

**TPS22810** 

JAJSCS0C - DECEMBER 2016-REVISED JANUARY 2018

# TPS22810 2.7~18V、79mΩオン抵抗、熱保護付き負荷スイッチ

# 1 特長

- シングル・チャネル負荷スイッチを内蔵
- 動作時周囲温度: -40℃~+105℃
  - SOT23-6 (DBV): 最大連続電流2A<sup>1</sup>
  - WSON (DRV): 最大連続電流3A1
- 入力電圧範囲: 2.7V~18V
- 絶対最大入力電圧: 20V
- オン抵抗(R<sub>ON</sub>)
  - V<sub>IN</sub> = 12VでR<sub>ON</sub> = 79mΩ (標準値)
- 静止電流
  - V<sub>IN</sub> = 12Vにおいて62µA (標準値)
- シャットダウン電流
  - V<sub>IN</sub> = 12Vにおいて500nA (標準値)
- サーマル・シャットダウン
- 低電圧誤動作防止(UVLO)
- 可変クイック出力放電(QOD)
- CTピンで立ち上がり時間を設定可能
- SOT23-6パッケージ
  - 2.9mm×2.8mm、0.95mmピッチ、 高さ1.45mm (DBV)
- WSONパッケージ
  - 2mm×2mm、0.65mmピッチ、 高さ0.75mm (DRV)
- ESD性能はJESD 22に準拠しテスト済み
  - HBM ±2kV, CDM ±1kV
- (1) 熱性能を考慮する必要があります

# 2 アプリケーション

- HDTV
- 産業用システム
- セットトップ・ボックス
- 監視システム

## 3 概要

TPS22810はシングル・チャネルの負荷スイッチで、立ち上がり時間を設定可能、クイック出力放電(QOD)が内蔵されています。さらに、このデバイスには接合部温度の上昇からデバイスを保護するため、サーマル・シャットダウン機能が搭載されています。これらの機能により、デバイスの安全な動作が本質的に保証されています。このデバイスにはNチャネルMOSFETが搭載され、2.7V~18Vの入力電圧範囲で動作できます。SOT23-5 (DBV)パッケージは最大で2Aの電流をサポートできます。WSON (DRV)パッケージは最大で3Aの電流をサポートできます。スイッチはオン/オフ入力により制御され、低電圧の制御信号と直接接続が可能です。

デバイスの立ち上がり時間を設定可能なため、大きな負荷容量により発生する突入電流が大幅に減少し、電源ドループが低減、または生じなくなります。低電圧誤動作防止機能は、VIN電圧がスレッショルド値よりも低下した場合にデバイスの電源をオフにし、想定よりも低い電圧の供給によって下流の回路が損害を受けることを防止します。 QODピンは設定可能で、デバイスの立ち下がり時間を制御し、電源オフ時の設計を柔軟に行えるようにします。

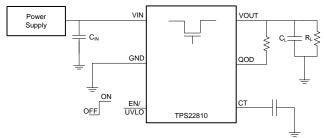

TPS22810はリード付きのSOT-23パッケージ(DBV)で供給され、ハンダ付け結合部を目視で検査できるほか、WSONパッケージ(DRV)でも供給されます。このデバイスは、-40℃~+105℃の周囲温度範囲で動作するよう規定されています。

#### 製品情報(1)

型番	パッケージ	本体サイズ(公称)
TPS22810	SOT-23 (6) 2.90mm×2.80mm	
17522010	WSON (6)	2.00mm×2.00mm

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

# 7 Specifications

# 7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted) (1) (2)

		MIN	MAX	UNIT
V <sub>IN</sub>	Input voltage	-0.3	20	V
V <sub>OUT</sub>	Output voltage	-0.3	min(VIN + 0.3, 20)	V
V <sub>EN/UVLO</sub>	EN/UVLO voltage	-0.3	20	V
TJ	Maximum junction temperature		150	°C
T <sub>stg</sub>	Storage temperature	<b>–</b> 65	150	°C

<sup>(1)</sup> Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to network ground terminal.

