

TPSM83102 および TPSM83103 1.2A 出力電流、昇降圧モジュール

1 特長

- 入力電圧範囲: 1.6V~5.5V
 - スタートアップ時のデバイス入力電圧 > 1.65V
- 出力電圧範囲 (調整可能): 1V~5.5V
- 高い出力電流能力、3A ピーク スイッチ電流
 - $V_{IN} \geq 3V$, $V_{OUT} = 3.3V$ 時の出力電流: 1.5A
 - $V_{IN} \geq 2.7V$, $V_{OUT} = 3.3V$ 時の出力電流: 1.2A
- 全負荷範囲にわたって高効率を実現
 - 静止電流: 8 μ A (代表値)
 - 自動パワー セーブ モードおよび強制 PWM モードを構成可能
- ピーク電流昇降圧モード アーキテクチャ
 - シームレスなモード遷移
 - 順方向および逆方向電流動作
 - あらかじめ出力にバイアスを印加した状態で起動
 - 2MHz スイッチングの固定周波数動作
- 安全性と堅牢な動作機能
 - 過電流保護および短絡保護
 - アクティブ ランプを採用したソフト スタート機能内蔵
 - 過熱保護および過電圧保護
 - 負荷の切り離しを伴う真のシャットダウン機能
 - 順方向および逆方向の電流制限
- 小型ソリューション サイズ
 - 2.6mm × 2.0mm × 1.2mm (最大) 8 ピン μ SiP パッケージ

2 アプリケーション

- TWS**
- システム プリレギュレータ (スマートフォン、タブレット、端末、テレマティクス)
- ポイント オブ ロード レギュレーション (有線センサ、ポート/ケーブル アダプタ、 dongle)
- 指紋、カメラ センサ (電子スマート ロック、IP ネットワーク カメラ)
- 電圧スタビライザ (データコム、光モジュール、冷却 / 加熱)

3 概要

TPSM83102 および TPSM83103 は、小型 μ SiP モジュール パッケージに封止された定周波数ピーク電流モード制御昇降圧コンバータです。3A のピーク電流制限 (標準値) と 1.6V~5.5V の入力電圧範囲を備え、システム プリレギュレータと電圧スタビライザの電源ソリューションを提供します。

TPSM83102 と TPSM83103 は入力電圧に応じて自動的に昇圧モード、降圧モード、3 サイクル昇降圧モード (入力電圧が出力電圧とほぼ等しい場合) で動作します。モード間の遷移は定義されたデューティ サイクルで発生し、モード間の不要な切り替えが避けられるので出力電圧リップルを減らすことができます。8 μ A の静止電流とパワーセーブ モードの電力により、軽負荷から無負荷までの状況で非常に高い効率を実現します。

このデバイスは、 μ SiP モジュール パッケージで非常に小型のソリューション サイズを実現しています。

パッケージ情報

部品番号	パッケージ (1)	本体サイズ (公称)
TPSM83102	μ SiP モジュール	2.6mm × 2.0mm × 1.2mm (最大高さ)
TPSM83103	μ SiP モジュール	2.6mm × 2.0mm × 1.2mm (最大高さ)

- (1) 供給されているすべてのパッケージについては、**セクション 12** を参照してください。

表 5-1. Pin Functions

PIN		I/O ⁽¹⁾	DESCRIPTION
NAME	NO.		
VIN	1	PWR	Supply input voltage
GND	2, 3, 6	PWR	Power ground
VOUT	4	PWR	Power stage output
SCL	5	I/O	I2C serial interface clock. Pull this pin up to the I2C bus voltage with a resistor or a current source.
SDA	7	I/O	I2C serial interface data. Pull this pin up to the I2C bus voltage with a resistor or a current source.
EN	8	I	Device enable. Set High to enable and Low to disable. It must not be left floating.

(1) PWR = power, I = input, I/O = input and output

6 Specifications

6.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V_I	Input voltage (VIN, VOUT, EN, SCL, SDA) ⁽²⁾	−0.3	6.0	V
	Input voltage for less than 10 ns	−0.3	7	V
T_J	Operating junction temperature	−40	150	°C
T_{stg}	Storage temperature	−65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to network ground terminal, unless otherwise noted.

