

# ADC3644 14 ビット、125MSPS、低ノイズ、低消費電力デュアル・チャンネル ADC

## 1 特長

- デュアル・チャンネル
- 14 ビット、125MSPS ADC
- ノイズ・フロア:  $-153\text{dBFS}/\text{Hz}$
- 最適な電力スケールで超低消費電力を実現:  $82\text{mW}/\text{ch}$  (125MSPS 時)
- レイテンシ: 1 クロック・サイクル
- 14 ビット、ミッシングコードなし
- INL:  $\pm 1.5\text{LSB}$ , DNL:  $\pm 0.5\text{LSB}$
- リファレンス: 外部または内部
- 産業用温度範囲:  $-40^\circ\text{C} \sim +105^\circ\text{C}$
- オンチップ・デジタル・フィルタ (オプション)
  - デシメーション比: 2, 4, 8, 16, 32
  - 32 ビット NCO
- DDR およびシリアル CMOS インターフェイス
- 小型サイズ: 40-WQFN (5mm × 5mm) パッケージ
- 1.8V 単電源
- スペクトル性能 ( $f_{\text{IN}} = 5\text{MHz}$ ):
  - SNR:  $74.0\text{dBFS}$
  - SFDR:  $90\text{dBc}$  HD2, HD3
  - SFDR:  $100\text{dBFS}$  の最大スプリアス
- スペクトル性能 ( $f_{\text{IN}} = 70\text{MHz}$ ):
  - SNR:  $72.5\text{dBFS}$
  - SFDR:  $70\text{dBc}$  HD2, HD3
  - SFDR:  $85\text{dBFS}$  の最大スプリアス

## 2 アプリケーション

- 高速データ・アキュジション
- 産業機器監視
- サーマル・イメージング
- 画像処理およびソナー
- ソフトウェア無線
- 電力品質
- 通信インフラ
- 高速制御ループ
- 計測機器
- スマート・グリッド
- 分光器
- レーダー

## 3 説明

ADC3644 デバイスは、低ノイズ、超低消費電力、14 ビット、125MSPS のデュアル・チャンネル、高速 A/D コンバータ (ADC) です。低消費電力を実現するように設計されており、ノイズ・スペクトル密度は  $-153\text{dBFS}/\text{Hz}$  で、非常に優れた直線性とダイナミック・レンジを備えています。ADC3644 は IF サンプリングをサポートしています。これにより、このデバイスは広範なアプリケーションに最適です。待ち時間 (レイテンシ) がわずか 1 クロック・サイクルと短いため、高速な制御ループを実現できます。本 ADC の消費電力はわずか  $82\text{mW}$  (125MSPS 時) であり、サンプリング・レートを下げることで、消費電力を良好に低減できます。

ADC3644 は、DDR またはシリアル CMOS インターフェイスを使用してデータを出力するため、デジタル信号の相互接続数を柔軟に減らせると共に、最小限の消費電力のデジタル・インターフェイスを実現できます。これらのデバイスは、各種速度グレードを含むピン互換ファミリーです。これらのデバイスは、 $-40 \sim +105^\circ\text{C}$  の拡張産業用温度範囲をサポートしています。

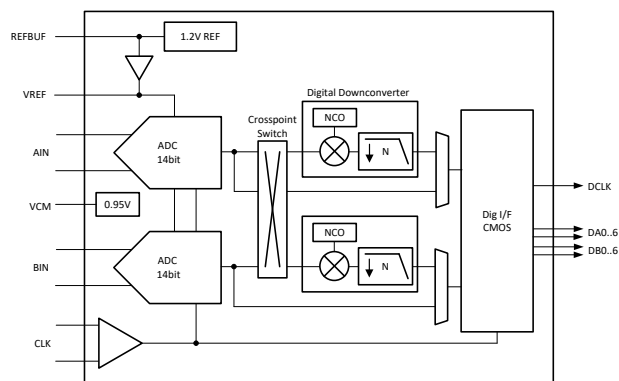

### 製品情報

部品番号 <sup>(1)</sup>	パッケージ	本体サイズ (公称)
ADC3644	WQFN (40)	5.00 × 5.00 mm

(1) 利用可能なパッケージについては、データシートの末尾にあるパッケージ・オプションについての付録を参照してください。

### デバイスの比較

部品番号	分解能	サンプリング・レート
ADC3641	14 ビット	10MSPS
ADC3642	14 ビット	25MSPS
ADC3643	14 ビット	65MSPS
ADC3644	14 ビット	125MSPS

## 5 Pin Configuration and Functions

图 5-1. RSB Package, 40-Pin WQFN, Top View

表 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
<b>INPUT/REFERENCE</b>			
AINM	13	I	Negative analog input, channel A
AINP	12	I	Positive analog input, channel A
BINP	39	I	Positive analog input, channel B
BINM	38	I	Negative analog input, channel B
REFBUF	4	I	1.2 V external voltage reference input for use with internal reference buffer. Internal 100 kΩ pull-up resistor to AVDD. This pin is also used to configure default operating conditions.
REFGND	3	I	Reference ground input, 0 V
VCM	8	O	Common-mode voltage output for the analog inputs, 0.95 V.
VREF	2	I	External voltage reference input, 1.6 V
<b>CLOCK</b>			
CLKM	7	I	Negative differential sampling clock input for the ADC
CLKP	6	I	Positive differential sampling clock input for the ADC
<b>CONFIGURATION</b>			
PDN/SYNC	1	I	Power down/Synchronization input. This pin can be configured via the SPI interface. Active high. This pin has an internal 21 kΩ pull-down resistor.
RESET	9	I	Hardware reset. Active high. This pin has an internal 21 kΩ pull-down resistor.
SCLK	35	I	Serial interface clock input. This pin has an internal 21 kΩ pull-down resistor.
SDIO	10	I	Serial interface data input and output. This pin has an internal 21 kΩ pull-down resistor.

表 5-1. Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
SEN	16	I	Serial interface enable. Active low. This pin has an internal 21 kΩ pull-up resistor to AVDD.
<b>DIGITAL INTERFACE</b>			
DA0	17	O	CMOS digital data output.
DA1	18	I/O	CMOS digital data output. Used as FCLK frame clock output for serialized CMOS output modes. Configured using SPI.
DA2	19	O	CMOS digital data output.
DA3	20	O	CMOS digital data output.
DA4	22	O	CMOS digital data output.
DA5	23	O	CMOS digital data output.
DA6	24	O	CMOS digital data output.
DB0	34	O	CMOS digital data output.
DB1	33	I/O	CMOS digital data output. Used as DCLKIN bit clock input for serialized CMOS output modes. Configured using SPI.
DB2	32	O	CMOS digital data output.
DB3	31	O	CMOS digital data output.
DB4	29	O	CMOS digital data output.
DB5	28	O	CMOS digital data output.
DB6	27	O	CMOS digital data output.
DCLK	25	O	CMOS output for data bit clock.
<b>POWER SUPPLY</b>			
AVDD	5,15,36	I	Analog 1.8-V power supply
GND	11,14,37,40, PowerPAD™	I	Ground, 0 V
IOGND	26	I	Ground, 0 V for digital interface
IOVDD	21,30	I	1.8-V power supply for digital interface

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
Supply voltage range, AVDD, IOVDD		-0.3	2.1	V
Supply voltage range, GND, IOGND, REFGND		-0.3	0.3	V
Voltage applied to input pins	AINP/M, BINP/M, CLKP/M, VREF, REFBUF	-0.3	MIN(2.1, AVDD+0.3)	V
	PDN, RESET, SCLK, SEN, SDIO	-0.3	MIN(2.1, AVDD+0.3)	
	DB1 (DCLKIN)	-0.3	MIN(2.1, IOVDD+0.3)	
Junction temperature, T <sub>J</sub>			105	°C
Storage temperature, T <sub>stg</sub>		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	2500	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins <sup>(2)</sup>	1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage range	AVDD <sup>(1)</sup>	1.75	1.8	1.85	V
	IOVDD <sup>(1)</sup>	1.75	1.8	1.85	V
T <sub>A</sub>	Operating free-air temperature	-40		105	°C
T <sub>J</sub>	Operating junction temperature			105 <sup>(2)</sup>	°C

- (1) Measured to GND.  
(2) Prolonged use above this junction temperature may increase the device failure-in-time (FIT) rate.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ADC3644	UNIT
		RSB (QFN)	
		40 Pins	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	30.7	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	16.4	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	10.5	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.2	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	10.5	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	2.0	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

## 6.5 Electrical Characteristics - Power Consumption

Typical values are over the operating free-air temperature range, at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 105^\circ\text{C}$ , ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, external 1.6 V reference, 5 pF output load, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>Power Consumption</b>						
$I_{\text{AVDD}}$	Analog supply current	External reference		65	79	mA
$I_{\text{IOVDD}}$	I/O supply current <sup>(1)</sup>	DDR CMOS		26	39	
$P_{\text{DIS}}$	Power dissipation <sup>(1)</sup>	External reference, DDR CMOS		164	212	mW
$I_{\text{IOVDD}}$	I/O supply current <sup>(1)</sup>			29		mA
<b>MISCELLANEOUS</b>						
$I_{\text{AVDD}}$	Internal reference, additional analog supply current			3		mA
	External reference, Internal reference buffer (REFBUF), additional analog supply current			0.5		
	Single ended clock input, reduces analog supply current by	Enabled via SPI		1		
$P_{\text{DIS}}$	Power consumption in global power down mode	Default mask settings, internal reference		5		mW
		Default mask settings, external reference		9		

(1) Measured with a full-scale sine wave input signal with ~ 5 pF loading on each CMOS output pin.

## 6.6 Electrical Characteristics - DC Specifications

Typical values are over the operating free-air temperature range, at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 105^\circ\text{C}$ , ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, external 1.6 V reference, 5 pF output load, and -1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>DC ACCURACY</b>						
No missing codes			14			bits
PSRR		$F_{\text{IN}} = 1 \text{ MHz}$		35		dB
<b>DC ACCURACY</b>						
DNL	Differential nonlinearity	$F_{\text{IN}} = 5 \text{ MHz}$		$\pm 0.5$	$\pm 0.97$	LSB
INL	Integral nonlinearity	$F_{\text{IN}} = 5 \text{ MHz}$		$\pm 1.5$	$\pm 7.5$	LSB
V <sub>OS_ERR</sub>	Offset error			8	65	LSB
V <sub>OS_DRIFT</sub>	Offset drift over temperature			0.02		LSB/ $^\circ\text{C}$
GAIN <sub>ERR</sub>	Gain error	External 1.6 V reference		0.5		%FSR
GAIN <sub>DRIFT</sub>	Gain drift over temperature	External 1.6 V reference		9		ppm/ $^\circ\text{C}$
GAIN <sub>ERR</sub>	Gain error	Internal reference		-0.4		%FSR
GAIN <sub>DRIFT</sub>	Gain drift over temperature	Internal reference		74		ppm/ $^\circ\text{C}$
Transition Noise				0.71		LSB <sub>RMS</sub>
<b>ADC ANALOG INPUT (AINP/M, BINP/M)</b>						
FS	Input full scale	Default, differential		2.25		V <sub>pp</sub>
V <sub>CM</sub>	Input common mode voltage		0.9	0.95	1.0	V
R <sub>IN</sub>	Input resistance	Differential at DC		8		k $\Omega$
C <sub>IN</sub>	Input capacitance	Each pin to GND		5.4		pF
V <sub>OCM</sub>	Output common mode voltage			0.95		V
BW	Analog input bandwidth (-3dB)			1.4		GHz
<b>Internal Voltage Reference</b>						
V <sub>REF</sub>	Internal reference voltage			1.6		V
V <sub>REF</sub> Output Impedance				8		$\Omega$
<b>Reference Input Buffer (REFBUF)</b>						
External reference voltage				1.2		V
<b>External voltage reference (VREF)</b>						
V <sub>REF</sub>	External voltage reference			1.6		V
Input Current				1		mA
Input impedance				5.3		k $\Omega$
<b>Clock Input (CLKP/M)</b>						
Input clock frequency			0.01	125	125	MHz
V <sub>ID</sub>	Differential input voltage		250	1000	2000	mV
V <sub>CM</sub>	Input common mode voltage			0.9		V
Clock duty cycle			40	50	60	%
<b>Digital Inputs (RESET, PDN, SCLK, SEN, SDIO)</b>						
V <sub>IH</sub>	High level input voltage		1.4			V
V <sub>IL</sub>	Low level input voltage				0.4	
I <sub>IH</sub>	High level input current			90	150	uA
I <sub>IL</sub>	Low level input current		-150	-90		
C <sub>I</sub>	Input capacitance			1.5		pF

## 6.6 Electrical Characteristics - DC Specifications (continued)

Typical values are over the operating free-air temperature range, at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 105^\circ\text{C}$ , ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, external 1.6 V reference, 5 pF output load, and  $-1\text{-dBFS}$  differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>Digital Output (SDOUT)</b>						
$V_{\text{OH}}$	High level output voltage	$I_{\text{LOAD}} = -400\ \mu\text{A}$	IOVDD - 0.1	IOVDD		V
$V_{\text{OL}}$	Low level output voltage	$I_{\text{LOAD}} = 400\ \mu\text{A}$			0.1	
<b>CMOS Interface (DA0:DA6, DB0:DB6, DCLK)</b>						
Output data rate		per CMOS output pin			250	MHz
$V_{\text{OH}}$	High level output voltage	$I_{\text{LOAD}} = -400\ \mu\text{A}$	IOVDD - 0.1	IOVDD		V
$V_{\text{OL}}$	Low level output voltage	$I_{\text{LOAD}} = 400\ \mu\text{A}$			0.1	
$V_{\text{IH}}$	High level input voltage	Input clock (Serial CMOS)	IOVDD - 0.1	IOVDD		V
$V_{\text{IL}}$	Low level input voltage				0.1	