## 7.2 ESD Ratings

			VALUE	UNIT
V	Electrostatic	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)	±2000	<b>V</b>
V <sub>(ESD)</sub>	discharge	Charged-device model (CDM), per JEDEC specification JESD22-C101 (2)	±1000	V

JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.

# 7.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V <sub>IN</sub>	Input voltage	2.7	18	V
V <sub>EN/UVLO</sub>	EN/UVLO voltage	0	18	V
V <sub>OUT</sub>	Output voltage		$V_{IN}$	V
IMAX	Maximum continuous switch current, T <sub>A</sub> = 65°C (DBV)		2	٨
	Maximum continuous switch current, T <sub>A</sub> = 65°C (DRV)		3	А
T <sub>A</sub>	Operating free-air temperature <sup>(1)</sup>	-40	105	°C
C <sub>IN</sub>	Input capacitor	1 <sup>(2)</sup>		μF

<sup>(1)</sup> In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature  $[T_{A(max)}]$  is dependent on the maximum operating junction temperature  $[T_{J(MAX)}]$ , the maximum power dissipation of the device in the application  $[P_{D(MAX)}]$ , and the junction-to-ambient thermal resistance of the part/package in the application  $(\theta_{JA})$ , as given by the following equation:  $T_{A(MAX)} = T_{J(MAX)} - (\theta_{JA} \times P_{D(MAX)})$ .

(2) See the *Detailed Description* section.

#### 7.4 Thermal Information

		TPS22		
	THERMAL METRIC (1)	DBV (SOT23)	DRV (WSON)	UNIT
		6 PINS	6 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	182	74.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	127.2	80.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	16.9	44.3	°C/W
ΨЈТ	Junction-to-top characterization parameter	26.4	3.2	°C/W
ΨЈВ	Junction-to-board characterization parameter	36.3	44.6	°C/W

For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

<sup>(2)</sup> JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

# 7.5 Electrical Characteristics

Unless otherwise noted, the specification in the following table applies over the following ambient operating temperature  $-40^{\circ}\text{C} \le T_{A} \le +105^{\circ}\text{C}$ . Typical values are for  $T_{A} = 25^{\circ}\text{C}$ .

# 9 Detailed Description

#### 9.1 Overview

The TPS22810 is a 6-pin, 2.7-18-V load switch with thermal protection in two separate package options. To reduce voltage drop for low voltage and high current rails, the device implements a low resistance N-channel MOSFET which reduces the drop out voltage across the device.

The device starts its operation by monitoring the VIN bus. When VIN exceeds the undervoltage-lockout threshold (VUVR), the device samples the EN/UVLO pin. A high level on this pin enables the internal MOSFET. As VIN rises, the internal MOSFET of the device starts conducting and allow current to flow from VIN to VOUT. When EN/UVLO is held low (below VENF), internal MOSFET is turned off.

A voltage V(EN/UVLO) < V(ENF) on this pin turns off the internal FET, thus disconnecting VIN from VOUT, while voltage below V(SHUTF) takes the device into shutdown mode, with IQ less than 1  $\mu$ A to ensure minimal power loss.

The device has a configurable slew rate which helps reduce or eliminate power supply droop because of large inrush currents. The device also features an internal RPD resistor, which discharges VOUT once the switch is disabled.

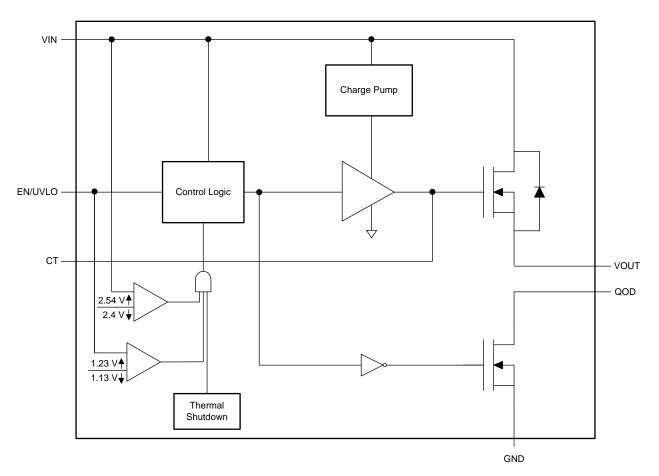

During shutdown, the device has very low leakage currents, thereby reducing unnecessary leakages for downstream modules during standby. Integrated control logic, driver, charge pump, and output discharge FET eliminates the need for any external components which reduces solution size and bill of materials (BOM) count.

