

TPS25947xx、2.7V~23V、5.5A、28mΩ、真の逆電流ブロッキング eFuse、入力逆極性保護付き

1 特長

- 広い動作時入力電圧範囲: 2.7V~23V
 - 絶対最大定格: 28V
 - 15V までの負電圧に対応可能
- 低いオン抵抗を持つバック・ツー・バック FET を内蔵: $R_{ON} = 28.3m\Omega$ (標準値)
- 真の逆電流ブロックによる理想ダイオード動作
- 高速過電圧保護
 - 過電圧クランプ (OVC) (ピンで選択可能なスレッシュホルド (3.8V、5.7V、13.8V)、5μs (標準値) の応答時間) または
 - 調整可能な過電圧誤動作防止 (OVLO) (1.2μs (標準値) の応答時間)
- 負荷電流監視出力 (ILM) を備えた過電流保護
 - アクティブ電流制限またはサーキット・ブレーカを選択可能
 - 調整可能なスレッシュホルド (I_{LIM}) 0.5A~6A
 - 精度: $\pm 10\%$ ($I_{LIM} > 1A$)
 - 可変の過渡ブランピング・タイマ (ITIMER)、最大 $2 \times I_{LIM}$ のピーク電流を許容
 - 出力負荷電流監視精度: $\pm 6\%$ ($I_{OUT} \geq 1A$)
- 高速トリップ応答による短絡保護
 - 応答時間 500ns (標準値)
 - 可変 ($2 \times I_{LIM}$) および固定のスレッシュホルド
- アクティブ HIGH のイネーブル入力、低電圧誤動作防止 (UVLO) スレッシュホルドを設定可能
- 可変の出力スルーレート (dVdt) 制御
- 過熱保護
- デジタル出力
 - 優先パワー・マルチプレクサ制御 (AUXOFF) とフォルト通知 (FLT) または
 - 可変スレッシュホルド (PGTH) 付きのパワー・グッド表示 (PG)
- UL 2367 認定
 - ファイル番号 E339631
 - $R_{ILIM} \geq 750\Omega$
- IEC 62368-1 CB 認証
- 小型サイズ: QFN 2mm × 2mm (0.45mm ピッチ)

2 アプリケーション

- パワー・マルチプレクサ / OR 接続
- アダプタ 入力保護
- USB PD 保護 - PC、ノート PC、モニタ、ドック
- サーバー、PC マザーボード、アドオン・カード
- エンタープライズ・ストレージ: RAID/HBA/SAN/eSSD

- 患者モニタ

3 概要

TPS25947xx ファミリの eFuse は、小さいパッケージに搭載され、高度に統合された回路保護および電源管理ソリューションです。このデバイスは、非常に少ない数の外付け部品でさまざまな保護モードを提供し、過負荷、短絡、電圧サージ、逆極性、および過剰な突入電流に対して堅牢な保護を行います。バック・ツー・バック FET が内蔵されており、出力から入力への逆電流が常にブロックされるため、このデバイスはパワー・マルチプレクサや OR 接続アプリケーションに最適で、また、入力電源に障害が発生した場合に負荷側のエネルギーを保持するストレージを必要とするシステムにも適しています。これらのデバイスは、リニア OR 接続ベースの方式を採用して DC 逆電流がほぼゼロになっているので、順方向電圧降下と消費電力を最小限にした理想ダイオード動作をエミュレートできます。

出力のスルーレートと突入電流は、単一の外付けコンデンサを使用して調整できます。固定の安全な最大電圧 (ピンで選択可能) に出力をクランプする方法と、可変の過電圧スレッシュホルドを入力が超えた際に出力を遮断する方法のどちらかで、入力過電圧状態から負荷を保護します。このデバイスは、電流をアクティブに制限するか、または回路を遮断することにより、出力過負荷に対応します。出力電流制限スレッシュホルドおよび過渡過電流ブランピング・タイマは、ユーザーが調整可能です。電流制限制御ピンは、アナログ負荷電流モニタとしても機能します。

これらのデバイスは、2mm × 2mm、10 ピンの HotRod QFN パッケージで供給され、放熱性能の向上とシステムのフットプリント削減に役立ちます。

これらのデバイスは、-40°C~+125°C の接合部温度範囲で動作が規定されています。

デバイス情報

4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision A (March 2021) to Revision B (March 2022)	Page
• UIL/IEC 認証ステータスを更新.....	1
• Corrected the ESD Ratings to show CDM testing was per JS-002.....	6
• Updated image formatting.....	12
• Updated 表 8-5	37
Changes from Revision * (October 2020) to Revision A (March 2021)	Page
• ステータスを「事前情報」から「量産データ」に変更.....	1

5 Device Comparison Table

Part Number	Overvoltage Response	Overcurrent Response	AUXOFF or PG	FLT or PGTH	Response to Fault
TPS259470ARPW	Adjustable OVLO	Active Current Limit	AUXOFF	FLT	Auto-Retry
TPS259470LRPW					Latch-Off
TPS259472ARPW	Pin Selectable OVC (3.8 V/5.7 V/13.8 V)		PG	PGTH	Auto-Retry
TPS259472LRPW					Latch-Off
TPS259474ARPW	Adjustable OVLO	Circuit Breaker			Auto-Retry
TPS259474LRPW					Latch-Off

6 Pin Configuration and Functions

图 6-1. TPS25947xx RPW Package 10-Pin QFN Top View

表 6-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
EN/UVLO	1	Analog Input	Active High Enable for the device. A Resistor Divider on this pin from input supply to GND can be used to adjust the Undervoltage Lockout threshold. <i>Do not leave floating.</i> Refer to セクション 8.3.2 for details.
OVLO	2	Analog Input	TPS259470x, TPS259474x: A Resistor Divider on this pin from supply to GND can be used to adjust the Overvoltage Lockout threshold. This pin can also be used as an Active Low Enable for the device. <i>Do not leave floating.</i> Refer to セクション 8.3.3 for details.
OVCSEL		Analog Input	TPS259472x: Overvoltage Clamp Threshold Select Pin. Refer to セクション 8.3.4 for details.
PG	3	Digital Output	TPS259472x, TPS259474x: Power Good indication. This pin is an Open Drain signal which is asserted High when the internal powerpath is fully turned ON and PGTH input exceeds a certain threshold. Refer to セクション 8.3.11 for more details.
AUXOFF		Digital Output	TPS259470x: Auxiliary channel control signal. This pin is an Open Drain signal which is asserted High when the input supply is valid and channel has completed inrush sequence. This can be used to enable/disable the auxiliary supply eFuse to facilitate smooth switchover in a Priority power MUXing configuration. Refer to セクション 8.3.10 for more details.
FLT	4	Digital Output	TPS259470x: Active low Fault event indicator. This pin is an Open Drain signal which will be pulled low when a fault is detected. Refer to セクション 8.3.9 for more details.
PGTH		Analog Input	TPS259472x, TPS259474x: Power Good Threshold. Refer to セクション 8.3.11 for more details.
IN	5	Power	Power input
OUT	6	Power	Power output
DVDT	7	Analog Output	A capacitor from this pin to GND sets the output turn on slew rate. Leave this pin floating for the fastest turn on slew rate. Refer to セクション 8.3.5.1 for details.
GND	8	Ground	This pin is the ground reference for all internal circuits and must be connected to system GND.

表 6-1. Pin Functions (continued)

PIN		TYPE	DESCRIPTION
NAME	NO.		
ILM	9	Analog Output	This pin is a dual function pin used to limit and monitor the output current. An external resistor from this pin to GND sets the output current limit threshold during start-up as well as steady state. The pin voltage can also be used as analog output load current monitor signal. <i>Do not leave floating.</i> Refer to セクション 8.3.5.2 or セクション 8.3.5.3 for more details.
ITIMER	10	Analog Output	A capacitor from this pin to GND sets the overcurrent blanking interval during which the output current can temporarily exceed set current limit (but lower than fast-trip threshold) before the device overcurrent response takes action. Leave this pin open for fastest response to overcurrent events. Refer to セクション 8.3.5.2 or セクション 8.3.5.3 for more details.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

Parameter		Pin	MIN	MAX	UNIT
V _{IN}	Maximum Input Voltage Range, $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$	IN	$\max(-15, V_{\text{OUT}} - 21)$	28	V
	Maximum Input Voltage Range, $-10^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$		$\max(-15, V_{\text{OUT}} - 22)$	28	V
V _{OUT}	Maximum Output Voltage Range, $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$	OUT	-0.3	min (28, V _{IN} + 21)	
	Maximum Output Voltage Range, $-10^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$		-0.3	min (28, V _{IN} + 22)	
V _{OUT,PLS}	Minimum Output Voltage Pulse (< 1 μs)	OUT	-0.8		
V _{EN/UVLO}	Maximum Enable Pin Voltage Range ⁽²⁾	EN/UVLO	-0.3	6.5	V
V _{OVLO}	Maximum OVLO Pin Voltage Range (TPS259470x/4x) ⁽²⁾	OVLO	-0.3	6.5	V
V _{OVCSEL}	Maximum OVCSEL Pin Voltage Range (TPS259472x)	OVCSEL	Internally Limited		V
V _{dVdT}	Maximum dVdT Pin Voltage Range	dVdT	Internally Limited		V
V _{ITIMER}	Maximum ITIMER Pin Voltage Range	ITIMER	Internally Limited		V
V _{PGTH}	Maximum PGTH Pin Voltage Range (TPS259472x/4x) ⁽²⁾	PGTH	-0.3	6.5	V
V _{AUXOFF}	Maximum AUXOFF Pin Voltage Range (TPS259470x)	AUXOFF	-0.3	6.5	V
V _{PG}	Maximum PG Pin Voltage Range (TPS259472x/4x)	PG	-0.3	6.5	V
V _{FLTB}	Maximum FLT Pin Voltage Range (TPS259470x) ⁽²⁾	FLT	-0.3	6.5	V
V _{ILM}	Maximum ILM Pin Voltage Range	ILM	Internally Limited		V
I _{MAX}	Maximum Continuous Switch Current	IN to OUT	Internally Limited		A
T _J	Junction temperature		Internally Limited		°C
T _{LEAD}	Maximum Lead Temperature			300	°C
T _{STG}	Storage temperature		-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) If this pin has a pull-up up to V_{IN}, it is recommended to use a resistance of 350 k Ω or higher to limit the current under conditions where IN can be exposed to reverse polarity.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 2000	V
		Charged device model (CDM), ANSI/ESDA/JEDEC JS-002 ⁽²⁾	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

Parameter		Pin	MIN	MAX	UNIT
V _{IN}	Input Voltage Range	IN	2.7	23 ⁽¹⁾	V
V _{OUT}	Output Voltage Range	OUT	min (23, V _{IN} + 20)		V
V _{EN/UVLO}	Enable Pin Voltage Range	EN/UVLO		5 ⁽²⁾	V
V _{OVLO}	OVLO Pin Voltage Range (TPS259470x/4x)	OVLO	0.5	1.5	V
V _{dVdT}	dVdt Capacitor Voltage Rating	dVdt	V _{IN} + 5 V ⁽³⁾		V
V _{FLTB}	FLT Pin Voltage Range (TPS259470x)	FLT		5 ⁽⁴⁾	V
V _{PGTH}	PGTH Pin Voltage Range (TPS259472x/4x)	PGTH		5 ⁽⁴⁾	V
V _{AUXOFF}	AUXOFF Pin Voltage Range (TPS259470x)	AUXOFF		5 ⁽⁴⁾	V
V _{PG}	PG Pin Voltage Range (TPS259472x/4x)	PG		5 ⁽⁴⁾	V
V _{ITIMER}	ITIMER Pin Capacitor Voltage Rating	ITIMER	4		V
R _{ILM}	ILM Pin Resistance	ILM	549	6650	Ω
I _{MAX}	Continuous Switch Current, T _J ≤ 125°C	IN to OUT		5.5	A
T _J	Junction temperature		–40	125	°C

- (1) For TPS259472x variants, the input operating voltage should be limited to the selected Output Voltage Clamp threshold as listed in the Electrical Characteristics section
- (2) For supply voltages below 5V, it is okay to pull up the EN pin to IN directly. For supply voltages greater than 5V or systems which can be exposed to reverse polarity on input supply, it is recommended to use a pull-up resistor with a minimum value of 350 kΩ.
- (3) In a PowerMUX/ORing scenario with unequal supplies, the dVdt capacitor rating for each device should be chosen based on the highest of the 2 rails.
- (4) For systems which can be exposed to reverse polarity on input supply, if this pin is referred to input supply, it is recommended to use a pull-up resistor with a minimum value of 350 kΩ to limit the current through the pin.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS25947xx	UNIT
		RPW (QFN)	
		10 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	41.7 ⁽²⁾	°C/W
		74.5 ⁽³⁾	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	1	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	20 ⁽²⁾	°C/W
		27.6 ⁽³⁾	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) Based on simulations conducted with the device mounted on a custom 4-layer PCB (2s2p) with 8 thermal vias under device
- (3) Based on simulations conducted with the device mounted on a JEDEC 4-layer PCB (2s2p) with no thermal vias under device

7.5 Electrical Characteristics

(Test conditions unless otherwise noted) $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$, $V_{\text{IN}} = 12\text{ V}$, $\text{OUT} = \text{Open}$, $V_{\text{EN/UVLO}} = 2\text{ V}$, $V_{\text{OVLO}} = 0\text{ V}$ for TPS259470x/4x, $\text{OVCSEL} = 390\text{ k}\Omega$ to GND for TPS259472x, $R_{\text{ILM}} = 549\text{ }\Omega$, $\text{dVdT} = \text{Open}$, $\text{ITIMER} = \text{Open}$, $\text{AUXOFF} = \text{Open}$ for TPS259470x, $\text{FLT} = \text{Open}$ for TPS259470x, $\text{PGTH} = \text{Open}$ for TPS259472x/4x, $\text{PG} = \text{Open}$ for TPS259472x/4x. All voltages referenced to GND.

Test Parameter	Description	MIN	TYP	MAX	UNITS
INPUT SUPPLY (IN)					
$V_{\text{UVP(R)}}$	IN Supply UVP Rising threshold	2.44	2.53	2.64	V
$V_{\text{UVP(F)}}$	IN Supply UVP Falling threshold	2.35	2.42	2.55	V
$I_{\text{Q(ON)}}$	IN Supply Quiescent Current (TPS259470x)		428	610	μA
	IN Supply Quiescent Current (TPS259472x)		426	610	μA
	IN Supply Quiescent Current (TPS259474x)		428	610	μA
	IN Supply Quiescent Current during RCB, $V_{\text{OUT}} = V_{\text{IN}} + 1\text{ V}$		193		μA
	IN Supply Current during OVC (TPS259472x)		445	625	μA
$I_{\text{Q(OFF)}}$	IN Supply disabled State Current ($V_{\text{SD(F)}} < V_{\text{EN}} < V_{\text{UVLO(F)}}$)		73	130	μA
I_{SD}	IN Supply Shutdown Current ($V_{\text{EN}} < V_{\text{SD(F)}}$)		4.4	28.7	μA
$I_{\text{Q(OVLO)}}$	IN Supply OFF Current (OVLO condition), $V_{\text{OUT}} = V_{\text{IN}} + 1\text{ V}$		190	267	μA
$I_{\text{INLKG(IRPP)}}$	IN Supply Leakage Current ($V_{\text{IN}} = -14\text{ V}$, $V_{\text{OUT}} = 0\text{ V}$)		-3.7		μA
$I_{\text{OUTLKG(OVLO)}}$	OUT Leakage Current (OVLO condition), $V_{\text{OUT}} > V_{\text{IN}}$		319	443	μA
ON RESISTANCE (IN - OUT)					
R_{ON}	$V_{\text{IN}} = 12\text{ V}$, $I_{\text{OUT}} = 3\text{ A}$, $T_J = 25^{\circ}\text{C}$		28.2		m Ω
	$2.7 \leq V_{\text{IN}} \leq 23\text{ V}$, $I_{\text{OUT}} = 3\text{ A}$, $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$			45	m Ω
ENABLE/UNDERVOLTAGE LOCKOUT (EN/UVLO)					
$V_{\text{UVLO(R)}}$	UVLO Rising threshold	1.183	1.20	1.223	V
$V_{\text{UVLO(F)}}$	UVLO Falling threshold	1.076	1.09	1.116	V
$V_{\text{SD(F)}}$	EN/UVLO Falling Threshold for lowest shutdown current	0.45	0.74		V
I_{ENLKG}	EN/UVLO leakage current	-0.1		0.1	μA
OVERVOLTAGE LOCKOUT (OVLO) - TPS259470x/4x					
$V_{\text{OV(R)}}$	OVLO Rising threshold	1.183	1.20	1.223	V
$V_{\text{OV(F)}}$	OVLO Falling threshold	1.076	1.09	1.116	V
I_{OVLKG}	OVLO pin leakage current, $0.5\text{ V} < V_{\text{OVLO}} < 1.5\text{ V}$	-0.1		0.1	μA
OUTPUT VOLTAGE CLAMP (OUT) - TPS259472x					
V_{OVC}	Overvoltage Clamp Threshold, $\text{OVCSEL} = \text{Shorted to GND}$	3.65	3.88	4.1	V
	Overvoltage Clamp Threshold, $\text{OVCSEL} = \text{Open}$	5.25	5.74	6.2	V
	Overvoltage Clamp Threshold, $\text{OVCSEL} = 390\text{ k}\Omega$ to GND	13.2	13.85	14.5	V
V_{CLAMP}	Output Voltage During Clamping, $\text{OVCSEL} = \text{Shorted to GND}$, $I_{\text{OUT}} = 10\text{ mA}$	3.2	3.82	4.2	V
	Output Voltage During Clamping, $\text{OVCSEL} = \text{Open}$, $I_{\text{OUT}} = 10\text{ mA}$	5.0	5.68	6.12	V
	Output Voltage During Clamping, $\text{OVCSEL} = 390\text{ k}\Omega$ to GND, $I_{\text{OUT}} = 10\text{ mA}$	13.0	13.79	14.6	V
OVERCURRENT PROTECTION (OUT)					
I_{ILM}	Overcurrent Threshold, $R_{\text{ILM}} = 6.65\text{ k}\Omega$	0.425	0.500	0.575	A
	Overcurrent Threshold, $R_{\text{ILM}} = 3.32\text{ k}\Omega$	0.850	1.007	1.150	A
	Overcurrent Threshold, $R_{\text{ILM}} = 1.65\text{ k}\Omega$	1.800	2.028	2.200	A
	Overcurrent Threshold, $R_{\text{ILM}} = 750\text{ }\Omega$	3.960	4.452	4.840	A
	Overcurrent Threshold, $R_{\text{ILM}} = 549\text{ }\Omega$	5.400	6.068	6.600	A

7.5 Electrical Characteristics (continued)

(Test conditions unless otherwise noted) $-40^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$, $V_{IN} = 12\text{ V}$, $\text{OUT} = \text{Open}$, $V_{EN/UVLO} = 2\text{ V}$, $V_{OVLO} = 0\text{ V}$ for TPS259470x/4x, $\text{OVCSEL} = 390\text{ k}\Omega$ to GND for TPS259472x, $R_{ILM} = 549\text{ }\Omega$, $\text{dVdT} = \text{Open}$, $\text{ITIMER} = \text{Open}$, $\text{AUXOFF} = \text{Open}$ for TPS259470x, $\text{FLT} = \text{Open}$ for TPS259470x, $\text{PGTH} = \text{Open}$ for TPS259472x/4x, $\text{PG} = \text{Open}$ for TPS259472x/4x. All voltages referenced to GND.