## 6.7 Electrical Characteristics - AC Specifications

Typical values are over the operating free-air temperature range, at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 105^\circ\text{C}$ , ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, external 1.6V reference, 5 pF output load, and  $-1\text{-dBFS}$  differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
NSD	Noise Spectral Density	No input signal		-152		dBFS/Hz
SNR	Signal to noise ratio	$f_{\text{IN}} = 5\text{ MHz}$	72	74.0		dBFS
		$f_{\text{IN}} = 10\text{ MHz}$		73.9		
		$f_{\text{IN}} = 40\text{ MHz}$		73.0		
		$f_{\text{IN}} = 70\text{ MHz}$		70.6		
		$f_{\text{IN}} = 100\text{ MHz}$		69.2		
SINAD	Signal to noise and distortion ratio	$f_{\text{IN}} = 5\text{ MHz}$	71	74.0		dBFS
		$f_{\text{IN}} = 10\text{ MHz}$		73.9		
		$f_{\text{IN}} = 40\text{ MHz}$		73.0		
		$f_{\text{IN}} = 70\text{ MHz}$		70.6		
		$f_{\text{IN}} = 100\text{ MHz}$		69.2		
ENOB	Effective number of bits	$f_{\text{IN}} = 5\text{ MHz}$	11.5	12.0		bit
		$f_{\text{IN}} = 10\text{ MHz}$		12.0		
		$f_{\text{IN}} = 40\text{ MHz}$		11.8		
		$f_{\text{IN}} = 70\text{ MHz}$		11.4		
		$f_{\text{IN}} = 100\text{ MHz}$		11.2		
THD	Total Harmonic Distortion (First five harmonics)	$f_{\text{IN}} = 5\text{ MHz}$	72	82		dBc
		$f_{\text{IN}} = 10\text{ MHz}$		81		
		$f_{\text{IN}} = 40\text{ MHz}$		80		
		$f_{\text{IN}} = 70\text{ MHz}$		75		
		$f_{\text{IN}} = 100\text{ MHz}$		72		
HD2	Second Harmonic Distortion	$f_{\text{IN}} = 5\text{ MHz}$	76	85		dBc
		$f_{\text{IN}} = 10\text{ MHz}$		82		
		$f_{\text{IN}} = 40\text{ MHz}$		83		
		$f_{\text{IN}} = 70\text{ MHz}$		79		
		$f_{\text{IN}} = 100\text{ MHz}$		72		
HD3	Third Harmonic Distortion	$f_{\text{IN}} = 5\text{ MHz}$	77	90		dBc
		$f_{\text{IN}} = 10\text{ MHz}$		96		
		$f_{\text{IN}} = 40\text{ MHz}$		92		
		$f_{\text{IN}} = 70\text{ MHz}$		82		
		$f_{\text{IN}} = 100\text{ MHz}$		83		
Non HD2,3	Spur free dynamic range (excluding HD2 and HD3)	$f_{\text{IN}} = 5\text{ MHz}$	86	93		dBFS
		$f_{\text{IN}} = 10\text{ MHz}$		94		
		$f_{\text{IN}} = 40\text{ MHz}$		89		
		$f_{\text{IN}} = 70\text{ MHz}$		85		
		$f_{\text{IN}} = 100\text{ MHz}$		83		
IMD3	Two tone inter-modulation distortion	$f_1 = 10\text{ MHz}$ , $f_2 = 12\text{ MHz}$ , $A_{\text{IN}} = -7\text{ dBFS/ tone}$		93		dBc

## 6.8 Timing Requirements

Typical values are over the operating free-air temperature range, at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 105^\circ\text{C}$ , ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, external 1.6 V reference, 5 pF output load, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
<b>ADC Timing Specifications</b>						
$t_{\text{AD}}$	Aperture delay			0.85		ns
$t_{\text{A}}$	Aperture jitter	square wave clock with fast edges		230		fs
$t_{\text{J}}$	Jitter on DCLKIN	Serial CMOS output mode			$\pm 50$	ps (pk-pk)
$t_{\text{ACQ}}$	Signal acquisition period	referenced to sampling clock falling edge		$-T_{\text{S}}/4$		Sampling Clock Period
$t_{\text{CONV}}$	Signal conversion period	referenced to sampling clock falling edge		6		ns
Wake up time	Time to valid data after coming out of power down. Internal reference.	Bandgap reference enabled, single ended clock		13		us
		Bandgap reference enabled, differential clock		15		
		Bandgap reference disabled, single ended clock		2.4		ms
		Bandgap reference disabled, differential clock		2.3		
	Time to valid data after coming out of power down. External 1.6V reference.	Bandgap reference enabled, single ended clock		13		us
		Bandgap reference enabled, differential clock		14		
		Bandgap reference disabled, single ended clock		2.0		ms
		Bandgap reference disabled, differential clock		2.2		
$t_{\text{S,SYNC}}$	Setup time for SYNC input signal	Referenced to sampling clock rising edge	500			ps
$t_{\text{H,SYNC}}$	Hold time for SYNC input signal		600			
ADC Latency	Signal input to data output	DDR CMOS		1		Clock cycles
		Serialized CMOS: 2-wire		2		
		Serialized CMOS: 1-wire		1		
		Serialized CMOS: 1/2-wire		1		
Add Latency	Real decimation by 2			21		Output clock cycles
	Complex decimation by 2			22		
	Real or complex decimation by 4, 8, 16, 32			23		
<b>OUTPUT RATE: 125 MSPS</b>						
<b>INTERFACE TIMING - PARALLEL DDR CMOS</b>						
$t_{\text{PD}}$	Propagation delay: sampling clock falling edge to DCLK rising edge	Propagation delay: sampling clock falling edge to DCLK rising edge	3	5	7	ns
$t_{\text{CD}}$	DCLK rising edge to output data delay	$F_{\text{out}} = 125 \text{ MSPS}$	-0.75	0.3		ns
$t_{\text{DV}}$	Data valid, DDR CMOS	$F_{\text{out}} = 125 \text{ MSPS}$	3.6	3.8		ns

## 6.8 Timing Requirements (continued)

Typical values are over the operating free-air temperature range, at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 105^\circ\text{C}$ , ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD, IOVDD = 1.8 V, external 1.6 V reference, 5 pF output load, and -1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
<b>INTERFACE TIMING - SERIAL CMOS</b>						
$t_{\text{PD}}$	Propagation delay: sampling clock falling edge to DCLK rising edge	Delay between sampling clock falling edge to DCLKIN falling edge < 2.5ns. $T_{\text{DCLK}} = \text{DCLK period}$ $t_{\text{CDCLK}} = \text{Sampling clock falling edge to DCLKIN falling edge}$	$T_{\text{DCLK}} + t_{\text{CDCLK}}$	$T_{\text{DCLK}} + t_{\text{CDCLK}}$	$T_{\text{DCLK}} + t_{\text{CDCLK}}$	ns
	Propagation delay: sampling clock falling edge to DCLK rising edge	Delay between sampling clock falling edge to DCLKIN falling edge $\geq 2.5\text{ns}$ . $T_{\text{DCLK}} = \text{DCLK period}$ $t_{\text{CDCLK}} = \text{Sampling clock falling edge to DCLKIN falling edge}$	$T_{\text{DCLK}} + t_{\text{CDCLK}}$	$T_{\text{DCLK}} + t_{\text{CDCLK}}$	$T_{\text{DCLK}} + t_{\text{CDCLK}}$	ns
$t_{\text{CD}}$	DCLK rising edge to output data delay, 2-wire serial CMOS	Fout = 10 MSPS, DA/B5,6 = 80 MBPS	-0.24	0.10		ns
		Fout = 20 MSPS, DA/B5,6 = 160 MBPS	-0.29	0.10		ns
		Fout = 30 MSPS, DA/B5,6 = 240 MBPS	-0.28	0.09		ns
	DCLK rising edge to output data delay, 1-wire series CMOS	Fout = 5 MSPS, DA/B6 = 80 MBPS	-0.22	0.11		ns
		Fout = 10 MSPS, DA/B6 = 160 MBPS	-0.27	0.11		ns
		Fout = 15 MSPS, DA/B6 = 240 MBPS	-0.52	0.08		ns
DCLK rising edge to output data delay, 1/2-wire serial CMOS	Fout = 5 MSPS, DA6 = 160 MBPS	-0.24	0.10		ns	
$t_{\text{DV}}$	Data valid, 2-wire serial CMOS	Fout = 10 MSPS, DA/B5,6 = 80 MBPS	12.19	12.36		ns

## 8 Detailed Description

### 8.1 Overview

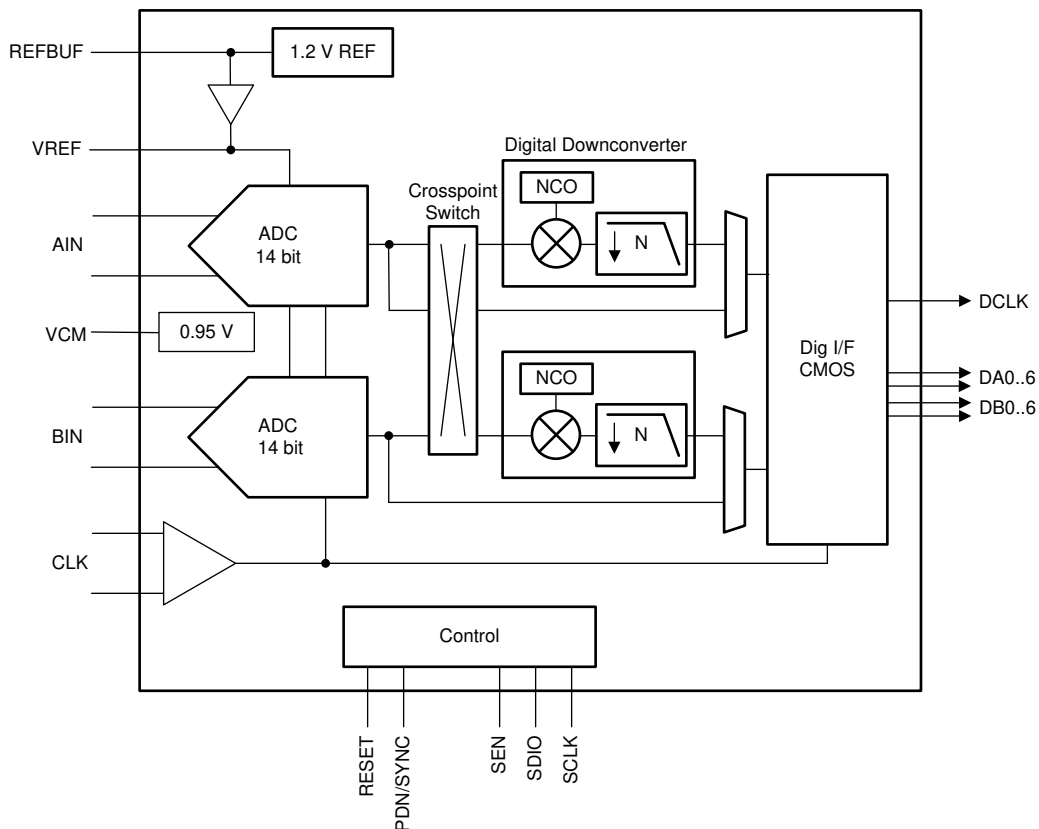

The ADC3644 is a low noise, ultra-low power 14-bit high-speed dual channel ADC supporting sampling rates up to 125 MSPS. It offers very good DC precision together with IF sampling support which makes it well suited for a wide range of applications. The ADC3644 is equipped with an on-chip internal reference option but it also supports the use of an external, high precision 1.6 V voltage reference or an external 1.2 V reference which is buffered and gained up internally. Because of the inherent low latency architecture, the digital output result is available after only one clock cycle. Single ended as well as differential input signaling is supported.

An optional programmable digital down converter enables external anti-alias filter relaxation as well as output data rate reduction. The digital filter provides a 32-bit programmable NCO and supports both real or complex decimation.

The ADC3644 uses a DDR as well as a 2-wire, 1-wire and 1/2-wire serial CMOS interface to output the data offering lowest power digital interface together with the flexibility to minimize the number of digital interconnects. The ADC3644 includes a digital output formatter which supports output resolutions from 14 to 20-bit. The device is a pin-to-pin compatible family with different speed grades.

The device features and control options can be set up either through pin configurations or via SPI register writes.

### 8.2 Functional Block Diagram

## 8.3 Feature Description

### 8.3.1 Analog Input

The analog inputs of ADC3644 are intended to be driven differentially. Both AC coupling and DC coupling of the analog inputs is supported. The analog inputs are designed for an input common mode voltage of 0.95 V which must be provided externally on each input pin. DC-coupled input signals must have a common mode voltage that meets the device input common mode voltage range.

The equivalent input network diagram is shown in [Figure 8-1](#). All four sampling switches, on-resistance shown in red, are in same position (open or closed) simultaneously.

**Figure 8-1. Equivalent Input Network**

#### 8.3.1.1 Analog Input Bandwidth

[Figure 8-2](#) shows the analog full power input bandwidth of the ADC3644 with a 50 Ω differential termination. The -3 dB bandwidth is approximately 1.4 GHz and the useful input bandwidth with good AC performance is approximately 200 MHz.

The equivalent differential input resistance  $R_{IN}$  and input capacitance  $C_{IN}$  vs frequency are shown in [Figure 8-3](#).

**Figure 8-2. ADC Analog Input bandwidth response**

**Figure 8-3. Equivalent  $R_{IN}/C_{IN}$  vs Input Frequency**

### 8.3.1.2 Analog Front End Design

The ADC3644 is an unbuffered ADC and thus a passive kick-back filter is recommended to absorb the glitch from the sampling operation. Depending on if the input is driven by a balun or a differential amplifier with low output impedance, a termination network may be needed. Additionally a passive DC bias circuit is needed in AC-coupled applications which can be combined with the termination network.

#### 8.3.1.2.1 Sampling Glitch Filter Design

The front end sampling glitch filter is designed to optimize the SNR and HD3 performance of the ADC. The filter performance is dependent on input frequency and therefore the following filter designs are recommended for different input frequency ranges as shown in [8-4](#) and [8-5](#) (assuming 50 Ω source impedance).

**8-4. Sampling glitch filter example for input frequencies from DC to 60 MHz**

**8-5. Sampling glitch filter example for input frequencies from 60 to 120 MHz**

#### 8.3.1.2.2 Single Ended Input

The ADC can be configured to operate with single ended input instead of differential using just the positive signal input. This operating mode must be enabled via SPI register write (address 0xE). The single ended signal is connected to the negative ADC input and both the positive and negative input need to be biased to  $V_{CM}$  as shown in [8-6](#).

**8-6. Single ended analog input: AC coupled (left) and DC coupled (right)**

The signal swing is now reduced by 6-dB (single ended input with 1.125 V<sub>pp</sub> vs differential 2.25 V<sub>pp</sub>), and the resulting SNR is reduced by 3-dB.

### 8.3.1.2.3 Analog Input Termination and DC Bias

Depending on the input drive circuitry, a termination network and/or DC biasing needs to be provided.

#### 8.3.1.2.3.1 AC-Coupling

The ADC3644 requires external DC bias using the common mode output voltage (VCM) of the ADC together with the termination network as shown in [Figure 8-7](#). The termination is located within the glitch filter network. When using a balun on the input, the termination impedance has to be adjusted to account for the turns ratio of the transformer. When using an amplifier, the termination impedance can be adjusted to optimize the amplifier performance.

**Figure 8-7. AC-Coupling: termination network provides DC bias (glitch filter example for up to 60 MHz)**

#### 8.3.1.2.3.2 DC-Coupling

In DC coupled applications the DC bias needs to be provided from the fully differential amplifier (FDA) using VCM output of the ADC as shown in [Figure 8-8](#). The glitch filter in this case is located between the anti-alias filter and the ADC. No termination may be needed if amplifier is located close to the ADC or if the termination is part of the anti-alias filter.