The device also features a QOD pin, which allows the configuration of the discharge rate of VOUT once the switch is disabled.

The device has a thermal protection feature. Due to this device protects itself against thermal damage due to over-temperature and over-current conditions. Safe Operating Area (SoA) requirements are thus inherently met without any special design consideration by the board designer.

#### 9.2 Functional Block Diagram

## 9.3 Feature Description

#### 9.3.1 On and Off Control

TThe EN/UVLO pin controls the state of the switch. EN/UVLO is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The EN/UVLO pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1.2 V or higher GPIO voltage. This pin cannot be left floating and must be driven either high or low for proper functionality.

#### 9.3.2 Quick Output Discharge (QOD)

The TPS22810 includes a QOD feature. The QOD pin can be configured in one of three ways:

- QOD pin shorted to VOUT pin. Using this method, the discharge rate after the switch becomes disabled is controlled with the value of the internal resistance R<sub>PD</sub>. The value of this resistance is listed in the *Electrical Characteristics* table.
- QOD pin connected to VOUT pin using an external resistor R<sub>EXT</sub>. After the switch becomes disabled, the
  discharge rate is controlled by the value of the total resistance of the QOD. To adjust the total QOD
  resistance, Equation 1 can be used.

$$R_{QOD} = R_{PD} + R_{EXT}$$

where

- R<sub>OOD</sub> is the total output discharge resistance
- R<sub>PD</sub> is the internal pulldown resistance
- R<sub>EXT</sub> is the external resistance placed between the VOUT and QOD pin.

(1)

## **Feature Description (continued)**

• QOD pin is unused and left floating. Using this method, there is no quick output discharge functionality, and the output remains floating after the switch is disabled.

Note that during thermal shutdown, the QOD functionality is not available. The device does not discharge the load as RPD does not become engaged.

The fall times of the device depend on many factors including the total resistance of the QOD,  $V_{IN}$ , and the output capacitance. When QOD is connected to VOUT, the fall time changes over  $V_{IN}$  as the internal  $R_{PD}$  varies over  $V_{IN}$ . To calculate the approximate fall time of  $V_{OUT}$  for a given  $R_{OOD}$ , use Equation 2 and Table 1.

$$V_{CAP} = V_{IN} \times e^{-t/\tau}$$

#### where

- V<sub>CAP</sub> is the voltage across the capacitor (V)
- t is the time since power supply removal (s)
- $\tau$  is the time constant equal to  $R_{QQD} \times C_L$

(2)

The fall times' dependency on  $V_{IN}$  becomes minimal as the QOD value increases with additional external resistance. See Table 1 for QOD fall times.

	rabio ii Qob i ali ililio											
	FALL TIME ( $\mu$ s) 90% - 10%, $C_{IN}$ = 1 $\mu$ F, $I_{OUT}$ = 0 A , $V_{IN}$ = 0 V, $ON$ = 0 $V^{(1)}$											
V <sub>IN</sub> (V)		T <sub>A</sub> = 25°C		T <sub>A</sub> = 85°C								
	C <sub>L</sub> = 1 μF	C <sub>L</sub> = 10 μF	C <sub>L</sub> = 100 μF	C <sub>L</sub> = 1 μF	C <sub>L</sub> = 10 μF	C <sub>L</sub> = 100 μF						
18	470	4700	47000	470	4700	47000						
12	450	4500	45000	450	4500	45000						
9	440	4400	44000	440	4400	44000						
5	500	5000	50000	480	4800	48000						
3.3	600	6000	60000	570	5700	57000						

**Table 1. QOD Fall Times** 

#### 9.3.2.1 QOD when System Power is Removed

The adjustable QOD can be used to control the power down sequencing of a system even when the system power supply is removed. When the power is removed, the input capacitor,  $C_{IN}$ , discharges at VIN. Past the set UVLO level, the pull-down resistance RPD becomes disabled and the output no longer becomes discharged. If there is still remaining charge on the output capacitor, this results in longer fall times. Care must be taken such that  $C_{IN}$  is large enough to meet the device UVLO settings.