Test Parameter	Description	MIN	TYP	MAX	UNITS
I_{FLT}	Circuit Breaker Threshold, ILM Pin Open (Single point failure)		0.1		A
	Circuit Breaker Threshold, ILM Pin Shorted to GND (Single point failure)		1.1	2.1	A
I_{SCGain}	Scalable Fast Trip Threshold (I_{SC}) : I_{LIM} Ratio		201		%
I_{FT}	Fixed Fast-trip current threshold		22.2		A
V_{FB}	V_{OUT} threshold to exit Current Limit Foldback		1.9		V
OVERCURRENT FAULT TIMER (ITIMER)					
V_{INT}	ITIMER pin internal pull-up voltage	2.3	2.57	2.72	V
R_{ITIMER}	ITIMER pin internal pull-up resistance		15		k Ω
I_{ITIMER}	ITIMER pin internal discharge current, $I_{\text{OUT}} > I_{\text{LIM}}$	1.2	1.8	2.5	μA
ΔV_{ITIMER}	ITIMER discharge differential voltage threshold	1.286	1.51	1.741	V
OUTPUT LOAD CURRENT MONITOR (ILM)					
G_{IMON}	Analog Load Current Monitor Gain ($I_{\text{MON}} : I_{\text{OUT}}$), $I_{\text{OUT}} = 0.5\text{ A}$ to 1 A , $I_{\text{OUT}} < I_{\text{LIM}}$	165	182	200	$\mu\text{A/A}$
	Analog Load Current Monitor Gain ($I_{\text{MON}} : I_{\text{OUT}}$), $I_{\text{OUT}} = 1\text{ A}$ to 5.5 A , $I_{\text{OUT}} < I_{\text{LIM}}$	165	182	200	$\mu\text{A/A}$
REVERSE CURRENT BLOCKING (IN - OUT)					
V_{FWD}	$V_{\text{IN}} - V_{\text{OUT}}$ Forward regulation voltage, $I_{\text{OUT}} = 10\text{ mA}$	4.7	16.9		mV
V_{REVTH}	$V_{\text{IN}} - V_{\text{OUT}}$ threshold for fast BFET turn off (enter reverse current blocking)	-36.45	-29.3	-22.3	mV
V_{FWDTH}	$V_{\text{IN}} - V_{\text{OUT}}$ threshold for fast BFET turn on (exit reverse current blocking)	83	104.1	125	mV
$I_{\text{REVLKG(OFF)}}$	OUT Leakage Current during unpowered condition ($V_{\text{OUT}} = 12\text{ V}$, $V_{\text{IN}} = 0\text{ V}$)		4.86		μA
I_{REVLKG}	Reverse leakage current, ($V_{\text{OUT}} - V_{\text{IN}} = 21.5\text{ V}$)		10.1		μA
$I_{\text{OUTLKG(RCB)}}$	OUT Leakage Current during ON state with RCB, $V_{\text{OUT}} = V_{\text{IN}} + 1\text{ V}$		234		μA
POWER GOOD INDICATION (PG) - TPS259472x/4x or AUXILIARY CHANNEL CONTROL (AUXOFF) - TPS259470x					
V_{PGD}	PG/AUXOFF pin voltage while de-asserted, $V_{\text{IN}} < V_{\text{UVP(F)}}$, $V_{\text{EN}} < V_{\text{SD(F)}}$, Weak pull-up ($I_{\text{PG}} = 26\text{ }\mu\text{A}$)		0.67	1	V
	PG/AUXOFF pin voltage while de-asserted, $V_{\text{IN}} < V_{\text{UVP(F)}}$, $V_{\text{EN}} < V_{\text{SD(F)}}$, Strong pull-up ($I_{\text{PG}} = 242\text{ }\mu\text{A}$)		0.79	1	V
	PG/AUXOFF pin voltage while de-asserted, $V_{\text{IN}} > V_{\text{UVP(R)}}$		0		V
I_{PGLKG}	PG/AUXOFF Pin leakage current, PG/AUXOFF asserted		0.9	3	μA
POWERGOOD THRESHOLD (PGTH) - TPS259472x/4x					
$V_{\text{PGTH(R)}}$	PGTH Rising threshold	1.183	1.20	1.223	V
$V_{\text{PGTH(F)}}$	PGTH Falling threshold	1.076	1.09	1.116	V
I_{PGTHLKG}	PGTH leakage current	-0.1		0.3	μA
FAULT INDICATION (FLT) - TPS259470x

7.7 Switching Characteristics

The output rising slew rate is internally controlled and constant across the entire operating voltage range to ensure the turn on timing is not affected by the load conditions. The rising slew rate can be adjusted by adding capacitance from the dVdt pin to ground. As C_{dVdt} is increased it will slow the rising slew rate (SR). See Slew Rate and Inrush Current Control (dVdt) section for more details. The Turn-Off Delay and Fall Time, however, are dependent on the RC time constant of the load capacitance (C_{OUT}) and Load Resistance (R_L). The Switching Characteristics are only valid for the power-up sequence where the supply is available in steady state condition and the load voltage is completely discharged before the device is enabled. Typical Values are taken at $T_J = 25^\circ\text{C}$ unless specifically noted otherwise. $R_L = 100\ \Omega$, $C_{OUT} = 1\ \mu\text{F}$

8 Detailed Description

8.1 Overview

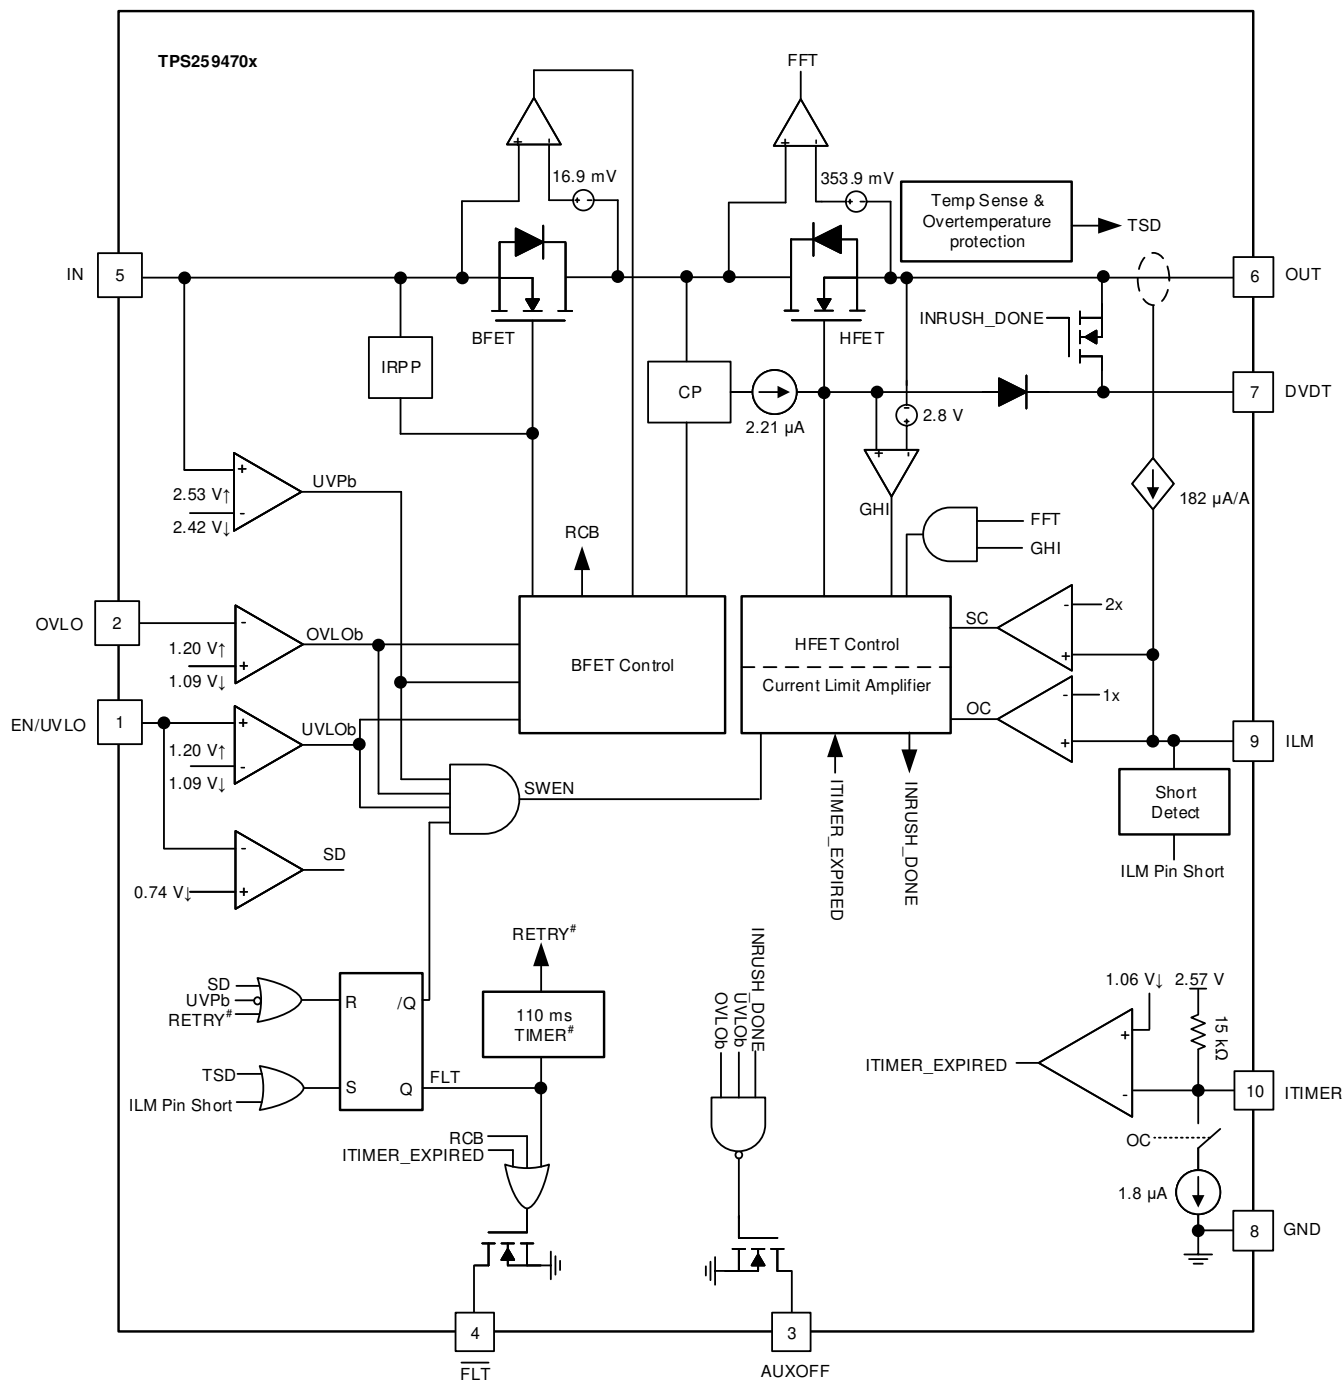

The TPS25947xx is an eFuse with integrated power path that is used to ensure safe power delivery in a system. The device starts its operation by monitoring the IN bus. When the input supply voltage (VIN) exceeds the Undervoltage Protection threshold (VUVP), the device samples the EN/UVLO pin. A high level (> VUVLO) on this pin enables the internal power path (BFET+HFET) to start conducting and allow current to flow from IN to OUT. When EN/UVLO is held low (< VUVLO), the internal power path is turned off. In case of reverse voltages appearing at the input, the power path remains OFF thereby protecting the output load.

After a successful start-up sequence, the device now actively monitors its load current and input voltage, and controls the internal HFET to ensure that the user adjustable overcurrent limit threshold (I_{LIM}) is not exceeded and overvoltage spikes are either safely clamped to the selected threshold voltage (V_{OVC}) or cut-off after they cross the user adjustable overvoltage lockout threshold (V_{OVLO}). The device also provides fast protection against severe overcurrent during short-circuit events. This keeps the system safe from harmful levels of voltage and current. At the same time, a user adjustable overcurrent blanking timer allows the system to pass moderate transient peaks in the load current profile without tripping the eFuse. This ensures a robust protection solution against real faults which is also immune to transients, thereby ensuring maximum system uptime.

The device has integrated reverse current blocking FET (BFET) which operates like an ideal diode. The BFET is linearly regulated to maintain a small constant forward drop (V_{FWD}) in forward conduction mode and turned off completely to block reverse current if output voltage exceeds the input voltage.