**Figure 8-8. DC-Coupling: DC bias provided by FDA (glitch filter example for DC - 60 MHz)**

### 8.3.2 Clock Input

In order to maximize the ADC SNR performance, the external sampling clock should be low jitter and differential signaling with a high slew rate. This is especially important in IF sampling applications. For less jitter sensitive applications, the ADC3644 provides the option to operate with single ended signaling which saves additional power consumption.

#### 8.3.2.1 Clock Amplitude

In IF sampling applications, the SNR of the ADC is dependent on the amplitude of the clock signal. The clock amplitude directly impacts the ADC aperture jitter.

#### 8.3.2.2 Single Ended vs Differential Clock Input

The ADC3644 can be operated using a differential or a single ended clock input where the single ended clock consumes less power consumption. However clock amplitude impacts the ADC aperture jitter and consequently the SNR. For maximum SNR performance, a large clock signal with fast slew rates needs to be provided.

- Differential Clock Input: The clock input can be AC coupled externally. The ADC3644 provides internal biasing for that use case.
- Single Ended Clock Input: This mode needs to be configured using SPI register (0x0E, D2 and D0) or with the REFBUF pin. In this mode there is no internal clock biasing and thus the clock input needs to be DC coupled around a 0.9 V center. The unused input needs to be AC coupled to ground.

**8-9. External and internal connection using differential (left) and single ended (right) clock input**

### 8.3.3 Voltage Reference

The ADC3644 provides three different options for supplying the voltage reference to the ADC. An external 1.6 V reference can be directly connected to the VREF input; a voltage 1.2 V reference can be connected to the REFBUF input using the internal gain buffer or the internal 1.2 V reference can be enabled to generate a 1.6 V reference voltage. For best performance, the reference noise should be filtered by connecting a 10 uF and a 0.1 uF ceramic bypass capacitor to the VREF pin. The internal reference circuitry of the ADC3644 is shown in [Figure 8-10](#).

#### Note

The voltage reference mode can be selected using SPI writes or by using the REFBUF pin (default) as a control pin ([Section 8.5.1](#)). If the REFBUF pin is not used for configuration, the REFBUF pin should be connected to AVDD (even though the REFBUF pin has a weak internal pullup to AVDD) and the voltage reference option has to be selected using the SPI interface.

**Figure 8-10. Different voltage reference options for ADC3644**

#### 8.3.3.1 Internal voltage reference

The 1.6 V reference for the ADC can be generated internal using the on-chip 1.2 V reference along with the internal gain buffer. A 10 uF and a 0.1 uF ceramic bypass capacitor ( $C_{VREF}$ ) should be connected between the VREF and REFGND pins as close to the pins as possible.

**Figure 8-11. Internal reference**

### 8.3.3.2 External voltage reference (VREF)

For highest accuracy and lowest temperature drift, the VREF input can be directly connected to an external 1.6 V reference. A 10 uF and a 0.1 uF ceramic bypass capacitor ( $C_{VREF}$ ) connected between the VREF and REFGND pins and placed as close to the pins as possible is recommended. The load current from the external reference is about 1 mA.

Note: The internal reference is also used for other functions inside the device, therefore the reference amplifier should only be powered down in power down state but not during normal operation.

☒ 8-12. External 1.6V reference

### 8.3.3.3 External voltage reference with internal buffer (REFBUF)

The ADC3644 is equipped with an on-chip reference buffer that also includes gain to generate the 1.6 V reference voltage from an external 1.2 V reference. A 10 uF and a 0.1 uF ceramic bypass capacitor ( $C_{VREF}$ ) between the VREF and REFGND pins and a 10 uF and a 0.1 uF ceramic bypass capacitor between the REFBUF and REFGND pins are recommended. Both capacitors should be placed as close to the pins as possible. The load current from the external reference is less than 100 uA.

☒ 8-13. External 1.2 V reference using internal reference buffer

### 8.3.4 Digital Down Converter

The ADC3644 includes an optional on-chip digital down conversion (DDC) decimation filter that can be enabled via SPI register setting. It supports complex decimation by 2, 4, 8, 16 and 32 using a digital mixer and a 32-bit numerically controlled oscillator (NCO) as shown in [Figure 8-14](#). Furthermore it supports a mode with real decimation where the complex mixer is bypassed (NCO should be set to 0 for lowest power consumption) and the digital filter acts as a low pass filter.

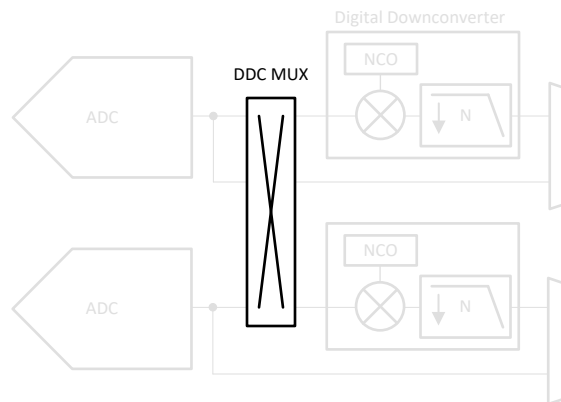

Internally the decimation filter calculations are performed with a 20-bit resolution in order to avoid any SNR degradation due to quantization noise. The output formatter [Section 8.3.5.4](#) truncates to the selected resolution prior to outputting the data on the digital interface.

**Figure 8-14. Internal Digital Decimation Filter**

#### 8.3.4.1 DDC MUX

The ADC3644 family contains a MUX in front of the digital decimation filter which allows the ADC channel A input to be connected to the DDC of channel B and vice versa.

**Figure 8-15. DDC MUX**

### 8.3.4.2 Digital Filter Operation

The complex decimation operation is illustrated with an example in [Figure 8-16](#). First the input signal (and the negative image) are frequency shifted by the NCO frequency as shown on the left. Next a digital filter is applied (centered around 0 Hz) and the output data rate is decimated - in this example the output data rate  $F_{S,OUT} = F_S/8$  with a Nyquist zone of  $F_S/16$ . During the complex mixing the spectrum (signal and noise) is split into real and complex parts and thus the amplitude is reduced by 6-dB. In order to compensate this loss, there is a 6-dB digital gain option in the decimation filter block that can be enabled via SPI write.

**Figure 8-16. Complex decimation illustration**

The real decimation operation is illustrated with an example in [Figure 8-17](#). There is no frequency shift happening and only the real portion of the complex digital filter is exercised. The output data rate is decimated - a decimation of 8 would result in an output data rate  $F_{S,OUT} = F_S/8$  with a Nyquist zone of  $F_S/16$ .

During the real mixing the spectrum (signal and noise) amplitude is reduced by 3-dB. In order to compensate this loss, there is a 3-dB digital gain option in the decimation filter block that can be enabled via SPI write.

**Figure 8-17. Real decimation illustration**

### 8.3.4.3 FS/4 Mixing with Real Output

In this mode, the output after complex decimation gets mixed with FS/4 (FS = output data rate in this case). Instead of a complex output with the input signal centered around 0 Hz, the output is transmitted as a real output at twice the data rate and the signal is centered around FS/4 (F<sub>out</sub>/4) as illustrated in [Figure 8-18](#).

In this example, complex decimation by 8 is used. The output data is transmitted as a real output with an output rate of F<sub>out</sub> = FS'/4 (FS' = ADC sampling rate). The input signal is now centered around FS/4 (F<sub>out</sub>/4) or FS'/16.

**Figure 8-18. FS/4 Mixing with real output**

### 8.3.4.4 Numerically Controlled Oscillator (NCO) and Digital Mixer

The decimation block is equipped with a 32-bit NCO and a digital mixer to fine tune the frequency placement prior to the digital filtering. The oscillator generates a complex exponential sequence of:

$$e^{j\omega n} \text{ (default) or } e^{-j\omega n} \tag{1}$$

where: frequency ( $\omega$ ) is specified as a signed number by the 32-bit register setting

The complex exponential sequence is multiplied with the real input from the ADC to mix the desired carrier to a frequency equal to  $f_{IN} + f_{NCO}$ . The NCO frequency can be tuned from  $-F_S/2$  to  $+F_S/2$  and is processed as a signed, 2s complement number. After programming a new NCO frequency, the MIXER RESTART register bit or SYNC pin has to be toggled for the new frequency to get active. Additionally the ADC3644 provides the option via SPI to invert the mixer phase.

The NCO frequency setting is set by the 32-bit register value given and calculated as:

$$\text{NCO frequency} = 0 \text{ to } +F_S/2: \text{NCO} = f_{NCO} \times 2^{32} / F_S$$

$$\text{NCO frequency} = -F_S/2 \text{ to } 0: \text{NCO} = (f_{NCO} + F_S) \times 2^{32} / F_S$$

where:

- NCO = NCO register setting (decimal value)
- $f_{NCO}$  = Desired NCO frequency (MHz)
- $F_S$  = ADC sampling rate (MSPS)

The NCO programming is further illustrated with this example:

- ADC sampling rate  $F_S = 125$  MSPS
- Input signal  $f_{IN} = 10$  MHz
- Desired output frequency  $f_{OUT} = 0$  MHz

For this example there are actually four ways to program the NCO and achieve the desired output frequency as shown in [Table 8-1](#).

**Table 8-1. NCO value calculations example**

Alias or negative image	$f_{NCO}$	NCO Value	Mixer Phase	Frequency translation for $f_{OUT}$
$f_{IN} = -10$ MHz	$f_{NCO} = 10$ MHz	343597384	as is	$f_{OUT} = f_{IN} + f_{NCO} = -10 \text{ MHz} + 10 \text{ MHz} = 0 \text{ MHz}$
$f_{IN} = 10$ MHz	$f_{NCO} = -10$ MHz	373475417		$f_{OUT} = f_{IN} + f_{NCO} = 10 \text{ MHz} + (-10 \text{ MHz}) = 0 \text{ MHz}$
$f_{IN} = 10$ MHz	$f_{NCO} = 10$ MHz	343597384	inverted	$f_{OUT} = f_{IN} - f_{NCO} = 10 \text{ MHz} - 10 \text{ MHz} = 0 \text{ MHz}$
$f_{IN} = -10$ MHz	$f_{NCO} = -10$ MHz	373475417		$f_{OUT} = f_{IN} - f_{NCO} = -10 \text{ MHz} - (-10 \text{ MHz}) = 0 \text{ MHz}$

### 8.3.4.5 Decimation Filter

The ADC3644 supports complex decimation by 2, 4, 8, 16 and 32 with a pass-band bandwidth of ~ 80% and a stopband rejection of at least 85 dB. 表 8-2 gives an overview of the pass-band bandwidth of the different decimation settings with respect to ADC sampling rate  $F_S$ . In real decimation mode the output bandwidth is half of the complex bandwidth.

表 8-2. Decimation Filter Summary and Maximum Available Output Bandwidth

REAL/COMPLEX DECIMATION	DECIMATION SETTING N	OUTPUT RATE	OUTPUT BANDWIDTH	OUTPUT RATE ( $F_S = 125$ MSPS)	OUTPUT BANDWIDTH ( $F_S = 125$ MSPS)
Complex	2	$F_S / 2$ complex	$0.8 \times F_S / 2$	62.5 MSPS complex	50 MHz
	4	$F_S / 4$ complex	$0.8 \times F_S / 4$	31.25 MSPS complex	25 MHz
	8	$F_S / 8$ complex	$0.8 \times F_S / 8$	15.625 MSPS complex	12.5 MHz
	16	$F_S / 16$ complex	$0.8 \times F_S / 16$	7.8125 MSPS complex	6.25 MHz
	32	$F_S / 32$ complex	$0.8 \times F_S / 32$	3.90625 MSPS complex	3.125 MHz
Real	2	$F_S / 2$ real	$0.4 \times F_S / 2$	62.5 MSPS	25 MHz
	4	$F_S / 4$ real	$0.4 \times F_S / 4$	31.25 MSPS	12.5 MHz
	8	$F_S / 8$ real	$0.4 \times F_S / 8$	15.625 MSPS	6.25 MHz
	16	$F_S / 16$ real	$0.4 \times F_S / 16$	7.8125 MSPS	3.125 MHz
	32	$F_S / 32$ real	$0.4 \times F_S / 32$	3.90625 MSPS	1.5625 MHz

The decimation filter responses are normalized to the ADC sampling clock frequency  $F_S$  and illustrated in 图 8-20 to 图 8-29. They are interpreted as follows:

Each figure contains the filter pass-band, transition band(s) and alias or stop-band(s) as shown in 图 8-19. The x-axis shows the offset frequency (after the NCO frequency shift) normalized to the ADC sampling rate  $F_S$ .

For example, in the divide-by-4 complex setup, the output data rate is  $F_S / 4$  complex with a Nyquist zone of  $F_S / 8$  or  $0.125 \times F_S$ . The transition band (colored in blue) is centered around  $0.125 \times F_S$  and the alias transition band is centered at  $0.375 \times F_S$ . The stop-bands (colored in red), which alias on top of the pass-band, are centered at  $0.25 \times F_S$  and  $0.5 \times F_S$ . The stop-band attenuation is greater than 85 dB.

### 8.3.4.6 SYNC

The PDN/SYNC pin can be used to synchronize multiple devices using an external SYNC signal. The PDN/SYNC pin can be configured via SPI (SYNC EN bit) from power down to synchronization functionality and is latched in by the rising edge of the sampling clock as shown in 8-30.

8-30. External SYNC timing diagram

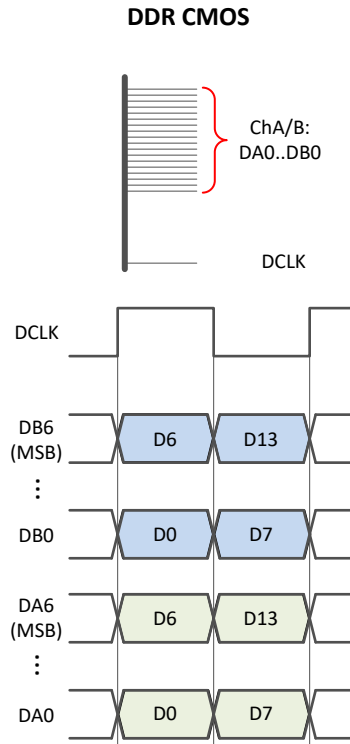

The synchronization signal is only required when using the decimation filter - either using the SPI SYNC register or the PDN/SYNC pin. It resets internal clock dividers used in the decimation filter and aligns the internal clocks as well as I and Q data within the same sample. If no SYNC signal is given, the internal clock dividers is not be synchronized, which can lead to a fractional delay across different devices. The SYNC signal also resets the NCO phase and loads the new NCO frequency (same as the MIXER RESTART bit).

When trying to resynchronize during operation, the SYNC toggle should occur at  $64 \cdot K$  clock cycles, where K is an integer. This ensures phase continuity of the clock divider.

### 8.3.4.7 Output Formatting with Decimation

#### 8.3.4.7.1 Parallel CMOS

In parallel CMOS mode, the ADC3644 device only supports real output with DDR CMOS interface as shown [Figure 8-31](#) (real decimation). In parallel CMOS output mode the maximum output resolution can only be 14-bit due to pin limitation.

**Figure 8-31. Output Data Format in Real Decimation**

[Table 8-3](#) illustrates the output interface data rate along with the corresponding DCLK frequency based on real decimation setting (M).

Furthermore the table shows an actual lane rate example with complex decimation by 4.

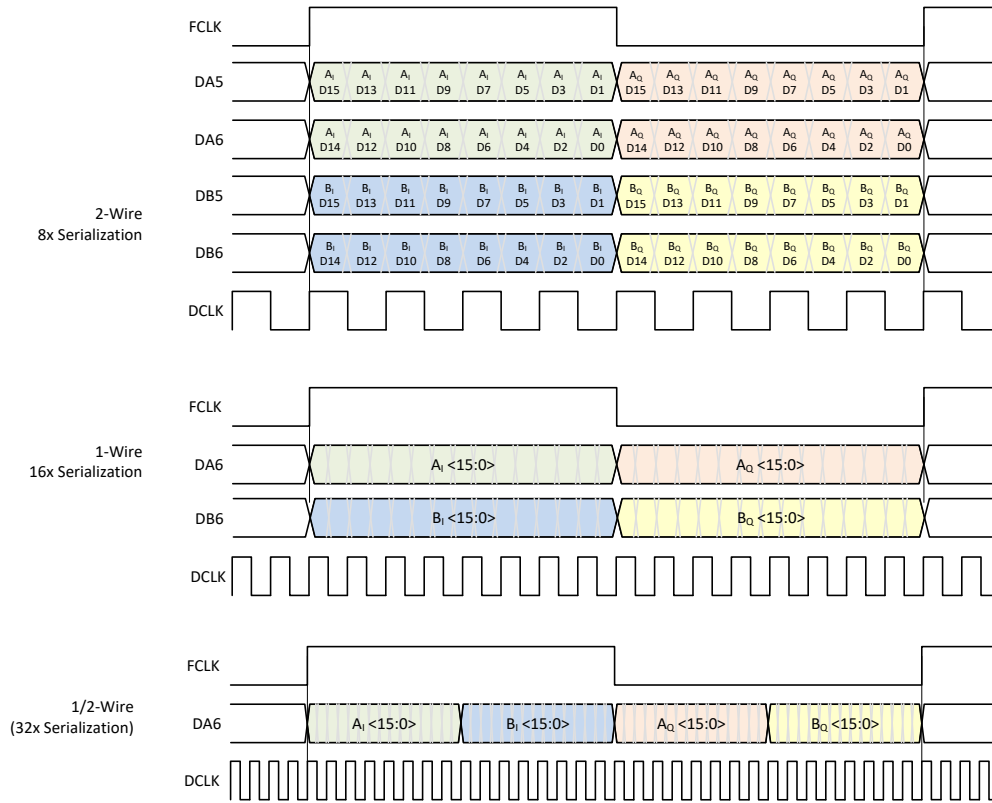

**Table 8-3. Parallel CMOS Data Rate Examples with Decimation**

REAL/COMPLEX DECIMATION	DECIMATION SETTING	ADC SAMPLING RATE	DCLK	DOUT
Real	M	$F_S$	$F_S / M$	$F_S \times 2 / M$
	4	125 MSPS	32.5 MHz	65 MHz

### 8.3.4.7.2 Serialized CMOS Interface

In serialized CMOS mode, the ADC3644 device supports complex decimation output [8-32](#) and real decimation output [8-33](#). The examples are shown for 16-bit output for 2-wire (8x serialization) and 1-wire (16x serialization).

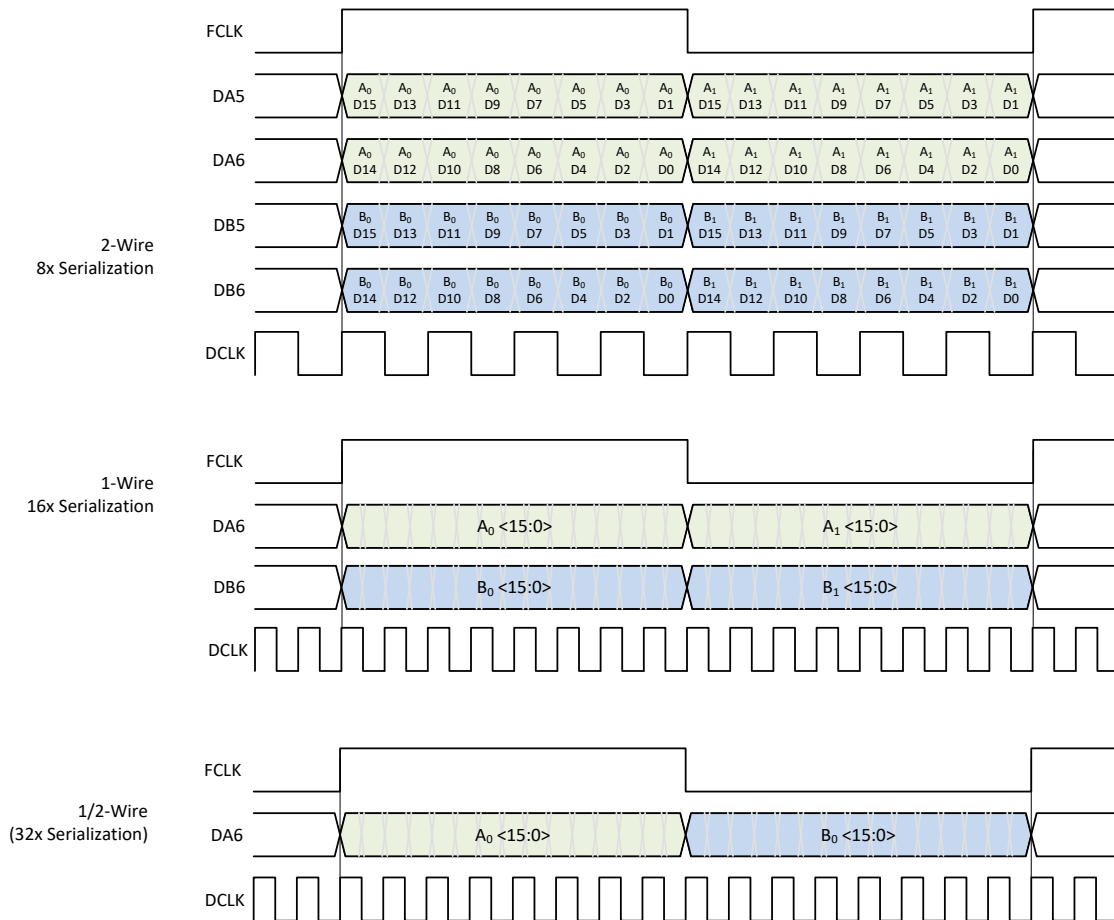

**8-32. Output Data Format in Complex Decimation**

表 8-4 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of serial CMOS lanes (L) and complex decimation setting (N).

Furthermore the table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 16-bit output resolution and complex decimation by 32.

**表 8-4. Serial CMOS Lane Rate Examples with Complex Decimation and 16-bit Output Resolution**

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DOUT
N	F <sub>S</sub>	R	L	F <sub>S</sub> / N	[DOUT] / 2	F <sub>S</sub> x 2 x R / L / N
32	125 MSPS	16	2	4.0625 MHz	31.25 MHz	62.5 MHz
			1		62.5 MHz	125 MHz
			1/2		125 MHz	250 MHz

**图 8-33. Output Data Format in Real Decimation**

表 8-5 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of serial CMOS lanes (L) and real decimation setting (M).

Furthermore the table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 16-bit output resolution and real decimation by 16.

**表 8-5. Serial CMOS Lane Rate Examples with Real Decimation and 16-bit Output Resolution**

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DOUT
M	$F_S$	R	L	$F_S / M / 2$ (L = 2) $F_S / M$ (L = 1, 1/2)	[DOUT] / 2	$F_S \times R / L / M$
16	125 MSPS	16	2	3.90625 MHz	31.25 MHz	62.5 MHz
			1	7.8125 MHz	62.5 MHz	125 MHz
			1/2		125 MHz	250 MHz

### 8.3.5 Digital Interface

The ADC3644 family supports two different CMOS output modes - parallel DDR output and serialized CMOS output formats.

#### 8.3.5.1 Parallel CMOS Output

The low power CMOS interface supports double data rate (DDR) output options. In DDR output mode the output clock is generated inside the ADC3644. The different interface options are configured using SPI register writes.

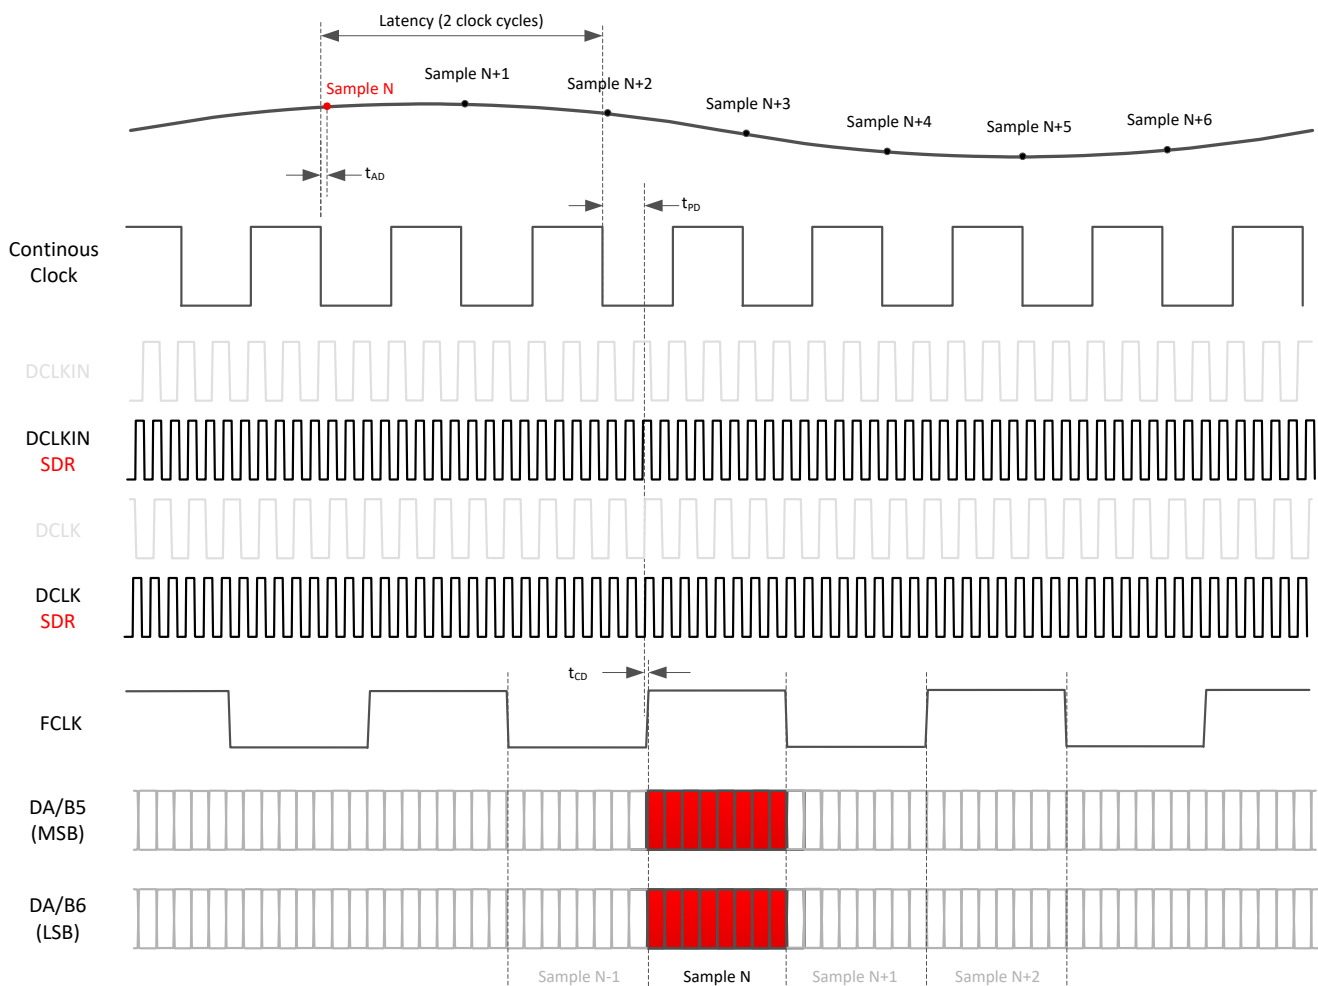

#### 8.3.5.2 Serialized CMOS output

In this mode the output data is serialized and transmitted over 2, 1 or 1/2-wires. Due to CMOS output speed limitation this mode is only available for reduced output data rates. This mode is similar to the multi-SPI interface.

##### 8.3.5.2.1 SDR Output Clocking

The ADC3644 provides a SDR output clocking option for all serial CMOS output modes (including decimation) which is enabled using the SPI interface. In serial CMOS mode by default the data is output on rising and falling edge of DCLK. In SDR clocking mode, DCLKIN has to be twice as fast as the default DCLKIN so that the output data are clocked out only on DCLK rising edge.

Internally DCLKIN is divided by 2 for data processing and this operation can add 1 extra clock cycle latency to the ADC latency.

**8-34. SDR Output Clocking**

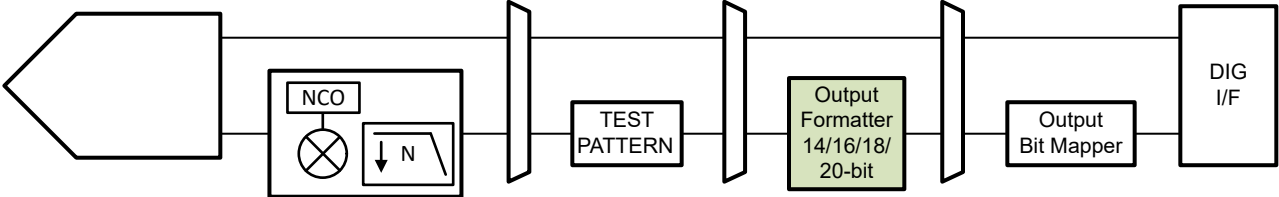

### 8.3.5.3 Output Data Format

The output data can be configured to two's complement (default) or offset binary formatting using SPI register writes (register 0x8F and 0x92). 表 8-6 provides an overview for minimum and maximum output codes for the two formatting options. The actual output resolution is set by the output bit mapper.