#### 9.3.2.2 Internal QOD Considerations

Special considerations must be taken when using the internal  $R_{PD}$  by shorting the QOD pin to the VOUT pin. The internal  $R_{PD}$  is a pulldown resistance designed to quickly discharge a load after the switch has been disabled. Care must be used to ensure that excessive current does not flow through  $R_{PD}$  during discharge so that the maximum  $T_J$  of 125°C is not exceeded. When using only the internal  $R_{PD}$  to discharge a load, the total capacitive load must not exceed 200 uF. Otherwise, an external resistor,  $R_{EXT}$ , must be used to ensure the amount of current flowing through  $R_{PD}$  is properly limited and the maximum  $T_J$  is not exceeded. To ensure the device is not damaged, the remaining charge from  $C_L$  needs to decay naturally through the internal QOD resistance and must not be driven.

#### 9.3.3 EN/UVLO

As an input pin, EN/UVLO controls the ON and OFF state of the internal MOSFET. In its high state, the internal MOSFET is enabled. A low on this pin turns off the internal MOSFET. High and Low levels are specified in the parametric table of the datasheet

A voltage V(EN/UVLO < V(ENF) on this pin turns off the internal FET, thus disconnecting VIN from VOUT, while voltage below V(SHUTF) takes the device into shutdown mode, with IQ less than 1  $\mu$ A to ensure minimal power loss.

<sup>(1)</sup> TYPICAL VALUES WITH QOD SHORTED TO VOUT

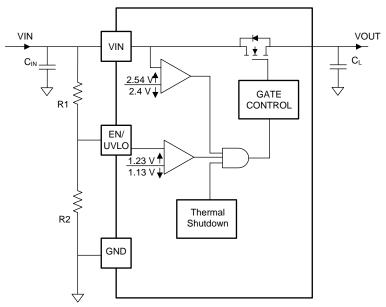

The EN/UVLO pin can be directly driven by a 1.8 V, 3.3 V or 5 V general purpose output pin.

The internal de-glitch delay on EN/UVLO falling edge is intentionally kept low (2.5  $\mu$ s typical) for quick detection of power failure. For applications where a higher de-glitch delay on EN/UVLO is desired, or when the supply is particularly noisy, it is recommended to use an external bypass capacitor from EN/UVLO to GND.

The undervoltage lock out can be programmed by using an external resistor divider from supply VIN terminal to EN/UVLO terminal to GND as shown in Figure 18. When an undervoltage or input power fail event is detected, the internal FET is quickly turned off. If the Under-Voltage Lock-Out function is not needed, the EN/UVLO terminal must be connected to the VIN terminal. EN/UVLO terminal must not be left floating.

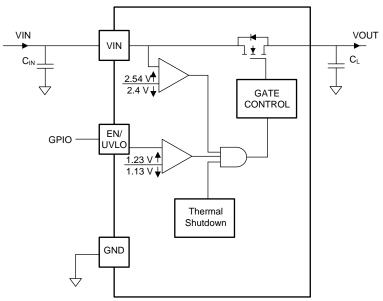

The device also implements internal undervoltage-lockout (UVLO) circuitry on the VIN terminal. The device disables when the VIN terminal voltage falls below internal UVLO Threshold V(UVF). The internal UVLO threshold has a hysteresis of 125 mV (5% of V(UVR)). See Figure 19 and Figure 20.

Figure 20. Default UVLO Threshold V(UVR) Using No Additional External Components

# 9.3.4 Adjustable Rise Time (CT)

A capacitor to GND on the CT pin sets the slew rate. The voltage on the CT pin can be as high as 2.5 V. An approximate formula for the relationship between CT and slew rate is shown in Equation 3. This equation accounts for 10% to 90% measurement on VOUT and does NOT apply for CT < 1 nF.

Use Table 2 to determine rise times for when  $Ct \ge 1$  nF.

SR = 46.62 / Ct

where

• SR is the slew rate (in V/µs)

- CT is the the capacitance value on the CT pin (in pF)
- The units for the constant a are  $\mu$ s/V. The units for the constant b are  $\mu$ s/(V × pF).