6.2 ESD Rating

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
		Charged-device model (CDM), per JEDEC specification JS-002 ⁽²⁾	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating junction temperature (unless otherwise noted)

			MIN	NOM	MAX	UNIT

(1) Current limit production test are performed under DC conditions. The current limit in operation is somewhat higher and depending on propagation delay and the applied external components

7 Detailed Description

7.1 Overview

The TPSM83102 and TPSM83103 is a constant frequency peak current mode control buck-boost converter. The converter uses a fixed-frequency topology with approximately 2-MHz switching frequency. The modulation scheme has three clearly defined operation modes where the converters enter with defined thresholds over the full operation range of V_{IN} and V_{OUT} . The maximum output current is determined by the Q1 peak current limit, which is typically 3 A.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Undervoltage Lockout (UVLO)

The input voltage of the VIN pin is continuously monitored if the device is not in shutdown mode. UVLO only stops or starts the converter operation. The UVLO does not impact the core logic of the device. UVLO avoids a brownout of the device during device operation. In case the supply voltage on the VIN pin is lower than the negative-going threshold of UVLO, the converter stops its operation. To avoid a false disturbance of the power conversion, the UVLO falling threshold logic signal is digitally de-glitched.

If the supply voltage on the VIN pin recovers to be higher than the UVLO rising threshold, the converter returns to operation. In this case, the soft-start procedure restarts faster than under start-up without a pre-biased output.

7.3.2 Enable and Soft Start

Figure 7-1. Typical Soft-Start Behavior

When the input voltage is above the UVLO rising threshold and the EN pin is pulled to a voltage above 1.2 V, the TPSM83102 and TPSM83103 are enabled and start up after a short delay time, $t_{d(EN)}$.

The devices have an inductor peak current clamp to limit the inrush current during start-up. When the minimum current clamp ($I_{L(lim_SS)}$) is lower than the current that is necessary to follow the voltage ramp, the current automatically increases to follow the voltage ramp. The minimum current limit ensures as fast as possible soft start if the capacitance is chosen lower than what the ramp time $t_{d(RAMP)}$ was selected for.

In a typical start-up case as shown in Figure 7-1 (low output load, typical output capacitance), the minimum current clamp limits the inrush current and charges the output capacitor. The output voltage then rises faster than the reference voltage ramp (see phase A in Figure 7-1). To avoid an output overshoot, the current clamp is deactivated when the output is close to the target voltage and follows the reference voltage ramp slew value given by the voltage ramp, which is finishing the start up (see phase B in Figure 7-1). The transition from the minimum current clamp operation is sensed by using the threshold 95% V_{out_target} . After phase B, the output voltage is well regulated to the nominal target voltage. The current waveform depends on the output load and operation mode.

7.3.3 Adjustable Output Voltage

The output voltage is adjusted by the I2C control. Please refer to the part of "Programming" and "Register Map" for the V_{out} settings.

7.3.4 Reverse Current Operation

The device can support reverse current operation in FPWM mode (the current flows from VOUT pin to VIN pin). If the output feedback voltage on the FB pin is higher than the reference voltage, the converter regulation forces a current into the input capacitor. The reverse current operation is independent of the V_{IN} voltage or V_{OUT} voltage ratio, hence it is possible on all device operation modes boost, buck, or buck-boost.

7.3.5 Protection Features

The following sections describe the protection features of the device.

7.3.5.1 Input Overvoltage Protection

The TPSM83102 and TPSM83103 have input overvoltage protection which avoids any damage to the device in case the current flows from the output to the input and the input source cannot sink current (for example, a diode in the supply path).

If forced PWM mode is active, the current can go negative until it reaches the sink current limit. Once the input voltage threshold, $V_{T+(IVP)}$, is reached on the VIN pin, the protection disables forced PWM mode and only allows current to flow from VIN to VOUT. After the input voltage drops under the input voltage protection threshold, forced PWM mode can be activated again.

7.3.5.2 Short Circuit Protection

The device features peak current limit performance at short circuit protection.  7-2 shows a typical device behavior of an short/overload event of the short circuit protection.

 7-2. Typical Device Behavior During Short Circuit Protection

7.3.5.3 Thermal Shutdown

To avoid thermal damage of the device, the temperature of the die is monitored. The device stops operation once the sensed temperature rises over the thermal threshold. After the temperature drops below the thermal shutdown hysteresis, the converter returns to normal operation.

7.4 Device Functional Modes

The device has two functional modes: off and on. The device enters the on mode when the voltage on the VIN pin is higher than the UVLO threshold and a high logic level is applied to the EN pin. The device enters the off mode when the voltage on the VIN pin is lower than the UVLO threshold or a low logic level is applied to the EN pin.

