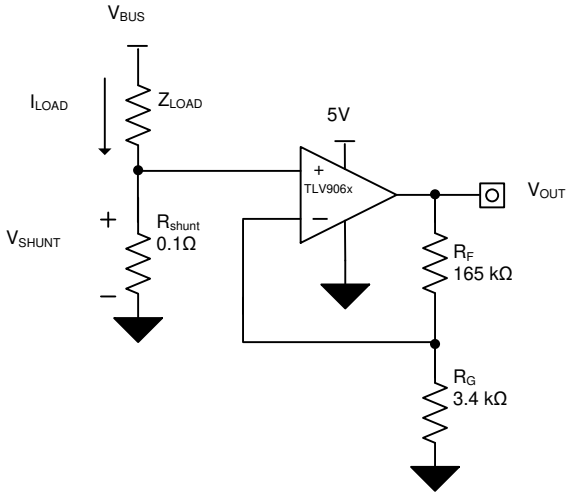

図 7-1. TLV906x in a Low-Side, Current-Sensing Application

7.2.2 Design Requirements

The design requirements for this design are:

- Load current: 0A to 1A
- Output voltage: 4.95V
- Maximum shunt voltage: 100mV

7.2.3 Detailed Design Procedure

The transfer function of the circuit in 図 7-1 is given in 式 1.

$$V_{OUT} = I_{LOAD} \times R_{SHUNT} \times GAIN \quad (1)$$

The load current (I_{LOAD}) produces a voltage drop across the shunt resistor (R_{SHUNT}). The load current is set from 0A to 1A. To keep the shunt voltage below 100mV at maximum load current, the largest shunt resistor is defined using 式 2.

$$R_{SHUNT} = \frac{V_{SHUNT\_MAX}}{I_{LOAD\_MAX}} = \frac{100mV}{1A} = 100m\Omega \quad (2)$$

Using 式 2, R_{SHUNT} equals 100mΩ. The voltage drop produced by I_{LOAD} and R_{SHUNT} is amplified by the TLV906x to produce an output voltage of approximately 0V to 4.95V. 式 3 calculates the gain required for the TLV906x to produce the required output voltage.

$$Gain = \frac{(V_{OUT\_MAX} - V_{OUT\_MIN})}{(V_{IN\_MAX} - V_{IN\_MIN})} \quad (3)$$

Using 式 3, the required gain equals 49.5V/V, which is set with the R_F and R_G resistors. 式 4 sizes the R_F and R_G, resistors to set the gain of the TLV906x to 49.5V/V.

$$Gain = 1 + \frac{(R_F)}{(R_G)} \quad (4)$$

Selecting R_F to equal 165kΩ and R_G to equal 3.4kΩ provides a combination that equals approximately 49.5V/V. 図 7-2 shows the measured transfer function of the circuit shown in 図 7-1. Notice that the gain is only a function of the feedback and gain resistors. This gain is adjusted by varying the ratio of the resistors and the actual resistor values are determined by the impedance levels that the designer wants to establish. The impedance level determines the current drain, the effect that stray capacitance has, and a few other behaviors. There is no optimal impedance selection that works for every system, you must choose an impedance that is ideal for your system parameters.

7.2.4 Application Curve

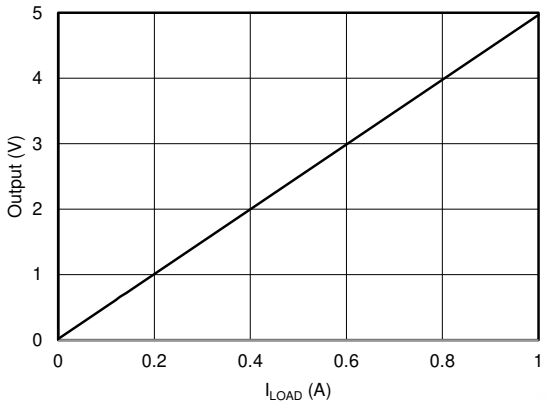

図 7-2. Low-Side, Current-Sense, Transfer Function

7.3 Power Supply Recommendations

The TLV906x series is specified for operation from 1.8V to 5.5V (±0.9V to ±2.75V); many specifications apply from –40°C to 125°C. The *Typical Characteristics* section presents parameters that can exhibit significant variance with regard to operating voltage or temperature.

> **注意**
>
> Supply voltages larger than 6V can permanently damage the device; see the *Absolute Maximum Ratings* table.

Place 0.1µF bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see the *Layout* section.