(3)

Rise time can be calculated by dividing the input voltage by the slew rate. Table 2 contains rise time values measured on a typical device. Rise times shown below are only valid for the power-up sequence where VIN is already in steady state condition before the EN/UVLO pin is asserted high.

Table 2. Rise Time Table

CT (pF)	RISE TIME (µs) 10% - 90%, $C_L$ = 0.1 µF, $C_{IN}$ = 1 µF, $R_L$ = 10 $\Omega$										
CT (pF)	VIN = 18 V	VIN = 12 V	VIN = 9 V	VIN = 5 V	VIN = 3.3 V						
0	115	91	78	60	98						
470	136	94	80	63	98						
1000	310	209	158	91	102						
2200	688	464	345	198	135						
4700	1430	957	704	397	265						
10000	3115	2085	1540	864	550						
27000	8230	5460	4010	2245	1430						

#### 9.3.5 Thermal Shutdown

The switch disables when the junction temperature  $(T_J)$  rises above the thermal shutdown threshold,  $T_{SD}$ . The switch re-enables once the temperature drops below the  $T_{SD} - T_{SD,HYS}$  value.

#### 9.4 Device Functional Modes

The features of the TPS22810 depend on the operating mode. Table 3 summarizes the Device Functional Modes.

**Table 3. Function Table** 

EN/UVLO Device State						
L Disabled						
Н	Enabled					

# 10 Application and Implementation

#### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

# 10.1 Application Information

This section highlights some of the design considerations when implementing this device in various applications. A PSPICE model for this device is also available in the product page of this device on www.ti.com (See the  $\vec{\tau}/V$  t) section for more information).

#### 10.2 ON and OFF Control

The EN/UVLO pin controls the state of the switch. Asserting EN/UVLO high enables the switch. EN/UVLO is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The EN/UVLO pin is compatible with standard GPIO logic thresholds. It can be used with any microcontroller with 1.2 V or higher GPIO voltage. This pin cannot be left floating and must be driven either high or low for proper functionality.

#### 10.3 Input Capacitor (Optional)

To limit the voltage drop on the input supply caused by transient inrush currents when the switch turns on into a discharged load capacitor, a capacitor needs to be placed between VIN and GND. A 1- $\mu$ F ceramic capacitor, C<sub>IN</sub>, placed close to the pins, is usually sufficient. Higher values of C<sub>IN</sub> can be used to further reduce the voltage drop during high current applications. When switching heavy loads, it is recommended to have an input capacitor about 10 times higher than the output capacitor to avoid excessive voltage drop.

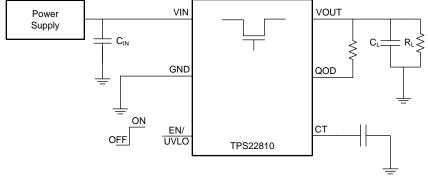

## 10.4 Output Capacitor (Optional)

Due to the integrated body diode in the NMOS switch, a  $C_{IN}$  greater than  $C_{L}$  is highly recommended. A  $C_{L}$  greater than  $C_{IN}$  can cause VOUT to exceed VIN when the system supply is removed. This can result in current flow through the body diode from VOUT to VIN. A  $C_{IN}$  to  $C_{L}$  ratio of 10 to 1 is recommended for minimizing VIN dip caused by inrush currents during startup; however, a 10 to 1 ratio for capacitance is not required for proper functionality of the device. A ratio smaller than 10 to 1 (such as 1 to 1) can cause slightly more VIN dip upon turnon due to inrush currents.

This can be mitigated by increasing the capacitance on the CT pin for a longer rise time.

# 10.5 Typical Application

This typical application demonstrates how the TPS22810 can be used to power downstream modules.