 7-3. Device Functional Modes

7.5 Programming

7.5.1 Serial Interface Description

I²C is a 2-wire serial interface developed by Philips Semiconductor, now NXP Semiconductors (see [NXP Semiconductors, UM10204 – I²C-Bus Specification and User Manual](#)). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I²C-compatible devices connect to the I²C bus through open-drain I/O pins, SDA, and SCL. A controller device, usually a microcontroller or a digital signal processor, controls the bus. The controller is responsible for generating the SCL signal and device addresses. The controller also generates specific conditions that indicate

the START and STOP of data transfer. A peripheral device receives and transmits data on the bus under control of the controller device.

The device works as a peripheral and supports the following data transfer modes, as defined in the I²C-Bus Specification:

- Standard-mode (100 kbps)
- Fast-mode (400 kbps)
- Fast-mode Plus (1 Mbps)

The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values, depending on the instantaneous application requirements. Register contents remain intact as long as supply voltage remains above $V_{IT+(POR)}$.

The data transfer protocol for standard and fast modes is exactly the same, therefore, it is referred to as F/S-mode in this document. The device supports 7-bit addressing; 10-bit addressing and general call address are not supported. The device 7-bit address is 6Ah (01101010b).

To make sure that the I²C function in the device is correctly reset, it is recommended that the I²C controller initiates a STOP condition on the I²C bus after the initial power up of SDA and SCL pullup voltages.

7.5.2 Standard-, Fast-, and Fast-Mode Plus Protocol

The controller initiates a data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in 7-4. All I²C-compatible devices recognize a start condition.

7-4. START and STOP Conditions

The controller then generates the SCL pulses and transmits the 7-bit address and the read/write direction bit, R/W, on the SDA line. During all transmissions, the controller ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse (see 7-5). All devices recognize the address sent by the controller and compare it to their internal fixed addresses. Only the peripheral device with a matching address generates an acknowledge (see 7-6) by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the controller knows that communication link with a peripheral has been established.

7-5. Bit Transfer on the Serial Interface

The controller generates further SCL cycles to either transmit data to the peripheral (R/W bit 1) or receive data from the peripheral (R/W bit 0). In either case, the receiver needs to acknowledge the data sent by the transmitter. An acknowledge signal can either be generated by the controller or by the peripheral, depending on which one is the receiver. 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary.

To signal the end of the data transfer, the controller generates a stop condition by pulling the SDA line from low to high while the SCL line is high (see [Figure 7-4](#)). This releases the bus and stops the communication link with the addressed peripheral. All I²C-compatible devices must recognize the stop condition. Upon the receipt of a stop condition, all devices know that the bus is released and they wait for a start condition followed by a matching address.

Attempting to read data from register addresses not listed in this section results in 00h being read out.

Figure 7-6. Acknowledge on the I²C Bus

Figure 7-7. Bus Protocol

7.5.3 I²C Update Sequence

A single update requires the following:

- A start condition
- A valid I²C peripheral address
- A register address
- A data byte

To acknowledge the receipt of each byte, the device pulls the SDA line low during the high period of a single clock pulse. The device performs an update on the falling edge of the acknowledge signal that follows the last byte.

8 Application and Implementation

注

以下のアプリケーション情報は、テキサス・インスツルメンツの製品仕様に含まれるものではなく、テキサス・インスツルメンツはその正確性も完全性も保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。また、お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The TPSM83102 and TPSM83103 are a high-efficiency, low-quiescent current, buck-boost modules. The devices are suitable for applications needing a regulated output voltage from an input supply that can be higher or lower than the output voltage. The output voltage can be set from 1.0V to 5.5V conveniently by I2C.

8.2 Typical Application

図 8-1. 3.3-V_{OUT} Typical Application

8.2.1 Design Requirements

The design parameters are listed in 表 8-1.

表 8-1. Design Parameters

PARAMETERS	VALUES
Input voltage	2.7 V to 4.3 V
Output voltage	3.3 V
Output current	1.5 A

8.2.2 Detailed Design Procedure

The first step is the selection of the output filter components. To simplify this process, セクション 6.3 outlines minimum and maximum values for capacitance. Pay attention to the tolerance and derating when selecting nominal capacitance.

8.2.2.1 Custom Design with WEBENCH Tools

[Click here](#) to create a custom design using the TPSM83102 and TPSM83103 devices with the WEBENCH® Power Designer.