7.3.1 Input and ESD Protection

The TLV906x series incorporates internal ESD protection circuits on all pins. For input and output pins, this protection primarily consists of current-steering diodes connected between the input and power-supply pins. These ESD protection diodes provide in-circuit, input overdrive protection, as long as the current is limited to 10mA, as shown in the *Absolute Maximum Ratings* table. 図 7-3 shows how a series input resistor can be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the value must be kept to a minimum in noise-sensitive applications.

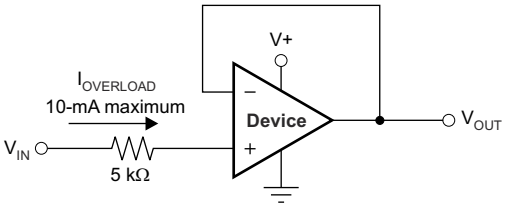

図 7-3. Input Current Protection

7.4 Layout

7.4.1 Layout Guidelines

For best operational performance of the device, use good printed circuit board (PCB) layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and of the op amp itself. Bypass capacitors are used to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1µF ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is adequate for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup. Take care to physically separate digital and analog grounds, paying attention to the flow of the ground current. For more detailed information, see *Circuit Board Layout Techniques*.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace at a 90 degree angle is much better as opposed to running the traces in parallel with the noisy trace.
- Place the external components as close to the device as possible. As illustrated in 図 7-5, keeping R_F and R_G close to the inverting input minimizes parasitic capacitance on the inverting input.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.
- Cleaning the PCB following board assembly is recommended for best performance.
- Any precision integrated circuit can experience performance shifts resulting from moisture ingress into the plastic package. Following any aqueous PCB cleaning process, baking the PCB assembly is recommended to remove moisture introduced into the device packaging during the cleaning process. A low-temperature, post-cleaning bake at 85°C for 30 minutes is sufficient for most circumstances.

- Deleted package preview note from DPW (X2SON) package in *Thermal Information: TLV9061* table ... 11
- Deleted package preview note from DPW (X2SON) package in *Thermal Information: TLV9061* table ... 11

Changes from Revision A (June 2017) to Revision B (October 2017) **Page**

- Added 8-pin PW package, to *Pin Configuration and Functions* section ... 4
- Added DSG (WSON) package to *Thermal Information* table ... 11
- Added PW (TSSOP) to TLV9062 *Thermal Information* table ... 11
- Changed maximum input offset voltage value from ±1.6mV to 2mV ... 13
- Changed maximum input offset voltage value from ±1.5 to ±1.6mV ... 13

- Changed minimum common-mode rejection ratio input voltage range from 86dB to 80dB 13
- Changed typical input current noise density value from 10 to 23fA/√Hz 13
- Changed THD + N test conditions from V_S = 5V to V_S = 5.5V..... 13
- Added V_{CM} = 2.5V test condition to THD + N parameter in *Electrical Characteristics* table 13
- Added maximum output voltage swing value from 25mV to 60mV..... 13
- Changed maximum output voltage swing value from 15mV to 20mV 13

Changes from Revision * (March 2017) to Revision A (June 2017) **Page**

- デバイス ステータスを「事前情報」から「量産データ」に変更..... 1

10 Mechanical, Packaging, and Orderable Information

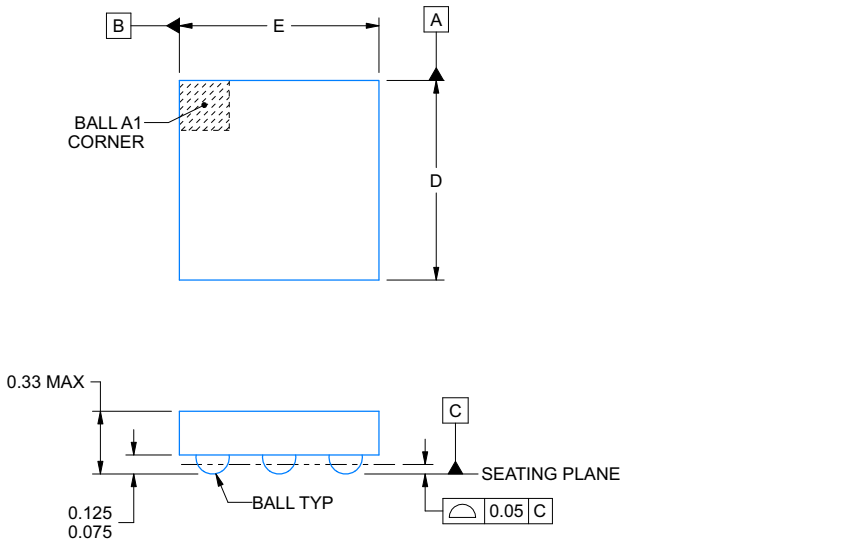
The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