Copyright © 2016, Texas Instruments Incorporated

Figure 21. Typical Application Schematic

## **Typical Application (continued)**

#### 10.5.1 Design Requirements

For this design example, use the values listed in Table 4 as the design parameters:

**Table 4. Design Parameters** 

DESIGN PARAMETER	EXAMPLE VALUE		
V <sub>IN</sub>	12 V		
Load current	2 A		
C <sub>L</sub>	22 μF		
Desired fall time	20 ms		
Maximum acceptable inrush current	400 mA		

#### 10.5.2 Detailed Design Procedure

#### 10.5.2.1 Shutdown Sequencing During Unexpected Power Loss

Using the adjustable Quick Output Discharge function of the TPS22810, adding a load switch to each power rail can be used to manage the power down sequencing in the event of an unexpected power loss (that is battery removal). To determine the QOD values for each load switch, first confirm the power down order of the device you wish to power sequence. Be sure to check if there are voltage or timing margins that must be maintained during power down. Next, consult Table 1 to determine appropriate  $C_L$  and  $R_{\rm QOD}$  values for each power rail's load switch so that the load switches' fall times correspond to the order in which they need to be powered down. In the above example, we must have this power rail's fall time to be 4 ms. Using Equation 2, we can determine the appropriate  $R_{\rm QOD}$  to achieve our desired fall time.

Since fall times are measured from 90% of  $V_{OUT}$  to 10% of  $V_{OUT}$ , using Equation 2, we get Equation 4 and Equation 5.

$$1.2V = 10.8V \times e^{-(20ms)/(RQOD \times (22\mu F))}$$
(4)

$$R_{OOD} = 413.7 \Omega \tag{5}$$

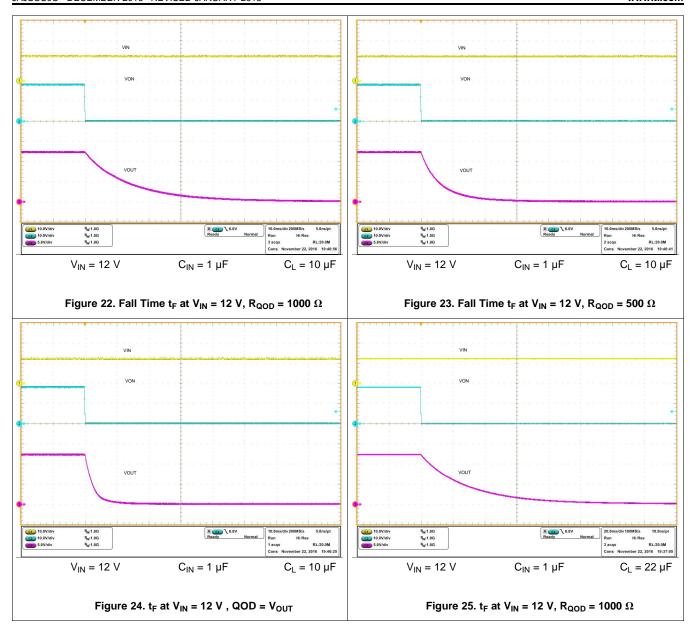

Consulting Figure 6,  $R_{PD}$  at  $V_{IN}$  = 12 V is approximately 250  $\Omega$ . Using Equation 1, the required external QOD resistance can be calculated as shown in Equation 6 and Equation 7.

413.7 
$$\Omega = 250 \Omega + R_{EXT}$$
 (6)

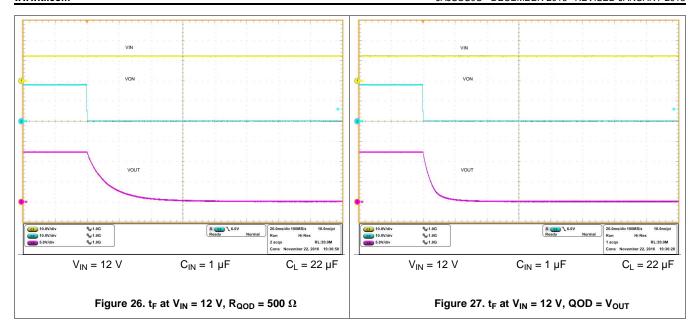

$$R_{EXT} = 163.7 \Omega \tag{7}$$

Figure 22 through Figure 25 are scope shots demonstrating an example of the QOD functionality when power is removed from the device (both ON and VIN are disconnected simultaneously). In the scope shots, the  $V_{IN}$  = 12 V and correspond to when  $R_{QOD}$  = 1000  $\Omega$ ,  $R_{QOD}$ = 500  $\Omega$ , and QOD = VOUT with two values of  $C_L$  = 10  $\mu F$  and 22  $\mu F$ .

#### 10.5.2.2 VIN to VOUT Voltage Drop

The VIN to VOUT voltage drop in the device is determined by the  $R_{ON}$  of the device and the load current. The  $R_{ON}$  of the device depends upon the VIN conditions of the device. Refer to the  $R_{ON}$  specification of the device in the *Electrical Characteristics* table of this datasheet. Once the  $R_{ON}$  of the device is determined based upon the VIN conditions, use Equation 8 to calculate the VIN to VOUT voltage drop.

$$\Delta V = I_{LOAD} \times R_{ON}$$

#### where

- \( \Delta V \) is the voltage drop from VIN to VOUT
- I<sub>LOAD</sub> is the load current
- R<sub>ON</sub> is the On-resistance of the device for a specific V<sub>IN</sub>

An appropriate I<sub>LOAD</sub> must be chosen such that the I<sub>MAX</sub> specification of the device is not violated.

#### 10.5.2.3 Inrush Current

To determine how much inrush current is caused by the C<sub>L</sub> capacitor, use Equation 9.

$$I_{INRUSH} = C_L \times \frac{dV_{OUT}}{dt}$$

#### where

- I<sub>INRUSH</sub> is the amount of inrush caused by C<sub>L</sub>
- C<sub>I</sub> is the capacitance on VOUT
- dt is the Output Voltage rise time during the ramp up of VOUT when the device is enabled
- dV<sub>OUT</sub> is the change in V<sub>OUT</sub> during the ramp up of VOUT when the device is enabled

The appropriate rise time can be calculated using the design requirements and the inrush current equation. As we calculate the rise time (measured from 10% to 90% of  $V_{OUT}$ ), we account for this in our  $d_{VOUT}$  parameter (80% of  $V_{OUT}$  = 9.6 V) as shown in Equation 10 and Equation 11.

$$400 \text{ mA} = 22 \mu\text{F} \times 9.6 \text{ V/dt}$$
 (10)

$$dt = 528 \,\mu s \tag{11}$$

To ensure an inrush current of less than 400 mA, choose a CT value that yields a rise time of more than 528  $\mu$ s. Consulting Table 2 at  $V_{IN}$  = 12 V, CT = 4700 pF provides a typical rise time of 957  $\mu$ s. Using this rise time and voltage into Equation 9, yields Equation 12 and Equation 13.

$$I_{\text{lnrush}} = 22 \,\mu\text{F} \times 9.6 \,\text{V}/957 \,\mu\text{s}$$
 (12)

$$_{lnrush} = 220 \text{ mA} \tag{13}$$

(9)

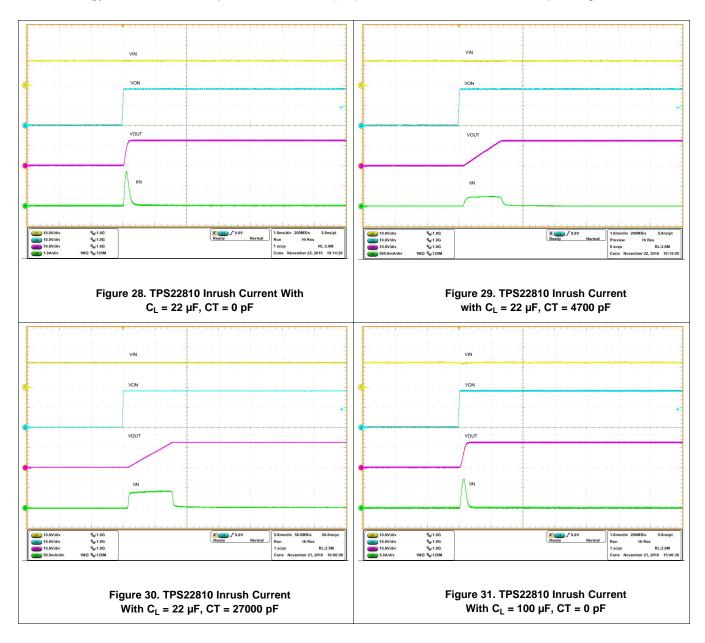

(8)