**表 8-6. Overview of minimum and maximum output codes vs resolution for different formatting**

RESOLUTION (BIT)	Two's Complement (default)				Offset Binary			
	14	16	18	20	14	16	18	20
$V_{IN,MAX}$	0x1FFF	0x7FFF	0x1FFFF	0x7FFFF	0x3FFF	0xFFFF	0x3FFFF	0xFFFFF
0	0x0000		0x00000		0x2000	0x8000	0x20000	0x80000
$V_{IN,MIN}$	0x2000	0x8000	0x20000	0x80000	0x0000		0x00000	

### 8.3.5.4 Output Formatter

The digital output interface uses a flexible output formatter  8-35. The output formatter takes the 14-bit output directly from the ADC or from digital filter block and reformats it to a resolution of 14, 16, 18 or 20-bit. With parallel output format the maximum output resolution supported is 14-bit. With serial CMOS output the output serialization factor gets adjusted accordingly for 2-, 1- and 1/2-wire interface mode. The maximum output data rate can not be exceeded independently of output resolution and serialization factor.

**图 8-35. Interface output bit formatter**

表 8-7 provides an overview for the resulting serialization factor depending on output resolution and output modes. Note that the DCLKIN frequency needs to be adjusted accordingly as well. Changing the output resolution to 16-bit, 2-wire mode for example would result in  $DCLKIN = F_S * 4$  instead of  $* 3.5$ .

The output bit formatter can be used for DDC bypass and decimation filter.

**表 8-7. Serialization factor vs output resolution for different output modes**

OUTPUT RESOLUTION	Interface	SERIALIZATION	FCLK	DCLKIN	DCLK	D0/D1
14-bit (default)	2-Wire	7x	$F_S/2$	$F_S * 3.5$	$F_S * 3.5$	$F_S * 7$
	1-Wire	14x	$F_S$	$F_S * 7$	$F_S * 7$	$F_S * 14$
	1/2-Wire	28x	$F_S$	$F_S * 14$	$F_S * 14$	$F_S * 28$
16-bit	2-Wire	8x	$F_S/2$	$F_S * 4$	$F_S * 4$	$F_S * 8$
	1-Wire	16x	$F_S$	$F_S * 8$	$F_S * 8$	$F_S * 16$
	1/2-Wire	32x	$F_S$	$F_S * 16$	$F_S * 16$	$F_S * 32$
18-bit	2-Wire	9x	$F_S/2$	$F_S * 4.5$	$F_S * 4.5$	$F_S * 9$
	1-Wire	18x	$F_S$	$F_S * 9$	$F_S * 9$	$F_S * 18$
	1/2-Wire	36x	$F_S$	$F_S * 18$	$F_S * 18$	$F_S * 36$
20-bit	2-Wire	10x	$F_S/2$	$F_S * 5$	$F_S * 5$	$F_S * 10$
	1-Wire	20x	$F_S$	$F_S * 10$	$F_S * 10$	$F_S * 20$
	1/2-Wire	40x	$F_S$	$F_S * 20$	$F_S * 20$	$F_S * 40$

The programming sequence to change the output interface and/or resolution from default settings is shown in [Output Interface or Mode Configuration](#).

### 8.3.5.5 Output Bit Mapper

The output bit mapper allows to change the output bit order for any selected interface mode.

图 8-36. Output Bit Mapper

It is a two step process to change the output bit mapping and assemble the output data bus:

1. Both channel A and B can have up to 20-bit output. Each output bit of either channel has a unique identifier bit as shown in the 表 8-8. The MSB starts with bit D19 – depending on output resolution chosen the LSB would be D6 (14-bit) to D0 (20-bit). The 'previous sample' is only needed in 2-w mode.
2. The bit mapper is then used to assemble the output sample. The following sections detail how to remap both a parallel and a serial output format.

表 8-8. Unique identifier of each data bit

Bit	Channel A		Channel B	
	Previous sample (2-w only)	Current sample	Previous sample (2-w only)	Current sample
D19 (MSB)	0x2D	0x6D	0x29	0x69
D18	0x2C	0x6C	0x28	0x68
D17	0x27	0x67	0x23	0x63
D16	0x26	0x66	0x22	0x62
D15	0x25	0x65	0x21	0x61
D14	0x24	0x64	0x20	0x60
D13	0x1F	0x5F	0x1B	0x5B
D12	0x1E	0x5E	0x1A	0x5A
D11	0x1D	0x5D	0x19	0x59
D10	0x1C	0x5C	0x18	0x58
D9	0x17	0x57	0x13	0x53
D8	0x16	0x56	0x12	0x52
D7	0x15	0x55	0x11	0x51
D6	0x14	0x54	0x10	0x50
D5	0x0F	0x4F	0x0B	0x4B
D4	0x0E	0x4E	0x0A	0x4A
D3	0x0D	0x4D	0x09	0x49
D2	0x0C	0x4C	0x08	0x48
D1	0x07	0x47	0x03	0x43
D0 (LSB)	0x06	0x46	0x02	0x42

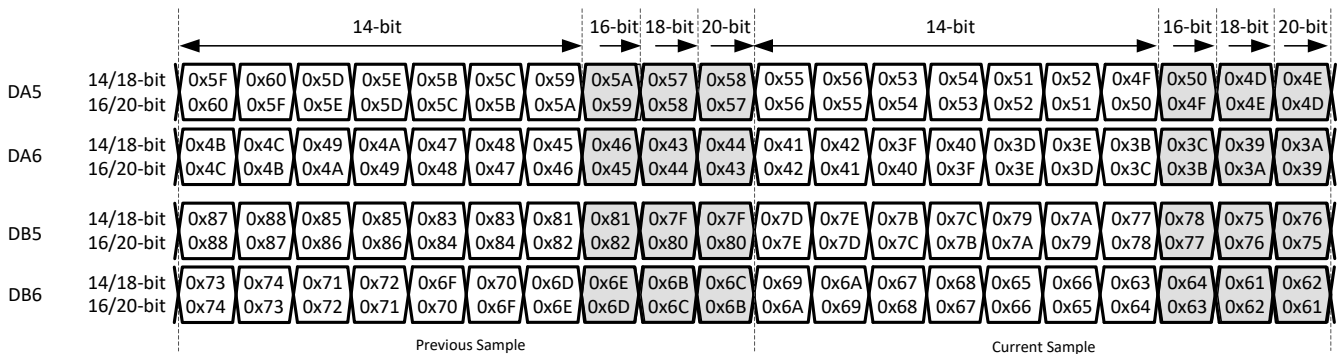

In **parallel DDR mode**, a data bit (with unique identifier) needs to be assigned to each output pin for both the rising and the falling edge of the DCLK using the register addresses as shown in [Figure 8-37](#). The example on the right shows the output data bus remapped to where all 14 bit of channel A is output on DCLK rising edge followed by all 14 bit of channel B on DCLK falling edge.

**Figure 8-37. DDR output timing diagram with output mapping (left) and example (right)**

In the serial output mode, a data bit (with unique identifier) needs to be assigned to each location within the serial output stream. There are a total of 40 addresses available per channel. Channel A spans from address 0x39 to 0x60 and channel B from address 0x61 to 0x88. When using complex decimation, the output bit mapper is applied to both the “I” and the “Q” sample.

**2-wire mode:** in this mode both the current and the previous sample have to be used in the address space as shown in [Figure 8-38](#) below. The address order is different for 14/18-bit and 16/20-bit. Note: there are unused addresses between samples for resolution less than 20-bit (grey back ground), which can be skipped if not used.

**Figure 8-38. 2-wire output bit mapper**

In the following example (Figure 8-39), the 16-bit 2-wire serial output is reordered to where lane DA5/DB5 carries the 8 MSB and lane DA6/DB6 carries 8 LSBs.

	Previous Sample								Current Sample							
DA5	D19 <sub>A</sub> (0x60 0x2D)	D18 <sub>A</sub> (0x5F 0x2C)	D17 <sub>A</sub> (0x5E 0x27)	D16 <sub>A</sub> (0x5D 0x26)	D15 <sub>A</sub> (0x5C 0x25)	D14 <sub>A</sub> (0x5B 0x24)	D13 <sub>A</sub> (0x5A 0x1F)	D12 <sub>A</sub> (0x59 0x1E)	D19 <sub>A</sub> (0x56 0x6D)	D18 <sub>A</sub> (0x55 0x6C)	D17 <sub>A</sub> (0x54 0x67)	D16 <sub>A</sub> (0x53 0x66)	D15 <sub>A</sub> (0x52 0x65)	D14 <sub>A</sub> (0x51 0x64)	D13 <sub>A</sub> (0x50 0x5F)	D12 <sub>A</sub> (0x4F 0x5E)
DA6	D11 <sub>A</sub> (0x4C 0x1D)	D10 <sub>A</sub> (0x4B 0x1C)	D9 <sub>A</sub> (0x4A 0x17)	D8 <sub>A</sub> (0x49 0x16)	D7 <sub>A</sub> (0x48 0x15)	D6 <sub>A</sub> (0x47 0x14)	D5 <sub>A</sub> (0x46 0x0F)	D4 <sub>A</sub> (0x45 0x0E)	D11 <sub>A</sub> (0x42 0x5D)	D10 <sub>A</sub> (0x41 0x5C)	D9 <sub>A</sub> (0x40 0x57)	D8 <sub>A</sub> (0x39 0x56)	D7 <sub>A</sub> (0x38 0x55)	D6 <sub>A</sub> (0x37 0x54)	D5 <sub>A</sub> (0x36 0x4F)	D4 <sub>A</sub> (0x35 0x4E)
DB5	D19 <sub>B</sub> (0x88 0x29)	D18 <sub>B</sub> (0x87 0x28)	D17 <sub>B</sub> (0x86 0x23)	D16 <sub>B</sub> (0x85 0x22)	D15 <sub>B</sub> (0x84 0x21)	D14 <sub>B</sub> (0x83 0x20)	D13 <sub>B</sub> (0x82 0x1B)	D12 <sub>B</sub> (0x81 0x1A)	D19 <sub>B</sub> (0x7E 0x69)	D18 <sub>B</sub> (0x7D 0x68)	D17 <sub>B</sub> (0x7C 0x63)	D16 <sub>B</sub> (0x7B 0x62)	D15 <sub>B</sub> (0x7A 0x61)	D14 <sub>B</sub> (0x79 0x60)	D13 <sub>B</sub> (0x78 0x5B)	D12 <sub>B</sub> (0x77 0x5A)
DB6	D11 <sub>B</sub> (0x74 0x19)	D10 <sub>B</sub> (0x73 0x18)	D9 <sub>B</sub> (0x72 0x13)	D8 <sub>B</sub> (0x71 0x12)	D7 <sub>B</sub> (0x70 0x11)	D6 <sub>B</sub> (0x6F 0x10)	D5 <sub>B</sub> (0x6E 0x0B)	D4 <sub>B</sub> (0x6D 0x0A)	D11 <sub>B</sub> (0x6A 0x59)	D10 <sub>B</sub> (0x69 0x58)	D9 <sub>B</sub> (0x68 0x53)	D8 <sub>B</sub> (0x67 0x52)	D7 <sub>B</sub> (0x66 0x51)	D6 <sub>B</sub> (0x65 0x50)	D5 <sub>B</sub> (0x64 0x4B)	D4 <sub>B</sub> (0x63 0x4A)

Figure 8-39. Example: 2-wire output mapping

**1-wire mode:** Only the ‘current’ sample needs to be programmed in the address space. If desired, it can be duplicated on DA5/DB5 as well (using addresses shown below) in order to have a redundant output. Lane DA5/DB5 needs to be powered up in that case.

Figure 8-40. 1-wire output bit mapping

**1/2-wire mode:** The output is only on lane DA6 and the sample order is programmed into the 40 addresses of chA (from 0x39 to 0x60). It covers 2 samples (one for chA, one for chB) as shown below.

Figure 8-41. 1/2-wire output bit mapping

### 8.3.5.6 Output Interface or Mode Configuration

The following sequence summarizes all the relevant registers for changing the output interface and/or enabling the decimation filter. Steps 1 and 2 must come first since the E-Fuse load reset the SPI writes, the remaining steps can come in any order.

**表 8-9. Configuration steps for changing interface or decimation**

STEP	FEATURE	ADDRESS	DESCRIPTION				
1	Output Interface	0x07	Select the output interface format depending on resolution and output interface.				
			Output Resolution	DDR	2-wire	1-wire	1/2-wire
			14-bit	0xA9	0x2B	0x6C	0x8D
			16-bit		0x4B		
			18-bit	N/A	0x2B		
20-bit	N/A	0x4B					
2		0x13	Load the output interface bit mapping using the E-fuse loader (0x13, D0). Program register 0x13 to 0x01, wait ~ 1ms so that bit mapping is loaded properly followed by 0x13 0x00				
3		0x0A/B/C	Power down relevant CMOS output buffers to avoid contention.				
4		0x18	For serial CMOS modes, DCLKIN EN (D4) needs to be enabled.				
5	Output Interface	0x19	When using serial CMOS, configure the FCLK frequency based on bypass/decimation and number of lanes used.				
			Bypass/Dec	SCMOS	FCLK SRC (D7)	FCLK DIV (D4)	TOG FCLK (D0)
			Bypass/ Real Decimation	2-wire	0	1	0
				1-wire	0	0	0
				1/2-wire	0	0	0
			Complex Decimation	2-wire	1	0	0
1-wire	1	0		0			
1/2-wire	0	0		1			
6		0x1B	Select the output interface resolution using the bit mapper (D5-D3).				
7		0x1F	For serial CMOS modes, DCLKIN EN (D6) and DCLK OB EN (D4) need to be enabled.				
8	Output Interface	0x20 0x21 0x22	When using serial CMOS, select the FCLK pattern for decimation for proper duty cycle output of the frame clock.				
			Decimation	Output Resolution	2-wire	1-wire	1/2-wire
			Real Decimation	14-bit	use default	0xFE000	use default
				16-bit		0xFF000	
				18-bit		0xFF800	
				20-bit		0xFFC00	
			Complex Decimation	14-bit	use default	0xFFFFF	0xFFFFF
				16-bit			
18-bit							
20-bit							
9		0x39..0x60 0x61..0x88	Change output bit mapping for chA and chB if desired. This works also with the default interface selection.				
10		0x24	Enable the decimation filter				
11		0x25	Configure the decimation filter				
12		0x2A/B/C/D 0x31/2/3/4	Program the NCO frequency for complex decimation (can be skipped for real decimation)				
13	Decimation Filter	0x27 0x2E	Configure the complex output data stream (set both bits to 0 for real decimation)				
			Serial CMOS	OP-Order (D4)	Q-Delay (D3)		
			2-wire	1	0		
			1-wire	0	1		
			1/2-wire	1	1		
14		0x26	Set the mixer gain and toggle the mixer reset bit to update the NCO frequency.				

### 8.3.5.6.1 Configuration Example

The following is a step by step programming example to configure the ADC3644 to complex decimation by 8 with 1-wire serial CMOS and 16-bit output.