PACKAGE OUTLINE

YCK0009-C01

DSBGA - 0.33 mm max height

DIE SIZE BALL GRID ARRAY



4226891/A 06/2021

NOTES:

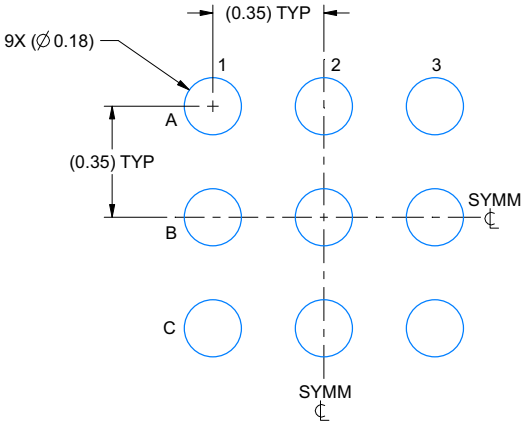
1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

EXAMPLE BOARD LAYOUT

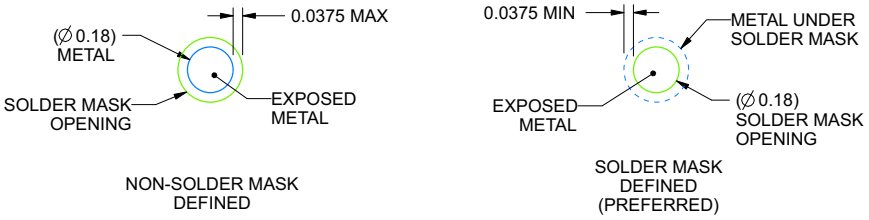
YCK0009-C01

DSBGA - 0.33 mm max height

DIE SIZE BALL GRID ARRAY



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 50X



SOLDER MASK DETAILS
NOT TO SCALE

4226891/A 06/2021

NOTES: (continued)

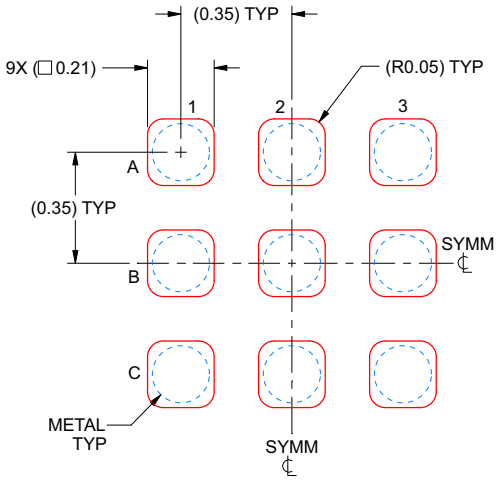
3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints.
   See Texas Instruments Literature No. SNVA009 (www.ti.com/lit/snva009).

EXAMPLE STENCIL DESIGN

YCK0009-C01

DSBGA - 0.33 mm max height

DIE SIZE BALL GRID ARRAY



SOLDER PASTE EXAMPLE
BASED ON 0.075 mm THICK STENCIL
SCALE: 50X

4226891/A 06/2021

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

OTHER QUALIFIED VERSIONS OF TLV9061, TLV9062, TLV9064 :

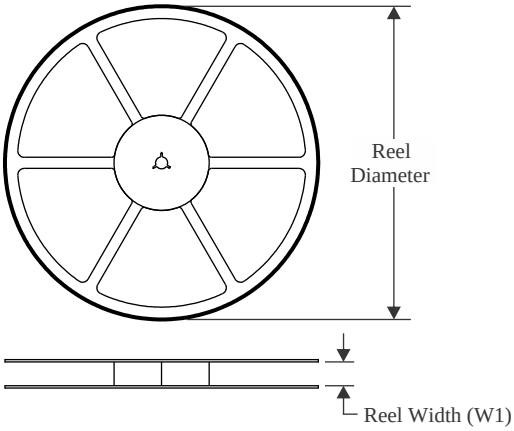
- Automotive : TLV9061-Q1, TLV9062-Q1, TLV9064-Q1

NOTE: Qualified Version Definitions:

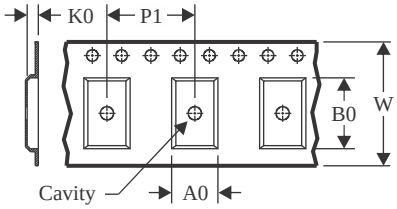
- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers