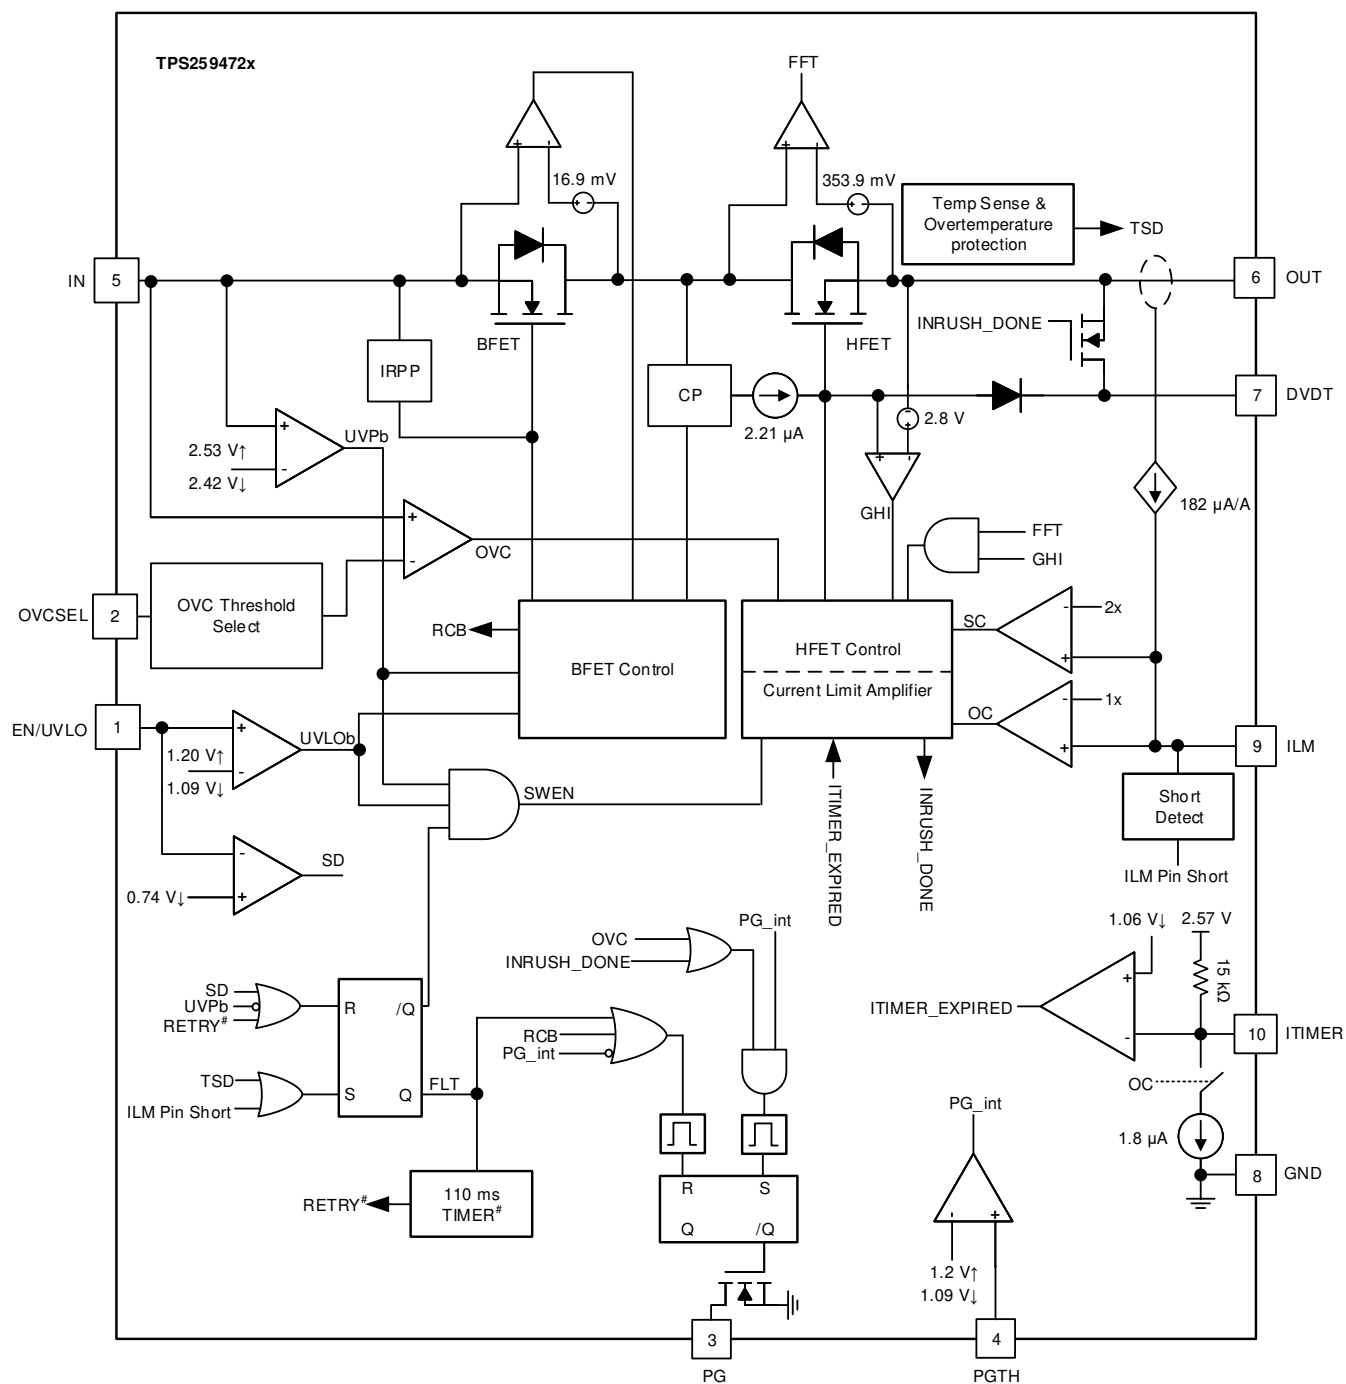

The device also has a built-in thermal sensor based shutdown mechanism to protect itself in case the device temperature (T_J) exceeds the recommended operating conditions.

8.3 Feature Description

The TPS25947xx eFuse is a compact, feature rich power management device that provides detection, protection and indication in the event of system faults.

8.3.1 Input Reverse Polarity Protection

The TPS25947xx device is internally protected against steady state negative voltages applied at the input supply pin. The device blocks the negative voltage from appearing at the output, thereby protecting the load circuits. There's no reverse current flowing from output to the input in this condition. The lowest negative voltage the device can handle at the input is limited to -15 V or $V_{\text{OUT}} - 21\text{ V}$, whichever is higher. It's also recommended that all signal pins (e.g. EN/UVLO, OVLO, PGTH) which are connected to input supply must have a sufficiently large pull-up resistor to limit the current flowing out of these pins during reverse polarity conditions. Please refer to [Absolute Maximum Ratings](#) table for more details.

8.3.2 Undervoltage Lockout (UVLO and UVP)

The TPS25947xx implements Undervoltage Protection on IN in case the applied voltage becomes too low for the system or device to properly operate. The Undervoltage Protection has a default lockout threshold of V_{UVP} which is fixed internally. Also, the UVLO comparator on the EN/UVLO pin allows the Undervoltage Protection threshold to be externally adjusted to a user defined value. The [Figure 8-4](#) and [Equation 1](#) show how a resistor divider can be used to set the UVLO set point for a given voltage supply.

Figure 8-4. Adjustable Undervoltage Protection

$$V_{\text{IN(UV)}} = \frac{V_{\text{UVLO}} \times (R1 + R2)}{R2} \quad (1)$$

8.3.3 Overvoltage Lockout (OVLO)

The TPS259470x/4x variants allow the user to implement Overvoltage Lockout to protect the load from input overvoltage conditions. The OVLO comparator on the OVLO pin allows the Overvoltage Protection threshold to be adjusted to a user defined value. After the voltage at the OVLO pin crosses the OVLO rising threshold $V_{\text{OV(R)}}$, the device turns off the power to the output. Thereafter, the devices wait for the voltage at the OVLO pin to fall below the OVLO falling threshold $V_{\text{OV(F)}}$ before the output power is turned ON again. The rising and falling thresholds are slightly different to provide hysteresis. The [Figure 8-5](#) and [Equation 2](#) show how a resistor divider can be used to set the OVLO set point for a given voltage supply.

图 8-5. Adjustable Overvoltage Protection

$$V_{IN(OV)} = \frac{V_{OV} \times (R1 + R2)}{R2} \quad (2)$$

While recovering from a OVLO event, the TPS259470x variants bypass the inrush control (dV/dt) and start up in a current limited manner to provide faster turn ON and minimize power supply droop.

图 8-6. TPS259470x Overvoltage Lockout and Recovery

While recovering from a OVLO event, the TPS259474x variants start up with inrush control (dV/dt).

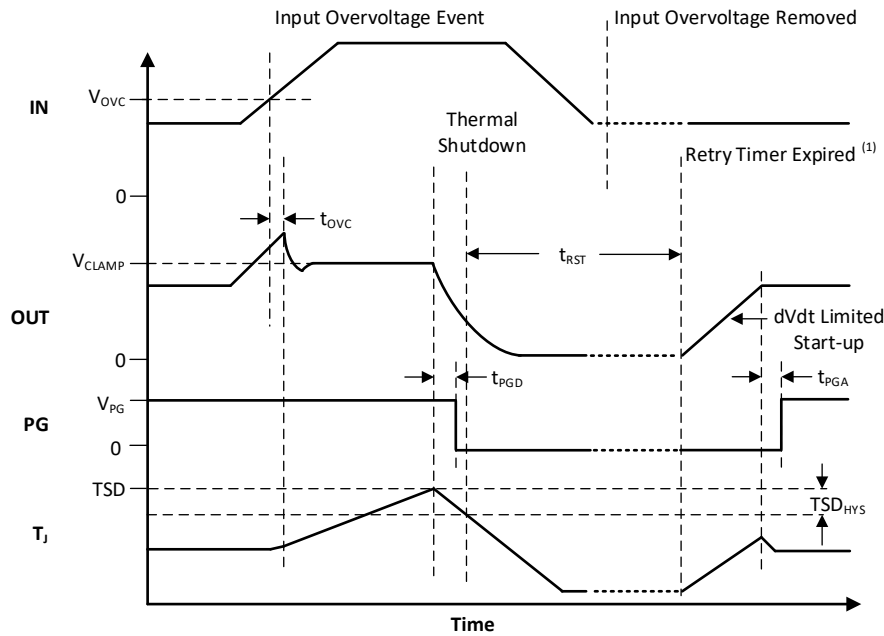

8-7. TPS25947x Overvoltage Lockout and Recovery

8.3.4 Overvoltage Clamp (OVC)

The TPS259472x variants implement a voltage clamp on the output to protect the system in the event of input overvoltage. When the device detects the input has exceeded the Overvoltage Clamp Threshold (V_{OVC}), it quickly responds within t_{OVC} and stops the output from rising further and then regulates the HFET linearly to clamp the output voltage below V_{CLAMP} as long as an overvoltage condition is present on the input.

If the part stays in clamping state for an extended period of time, there is a higher power dissipation inside the part which can eventually lead to thermal shut-down (TSD). After the part shuts down due to TSD fault, it can either stay latched off (TPS259472L variant) or restart automatically after a fixed delay (TPS259472A variant). See [Overtemperature Protection \(OTP\)](#) for more details on device response to overtemperature.

⁽¹⁾ Applicable only for TPS259472A (Auto-retry variant)

图 8-8. TPS259472x Overvoltage Response (Auto-Retry)

There are 3 available overvoltage clamp threshold options which can be configured using the OVCSEL pin.

表 8-1. TPS259472x Overvoltage Clamp Threshold Selection

OVCSEL Pin Connection	Overvoltage Clamp Threshold
Shorted to GND	3.8 V
Open	5.7 V
Connected to GND through a 390-kΩ resistor	13.8 V

8.3.5 Inrush Current, Overcurrent, and Short Circuit Protection

TPS25947xx incorporates four levels of protection against overcurrent:

1. Adjustable slew rate (dVdt) for inrush current control
2. Adjustable threshold (I_{LIM}) for overcurrent protection during start-up or steady-state
3. Adjustable threshold (I_{SC}) for fast-trip response to severe overcurrent during start-up or steady-state
4. Fixed threshold (I_{FT}) for fast-trip response to quickly protect against hard output short-circuits during steady-state

8.3.5.1 Slew Rate (dVdt) and Inrush Current Control

During hot-plug events or while trying to charge a large output capacitance at start-up, there can be a large inrush current. If the inrush current is not managed properly, it can damage the input connectors and/or cause the system power supply to droop leading to unexpected restarts elsewhere in the system. The inrush current during turn-on is directly proportional to the load capacitance and rising slew rate. 式 3 can be used to find the slew rate (SR) required to limit the inrush current (I_{INRUSH}) for a given load capacitance (C_{OUT}):

$$SR (V/ms) = \frac{I_{INRUSH} (mA)}{C_{OUT} (\mu F)} \quad (3)$$

A capacitor can be connected to the dVdt pin to control the rising slew rate and lower the inrush current during turn-on. The required C_{dVdt} capacitance to produce a given slew rate can be calculated using 式 4.

$$C_{dVdt} \text{ (pF)} = \frac{2000}{SR \text{ (V/ms)}} \quad (4)$$

The fastest output slew rate is achieved by leaving the dVdt pin open.

Note

For $C_{dVdt} > 10 \text{ nF}$, TI recommends to add a 100-Ω resistor in series with the capacitor on the dVdt pin.

8.3.5.2 Circuit-Breaker

The TPS259474x (Circuit-Breaker) variants respond to output overcurrent conditions by turning off the output after a user adjustable transient fault blanking interval. When the load current exceeds the set overcurrent threshold (I_{LIM}) set by the ILM pin resistor (R_{ILM}), but stays lower than the fast-trip threshold ($2 \times I_{LIM}$), the device starts discharging the ITIMER pin capacitor using an internal 1.8-μA pull-down current. If the load current drops below I_{LIM} before the ITIMER pin capacitor (C_{ITIMER}) discharges by ΔV_{ITIMER} , the ITIMER is reset by pulling it up to V_{INT} internally and the circuit breaker action is not engaged. This allows short load transient pulses to pass through the device without tripping the circuit. If the overcurrent condition persists, the C_{ITIMER} continues to discharge and after it discharges by ΔV_{ITIMER} , the circuit breaker action turns off the HFET immediately. At the same time, the C_{ITIMER} is charged up to V_{INT} again so that it is at its default state before the next overcurrent event. This ensures the full blanking timer interval is provided for every overcurrent event. 式 5 can be used to calculate the R_{ILM} value for a overcurrent threshold.

$$R_{ILM} \text{ (}\Omega\text{)} = \frac{3334}{I_{LIM} \text{ (A)}} \quad (5)$$

Note

1. Leaving the ILM pin open sets the current limit to nearly zero and results in the part breaking the circuit with the slightest amount of loading at the output.
 2. Shorting the ILM pin to ground at any point during normal operation is detected as a fault and the part shuts down. There is a minimum current (I_{FLT}) which the part allows in this condition before the pin short condition is detected.
-

The duration for which transients are allowed can be adjusted using an appropriate capacitor value from ITIMER pin to ground. The C_{ITIMER} value needed to set the desired transient overcurrent blanking interval can be calculated using 式 6.

$$t_{ITIMER} \text{ (ms)} = \frac{\Delta V_{ITIMER} \text{ (V)} \times C_{ITIMER} \text{ (nF)}}{I_{ITIMER} \text{ (}\mu\text{A)}} \quad (6)$$

Figure 8-9. TPS25947x Overcurrent Response

Note

1. Leave the ITIMER pin open to allow the part to break the circuit with the minimum possible delay.
2. Shorting the ITIMER pin to ground results in minimum overcurrent response delay (similar to ITIMER pin open condition), but increases the device current consumption. This is not a recommended mode of operation.
3. Increasing the ITIMER cap value extends the overcurrent blanking interval, but it also extends the time needed for the ITIMER cap to recharge up to V_{INT} . If the next overcurrent event occurs before the ITIMER cap is recharged fully, it takes lesser time to discharge to the ITIMER expiry threshold, thereby providing a shorter blanking interval than intended.

After the part shuts down due to a Circuit Breaker fault, it can either stay latched off (TPS259474L variant) or restart automatically after a fixed delay (TPS259474A variant).

8.3.5.3 Active Current Limiting

The TPS259470x/2x (Active Current Limit) variants respond to output overcurrent conditions by actively limiting the current after a user adjustable transient fault blanking interval. When the load current exceeds the set overcurrent threshold (I_{LIM}) set by the ILM pin resistor (R_{ILM}), but stays lower than the short-circuit threshold ($2 \times I_{LIM}$), the device starts discharging the ITIMER pin capacitor using an internal $1.8\text{-}\mu\text{A}$ pulldown current. If the load current drops below the overcurrent threshold before the ITIMER capacitor (C_{ITIMER}) discharges by ΔV_{ITIMER} , the ITIMER is reset by pulling it up to V_{INT} internally and the current limit action is not engaged. This allows short

load transient pulses to pass through the device without getting current limited. If the overcurrent condition persists, the C_{ITIMER} continues to discharge and after it discharges by ΔV_{ITIMER} , the current limit starts regulating the HFET to actively limit the current to the set overcurrent threshold (I_{LIM}). At the same time, the C_{ITIMER} is charged up to V_{INT} again so that it is at its default state before the next overcurrent event. This ensures the full blanking timer interval is provided for every overcurrent event. 式 7 can be used to calculate the R_{ILM} value for a desired overcurrent threshold.

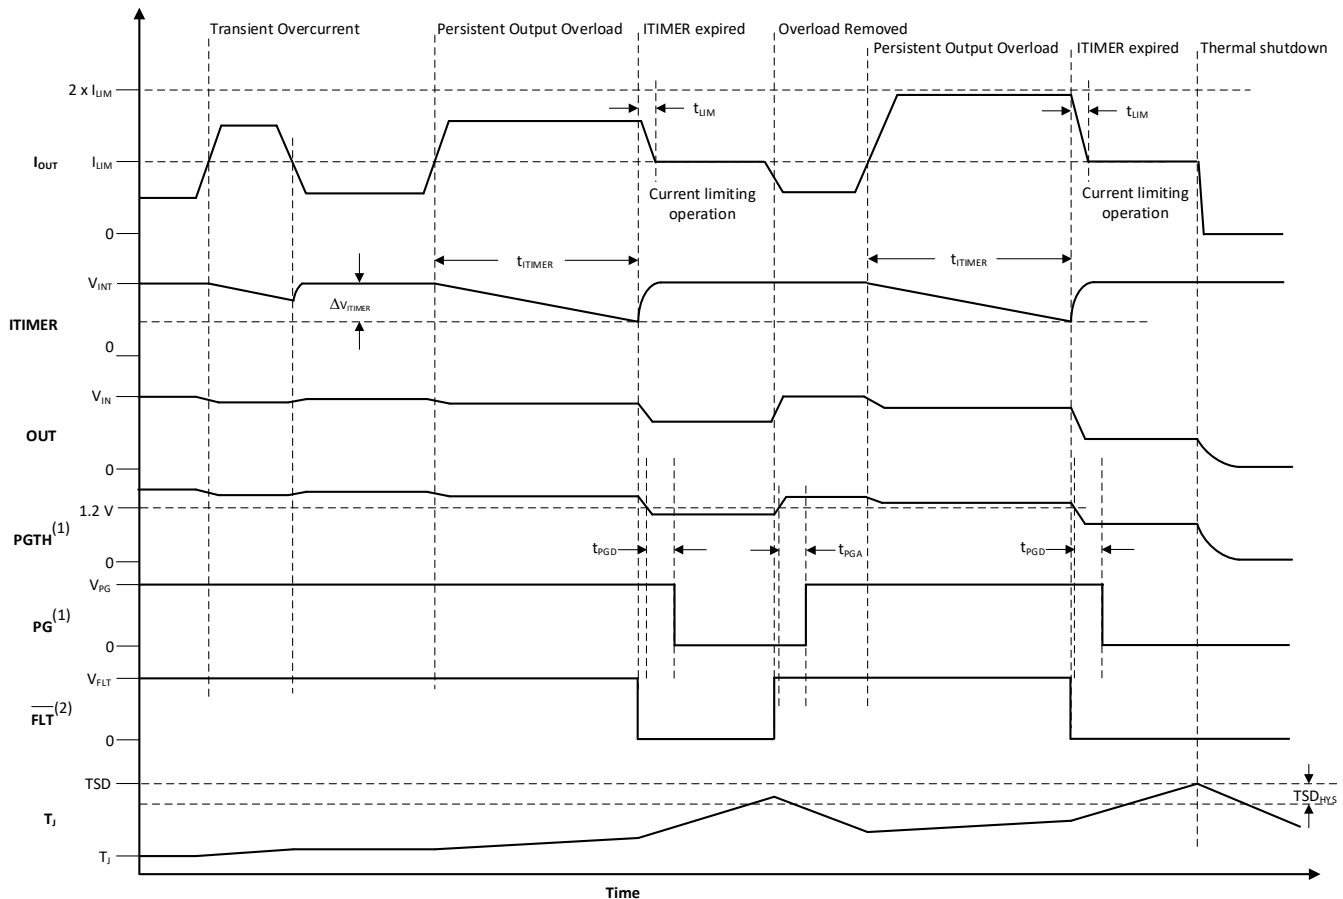

$$R_{ILM} (\Omega) = \frac{3334}{I_{LIM} (A)} \quad (7)$$

Note

1. Leaving the ILM pin open sets the current limit to nearly zero and results in the part entering current limit with the slightest amount of loading at the output.
 2. The current limit circuit employs a foldback mechanism. The current limit threshold in the foldback region ($0 V < V_{OUT} < V_{FB}$) is lower than the steady state current limit threshold (I_{LIM}).
 3. Shorting the ILM pin to ground at any point during normal operation is detected as a fault and the part shuts down. There's a minimum current (I_{FLT}) which the part allows in this condition before the pin short condition is detected.
-