1. 0x07 (address) 0x6C (load bit mapper configuration for 16-bit output with 1-wire serial CMOS)
2. 0x13 0x01, wait 1 ms, 0x13 0x00 (load e-fuse)
3. 0x0A 0xFF, 0x0B 0xEE, 0x0C 0xFD (Power down unused CMOS output buffers to avoid contention)
4. 0x18 0x10 (DCLKIN EN for serial CMOS mode)
5. 0x19 0x82 (configure FCLK)
6. 0x1B 0x0A (select 16-bit output resolution)
7. 0x1F 0x50 (DCLKIN EN for serial CMOS mode)
8. 0x20 0xFF, 0x21 0xFF, 0x22 0x0F (configure FCLK pattern)
9. 0x24 0x06 (enable decimation filter)
10. 0x25 0x30 (configure complex decimation by 8)
11. 0x2A/B/C/D and 0x31/32/33/34 (program NCO frequency)
12. 0x27/0x2E 0x08 (configure Q-delay register bit)
13. 0x26 0xAA, 0x26 0x88 (set digital mixer gain to 6-dB and toggle the mixer update)

### 8.3.6 Test Pattern

In order to enable in-circuit testing of the digital interface, the following test patterns are supported and enabled via SPI register writes (0x14/0x15/0x16). The test pattern generator is located after the decimation filter as shown in [Figure 8-42](#). In decimation mode (real and complex), the test patterns replace the output data of the DDC; however, channel A controls the test patterns for both channels.

**Figure 8-42. Test Pattern Generator**

- RAMP Pattern: The step size needs to be configured in the CUSTOM PAT register according to the native resolution of the ADC. When selecting a higher output resolution, then the additional LSBs is still 0 in RAMP pattern mode.
  - 00001: 18-bit output resolution
  - 00100: 16-bit output resolution
  - 10000: 14-bit output resolution
- Custom Pattern: Configured in the CUSTOM PAT register

## 8.4 Device Functional Modes

### 8.4.1 Normal operation

In normal operating mode, the entire ADC full scale range gets converted to a digital output with 14-bit resolution. The output is available in as little as 1 clock cycle on the digital CMOS outputs.

### 8.4.2 Power Down Options

A global power down mode can be enabled via SPI as well as using the power down pin (PDN/SYNC). There is an internal pull-down 21 kΩ resistor on the PDN/SYNC input pin and the pin is active high - so the pin needs to be pulled high externally to enter global power down mode.

The SPI register map provides the capability to enable/disable individual blocks directly or via PDN pin mask in order to trade off power consumption vs wake up time as shown in 表 8-10.

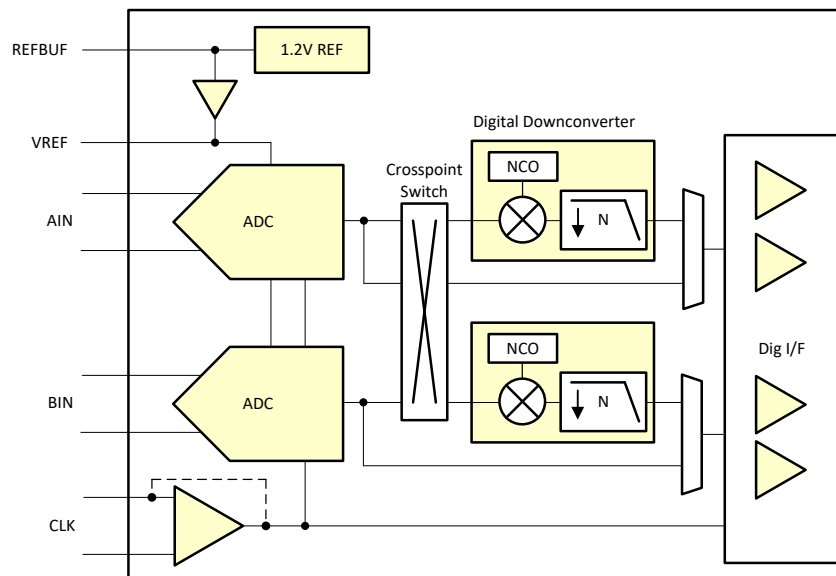

图 8-43. Power Down Configurations

表 8-10. Overview of Power Down Options

Function/ Register	PDN via SPI	Mask for Global PDN	Feature - Default	Power Impact	Wake-up time	Comment
ADC	Yes	-	Enabled			Both ADC channels are included in Global PDN automatically
Reference gain amplifier	Yes	Yes	Enabled	~ 0.4 mA	~3 us	Should only be powered down in power down state.
Internal 1.2 V reference	Yes		External ref	~ 1-3.5 mA	~3 ms	Internal/external reference selection is available through SPI and REFBUF pin.
Clock buffer	Yes		Differential clock	~ 1 mA	n/a	Single ended clock input saves ~ 1mA compared to differential. Some programmability is available through the REFBUF pin.
Output interface drivers	Yes	-	Enabled	varies	n/a	Depending on output interface mode, unused output drivers can be powered down for maximum power savings
Decimation filter	Yes	-	Disabled	see electrical table	n/a	

## 8.5 Programming

The device is primarily configured and controlled using the serial programming interface (SPI). However, it can operate in a default configuration without requiring the SPI interface. Furthermore, the power down function as well as internal and external reference configuration is possible via pin control (PDN/SYNC and REFBUF pin).

### Note

The power down command (via PIN or SPI) only goes in effect with the ADC sampling clock present.

After initial power up, the default operating configuration for each device is shown in 表 8-11.

表 8-11. Default device configuration after power up

FEATURE	DEFAULT
Signal Input	Differential
Clock Input	Differential
Reference	External
Decimation	DDC bypass
Interface	DDR CMOS
Output Format	2s compliment

### 8.5.1 Configuration using PINs only

The ADC voltage reference can be selected using the REFBUF pin. Even though there is an internal 100 kΩ pull-up resistor to AVDD, the REFBUF pin should be set to a voltage externally and not left floating.

When using a voltage divider to set the REFBUF voltage (R1 and R2 in 图 8-44), resistor values < 5 kΩ should be used.

图 8-44. Configuration of external voltage on REFBUF pin

表 8-12. REFBUF voltage levels control voltage reference selection

REFBUF VOLTAGE	VOLTAGE REFERENCE OPTION	CLOCKING OPTION
> 1.7 V (Default)	External reference	Differential clock input
1.2 V (1.15-1.25V)	External 1.2V input on REFBUF pin using internal gain buffer	Differential clock input
0.5 - 0.7V	Internal reference	Differential clock input
< 0.1V	Internal reference	Single ended clock input

### 8.5.2 Configuration using the SPI interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock) and SDIO (serial interface data input/output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data input are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 12 MHz down to very low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

### 8.5.2.1 Register Write

The internal registers can be programmed following these steps:

1. Drive the SEN pin low
2. Set the R/W bit to 0 (bit A15 of the 16-bit address) and bits A[14:12] in address field to 0.
3. Initiate a serial interface cycle by specifying the address of the register (A[11:0]) whose content is written and
4. Write the 8-bit data that are latched in on the SCLK rising edges

Figure 8-45 shows the timing requirements for the serial register write operation.

**Figure 8-45. Serial Register Write Timing Diagram**

### 8.5.2.2 Register Read

The device includes a mode where the contents of the internal registers can be read back using the SDIO pin. This readback mode can be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

1. Drive the SEN pin low
2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers. Set A[14:12] in address field to 0.
3. Initiate a serial interface cycle specifying the address of the register (A[11:0]) whose content must be read
4. The device launches the contents (D[7:0]) of the selected register on the SDIO pin on SCLK falling edge
5. The external controller can capture the contents on the SCLK rising edge

**Figure 8-46. Serial Register Read Timing Diagram**

## 8.6 Register Maps

**表 8-13. Register Map Summary**

REGISTER ADDRESS	REGISTER DATA							
	D7	D6	D5	D4	D3	D2	D1	D0

### 8.6.1 Detailed Register Description

**图 8-47. Register 0x00**

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	RESET
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

**表 8-14. Register 0x00 Field Descriptions**

Bit	Field	Type	Reset	Description
7-1	0	R/W	0	Must write 0
0	RESET	R/W	0	This bit resets all internal registers to the default values and self clears to 0.

**图 8-48. Register 0x07**

7	6	5	4	3	2	1	0
OP IF MAPPER			0	OP IF EN	OP IF SEL		
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

**表 8-15. Register 0x07 Field Descriptions**

Bit	Field	Type	Reset	Description
7-5	OP IF MAPPER	R/W	000	Output interface mapper. This register contains the proper output interface bit mapping for the different interfaces. The interface bit mapping is internally loaded from e-fuses and also requires a fuse load command to go into effect (0x13, D0). Register 0x07 along with the E-Fuse Load (0x13, D0) needs to be loaded first in the programming sequence since the E-Fuse load resets the SPI writes. After initial reset the default output interface variant is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. 001: 2-wire, 18 and 14-bit 010: 2-wire, 16-bit 011: 1-wire 100: 0.5-wire 101: DDR others: not used
4	0	R/W	0	Must write 0
3	OP IF EN	R/W	0	Enables changing the default output interface mode (D2-D0).
2-0	OP IF SEL	R/W	000	Selection of the output interface mode. OP IF EN (D3) needs to be enabled also. After initial reset the default output interface is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. 001: DDR CMOS 011: 2-wire 100: 1-wire 101: 0.5-wire others: not used

**图 8-49. Register 0x08**

0	0	PDN CLKBUF	PDN REFAMP	0	PDN A	PDN B	PDN GLOBAL
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

**表 8-16. Register 0x08 Field Descriptions**

Bit	Field	Type	Reset	Description
7-6	0	R/W	0	Must write 0
5	PDN CLKBUF	R/W	0	Powers down sampling clock buffer 0: Clock buffer enabled 1: Clock buffer powered down
4	PDN REFAMP	R/W	0	Powers down internal reference gain amplifier 0: REFAMP enabled 1: REFAMP powered down
3	0	R/W	0	Must write 0
2	PDN A	R/W	0	Powers down ADC channel A 0: ADC channel A enabled 1: ADC channel A powered down
1	PDN B	R/W	0	Powers down ADC channel B 0: ADC channel B enabled 1: ADC channel B powered down
0	PDN GLOBAL	R/W	0	Global power down via SPI 0: Global power disabled 1: Global power down enabled. Power down mask (register 0x0D) determines which internal blocks are powered down.

**图 8-50. Register 0x0A/B/C**

CMOS OB DIS [23:0]							
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

**表 8-17. Register 0x0A/B/C Field Descriptions**

Bit	Field	Type	Reset	Description
7:0	CMOS OB DIS [23:0]	R/W	0	<p>These register bits power down the individual CMOS output buffers. See 表 8-18 for the actual bit to pin mapping. Unused pins should be powered down (ie set to 1) for maximum power savings. Even though unused outputs don't toggle there is still a small amount of static power (&lt; 1mA) that can be saved by disabling the output buffers.</p> <p>There is a separate control to enable the DCLKIN buffer in register 0x1F (D6) and 0x18 (D4). DCLK output buffer is powered down using register 0x1F (D4).</p> <p>NOTE: When using serial CMOS interface the CMOS output buffer (D3/DB1) has to be powered down because it shares the pin with DCLKIN.</p> <p>0: Output buffer enabled 1: Output buffer powered down</p>

**表 8-18. Output buffer enable bit mapping vs output interface mode**

**表 8-19. Register 0x0D Field Descriptions**

Bit	Field	Type	Reset	Description
7-4	0	R/W	0	Must write 0
3	MASK CLKBUF	R/W	0	Global power down mask control for sampling clock input buffer. 0: Clock buffer will get powered down when global power down is exercised. 1: Clock buffer will NOT get powered down when global power down is exercised.
2	MASK REFAMP	R/W	0	Global power down mask control for reference amplifier. 0: Reference amplifier will get powered down when global power down is exercised. 1: Reference amplifier will NOT get powered down when global power down is exercised.
1	MASK BG DIS	R/W	0	Global power down mask control for internal 1.2V bandgap voltage reference. Setting this bit reduces power consumption in global power down mode but increases the wake up time. See the power down option overview. 0: Internal 1.2V bandgap voltage reference will NOT get powered down when global power down is exercised. 1: Internal 1.2V bandgap voltage reference will get powered down when global power down is exercised.
0	0	R/W	0	Must write 0

**图 8-52. Register 0x0E**

7	6	5	4	3	2	1	0
SYNC PIN EN	SPI SYNC	SPI SYNC EN	0	REF CTL	REF SEL		SE CLK EN
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

**表 8-20. Register 0x0E Field Descriptions**

Bit	Field	Type	Reset	Description
7	SYNC PIN EN	R/W	0	This bit controls the functionality of the SYNC/PDN pin. 0: SYNC/PDN pin exercises global power down mode when pin is pulled high. 1: SYNC/PDN pin issues the SYNC command when pin is pulled high.
6	SPI SYNC	R/W	0	Toggling this bit issues the SYNC command using the SPI register write. SYNC using SPI must be enabled as well (D5). This bit doesn't self reset to 0. 0: Normal operation 1: SYNC command issued.
5	SPI SYNC EN	R/W	0	This bit enables synchronization using SPI instead of the SYNC/PDN pin. 0: Synchronization using SPI register bit disabled. 1: Synchronization using SPI register bit enabled.
4	0	R/W	0	Must write 0
3	REF CTL	R/W	0	This bit determines if the REFBUF pin controls the voltage reference selection or the SPI register (D2-D1). 0: The REFBUF pin selects the voltage reference option. 1: Voltage reference is selected using SPI (D2-D1) and single ended clock using D0.
2-1	REF SEL	R/W	00	Selects of the voltage reference option. REF CTRL (D3) must be set to 1. 00: Internal reference 01: External voltage reference (1.2V) using internal reference buffer (REFBUF) 10: External voltage reference 11: not used
0	SE CLK EN	R/W	0	Selects single ended clock input and powers down the differential sampling clock input buffer. REF CTRL (D3) must be set to 1. 0: Differential clock input 1: Single ended clock input

**图 8-53. Register 0x11**

7	6	5	4	3	2	1	0
0	0	SE A	SE B	0	0	0	0
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

**表 8-21. Register 0x11 Field Descriptions**

Bit	Field	Type	Reset	Description
7-6	0	R/W	0	Must write 0
5	SE A	R/W	0	This bit enables single ended analog input, channel A 0: Differential input 1: Single ended input
4	SE B	R/W	0	This bit enables single ended analog input, channel B 0: Differential input 1: Single ended input
3-0	0	R/W	0	Must write 0

☒ 8-54. Register 0x13

7	6	5	4	3	2	1	0
0	0	0	0	0	0		E-FUSE LD
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