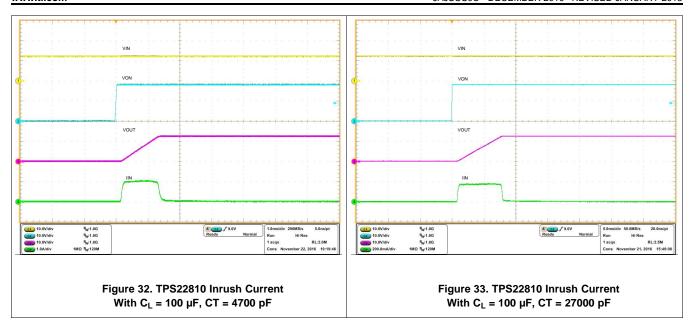

An appropriate  $C_L$  value must be placed on VOUT such that the  $I_{MAX}$  and  $I_{PLS}$  specifications of the device are not violated.

## 10.5.3 Application Curves

See the oscilloscope captures below for an example of how the CT capacitor can be used to reduce inrush current for  $V_{IN}$  = 12 V. See the *Adjustable Rise Time (CT)* section for rise times for corresponding CT values.

# 11 Power Supply Recommendations

The device is designed to operate from a VIN range of 2.7 V to 18 V. This supply must be well regulated and placed as close to the device terminal as possible with the recommended 1- $\mu$ F bypass capacitor. If the supply is located more than a few inches from the device terminals, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of  $1 \mu$ F may be sufficient.

The TPS22810 operates regardless of power sequencing order. The order in which voltages are applied to  $V_{IN}$  and ON does not damage the device as long as the voltages do not exceed the absolute maximum operating conditions.

# 12 Layout

## 12.1 Layout Guidelines

- 1. VIN and VOUT traces must be as short and wide as possible to accommodate for high current.
- 2. The VIN pin must be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is  $1-\mu F$  ceramic with X5R or X7R dielectric. This capacitor must be placed as close to the device pins as possible.

## 12.2 Layout Example

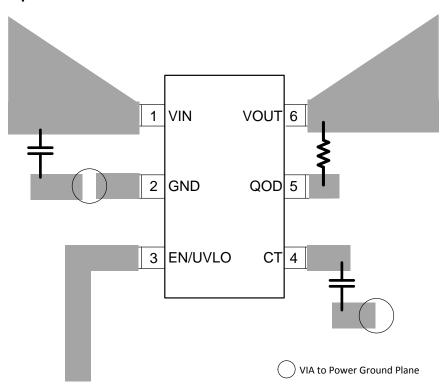

Figure 34. Recommended Board Layout

#### 12.3 Thermal Considerations

For best performance, all traces must be as short as possible. To be most effective, the input and output capacitors must be placed close to the device to minimize the effects that parasitic trace inductances may have on normal and short-circuit operation. Using wide traces for VIN, VOUT, and GND helps minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance.

The maximum IC junction temperature must be restricted to 150°C under normal operating conditions. To calculate the maximum allowable dissipation,  $P_{D(max)}$  for a given output current and ambient temperature, use Equation 14.

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_{A}}{\theta_{JA}}$$

where

- P<sub>D(MAX)</sub> is the maximum allowable power dissipation
- T<sub>J(MAX)</sub> is the maximum allowable junction temperature (150°C for the TPS22810)
- T<sub>A</sub> is the ambient temperature of the device
- θ<sub>JA</sub> is the junction to air thermal impedance. Refer to the *Thermal Information* table. This parameter is highly dependent upon board layout. (14)

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

TI は、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適したTI製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TIの製品は、TIの販売条件、TIの総合的な品質ガイドライン、 ti.com または TI 製品などに関連して提供される他の適用条件に従い提供されます。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。 TI がカスタム、またはカスタマー仕様として明示的に指定していない限り、TI の製品は標準的なカタログに掲載される汎用機器です。

お客様がいかなる追加条項または代替条項を提案する場合も、TIはそれらに異議を唱え、拒否します。