The duration for which transients are allowed can be adjusted using an appropriate capacitor value from ITIMER pin to ground. The C_{ITIMER} value needed to set the desired transient overcurrent blanking interval can be calculated using 式 8 below.

$$t_{ITIMER} (ms) = \frac{\Delta V_{ITIMER} (V) \times C_{ITIMER} (nF)}{I_{ITIMER} (\mu A)} \quad (8)$$

(1) Applicable only to TPS259472x/4x variants

(2) Applicable only to TPS259470x variants

8-10. TPS259470x/2x Active Current Limit Response

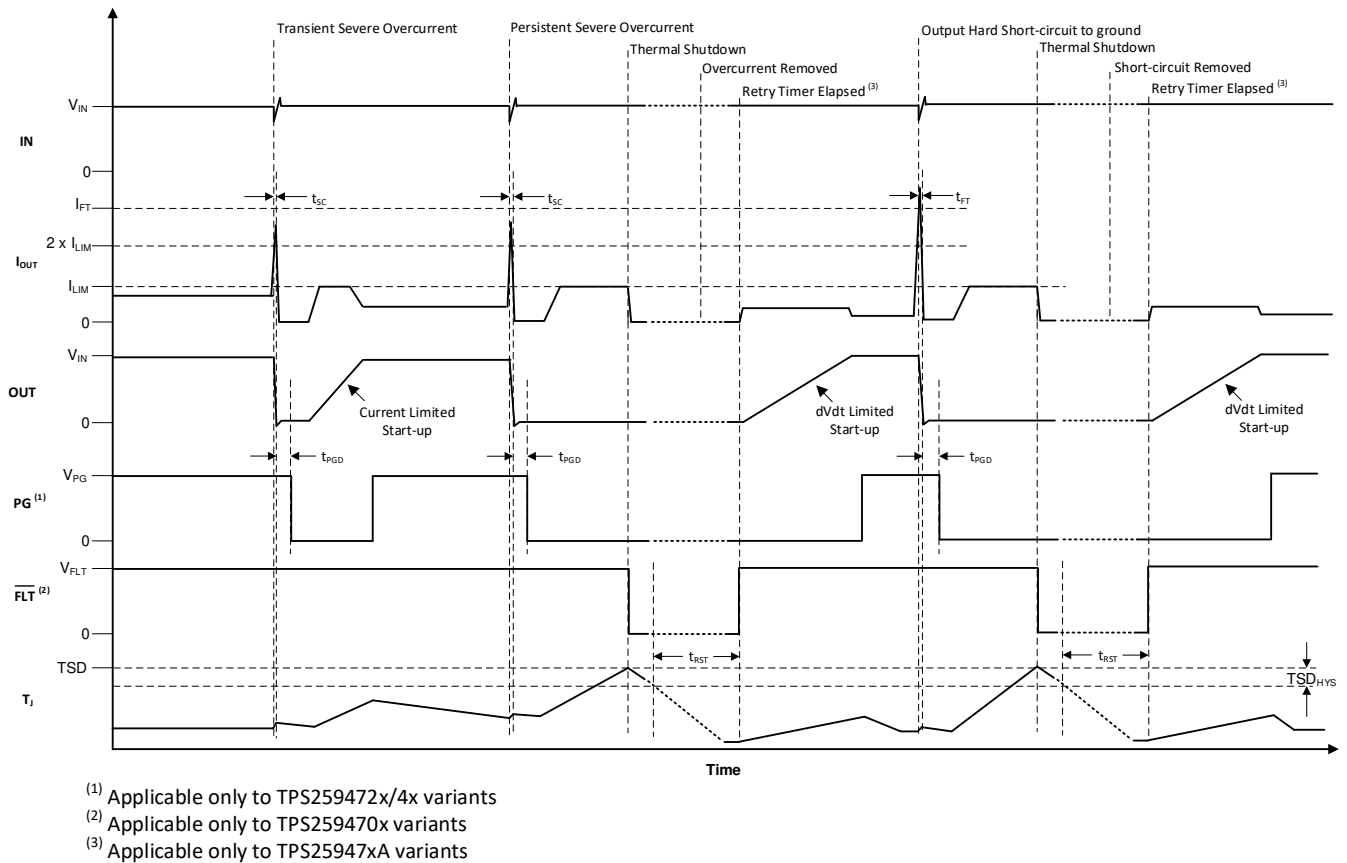

Note

1. Leave the ITIMER pin open to allow the part to limit the current with the minimum possible delay.
2. Shorting the ITIMER pin to ground results in minimum overcurrent response delay (similar to ITIMER pin open condition), but increases the device current consumption. This is not a recommended mode of operation.
3. Active current limiting based on R_{ILM} is active during start-up for both TPS259470x/2x (Current Limit) and TPS259474x (Circuit-Breaker) variants. In case the start-up current exceeds I_{LIM} , the device regulates the current to the set limit. However, during start-up the current limit is engaged without waiting for the ITIMER delay.
4. For the TPS259472x variants, during overvoltage clamp condition, if an overcurrent event occurs, the current limit is engaged without waiting for the ITIMER delay.
5. Increasing the C_{ITIMER} value extends the overcurrent blanking interval, but it also extends the time needed for the C_{ITIMER} to recharge up to V_{INT} . If the next overcurrent event occurs before the C_{ITIMER} is recharged fully, it takes less time to discharge to the ITIMER expiry threshold, thereby providing a shorter blanking interval than intended.

During active current limit, the output voltage drops resulting in increased device power dissipation across the HFET. If the device internal temperature (T_J) exceeds the thermal shutdown threshold (TSD), the HFET is turned off. After the part shuts down due to TSD fault, it can either stay latched off (TPS25947xL variants) or restart automatically after a fixed delay (TPS25947xA variants). See [Overtemperature Protection \(OTP\)](#) for more details on device response to overtemperature.

8.3.5.4 Short-Circuit Protection

During an output short-circuit event, the current through the device increases very rapidly. When a severe overcurrent condition is detected, the device triggers a fast-trip response to limit the current to a safe level. The internal fast-trip comparator employs a scalable threshold (I_{SC}) which is equal to $2 \times I_{LIM}$. This enables the user to adjust the fast-trip threshold rather than using a fixed threshold which can be too high for some low current systems. The device also employs a fixed fast-trip threshold (I_{FT}) to protect fast protection against hard short-circuits during steady state. The fixed fast-trip threshold is higher than the maximum recommended user adjustable scalable fast-trip threshold. After the current exceeds I_{SC} or I_{FT} , the HFET is turned off completely within t_{FT} . Thereafter, the device tries to turn the HFET back on after a short de-glitch interval (30 μ s) in a current limited manner instead of a dVdt limited manner. This ensures that the HFET has a faster recovery after a transient overcurrent event and minimizes the output voltage droop. However, if the fault is persistent, the device stays in current limit causing the junction temperature to rise and eventually enter thermal shutdown. See [Overtemperature Protection \(OTP\)](#) section for details on the device response to overtemperature.

8-11. TPS25947xx Short-Circuit Response

8.3.6 Analog Load Current Monitor

The device allows the system to accurately monitor the output load current by providing an analog current sense output on the ILM pin which is proportional to the current through the FET. The user can sense the voltage (V_{ILM}) across the R_{ILM} to get a measure of the output load current.

$$I_{OUT} (A) = \frac{V_{ILM} (\mu V)}{R_{ILM} (\Omega) \times G_{IMON} (\mu A/A)} \quad (9)$$

The waveform below shows the ILM signal response to a load step at the output.

$V_{IN} = 12\text{ V}$, $C_{OUT} = 22\text{ }\mu\text{F}$, $R_{ILM} = 1150\text{ }\Omega$, I_{OUT} varied dynamically between 0A and 3.5 A

8-12. Analog Load Current Monitor Response

Note

The ILM pin is sensitive to capacitive loading. Careful design and layout is needed to ensure the parasitic capacitive loading on the ILM pin is $< 50\text{ pF}$ for stable operation.

8.3.7 Reverse Current Protection

The device functions like an ideal diode and blocks reverse current flow from OUT to IN under all conditions. The device has integrated back-to-back MOSFETs connected in a common drain configuration. The voltage drop between the IN and OUT pins is constantly monitored and the gate drive of the blocking FET (BFET) is adjusted as needed to regulate the forward voltage drop at V_{FWD} . This closed loop regulation scheme (linear ORing control) enables graceful turn off of the MOSFET during a reverse current event and ensures there is no DC reverse current flow.

The device also uses a conventional comparator (V_{REVTH}) based reverse blocking mechanism to provide fast response (t_{RCB}) to transient reverse currents. After the device enters reverse current blocking condition, it waits for the $(V_{IN} - V_{OUT})$ forward drop to exceed the V_{FWDTH} before it performs a fast recovery to reach full forward conduction state. This provides sufficient hysteresis to prevent supply noise or ripple from affecting the reverse current blocking response. The recovery from reverse current blocking is very fast (t_{SWRCB}). This ensures minimum supply droop which is helpful in applications such as supply MUXing/ORing and USB Fast Role Swap (FRS).

BFET operating state

Linear ORing loop response

RCB fast comparator response

8-13. Reverse Current Blocking Response

The waveforms below illustrate the reverse current blocking performance in various scenarios.

During fast voltage step at output (for example. hot-plug), the fast comparator based reverse blocking mechanism ensures minimum jump/glitch on the input rail.

8-14. Reverse Current Blocking Performance During Fast Voltage Step at Output

During slow voltage ramp at output, the linear ORing based reverse blocking mechanism ensures there is no DC current flow from OUT to IN, thereby avoiding input rail from getting slowly charged up to output voltage.

8-15. Reverse Current Blocking Performance During Slow Voltage Ramp at Output

When the input supply droops or gets disconnected while the output storage element (bulk capacitor or super capacitor) is charged to the full voltage, the linear ORing scheme minimizes the self-discharge from OUT to IN. This ensures maximum hold-up time for the output storage element in critical power back-up applications.

It also prevents incorrect supply presence indication in applications which sense the input voltage to detect if the supply is connected.

8-16. Reverse Current Blocking Performance During Input Supply Failure

8.3.8 Overtemperature Protection (OTP)

The device monitors the internal die temperature (T_J) at all times and shuts down the part as soon as the temperature exceeds a safe operating level (TSD) thereby protecting the device from damage. The device does not turn back on until the junction cools down sufficiently, that is the die temperature falls below $(TSD - TSD_{HYS})$.

When the TPS25947xL (latch-off variant) detects thermal overload, it is shut down and remain latched-off until the device is power cycled or re-enabled. When the TPS25947xA (auto-retry variant) detects thermal overload, it remains off until it has cooled down by TSD_{HYS} . Thereafter, the device remains off for an additional delay of t_{RST} after which it automatically retries to turn on if it is still enabled.

表 8-2. Thermal Shutdown

Device	Enter TSD	Exit TSD
TPS25947xL (Latch-Off)	$T_J \geq T_{SD}$	$T_J < T_{SD} - T_{SD_{HYS}}$ V_{IN} cycled to 0 V and then above $V_{UVP(R)}$ OR EN/UVLO toggled below $V_{SD(F)}$
TPS25947xA (Auto-Retry)	$T_J \geq T_{SD}$	$T_J < T_{SD} - T_{SD_{HYS}}$ V_{IN} cycled to 0 V and then above $V_{UVP(R)}$ OR EN/UVLO toggled below $V_{SD(F)}$ OR t_{RST} timer expired

8.3.9 Fault Response and Indication (FLT)

The following table summarizes the device response to various fault conditions. Additionally, an active low external fault indication (FLT) pin is available on the TPS259470x variants.

表 8-3. Fault Summary

Event	Protection Response	Fault Latched Internally	FLT Pin Status ⁽¹⁾	FLT Assertion Delay ⁽¹⁾
Overtemperature	Shutdown	Y	L	
Undervoltage (UVP or UVLO)	Shutdown	N	H	
Input Reverse Polarity	Shutdown	N	H	
Input Overvoltage	Shutdown ^{(1) (2)}	N	H	
	Voltage Clamp ⁽²⁾	N	N/A	
Transient Overcurrent ($I_{LIM} < I_{OUT} < 2 \times I_{LIM}$)	None	N	N	
Persistent Overcurrent	Circuit Breaker ⁽³⁾	Y	N/A	
Persistent Overcurrent	Current Limit ⁽⁴⁾	N	L	t_{TIMER}
Output Short-Circuit to GND	Circuit Breaker followed by Current Limit	N	H	
ILM Pin Open (During Steady State)	Shutdown	N	L	t_{TIMER}
ILM Pin Shorted to GND	Shutdown	Y	L	t_{TIMER}
Reverse Current ($(V_{OUT} - V_{IN}) > V_{REVTH}$)	Reverse Current Blocking	N	L	

(1) Applicable to TPS259470x variants only.

(2) Applicable to TPS259472x variants only.

(3) Applicable to TPS259474x variants only.

(4) Applicable to TPS259470x/2x variants only.

Faults which are latched internally can be cleared either by power cycling the part (pulling V_{IN} to 0 V) or by pulling the EN/UVLO pin voltage below V_{SD} . This also releases the \overline{FLT} pin for the TPS259470x variants and resets the t_{RST} timer for the TPS25947xA (auto-retry) variants.

During a latched fault, pulling the EN/UVLO just below the UVLO threshold has no impact on the device. This is true for both TPS25947xL (latch-off) and TPS25947xA (auto-retry) variants.

For TPS25947xA (auto-retry) variants, on expiry of the t_{RST} timer after a fault, the device restarts automatically and the \overline{FLT} pin is de-asserted (TPS259470A variant).

8.3.10 Auxiliary Channel Control (AUXOFF)

The TPS259470x variants provide an active high digital output (AUXOFF) which is asserted to indicate when the priority input supply is in a valid range (above UVP/UVLO and below OVLO thresholds) and the device has

successfully completed its inrush sequence. The AUXOFF pin is an open-drain signal which must be pulled up to an external supply.

After power up, AUXOFF pin is pulled low initially. The device initiates a inrush sequence in which the HFET is turned on in a controlled manner. When the FET gate voltage has reached the full overdrive indicating that the inrush sequence is complete and device is capable of delivering full power, the AUXOFF pin is asserted high. Thereafter, the AUXOFF pin is de-asserted only if the input supply becomes invalid (below UVP/UVLO or above OVLO thresholds). No load side events/faults have any control over the AUXOFF de-assertion.

This pin is used to control the auxiliary channel when 2 TPS259470x devices are connected in a priority power MUX configuration. It can also be used as a supply valid status indication to the downstream load or system supervisor.

表 8-4. TPS259470x AUXOFF Indication Summary

Event	AUXOFF Pin
Undervoltage (UVP or UVLO)	L
Input Reverse Polarity	L
Overvoltage (OVLO)	L
Inrush	L
Steady State	H
Overcurrent	H
Short-Circuit	H
ILM Pin Open	H
ILM Pin Shorted to GND	H
Reverse current ($(V_{OUT} - V_{IN}) > V_{REVTH}$)	H
Overtemperature	H

When there is no supply to the device, the AUXOFF pin is expected to stay low. However, there is no active pull-down in this condition to drive this pin all the way down to 0 V. If the AUXOFF pin is pulled up to an independent supply which is present even if the device is unpowered, there can be a small voltage seen on this pin depending on the pin sink current, which is a function of the pull-up supply voltage and resistor. Minimize the sink current to keep this pin voltage low enough not to be detected as a logic HIGH by associated external circuits in this condition. This also ensures that the auxiliary channel is not turned off inadvertently in a priority power MUX configuration.

8.3.11 Power Good Indication (PG)

The TPS259472x, TPS259474x variants provide an active high digital output (PG) which serves as a power good indication signal and is asserted high depending on the voltage at the PGTH pin along with the device state information. The PG is an open-drain pin and must be pulled up to an external supply.