表 8-22. Register 0x13 Field Descriptions

Bit	Field	Type	Reset	Description
7-1	0	R/W	0	Must write 0
0	E-FUSE LD	R/W	0	This register bit loads the internal bit mapping for different interfaces. After setting the interface in register 0x07, this E-FUSE LD bit needs to be set to 1 and reset to 0 for loading to go into effect. Register 0x07 along with the E-Fuse Load (0x13, D0) needs to be loaded first in the programming sequence since the E-Fuse load resets the SPI writes. 0: E-FUSE LOAD set 1: E-FUSE LOAD reset

☒ 8-55. Register 0x14/15/16

7	6	5	4	3	2	1	0
CUSTOM PAT [7:0]							
CUSTOM PAT [15:8]							
TEST PAT B			TEST PAT A			CUSTOM PAT [17:16]	
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

表 8-23. Register 0x14/15/16 Field Descriptions

Bit	Field	Type	Reset	Description
7-0	CUSTOM PAT [17:0]	R/W	00000000	This register is used for two purposes: <ul style="list-style-type: none"> <li>It sets the constant custom pattern starting from MSB</li> <li>It sets the RAMP pattern increment step size.</li> </ul> 00001: Ramp pattern for 18-bit ADC 00100: Ramp pattern for 16-bit ADC 10000: Ramp pattern for 14-bit ADC
7-5	TEST PAT B	R/W	000	Enables test pattern output mode for channel B (NOTE: The test pattern is set prior to the bit mapper and is based on native resolution of the ADC starting from the MSB). These work in either output format. 000: Normal output mode (test pattern output disabled) 010: Ramp pattern: need to set proper increment using CUSTOM PAT register 011: Constant Pattern using CUSTOM PAT [17:0] in register 0x14/15/16. others: not used
4-2	TEST PAT A	R/W	000	Enables test pattern output mode for channel A (NOTE: The test pattern is set prior to the bit mapper and is based on native resolution of the ADC starting from the MSB). These work in either output format. 000: Normal output mode (test pattern output disabled) 010: Ramp pattern: need to set proper increment using CUSTOM PAT register 011: Constant Pattern using CUSTOM PAT [17:0] in register 0x14/15/16. others: not used

图 8-56. Register 0x18

7	6	5	4	3	2	1	0
0	0	0	DCLKIN EN	0	0	0	0
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

表 8-24. Register 0x18 Field Descriptions

Bit	Field	Type	Reset	Description
7-5	0	R/W	0	Must write 0
4	DCLKIN EN	R/W	0	This bit enables the DCLKIN clock input buffer for serial CMOS modes. Also DCLKIN EN (0x1F, D6) needs to be set as well. 0: DCLKIN buffer powered down. 1: DCLKIN buffer enabled.
3-0	0	R/W	0	Must write 0

图 8-57. Register 0x19

7	6	5	4	3	2	1	0
FCLK SRC	0	0	FCLK DIV	0	0	FCLK EN	TOG FCLK
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

表 8-25. Register 0x19 Field Descriptions

Bit	Field	Type	Reset	Description
7	FCLK SRC	R/W	0	User has to select if FCLK signal comes from ADC or from DDC block. Here real decimation is treated same as bypass mode 0: FCLK generated from ADC. FCLK SRC set to 0 for DDC bypass, real decimation mode and 1/2-w complex decimation mode. 1: FCLK generated from DDC block. In complex decimation mode only this bit needs to be set for 2-w and 1-w output interface mode but NOT for 1/2-w mode.
6-5	0	R/W	0	Must write 0
4	FCLK DIV	R/W	0	This bit needs to be set to 1 for 2-w output mode in bypass mode only (non decimation). 0: All output interface modes except 2-w bypass mode.. 1: 2-w output interface mode.
3-2	0	R/W	0	Must write 0
1	FCLK EN	R/W	0	This bit enables FCLK output for CMOS output. 0: Data output pin is used for parallel output data. 1: Data output pin is used for FCLK output in serialized CMOS mode.
0	TOG FCLK	R/W	0	This bit adjusts the FCLK signal appropriately for 1/2-wire mode where FCLK is stretched to cover channel A and channel B. This bit ONLY needs to be set in 1/2-wire mode with complex decimation mode. 0: all other modes. 1: FCLK for 1/2-wire complex decimation mode.

表 8-26. Configuration of FCLK SRC and FCLK DIV Register Bits vs Serial Interface

BYPASS/DECIMATION	SERIAL INTERFACE	FCLK SRC	FCLK DIV	TOG FCLK
Decimation Bypass/ Real Decimation	2-wire	0	1	0
	1-wire	0	0	0
	1/2-wire	0	0	0
Complex Decimation	2-wire	1	0	0
	1-wire	1	0	0
	1/2-wire	0	0	1

表 8-27. Register 0x1B Field Descriptions

Bit	Field	Type	Reset	Description
7	MAPPER EN	R/W	0	This bit enables changing the resolution of the output (including output serialization factor) in bypass mode only. This bit is not needed for 20-bit resolution output. 0: Output bit mapper disabled. 1: Output bit mapper enabled.
6	20B EN	R/W	0	This bit enables 20-bit output resolution which can be useful for very high decimation settings so that quantization noise doesn't impact the ADC performance. 0: 20-bit output resolution disabled. 1: 20-bit output resolution enabled.
5-3	BIT MAPPER RES	R/W	000	Sets the output resolution using the bit mapper. MAPPER EN bit (D6) needs to be enabled when operating in bypass mode.. 000: 18 bit 001: 16 bit 010: 14 bit all others, n/a
2-0	0	R/W	0	Must write 0

表 8-28. Register Settings for Output Bit Mapper vs Operating Mode

BYPASS/ DECIMATION	OUTPUT RESOLUTION	MAPPER EN (D7)	BIT MAPPER RES (D5-D3)
Decimation Bypass	Resolution Change	1	000: 18-bit 001: 16-bit 010: 14-bit
Real Decimation	Resolution Change (default 18-bit)	0	
Complex Decimation		0

**表 8-30. Register 0x1F Field Descriptions**

Bit	Field	Type	Reset	Description
7	LOW DR EN	R/W	0	This bit impacts the output drive strength of the CMOS output buffers. It can be enabled at slow speeds in order to save power consumption but it will also degrade the rise and fall times. 0: Low drive strength disabled. 1: Low drive strength enabled.
6	DCLKIN EN	R/W	0	This bit enables the DCLKIN clock input buffer for serial CMOS modes. Also DCLKIN EN (0x18, D4) needs to be set as well. 0: DCLKIN buffer powered down. 1: DCLKIN buffer enabled.
5	0	R/W	0	Must write 0
4	DCLK OB EN	R/W	1	This bit enables DCLK output buffer. 0: DCLK output buffer powered down. 1: DCLK output buffer enabled.
3	2X DCLK	R/W	0	This bit enables SDR output clocking with serial CMOS mode. When this mode is enabled, DCLKIN required is twice as fast and data is output only on rising edge of DCLK. 0: Serial data output on DCLK rising and falling edge. 1: Serial data output on DCLK rising edge only.
2-0	0	R/W	0	Must write 0

**图 8-61. Register 0x20/21/22**

0	0	CH AVG EN	DDC MUX		DIG BYP	DDC EN	0
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

表 8-33. Register 0x24 Field Descriptions

Bit	Field	Type	Reset	Description
7-6	0	R/W	0	Must write 0
5	CH AVG EN	R/W	0	Averages the output of ADC channel A and channel B together. The DDC MUX has to be enabled and set to '11'. The decimation filter needs to be enabled and set to bypass (fullrate output) or decimation and DIG BYP set to 1. 0: Channel averaging feature disabled 1: Output of channel A and channel B are averaged: (A+B)/2.
4-3	DDC MUX	R/W	0	Configures DDC MUX in front of the decimation filter. 00: ADC channel A connected to DDC A; ADC Channel B connected to DDC B 01: ADC channel A connected to DDC A and DDC B. 10: ADC channel B connected to DDC A and DDC B. 11: Output of ADC averaging block (see CH AVG EN) given to DDC A and DDC B.
2	DIG BYP	R/W	0	This bit needs to be set to enable digital features block which includes decimation and scrambling. 0: Digital feature block bypassed - lowest latency 1: Data path includes digital features
1	DDC EN	R/W	0	Enables internal decimation filter for both channels 0: DDC disabled. 1: DDC enabled.
0	0	R/W	0	Must write 0

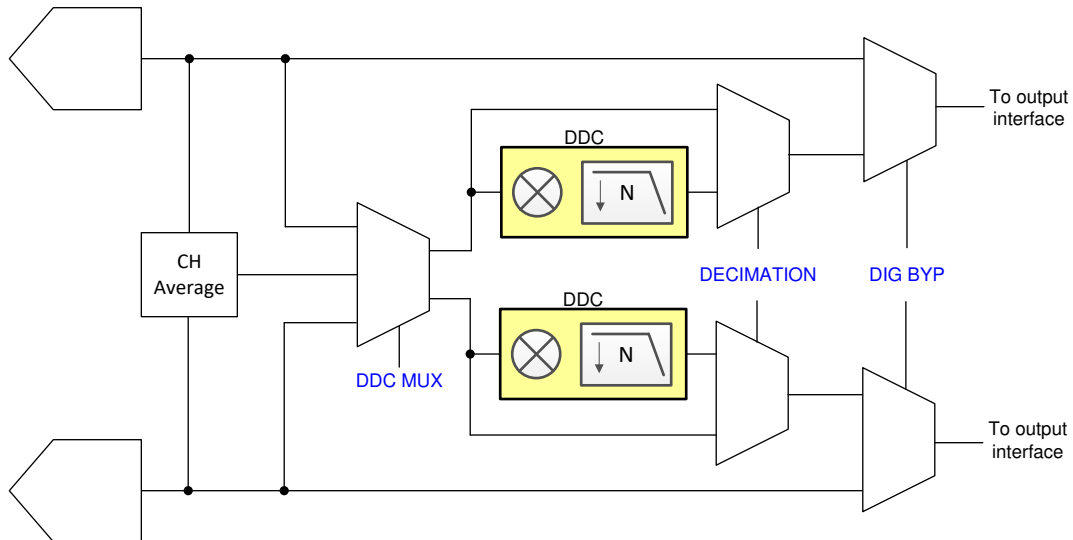

图 8-63. Register control for digital features

**图 8-64. Register 0x25**

7	6	5	4	3	2	1	0
DDC MUX EN	DECIMATION			REAL OUT	0	0	MIX PHASE
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

**表 8-34. Register 0x25 Field Descriptions**

Bit	Field	Type	Reset	Description
7	DDC MUX EN	R/W	0	Enables the digital mux between ADCs and decimation filters. This bit is required for DDC mux settings in register 0x024 (D4, D3) to go into effect. 0: DDC mux disabled 1: DDC mux enabled
6-4	DECIMATION	R/W	000	Complex decimation setting. This applies to both channels. 000: Bypass mode (no decimation) 001: Decimation by 2 010: Decimation by 4 011: Decimation by 8 100: Decimation by 16 101: Decimation by 32 others: not used
3	REAL OUT	R/W	0	This bit selects real output decimation. This mode applies to both channels. In this mode, the decimation filter is a low pass filter and no complex mixing is performed to reduce power consumption. For maximum power savings the NCO in this case should be set to 0. 0: Complex decimation 1: Real decimation
2-1	0	R/W	0	Must write 0
0	MIX PHASE	R/W	0	This bit used to invert the NCO phase 0: NCO phase as is. 1: NCO phase inverted.

**图 8-65. Register 0x26**

7	6	5	4	3	2	1	0
MIX GAIN A		MIX RES A	FS/4 MIX A	MIX GAIN B		MIX RES B	FS/4 MIX B
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

**表 8-35. Register 0x26 Field Descriptions**

Bit	Field	Type	Reset	Description
7-6	MIX GAIN A	R/W	00	This bit applies a 0, 3 or 6-dB digital gain to the output of digital mixer to compensate for the mixing loss for channel A. 00: no digital gain added 01: 3-dB digital gain added 10: 6-dB digital gain added 11: not used
5	MIX RES A	R/W	0	Toggling this bit resets the NCO phase of channel A and loads the new NCO frequency. This bit does not self reset.
4	FS/4 MIX A	R/W	0	Enables FS/4 mixing for DDC A (complex decimation only). 0: FS/4 mixing disabled. 1: FS/4 mixing enabled.
3-2	MIX GAIN B	R/W	00	This bit applies a 0, 3 or 6-dB digital gain to the output of digital mixer to compensate for the mixing loss for channel B. 00: no digital gain added 01: 3-dB digital gain added 10: 6-dB digital gain added 11: not used
1	MIX RES B	R/W	0	Toggling this bit resets the NCO phase of channel B and loads the new NCO frequency. This bit does not self reset.

## 9 Application Information Disclaimer

### Note

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 9.1 Typical Application

A spectrum analyzer is a typical frequency domain application for the ADC3644 and its front end circuitry is very similar to several other systems such as software defined radio (SDR), radar or communications. Some applications require frequency coverage including DC or near DC (such as, sonar), so it is included in this example.

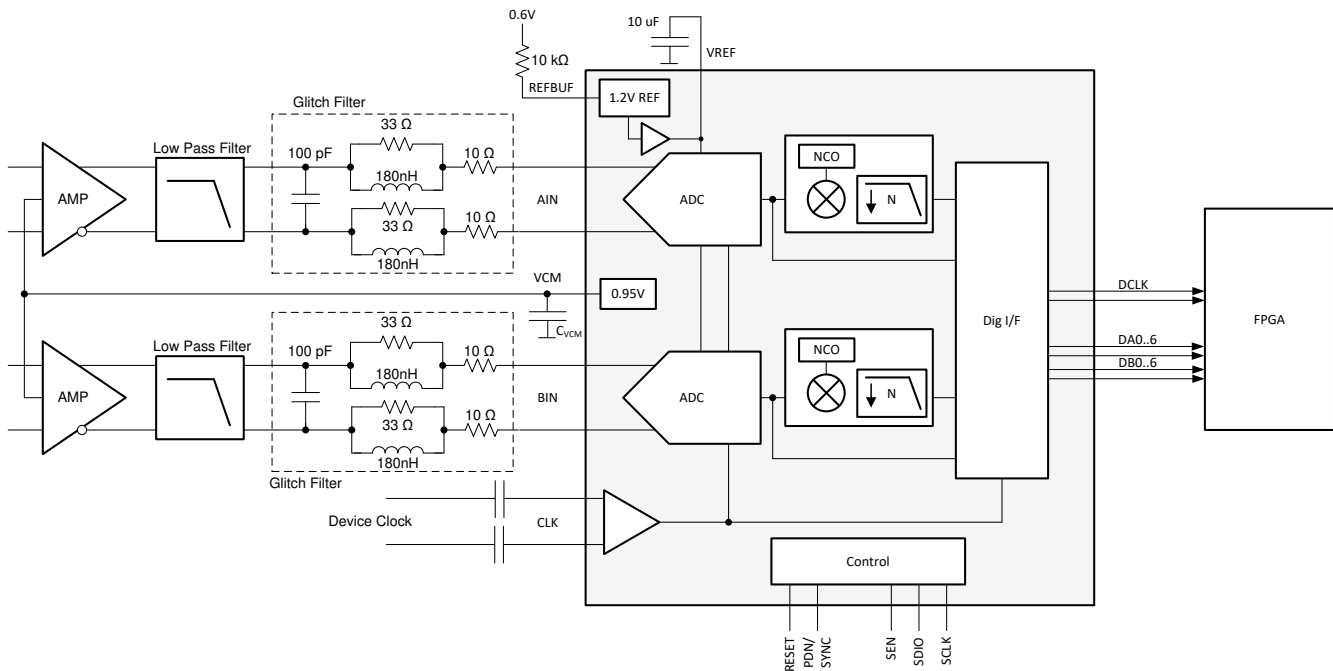

図 9-1. Typical configuration for a spectrum analyzer with DC support

#### 9.1.1 Design Requirements

Frequency domain applications cover a wide range of frequencies from low input frequencies at or near DC in the 1st Nyquist zone to undersampling in higher Nyquist zones. If low input frequency is supported, then the input has to be DC coupled and the ADC driven by a fully differential amplifier (FDA). If low frequency support is not needed, then AC coupling and use of a balun may be more suitable.