1. Start by entering your V_{IN} , V_{OUT} and I_{OUT} requirements.
2. Optimize your design for key parameters like efficiency, footprint or cost using the optimizer dial and compare this design with other possible solutions from Texas Instruments.
3. WEBENCH Power Designer provides you with a customized schematic along with a list of materials with real time pricing and component availability.
4. In most cases, you can:

- Run electrical simulations to see important waveforms and circuit performance,
- Run thermal simulations to understand the thermal performance of your board,
- Export your customized schematic and layout into popular CAD formats,
- Print PDF reports for the design, and share your design with colleagues.

5. Get more information about WEBENCH tools at www.ti.com/webench.

8.2.2.2 Output Capacitor Selection

For the output capacitor, use small ceramic capacitors placed as close as possible to the VOUT and PGND pins of the IC. The recommended nominal output capacitor value is a single 47μF. If, for any reason, the application requires the use of large capacitors that cannot be placed close to the IC, use a smaller ceramic capacitor in parallel to the large capacitor. and place the small capacitor as close as possible to the VOUT and PGND pins of the module.

It is important that the effective capacitance is given according to the recommended value in [セクション 6.3](#). In general, consider DC bias effects resulting in less effective capacitance. The choice of the output capacitance is mainly a tradeoff between size and transient behavior as higher capacitance reduces transient response over/undershoot and increases transient response time. Possible output capacitors are listed in [表 8-2](#).

表 8-2. List of Recommended Capacitors

CAPACITOR VALUE [μF]	VOLTAGE RATING [V]	ESR [mΩ]	PART NUMBER	MANUFACTURER ⁽¹⁾	SIZE (METRIC)
47	6.3	10	GRM219R60J476ME44	Murata	0805 (2012)

(1) See the [セクション 10.1.1](#).

8.2.2.3 Input Capacitor Selection

A 22μF input capacitor is recommended to improve line transient behavior of the regulator and EMI behavior of the total power supply circuit. An X5R or X7R ceramic capacitor placed as close as possible to the VIN and PGND pins of the module is recommended. This capacitance can be increased without limit. If the input supply is located more than a few inches from the TPSM83102 or TPSM83103, additional bulk capacitance can be required in addition to the ceramic bypass capacitors. An electrolytic or tantalum capacitor with a value of 47μF is a typical choice.

表 8-3. List of Recommended Capacitors

CAPACITOR VALUE [μF]	VOLTAGE RATING [V]	ESR [mΩ]	PART NUMBER	MANUFACTURER ⁽¹⁾	SIZE (METRIC)
22	6.3	43	GRM187R61A226ME15	Murata	0603 (1608)
10	10	40	GRM188R61A106ME69	Murata	0603 (1608)

9 Layout

9.1 Layout Guidelines

The PCB layout is an important step to maintain the high performance of the TPSM83102 and TPSM83103 devices.

- Place input and output capacitors as close as possible to the IC. Traces need to be kept short. Route wide and direct traces to the input and output capacitors results in low trace resistance and low parasitic inductance.

9.2 Layout Example

図 9-1. Layout Example

10 Device and Documentation Support

10.1 Device Support

10.1.1 サード・パーティ製品に関する免責事項

サード・パーティ製品またはサービスに関するテキサス・インスツルメンツの出版物は、単独またはテキサス・インスツルメンツの製品、サービスと一緒に提供される場合に関係なく、サード・パーティ製品またはサービスの適合性に関する是認、サード・パーティ製品またはサービスの是認の表明を意味するものではありません。

10.1.2 Development Support

10.1.2.1 Custom Design with WEBENCH Tools

[Click here](#) to create a custom design using the TPSM83102 and TPSM83103 devices with the WEBENCH® Power Designer.

1. Start by entering your V_{IN} , V_{OUT} and I_{OUT} requirements.
2. Optimize your design for key parameters like efficiency, footprint or cost using the optimizer dial and compare this design with other possible solutions from Texas Instruments.
3. WEBENCH Power Designer provides you with a customized schematic along with a list of materials with real time pricing and component availability.
4. In most cases, you can:
 - Run electrical simulations to see important waveforms and circuit performance,
 - Run thermal simulations to understand the thermal performance of your board,
 - Export your customized schematic and layout into popular CAD formats,
 - Print PDF reports for the design, and share your design with colleagues.
5. Get more information about WEBENCH tools at www.ti.com/webench.

10.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、www.tij.co.jp のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

10.3 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの[使用条件](#)を参照してください。

10.4 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.

WEBENCH® is a registered trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

10.5 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

10.6 用語集

テキサス・インスツルメンツ用語集

この用語集には、用語や略語の一覧および定義が記載されています。

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