After power up, PG is pulled low initially. The device initiates a inrush sequence in which the HFET is turned on in a controlled manner. When the HFET gate voltage reaches the full overdrive indicating that the inrush sequence is complete and the voltage at PGTH is above $V_{PGTH(R)}$, the PG is asserted after a de-glitch time (t_{PGA}).

PG is de-asserted if at any time during normal operation, the voltage at PGTH falls below $V_{PGTH(F)}$, or the device detects a fault (except overcurrent). The PG de-assertion de-glitch time is t_{PGD} .

图 8-17. TPS259472x, TPS259474x PG Timing Diagram

表 8-5. TPS259472x, TPS259474x PG Indication Summary

Event	Protection Response	PG Pin	PG Delay
Undervoltage (UVP or UVLO)	Shutdown	L	
Input Reverse Polarity	Shutdown	L	
Overvoltage (OVC) (TPS259472x only)	Clamp	H (If PGTH pin voltage > $V_{PGTH(R)}$) L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGA} t_{PGD}
Overvoltage (OVLO) (TPS259474x only)	Shutdown	L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGD}

表 8-5. TPS259472x, TPS259474x PG Indication Summary (continued)

Event	Protection Response	PG Pin	PG Delay
Steady State	NA	H (If PGTH pin voltage > $V_{PGTH(R)}$) L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGA} t_{PGD}
Transient overcurrent	NA	H (If PGTH pin voltage > $V_{PGTH(R)}$) L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGA} t_{PGD}
Persistent overload (TPS259472x only)	Current Limiting	H (If PGTH pin voltage > $V_{PGTH(R)}$) L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGA} t_{PGD}
Persistent overload (TPS259474x only)	Shutdown	L	
Output Short-Circuit to GND	Fast trip followed by Current Limit	H (If PGTH pin voltage > $V_{PGTH(R)}$) L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGA} t_{PGD}
ILM Pin Open	Shutdown	L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGD}
ILM Pin Shorted to GND	Shutdown	L (If PGTH pin voltage < $V_{PGTH(F)}$)	t_{PGD}
Reverse current ($(V_{OUT} - V_{IN}) > V_{REVTH}$)	Reverse current blocking	L	t_{PGD}
Overtemperature	Shutdown	L	

When there is no supply to the device, the PG pin is expected to stay low. However, there is no active pull-down in this condition to drive this pin all the way down to 0 V. If the PG pin is pulled up to an independent supply which is present even if the device is unpowered, there can be a small voltage seen on this pin depending on the pin sink current, which is a function of the pull-up supply voltage and resistor. Minimize the sink current to keep this pin voltage low enough not to be detected as a logic HIGH by associated external circuits in this condition.

8.4 Device Functional Modes

表 8-6. TPS259472x Overvoltage Clamp Threshold Selection

OVCSEL Pin Connection	Overvoltage Clamp Threshold
Shorted to GND	3.8 V
Open	5.7 V
Connected to GND through a 390-kΩ resistor	13.8 V

9 Application and Implementation

Note

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

9.1 Application Information

The TPS25947xx is a 2.7-V to 23-V, 5.5-A eFuse that is typically used for power rail protection applications. The device operates from 2.7 V to 23 V with adjustable overvoltage and undervoltage protection. The device provides ability to control inrush current and protection against input reverse polarity as well as reverse current conditions. The device can be used in a variety of systems such as adapter input protection, USB PD port protection, server/PC motherboard/add-on cards, enterprise storage – RAID/HBA/SAN/eSSD, monitors, docks. The design procedure explained in the subsequent sections can be used to select the supporting component values based on the application requirement. Additionally, a spreadsheet design tool, [TPS25947xx Design Calculator](#), is available in the web product folder.

9.2 Single Device, Self-Controlled

9-1. Single Device, Self-Controlled

Other variations:

In a Host MCU controlled system, EN/UVLO or OVLO can also be driven from the host GPIO to control the device.

ILM pin can be connected to the MCU ADC input for current monitoring purpose.

Note

TI recommends to keep parasitic capacitance on ILM pin below 50 pF to ensure stable operation.

For the TPS259472x/4x variants, either V_{IN} or V_{OUT} can be used to drive the PGTH resistor divider depending on which supply must be monitored for power good indication.

9.3 Typical Application

TPS259474x can be used for PCIe card input power protection. A full-sized ×16 graphics card can draw up to 5.5 A at +12 V (66 W). A typical PCIe slot has the capacity of providing current up to 6 A. During overcurrent or short-circuit event at load side, TPS259474x can quickly respond to this fault event by turning off the device and thus protect the load from damage as well as prevent input supply from drooping. The ITIMER feature allows short duration peak currents to pass through without tripping the eFuse, thereby meeting the transient load current profile of graphics cards.

* Optional circuit components needed for transient protection depending on input and output inductance. Please refer to [Transient Protection](#) section for details.

图 9-2. PCIe Card Input Power Protection

9.3.1 Design Requirements

表 9-1. Design Parameters

PARAMETER	VALUE
Input supply voltage (V_{IN})	12 V
Undervoltage threshold ($V_{IN(UV)}$)	10.8 V
Overvoltage threshold ($V_{IN(OV)}$)	13.2 V
Output power good threshold (V_{PG})	11.4 V
Max continuous current	5.5 A
Load transient blanking interval (t_{ITIMER})	2 ms
Output capacitance (C_{OUT})	470 μ F
Output rise time (t_R)	20 ms
Overcurrent threshold (I_{ILM})	6 A
Overcurrent response	Circuit breaker

表 9-1. Design Parameters (continued)

PARAMETER	VALUE
Fault response	Latch-off

9.3.2 Detailed Design Procedure

9.3.2.1 Device Selection

Because the application requires circuit-breaker response to overcurrent with latch-off response after a fault, the TPS259474L variant is selected after referring to the [Device Comparison Table](#).

9.3.2.2 Setting Undervoltage and Overvoltage Thresholds

The supply undervoltage and overvoltage thresholds are set using the resistors R1, R2 and R3 whose values can be calculated using 式 10 and 式 11:

$$V_{IN(UV)} = \frac{V_{UVLO(R)} \times (R1 + R2 + R3)}{R2 + R3} \quad (10)$$

$$V_{IN(OV)} = \frac{V_{OV(R)} \times (R1 + R2 + R3)}{R3} \quad (11)$$

Where $V_{UVLO(R)}$ is the UVLO rising threshold and $V_{OV(R)}$ is the OVLO rising threshold. Because R1, R2 and R3 leak the current from input supply V_{IN} , these resistors must be selected based on the acceptable leakage current from input power supply V_{IN} . The current drawn by R1, R2 and R3 from the power supply is $IR_{123} = V_{IN} / (R1 + R2 + R3)$. However, leakage currents due to external active components connected to the resistor string can add error to these calculations. So, the resistor string current, IR_{123} must be chosen to be 20 times greater than the leakage current expected on the EN/UVLO and OVLO pins.

From the device electrical specifications, both the EN/UVLO and OVLO leakage currents are 0.1 μ A (maximum), $V_{OV(R)} = 1.2$ V and $V_{UVLO(R)} = 1.2$ V. From design requirements, $V_{IN(OV)} = 13.2$ V and $V_{IN(UV)} = 10.8$ V. To solve the equation, first choose the value of $R1 = 470$ k Ω and use the above equations to solve for $R2 = 10.7$ k Ω and $R3 = 48$ k Ω .

Using the closest standard 1% resistor values, we get $R1 = 470$ k Ω , $R2 = 11$ k Ω , and $R3 = 47$ k Ω .

9.3.2.3 Setting Output Voltage Rise Time (t_R)

For a successful design, the junction temperature of device must be kept below the absolute maximum rating during both dynamic (start-up) and steady-state conditions. Dynamic power stresses often are an order of magnitude greater than the static stresses, so it is important to determine the right start-up time and inrush current limit required with system capacitance to avoid thermal shutdown during start-up.

The slew rate (SR) needed to achieve the desired output rise time can be calculated as:

$$SR(V/ms) = \frac{V_{IN}(V)}{t_R(ms)} = \frac{12V}{20ms} = 0.6V/ms \quad (12)$$

The C_{dVdt} needed to achieve this slew rate can be calculated as:

$$C_{dVdt}(pF) = \frac{2000}{SR(V/ms)} = \frac{2000}{0.6} = 3333pF \quad (13)$$

Choose the nearest standard capacitor value as 3300 pF.

For this slew rate, the inrush current can be calculated as:

$$I_{\text{INRUSH}} (\text{mA}) = \text{SR} (\text{V/ms}) \times C_{\text{OUT}} (\mu\text{F}) = 0.6 \times 470 = 282 \text{ mA} \quad (14)$$

The average power dissipation inside the part during inrush can be calculated as:

$$P_{\text{DINRUSH}} (\text{W}) = \frac{I_{\text{INRUSH}} (\text{A}) \times V_{\text{IN}} (\text{V})}{2} = \frac{0.282 \times 12}{2} = 1.69 \text{ W} \quad (15)$$

For the given power dissipation, the thermal shutdown time of the device must be greater than the ramp-up time t_R to avoid start-up failure. Figure 9-3 shows the thermal shutdown limit, for 1.69 W of power, the shutdown time is more than 10 s which is very large as compared to $t_R = 20 \text{ ms}$. Therefore, it is safe to use 20 ms as the startup time for this application.

Figure 9-3. Thermal Shut-Down Plot During Inrush

9.3.2.4 Setting Power Good Assertion Threshold

The Power Good assertion threshold can be set using the resistors R4 and R5 connected to the PGTH pin whose values can be calculated as:

$$V_{\text{PG}} = \frac{V_{\text{PGTH(R)}} \times (R4 + R5)}{R5} \quad (16)$$

Because R4 and R5 leak the current from the output rail V_{OUT} , these resistors must be selected to minimize the leakage current. The current drawn by R4 and R5 from the power supply is $I_{R45} = V_{\text{OUT}} / (R4 + R5)$. However, leakage currents due to external active components connected to the resistor string can add error to these calculations. So, the resistor string current, I_{R123} must be chosen to be 20 times greater than the PGTH leakage current expected.

From the device electrical specifications, PGTH leakage current is 1 μA (maximum), $V_{\text{PGTH(R)}} = 1.2 \text{ V}$ and from design requirements, $V_{\text{PG}} = 11.4 \text{ V}$. To solve the equation, first choose the value of $R4 = 47 \text{ k}\Omega$ and calculate $R5 = 5.52 \text{ k}\Omega$. Choose nearest 1% standard resistor value as $R5 = 5.6 \text{ k}\Omega$.

9.3.2.5 Setting Overcurrent Threshold (I_{LIM})

The overcurrent protection (Circuit Breaker) threshold can be set using the R_{ILM} resistor whose value can be calculated as:

$$R_{\text{ILM}} (\Omega) = \frac{3334}{I_{\text{LIM}} (\text{A})} = \frac{3334}{6 \text{ A}} = 555.6 \Omega \quad (17)$$

Choose nearest 1% standard resistor value as 549 Ω .

9.3.2.6 Setting Overcurrent Blanking Interval (t_{ITIMER})

The overcurrent blanking timer interval can be set using the C_{ITIMER} capacitor whose value can be calculated as:

$$C_{ITIMER} (nF) = \frac{t_{ITIMER} (ms) \times I_{ITIMER} (\mu A)}{\Delta V_{ITIMER} (V)} = \frac{2 \times 1.8}{1.51} = 2.38 nF \quad (18)$$

Choose nearest standard capacitor value as 2.2 nF.

9.3.3 Application Curves

9.4 Active ORing

A typical redundant power supply configuration is shown in [Figure 9-7](#) below. Schottky ORing diodes have been popular for connecting parallel power supplies, such as parallel operation of wall adapter with a battery or a hold-up storage capacitor. The disadvantage of using ORing diodes is high voltage drop and associated power loss. The TPS259470x/4x with integrated, low-ohmic, back-to-back FETs provide a simple and efficient solution. [Figure 9-7](#) below shows the Active ORing implementation using TPS249474x devices.

☒ 9-7. Two Devices, Active ORing Configuration

The linear ORing mechanism in TPS25947xx ensures that there's no reverse current flowing from one power source to the other during fast or slow ramp of either supply.

The following waveform illustrates the active ORing behavior when the supply rails are being ramped up sequentially.

9-8. Active ORing Response

9-9. Active ORing Response

When the bus voltages (IN1 and IN2) are matched, device in each path sees a forward voltage drop and is ON delivering the load current. During this period, current is shared between the rails in the ratio of differential voltage drop across each device.

In addition to supply ORing, the devices protect the system from overvoltage, excessive inrush current, overload and short-circuit faults at all times.

Note

1. The TPS259472x (OVC variants) are not recommended for use in ORing applications. While the device is in clamping state, if the output is forced to a higher voltage by the other channel, the device can get damaged.
2. ORing can be done either between two similar rails or between dissimilar rails. For ORing cases with skewed voltage combinations, care must be taken to design circuit components on PGTH/EN/OVLO pins for the lower voltage channel devices such that the Absolute maximum ratings on those pins are not exceeded when higher voltage is present on the other channel. Also, the dVdt pin capacitor rating must be chosen based on the highest of the 2 supplies. Refer to Recommended Operating Conditions table for more details.

9.5 Priority Power MUXing

Applications having two energy sources such as PCIe cards, Tablets and Portable battery powered equipment require preference of one source to another. For example, mains power (wall-adaptor) has the priority over the internal battery back-up power. These applications demand for switchover from mains power to backup power only when main input voltage falls below a user defined threshold. The TPS25947xx devices provide a simple solution for priority power multiplexing needs.

Figure 9-10 below shows a typical priority power multiplexing implementation using TPS259470x devices. When primary (priority) power source (IN1) is present and within the valid range (not in UV/OV condition), the primary path device powers the OUT bus irrespective of whether auxiliary supply voltage (V_{IN2}) is greater than, equal to or less than primary supply voltage (V_{IN1}). The device in auxiliary path is held in off condition by forcing its OVLO pin to high using the AUXOFF signal from the primary path device.

After the primary supply voltage falls outside the user-defined valid operating range (UV/OV condition), the primary path device de-asserts the AUXOFF which signals the auxiliary path device to turn on and the system starts operating from the auxiliary supply. During this transition, the auxiliary path device bypasses its dVdt limited startup and performs a fast recovery to start delivering power within t_{SWOV} .

When the primary supply is restored, the primary path device turns on fully at a defined slew rate and then asserts its AUXOFF pin high to turn the auxiliary path device off, allowing a seamless transition from auxiliary to the primary supply with minimal output voltage droop and with no shoot-through current.

A key consideration in power MUXing applications is the minimum voltage the output bus droops to during the switchover from one supply to another. This in turn depends on multiple factors including the output load current (I_{LOAD}), output bus hold-up capacitance (C_{OUT}) and switchover time (t_{SW}).