The internal reference is used since DC precision is not needed. However, the ADC AC performance is highly dependent on the quality of the external clock source. If in-band interferences are present, then the ADC SFDR performance is important. A higher ADC sampling rate is desirable in order to relax the external anti-aliasing filter – an internal decimation filter can be used to reduce the digital output rate afterwards.

表 9-1. Design key care-abouts

FEATURE	DESCRIPTION
Signal Bandwidth	DC to 30 MHz
Input Driver	Single ended to differential signal conversion and DC coupling

**表 9-1. Design key care-about (continued)**

FEATURE	DESCRIPTION
Clock Source	External clock with low jitter

When designing the amplifier or filter driving circuit, the ADC input full-scale voltage needs to be taken into consideration. For example, the ADC3644 input full-scale is 2.25 Vpp. When factoring in ~ 1 dB for insertion loss of the filter, then the amplifier needs to deliver close to 2.5 Vpp. The amplifier distortion performance degrades with a larger output swing and considering the ADC common mode input voltage the amplifier may not be able to deliver the full swing. The ADC3644 provides an output common mode voltage of 0.95 V and the THS4541 for example can only swing within 250 mV of its negative supply. A unipolar 3.3 V amplifier power supply limits the maximum voltage swing to ~ 2.8 Vpp. Additionally, input voltage protection diodes may be needed to protect the ADC from overvoltage events.

**表 9-2. Output voltage swing of THS4541 vs power supply**

DEVICE	MIN OUTPUT VOLTAGE	MAX SWING WITH 3.3 V/ 0 V SUPPLY
THS4541	VS- + 250 mV	2.8 Vpp

## 9.1.2 Detailed Design Procedure

### 9.1.2.1 Input Signal Path

The THS4541 provides a very good low power option to drive the ADC inputs. 表 9-3 provides an overview of the THS4541 with power consumption and usable frequency.

**表 9-3. Fully Differential Amplifier Options**

DEVICE	CURRENT (IQ) PER CHANNEL	USABLE FREQUENCY RANGE
THS4541	10 mA	< 70 MHz

The low pass filter design (topology, filter order) is driven by the application itself. However, when designing the low pass filter, the optimum load impedance for the amplifier should be taken into consideration as well. Between the low pass filter and the ADC input the sampling glitch filter needs to be added as well as shown in [セクション 8.3.1.2.1](#). In this example the DC - 30 MHz glitch filter is selected.

### 9.1.2.2 Sampling Clock

Applications operating with low input frequencies (such as DC to 20 MHz) typically are less sensitive to performance degradation due to clock jitter. The internal ADC aperture jitter improves with faster rise and fall times (i.e. square wave vs sine wave). 表 9-4 provides an overview of the estimated SNR performance of the ADC3644 based on different amounts of jitter of the external clock source. The SNR is estimated based on ADC3644 thermal noise of 77 dBFS and input signal at -1dBFS.

**表 9-4. ADC SNR performance across vs input frequency for different amounts of external clock jitter**

INPUT FREQUENCY	T <sub>J,EXT</sub> = 100 fs	T <sub>J,EXT</sub> = 250 fs	T <sub>J,EXT</sub> = 500 fs	T <sub>J,EXT</sub> = 1 ps
10 MHz	74.0	74.0	73.9	73.7
20 MHz	73.9	73.9	73.6	72.8
30 MHz	73.8	73.7	73.2	71.6

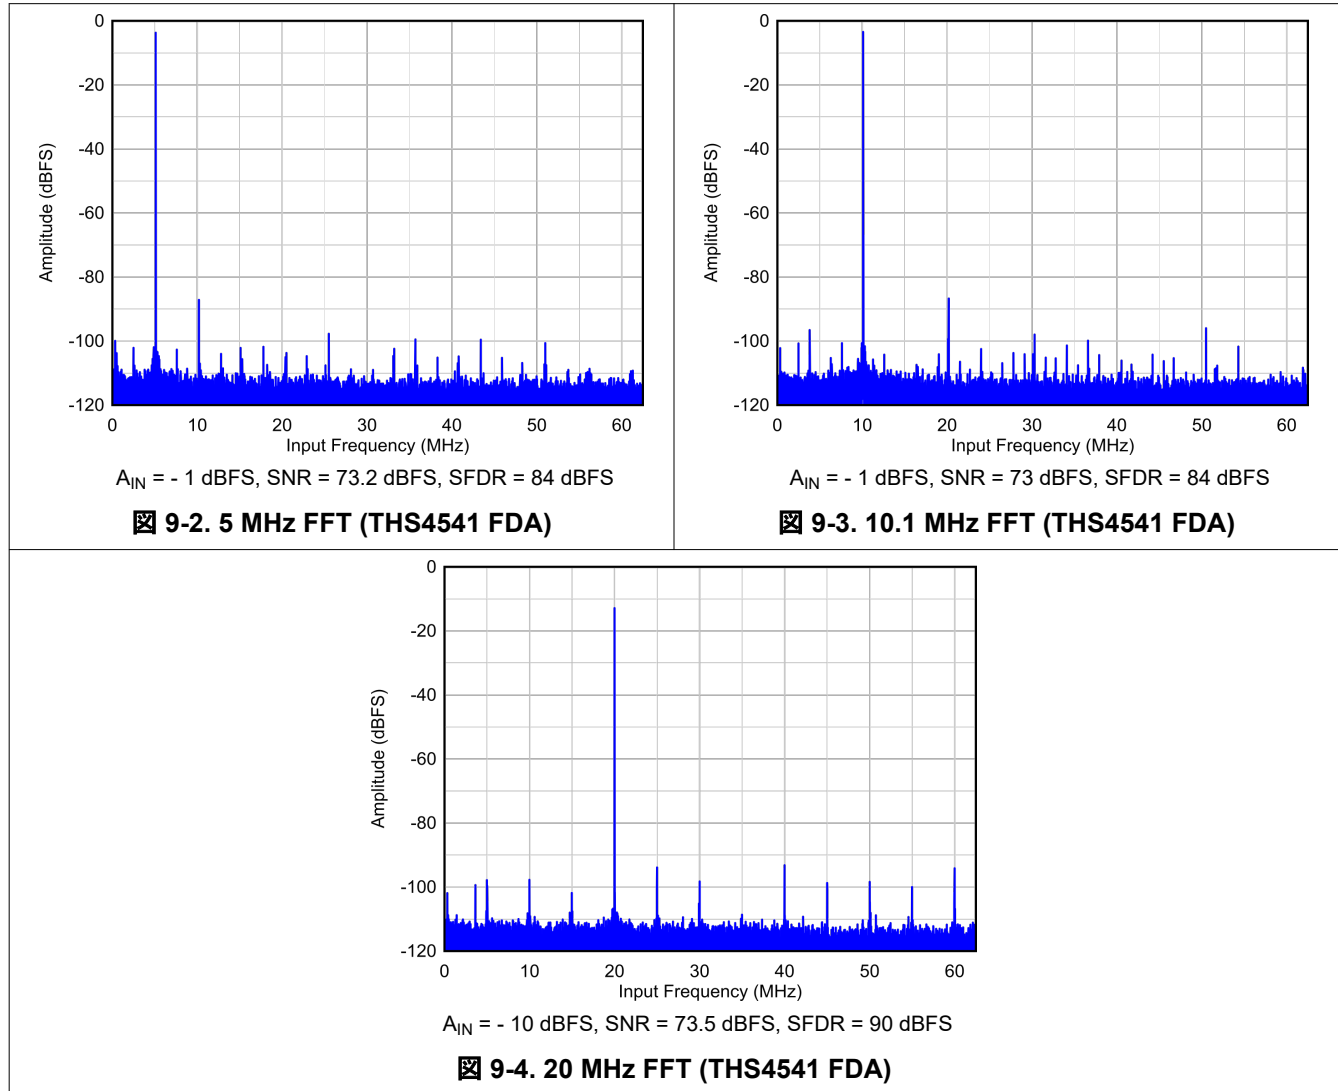

Termination of the clock input should be considered for long clock traces.

### 9.1.2.3 Voltage Reference

The ADC3644 is configured to internal reference operation by applying 0.6 V to the REFBUF pin.

### 9.1.3 Application Curves

The following FFT plots show the performance of THS4541 driving the ADC3644 operated at 125 MSPS with a full-scale input at -1 dBFS. The FFT spectrum also shows the response of the low pass filter located between the THS4541 and the glitch filter with a 30 MHz corner frequency.

## 9.2 Initialization Set Up

After power-up, the internal registers must be initialized to the default values through a hardware reset by applying a high pulse on the RESET pin, as shown in [Figure 9-5](#).

1. Apply AVDD and IOVDD (no specific sequence required). After AVDD is applied the internal bandgap reference will power up and settle out in ~ 2ms.
2. Configure REFBUF pin (pull high or low even if configured via SPI later on) and apply the sampling clock.
3. Apply hardware reset. After hardware reset is released, the default registers are loaded from internal fuses and the internal power up capacitor calibration is initiated. The calibration takes approximately 200000 clock cycles.
4. Begin programming using SPI interface.

**Figure 9-5. Initialization of serial registers after power up**

**Table 9-5. Power-up timing**

		MIN	TYP	MAX	UNIT
$t_1$	Power-on delay: delay from power up to logic level of REFBUF pin	2			ms
$t_2$	Delay from REFBUF pin logic level to RESET rising edge	100			ns
$t_3$	RESET pulse width	1			us
$t_4$	Delay from RESET disable to SEN active	~ 200000			clock cycles

### 9.2.1 Register Initialization During Operation

If required, the serial interface registers can be cleared and reset to default settings during operation either:

- through a hardware reset or
- by applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 0x00) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

After hardware or software reset the wait time is also ~ 200000 clock cycles before the SPI registers can be programmed.

### 9.3 Power Supply Recommendations

The ADC3644 requires two different power-supplies. The AVDD rail provides power for the internal analog circuits and the ADC itself while the IOVDD rail powers the digital interface and the internal digital circuits like decimation filter or output interface mapper. Power sequencing is not required.

The AVDD power supply must be low noise in order to achieve data sheet performance. In applications operating near DC, the 1/f noise contribution of the power supply needs to be considered as well. The ADC is designed for very good PSRR which aides with the power supply filter design.

FIG 9-6. Power supply rejection ratio (PSRR) vs frequency

There are two recommended power-supply architectures:

1. Step down using high-efficiency switching converters, followed by a second stage of regulation using a low noise LDO to provide switching noise reduction and improved voltage accuracy.
2. Directly step down the final ADC supply voltage using high-efficiency switching converters. This approach provides the best efficiency, but care must be taken to ensure switching noise is minimized to prevent degraded ADC performance.

TI WEBENCH® Power Designer can be used to select and design the individual power-supply elements needed: see the WEBENCH® Power Designer

Recommended switching regulators for the first stage include the TPS62821, and similar devices.

Recommended low dropout (LDO) linear regulators include the TPS7A4701, TPS7A90, LP5901, and similar devices.

For the switch regulator only approach, the ripple filter must be designed with a notch frequency that aligns with the switching ripple frequency of the DC/DC converter. Note the switching frequency reported from WEBENCH® and design the EMI filter and capacitor combination to have the notch frequency centered as needed. FIG 9-7 and FIG 9-8 illustrate the two approaches.

AVDD and IOVDD supply voltages should not be shared in order to prevent digital switching noise from coupling into the analog signal chain.

Figure 9-7. Example: LDO Linear Regulator Approach

Figure 9-8. Example Switcher-Only Approach

## 9.4 Layout

### 9.4.1 Layout Guidelines

There are several critical signals which require specific care during board design:

1. Analog input and clock signals
  - Traces should be as short as possible and vias should be avoided where possible to minimize impedance discontinuities.
  - Traces should be routed using loosely coupled 100-Ω differential traces.
  - Differential trace lengths should be matched as close as possible to minimize phase imbalance and HD2 degradation.
2. Digital output interface
  - A 20 ohm series isolation resistor should be used on each CMOS output and placed close the digital output. This isolation resistor limits the output current into the capacitive load and thus minimizes the switching noise inside the ADC. When driving longer distances a buffer should be used. The resistor value should be optimized for the desired output data rate.
3. Voltage reference
  - The bypass capacitor should be placed as close to the device pins as possible and connected between VREF and REFGND – on top layer avoiding vias.
  - Depending on configuration an additional bypass capacitor between REFBUF and REFGND may be recommended and should also be placed as close to pins as possible on top layer.
4. Power and ground connections
  - Provide low resistance connection paths to all power and ground pins.
  - Use power and ground planes instead of traces.

- Avoid narrow, isolated paths which increase the connection resistance.
- Use a signal/ground/power circuit board stackup to maximize coupling between the ground and power plane.

### 9.4.2 Layout Example

The following screen shot shows the top layer of the ADC364x EVM.

- Signal and clock inputs are routed as differential signals on the top layer avoiding vias.
- Serial CMOS output interface lanes with isolation resistor and digital buffer.
- Bypass caps are close to the VREF pin on the top layer avoiding vias.

9-9. Layout example: top layer of ADC364x EVM

## 10 Device and Documentation Support

### 10.1 Device Support (Optional)

#### 10.1.1 Development Support (Optional)

#### 10.1.2 Device Nomenclature (Optional)

### 10.2 Documentation Support (if applicable)

#### 10.2.1 Related Documentation

For related documentation see the following:

### 10.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 10.4 サポート・リソース

**TI E2E™ サポート・フォーラム**は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の [使用条件](#)を参照してください。

### 10.5 Trademarks

PowerPAD™ and TI E2E™ are trademarks of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

### 10.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 10.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADC3644IRSBR	ACTIVE	WQFN	RSB	40	3000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	AZ3644	<a href="#">Samples</a>
ADC3644IRSBT	ACTIVE	WQFN	RSB	40	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	AZ3644	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