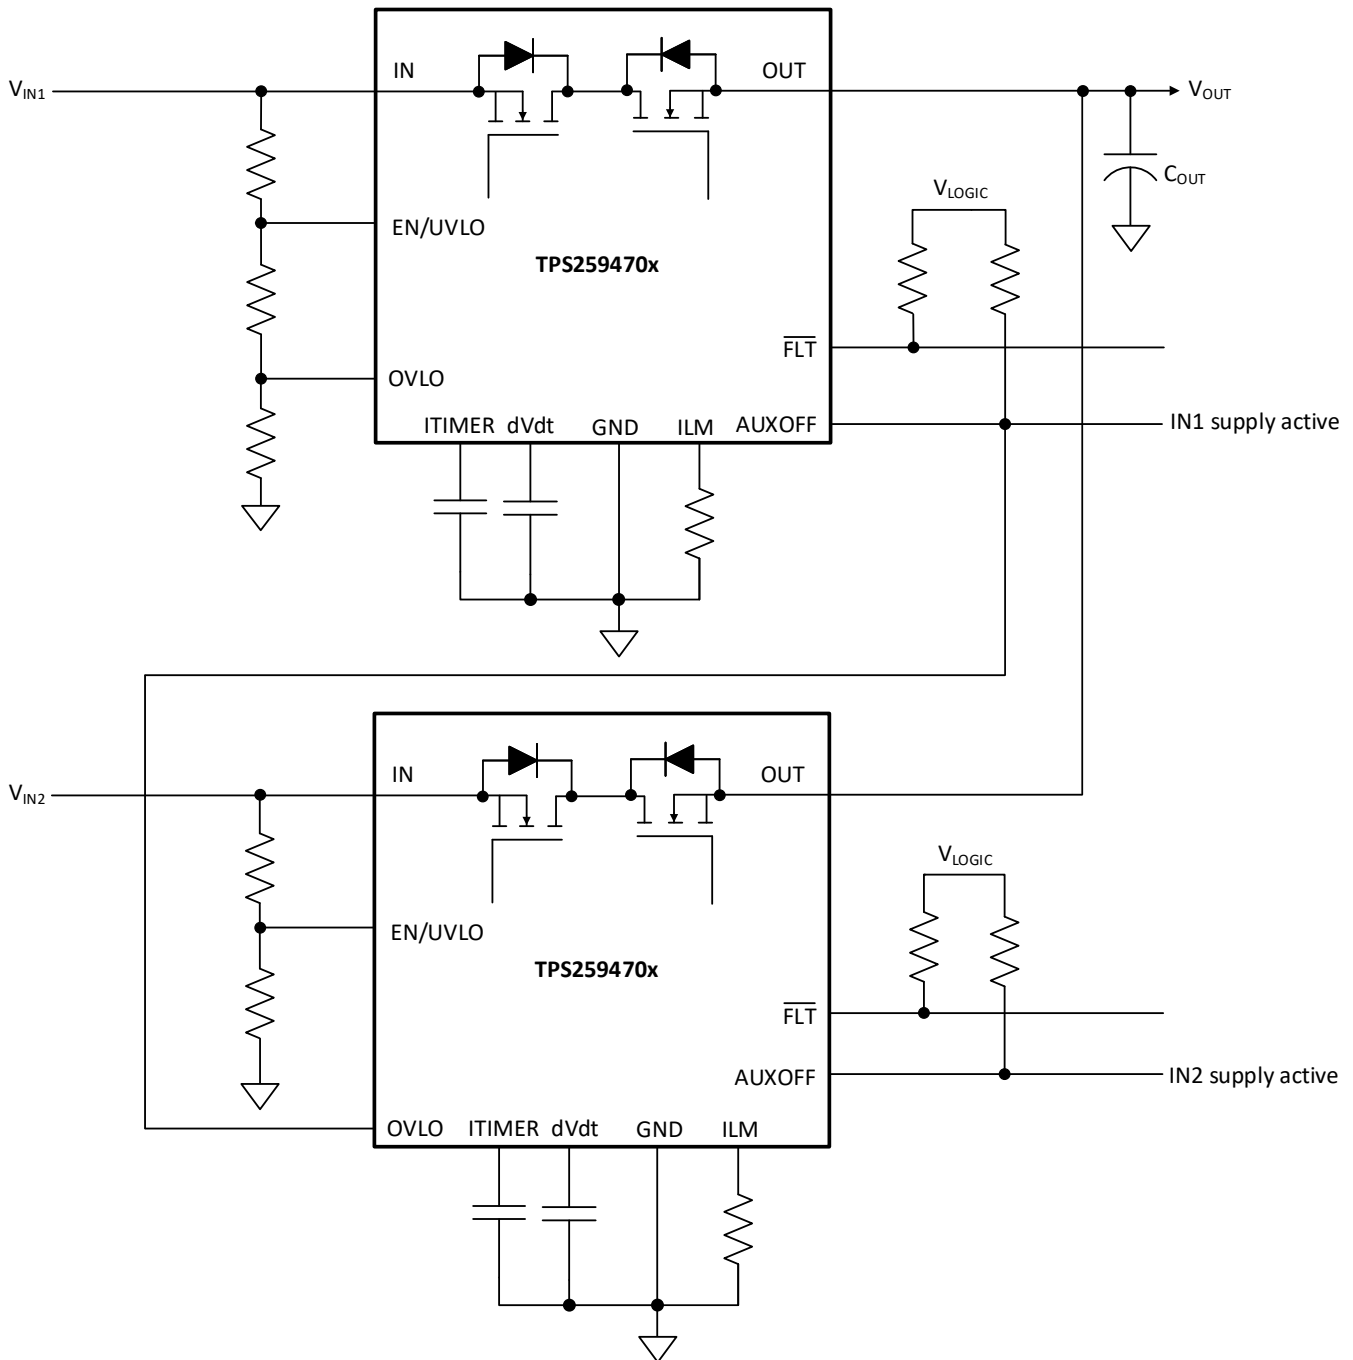

While switching from primary supply (V_{IN1}) to auxiliary supply (V_{IN2}), the minimum bus voltage can be calculated using Equation 19. Here, the switchover time (t_{SW}) is equal to the fast OVLO recovery time (t_{SWOV}) taken by the TPS259470x variants to turn on fully and start delivering current to the load.

$$V_{OUT(min)}(V) = \min(V_{IN1}, V_{IN2}) - \frac{t_{SW}(\mu s) \times I_{LOAD}(A)}{C_{OUT}(\mu F)} \quad (19)$$

While switching from auxiliary supply (V_{IN2}) to primary supply (V_{IN1}), the minimum bus voltage can be calculated using Equation 20. Here the maximum switchover time is equal to the RCB recovery time (t_{SWRCB}), depending on whether V_{IN1} is equal to or lower than V_{IN2} to start with.

$$V_{OUT(min)}(V) = \min(V_{IN1}, V_{IN2}) - V_{FWDTH}(V) - \frac{t_{SWRCB}(\mu s) \times I_{LOAD}(A)}{C_{OUT}(\mu F)} \quad (20)$$

The AUXOFF pins of the devices can be used as a digital indication to identify which of the 2 supplies is active and delivering power to the load.

9-10. Priority Power MUXing with 2 × TPS259470x - Option 1

This configuration provides the most compact priority power MUXing solution with multiple benefits, including active current limit protection on both channels as well as overvoltage protection on primary channel. It also provides the fastest switchover time from primary to auxiliary, but at the cost of a slightly increased quiescent current on the auxiliary path while primary path is active. Also, it uses the fewest external components, but at the cost of bypassing overvoltage protection on auxiliary channel.

The following waveforms illustrate the TPS259470x performance in a priority power MUXing configuration.

☒ 9-11. TPS259470x Power MUX - Switchover from Primary to Auxiliary Supply

☒ 9-12. TPS259470x Power MUX - Switchover from Auxiliary to Primary Supply

There's a possible variation to the above configuration in case overvoltage protection is needed on both channels. This needs an additional signal N-FET to drive the OVLO pin of the auxiliary path device as shown in [☒ 9-13](#) below. The switchover times are similar to the previous configuration.

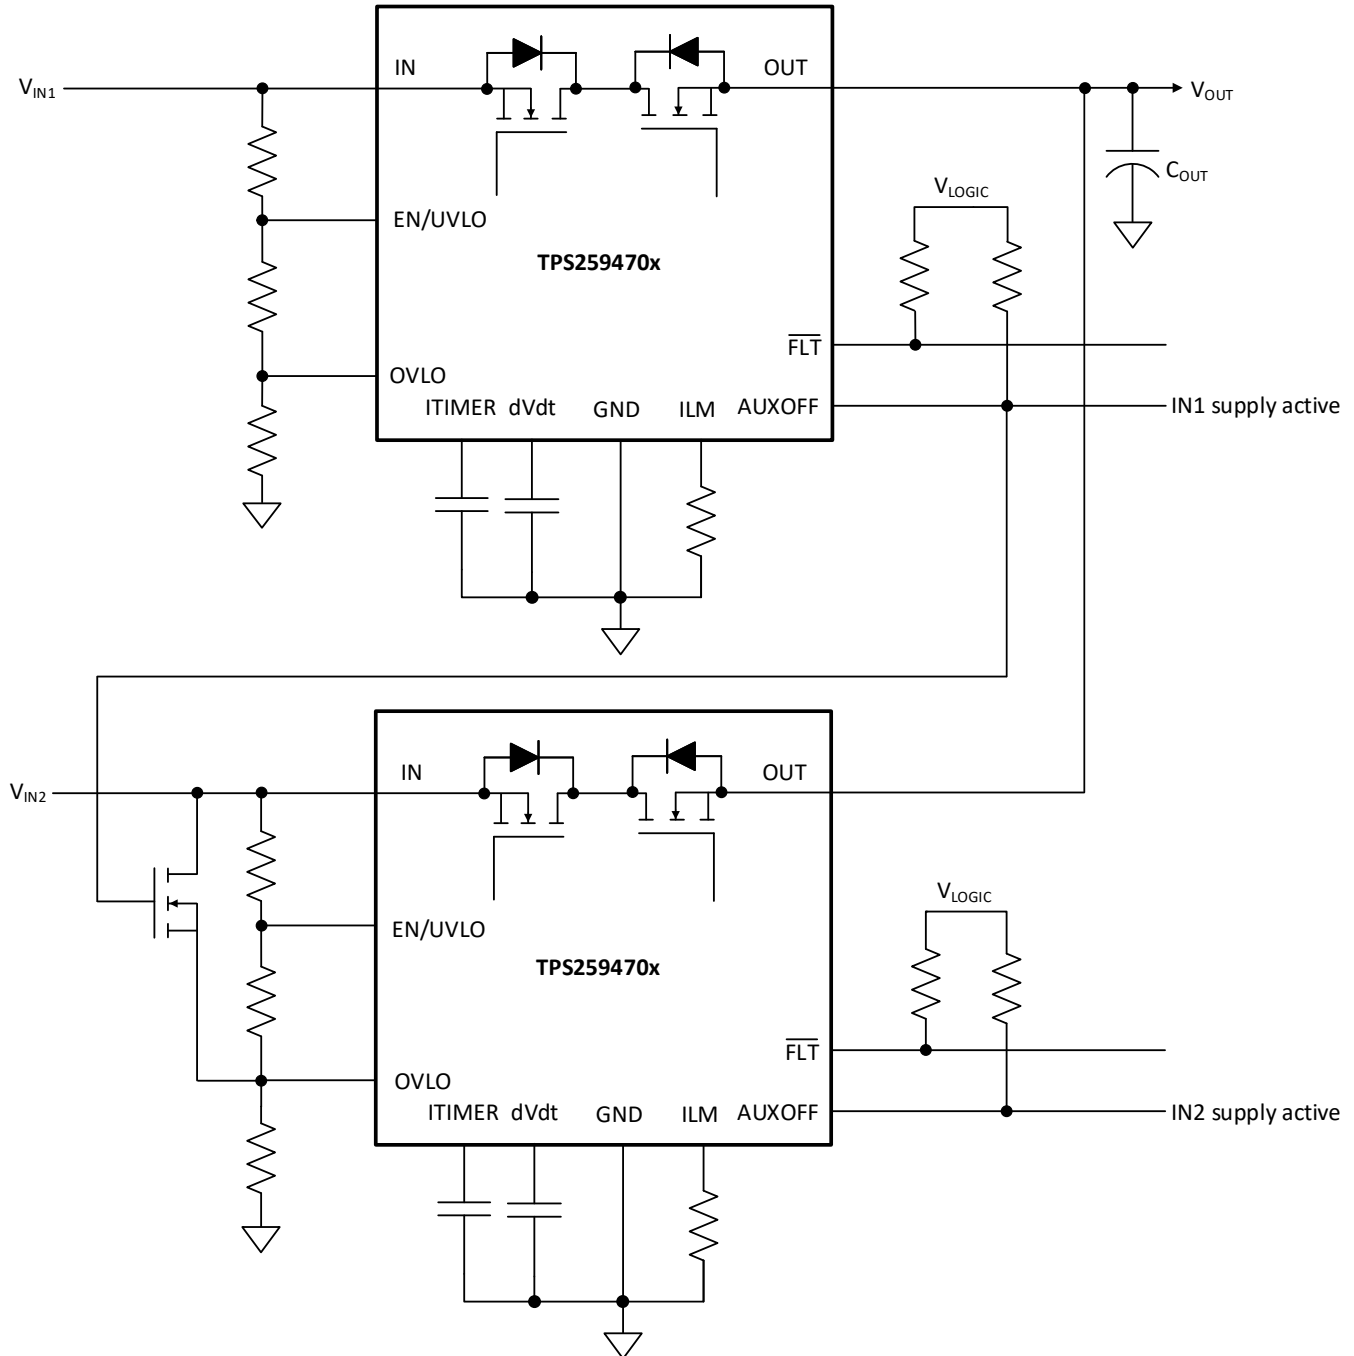

FIG 9-13. Priority Power MUXing with 2 × TPS259470x - Option 2

Another variation of the previous configuration ensures minimum quiescent current on the auxiliary channel while primary channel is active, but at the cost of additional N-FET to drive the EN/UVLO pin of auxiliary path device as shown in FIG 9-14 below. At the same time, it has a higher switchover delay from primary to auxiliary supply as compared to the previous configuration.

FIG 9-14. Priority Power MUXing with 2 × TPS259470x - Option 3

While switching from a higher supply rail to lower supply rail, the minimum bus voltage can be calculated using [式 21](#). Here, the switchover time is equal to the time taken by the device to come out of reverse current blocking state (t_{SWRCB}).

$$V_{OUT(min)}(V) = \min(V_{IN1}, V_{IN2}) - V_{FWDTH}(V) - \frac{t_{SWRCB}(\mu s) \times I_{LOAD}(A)}{C_{OUT}(\mu F)} \quad (21)$$

While switching from a lower supply rail to higher supply rail, the minimum bus voltage can be calculated using [式 22](#). Here, the switchover time (t_{SW}) is the time taken by the device to turn on fully and start delivering current

to the load, which is equal to the device turn-on time (t_{ON}), which in turn includes the turn-on delay ($t_{D,ON}$) and rise time (t_R) determined by the dVdt capacitor (C_{dVdt}) and bus voltage.

$$V_{OUT(min)}(V) = \min(V_{IN1}, V_{IN2}) - \frac{t_{SW}(\mu s) \times I_{LOAD}(A)}{C_{OUT}(\mu F)} \quad (22)$$

All the preceding configurations provide a priority power MUXing solution with active current limit protection response. In case circuit breaker response is preferred, it is possible to implement a solution using TPS259474x devices as shown in [Figure 9-15](#) below. Here, the EN/UVLO signal of the primary path device is used to control the OVLO of the auxiliary path device. This ensures that auxiliary path device is turned on only when the primary supply falls below a user-defined undervoltage (UVLO) threshold. In this configuration, supply overvoltage protection is not available on both channels. The PG pins of the devices can be used as a digital indication to identify which of the 2 supplies is active and delivering power to the load.

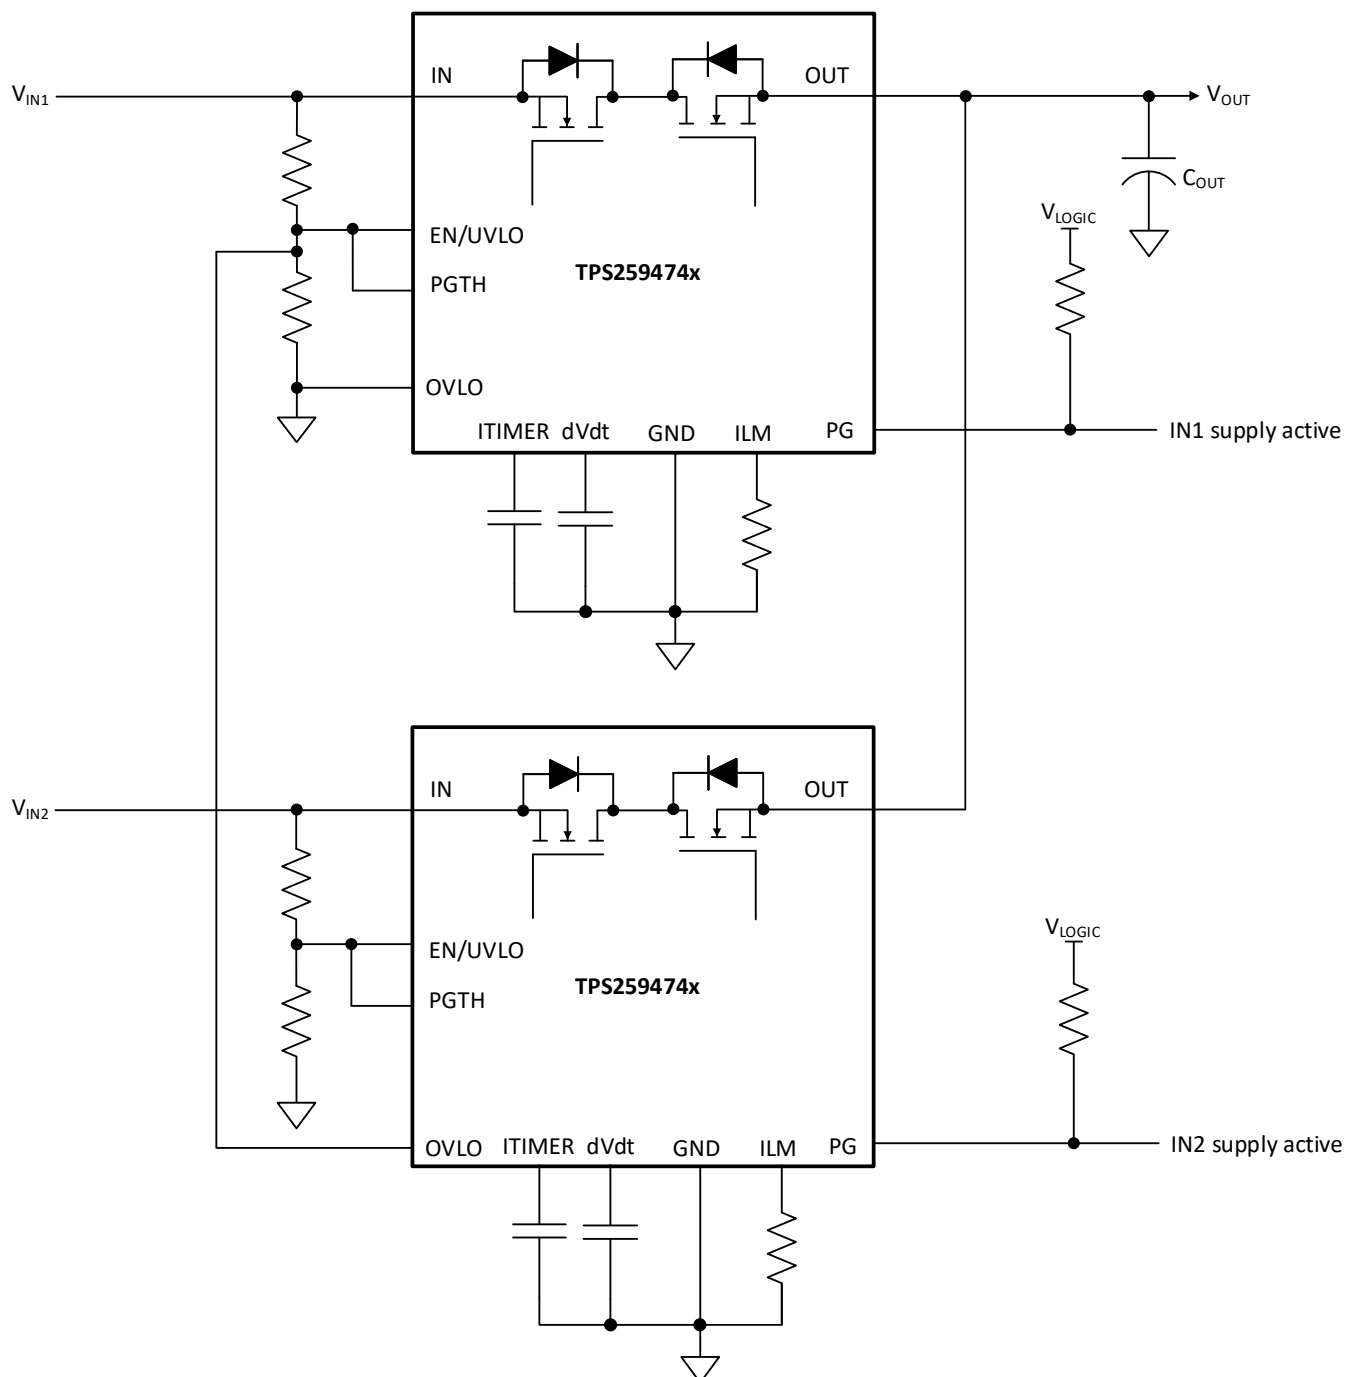

FIG 9-15. Priority power MUXing with 2 × TPS259474x

While switching from one supply rail to the other, the minimum bus voltage can be calculated using 式 23. Here, the maximum switchover time (t_{SW}) is the time taken by the device to turn on and start delivering power to the load, which is equal to the device turn-on time (t_{ON}), which in turn includes the turn-on delay ($t_{D,ON}$) and rise time (t_R) determined by the dVdt capacitor (C_{dVdt}) and bus voltage.

$$V_{OUT(min)} (V) = \min(V_{IN1}, V_{IN2}) - \frac{t_{SW} (\mu s) \times I_{LOAD} (A)}{C_{OUT} (\mu F)} \quad (23)$$

Note

1. The TPS259472x (OVC variants) are not recommended for use in power MUXing or ORing applications. While the device is in clamping state, if the output is forced to a higher voltage by the other channel, the device can get damaged.
 2. Power MUXing can be done either between two similar rails (such as 12-V Primary and 12-V Aux, 3.3-V Primary and 3.3-V Aux) or between dissimilar rails (such as 12-V Primary and 5-V Aux or vice versa).
 3. For power MUXing cases with skewed voltage combinations, care must be taken to design circuit components on PGTH/EN/OVLO pins for the lower voltage channel devices such that the Absolute maximum ratings on those pins are not exceeded when higher voltage is present on the other channel. Also, the dVdt pin capacitor rating must be chosen based on the highest of the 2 supplies. Refer to Recommended Operating Conditions table for more details.
-

9.6 USB PD Port Protection

End equipments like PC, Notebooks, Docking Stations, Monitors etc.. have USB PD ports which can be configured as DFP (Source), UFP (Sink) or DRP (Source+Sink). TPS259470x can be used independently or in conjunction with LM73100 to handle the power path protection requirements of USB PD ports as shown in [Figure 9-16](#) below.

TPS259470x provides Overcurrent and Short-Circuit protection in the source path, while blocking any reverse current from the port to the internal source power rail. The fast recovery (t_{SWRCB}) from reverse current blocking ensures minimum supply droop during Fast Role Swap (FRS) events. The PD controller can also use the OVLO pin as an active low enable signal to control the power path. Holding the OVLO pin high keeps the device in OFF state in sink mode and blocks current in both directions. After the PD controller determines the need to start sourcing power, it can pull the OVLO pin low to trigger a fast recovery from OFF to ON state within t_{SWOV} , meeting the FRS timing requirements.

The LM73100 provides overvoltage protection on the sink path, while blocking reverse current from internal sink rail to the port.

The linear ORing mechanism in TPS259470x and LM73100 ensures that there's no reverse current flowing from one power source to the other during fast or slow ramp of either supply.

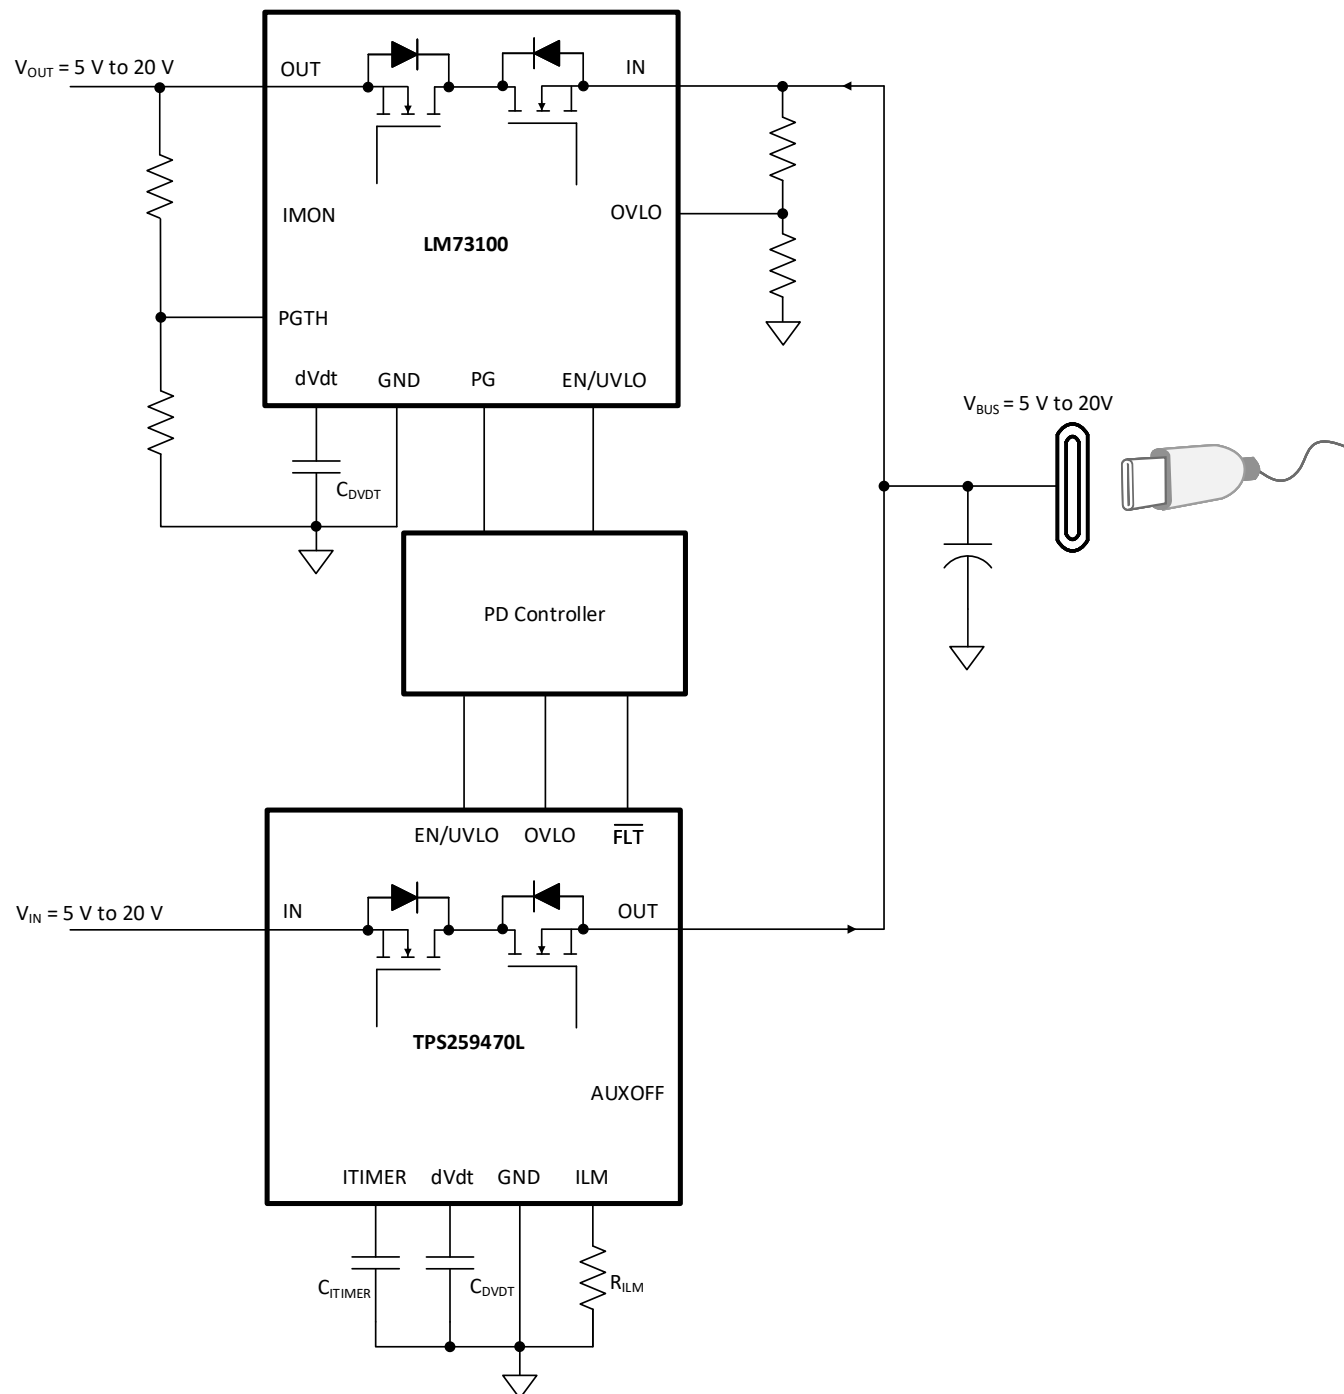

FIG 9-16. USB PD Port Protection

The waveform below shows the TPS259470x behavior when a 20-V source connected at the USB bus is suddenly disconnected. The TPS259470x is initially in reverse current blocking condition. As the bus voltage starts drooping, the TPS259470x exits the condition and performs a fast charge to restore the bus voltage above $v_{Safe5V(min)}$ within t_{SWRCB} , thereby meeting the USB FRS (Fast Role Swap) requirements.

$V_{IN} = 5\text{ V}$, $C_{OUT} = 10\text{ }\mu\text{F}$, $R_{OUT} = 8\text{ }\Omega$, $V_{OUT} = 20\text{ V}$ initially and then disconnected

9-17. TPS259470x 5-V Source Path - USB Fast Role Swap Response

9.7 Parallel Operation

Applications which need higher steady current can use 2 TPS25947xx devices connected in parallel as shown in [9-18](#) below. In this configuration, the first device turns on initially to provide the inrush current limiting. The second device is held in an OFF state by driving its EN/UVLO pin low using the AUXOFF/PG signal of the first device. After the inrush sequence is complete, the first device asserts its AUXOFF/PG pin high and turns on the second device. The second device asserts its AUXOFF/PG signal to indicate when it has turned on fully, thereby indicating to the system that the parallel combination is ready to deliver the full steady state current.

After in steady state, both devices share current nearly equally. There can be a slight skew in the currents depending on the part-to-part variation in the R_{ON} as well as the PCB trace resistance mismatch.

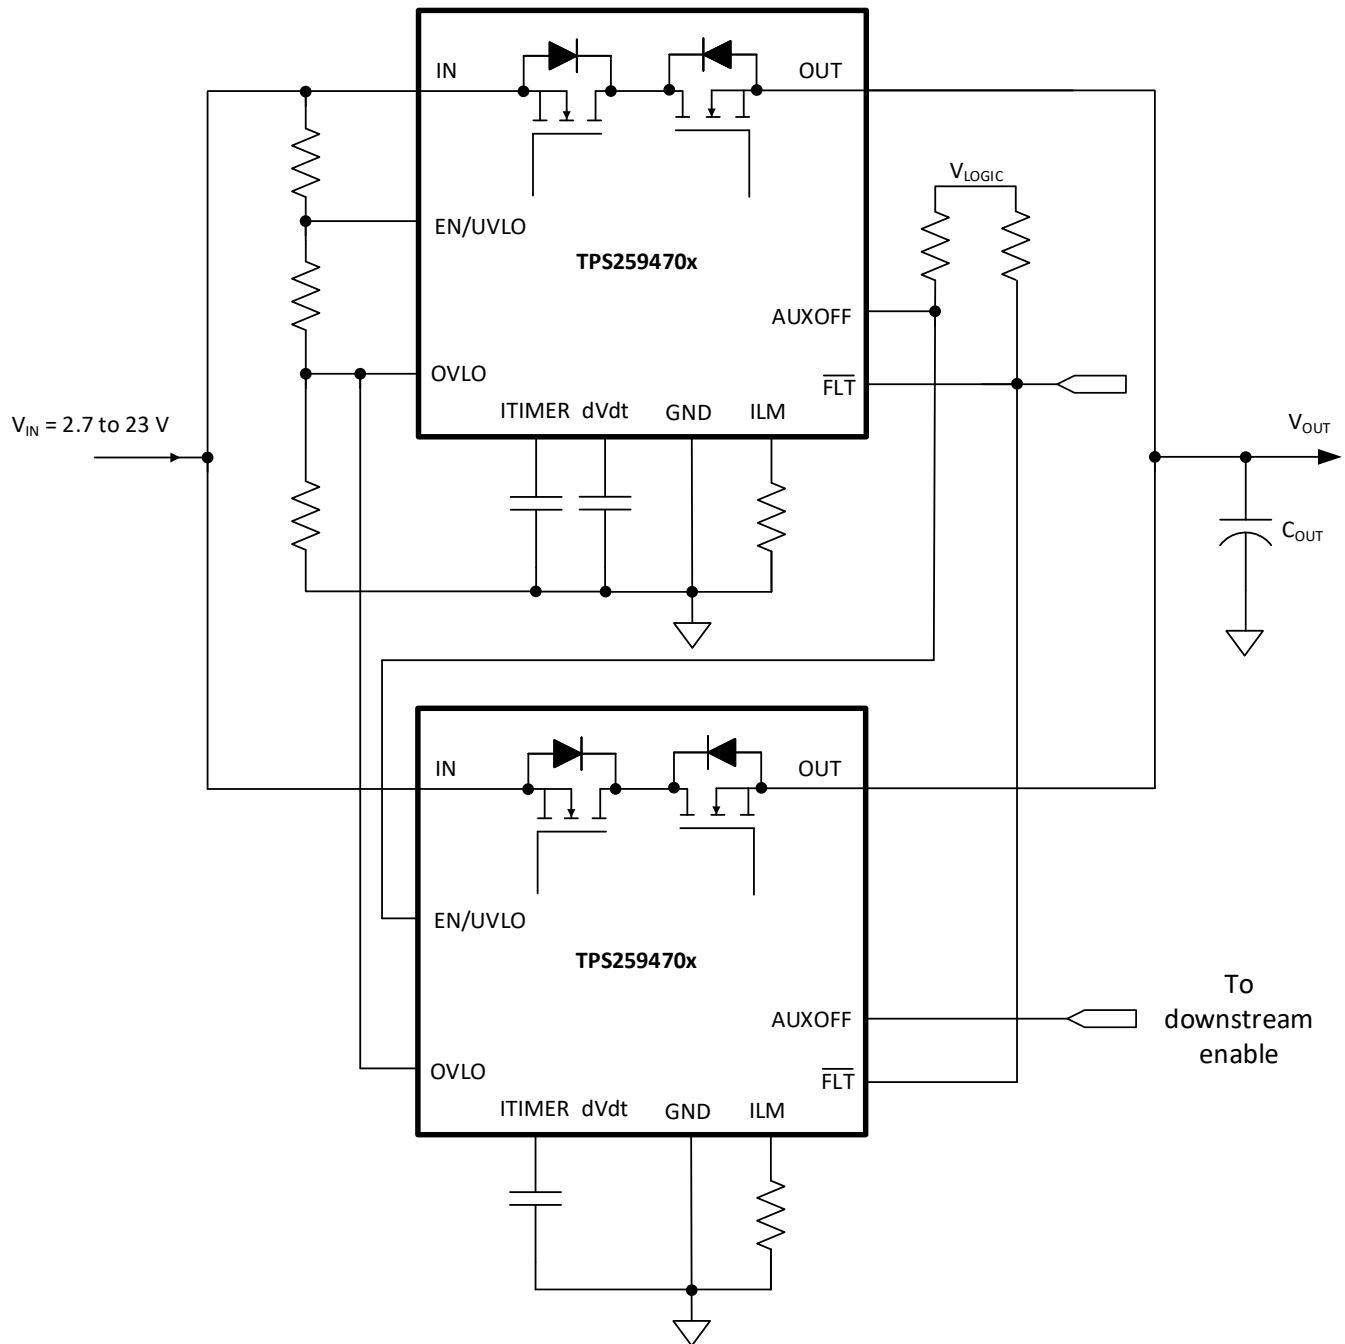

Figure 9-18. Two Devices Connected in Parallel for Higher Steady State Current Capability

The waveforms below illustrate the behavior of the parallel configuration during start-up as well as during steady state.

9-19. Parallel Devices Sequencing During Start-Up

9-20. Parallel Devices Load Current During Steady State

10 Power Supply Recommendations

The TPS25947xx devices are designed for a supply voltage range of $2.7\text{ V} \leq V_{\text{IN}} \leq 23\text{ V}$. TI recommends an input ceramic bypass capacitor higher than $0.1\text{ }\mu\text{F}$ if the input supply is located more than a few inches from the device. The power supply must be rated higher than the set current limit to avoid voltage droops during overcurrent and short-circuit conditions.

The lowest negative voltage the device can handle at the input is limited to -15 V or $V_{\text{OUT}} - 21\text{ V}$, whichever is higher. Any low voltage signals (for example, EN/UVLO, OVLO, PGTH) derived from the input supply must have a sufficiently large pull-up resistor to limit the current through those pins to $< 10\text{ }\mu\text{A}$ during reverse polarity conditions. Please refer to [Absolute Maximum Ratings](#) table for more details.

10.1 Transient Protection

In the case of a short-circuit and overload current limit when the device interrupts current flow, the input inductance generates a positive voltage spike on the input, and the output inductance generates a negative voltage spike on the output. The peak amplitude of voltage spikes (transients) is dependent on the value of inductance in series to the input or output of the device. Such transients can exceed the absolute maximum ratings of the device if steps are not taken to address the issue. Typical methods for addressing transients include:

- Minimize lead length and inductance into and out of the device.
- Use a large PCB GND plane.
- Connect a Schottky diode from the OUT pin ground to absorb negative spikes.
- Connect a low ESR capacitor larger than $1\text{ }\mu\text{F}$ at the OUT pin very close to the device.
- Use a low-value ceramic capacitor $C_{\text{IN}} = 1\text{ }\mu\text{F}$ to absorb the energy and dampen the transients. The capacitor voltage rating must be at least twice the input supply voltage to be able to withstand the positive voltage excursion during inductive ringing.

The approximate value of input capacitance can be estimated with 式 24:

$$V_{\text{SPIKE(Absolute)}} = V_{\text{IN}} + I_{\text{LOAD}} \times \sqrt{\frac{L_{\text{IN}}}{C_{\text{IN}}}} \quad (24)$$

where

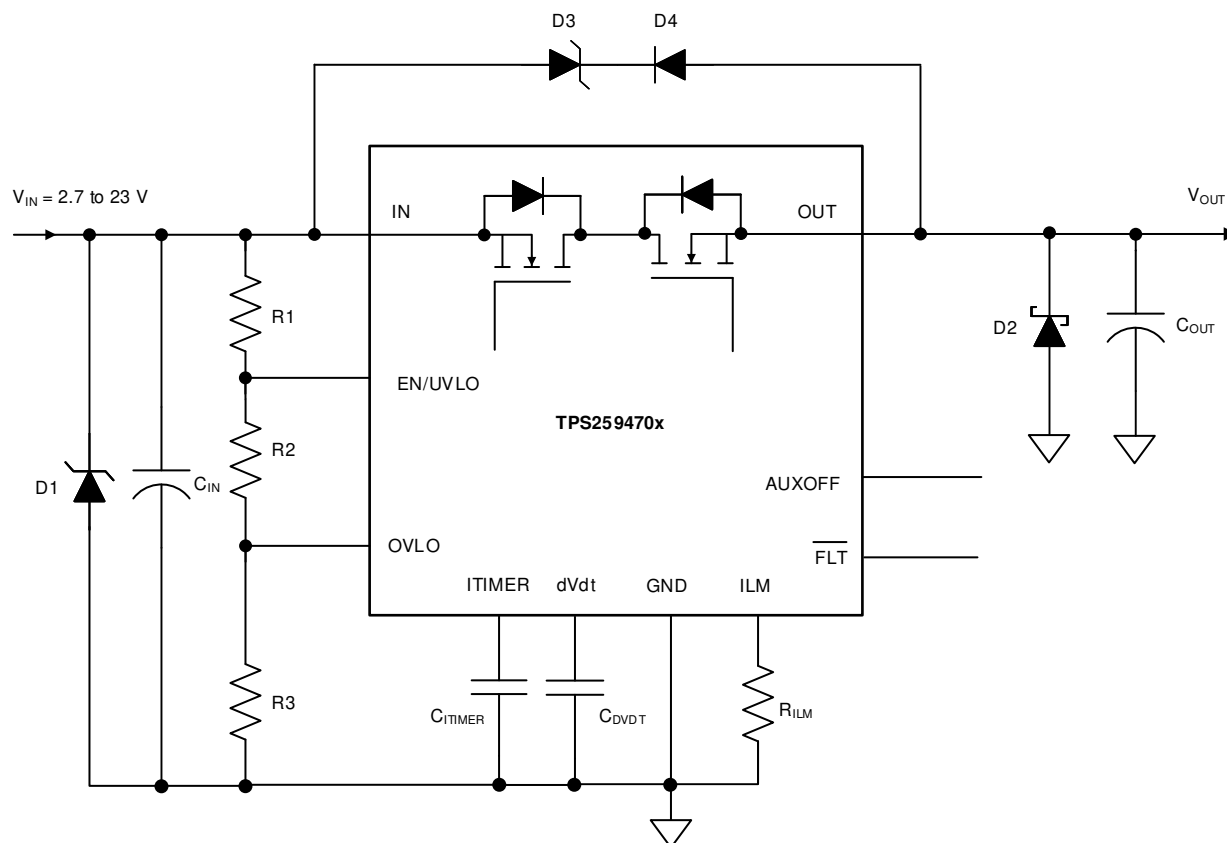

- V_{IN} is the nominal supply voltage.
- I_{LOAD} is the load current.
- L_{IN} equals the effective inductance seen looking into the source.
- C_{IN} is the capacitance present at the input.
- Some applications can require the addition of a Transient Voltage Suppressor (TVS) to prevent transients from exceeding the absolute maximum ratings of the device. In some cases, even if the maximum amplitude of the transients is below the absolute maximum rating of the device, a TVS can help to absorb the excessive energy dump and prevent it from creating very fast transient voltages on the input supply pin of the IC, which can couple to the internal control circuits and cause unexpected behavior.

Note

If there is a likelihood of input reverse polarity in the system, TI recommends to use a bi-directional TVS, or a reverse blocking diode in series with the TVS.

- For applications such as USB-C ports where a powered cable can be plugged to the output of the device, there can be excess voltage stress from OUT to IN which exceeds the absolute maximum rating of the device. TI recommends to add a TVS diode from OUT to IN to clamp the voltage to a safe level.

The circuit implementation with optional protection components is shown in [Figure 10-1](#).

✎ 10-1. Circuit Implementation with Optional Protection Components

10.2 Output Short-Circuit Measurements

It is difficult to obtain repeatable and similar short-circuit testing results. The following contribute to variation in results:

- Source bypassing
- Input leads
- Circuit layout
- Component selection
- Output shorting method
- Relative location of the short
- Instrumentation

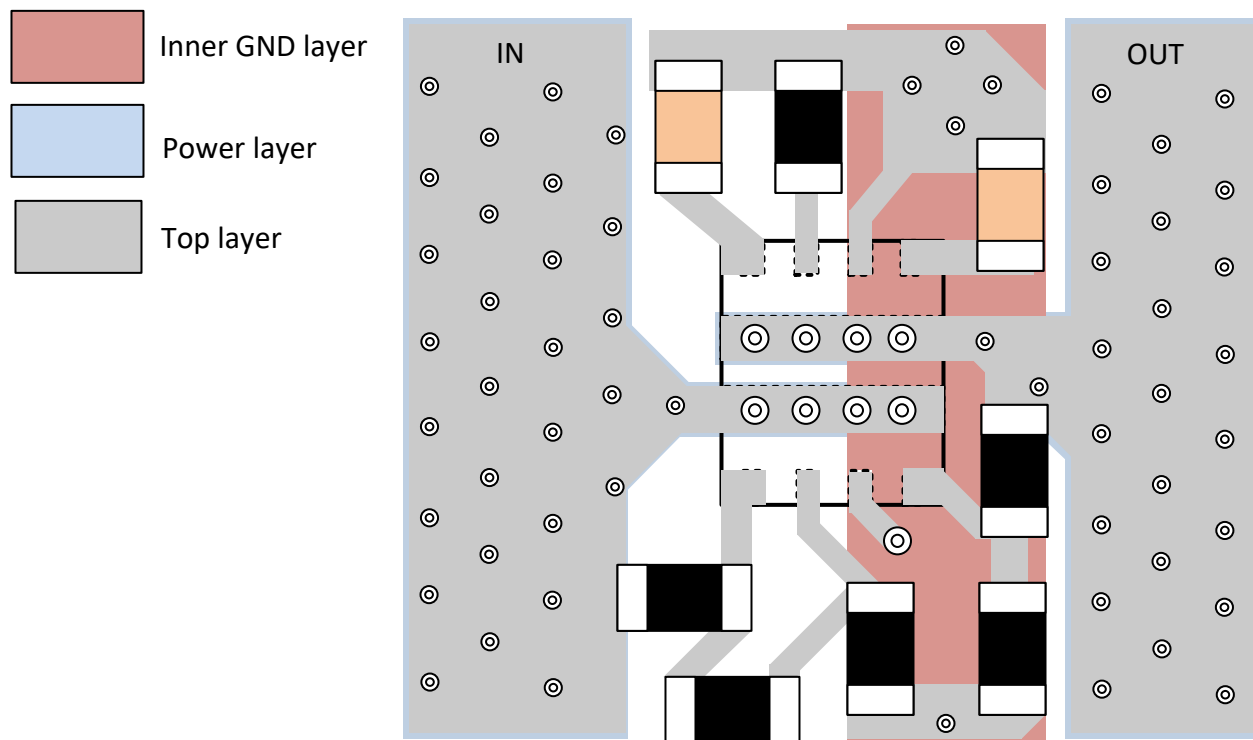

The actual short exhibits a certain degree of randomness because it microscopically bounces and arcs. Ensure that configuration and methods are used to obtain realistic results. Do not expect to see waveforms exactly like those in this data sheet because every setup is different.

11 Layout

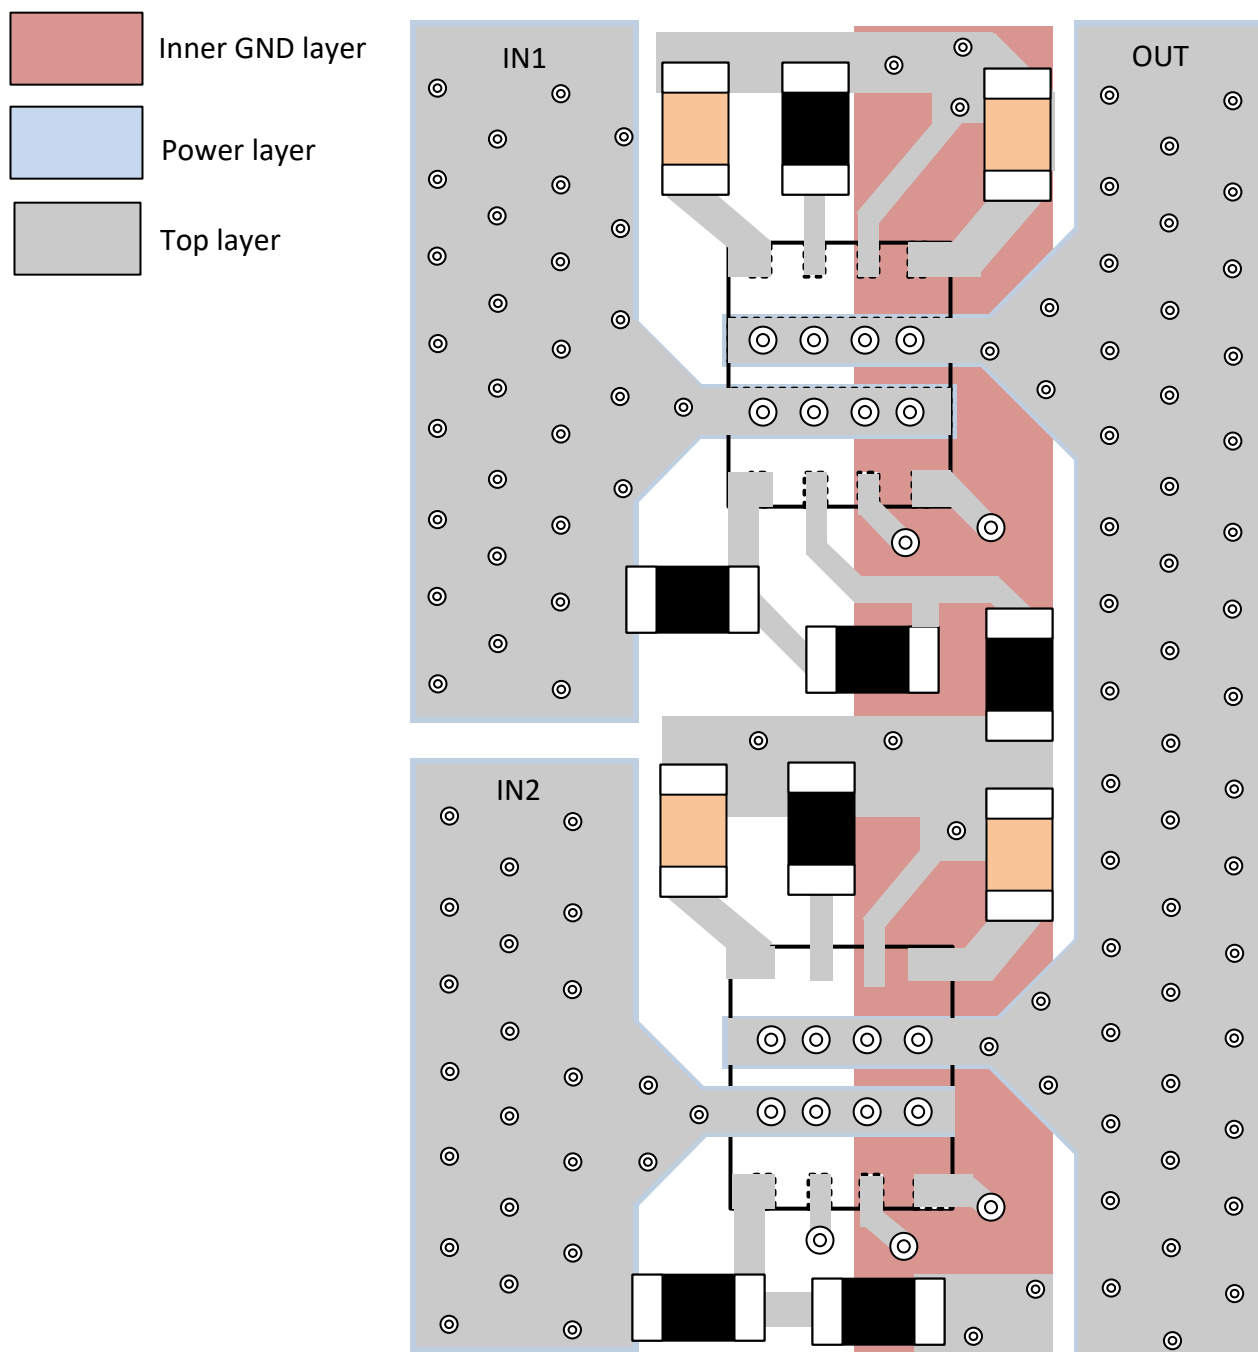

11.1 Layout Guidelines

- For all applications, TI recommends a ceramic decoupling capacitor of 0.1 μF or greater between the IN terminal and GND terminal.
- The optimal placement of the decoupling capacitor is closest to the IN and GND terminals of the device. Care must be taken to minimize the loop area formed by the bypass-capacitor connection, the IN terminal, and the GND terminal of the IC.
- High current-carrying power-path connections must be as short as possible and must be sized to carry at least twice the full-load current.
- The GND terminal must be tied to the PCB ground plane at the terminal of the IC with the shortest possible trace. The PCB ground must be a copper plane or island on the board. TI recommends to have a separate ground plane island for the eFuse. This plane doesn't carry any high currents and serves as a quiet ground reference for all the critical analog signals of the eFuse. The device ground plane must be connected to the system power ground plane using a star connection.
- The IN and OUT pins are used for heat dissipation. Connect to as much copper area on top and bottom PCB layers using as possible with thermal vias. The vias under the device also help to minimize the voltage gradient across the IN and OUT pads and distribute current uniformly through the device, which is essential to achieve the best on-resistance and current sense accuracy.
- Locate the following support components close to their connection pins:
 - R_{ILM}
 - C_{dVdt}
 - C_{TIMER}
 - Resistors for the EN/UVLO, OVLO/OVCSEL and PGTH pins
- Connect the other end of the component to the GND pin of the device with shortest trace length. The trace routing for the R_{ILM} , C_{TIMER} and C_{dVdt} components to the device must be as short as possible to reduce parasitic effects on the current limit, overcurrent blanking interval and soft start timing. TI recommends to keep parasitic capacitance on ILM pin below 50 pF to ensure stable operation. These traces must not have any coupling to switching signals on the board.
- Because the bias current on ILM pin directly controls the overcurrent protection behavior of the device, the PCB routing of this node must be kept away from any noisy (switching) signals.
- Protection devices such as TVS, snubbers, capacitors, or diodes must be placed physically close to the device they are intended to protect. These protection devices must be routed with short traces to reduce inductance. For example, TI recommends a protection Schottky diode to address negative transients due to switching of inductive loads. TI recommends to add a ceramic decoupling capacitor of 1 μF or greater between OUT and GND. These components must be physically close to the OUT pins. Care must be taken to minimize the loop area formed by the Schottky diode/bypass-capacitor connection, the OUT pin and the GND terminal of the IC.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.6 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
