ADS7066 小型、8 チャネル、16 ビット、250kSPS SAR ADC、GPIO 付き

1 特長

- 小型ソリューション・サイズ:
  - DSBGA および WQFN パッケージ
  - 省スペース、コンデンサ不要、2.5V 内部基準電圧
- 8 つのチャネルを次の任意の組み合わせに構成可能:
  - 最大 8 つのアナログ入力、デジタル入力、またはデジタル出力
- 平均化フィルタをプログラム可能:
  - 平均化のサンプル・サイズをプログラム可能
  - 内部変換による平均化
  - 平均出力の分解能:20 ビット
- チャネル・シーケンサ付きの低リーク・マルチプレクサ:
  - 手動モード、オンザフライ・モード、自動シーケンス・モード
- 非常に優れた AC および DC 性能:
  - SNR:91.9dB、THD:-100dB
  - プログラム可能な平均化フィルタによる SNR の向上
  - INL:±1 LSB、16 ビット、ノー・ミッシング・コード
  - 内部的な較正によりオフセットとドリフト係数が改善
  - レイテンシなしで 250kSPS のサンプル・レート
- 広い動作範囲:
  - ADC 入力範囲:0V～V_{REF} および 2 × V_{REF}
  - アナログ電源:3V～5.5V
  - デジタル電源:1.65V～5.5V
  - 温度範囲:-40℃～+125℃
- 拡張 SPI デジタル・インターフェイス:
  - 高速 (60MHz) の SPI

2 アプリケーション

- 光モジュール
- 光ライン・カード
- マルチパラメータ・メディカル・モニタ

3 概要

ADS7066 は小型、16 ビット、8 チャネル、高精度の逐次比較型 (SAR) アナログ / デジタル・コンバータ (ADC) です。ADS7066 はコンデンサ不要の基準電圧と基準電圧バッファを内蔵し、必要な外付け部品が少ないことからソリューションの小型化に役立ちます。このデバイス・ファミリには、ADS7067 (800kSPS) と ADS7066 (250kSPS) の速度バリアントがあります。

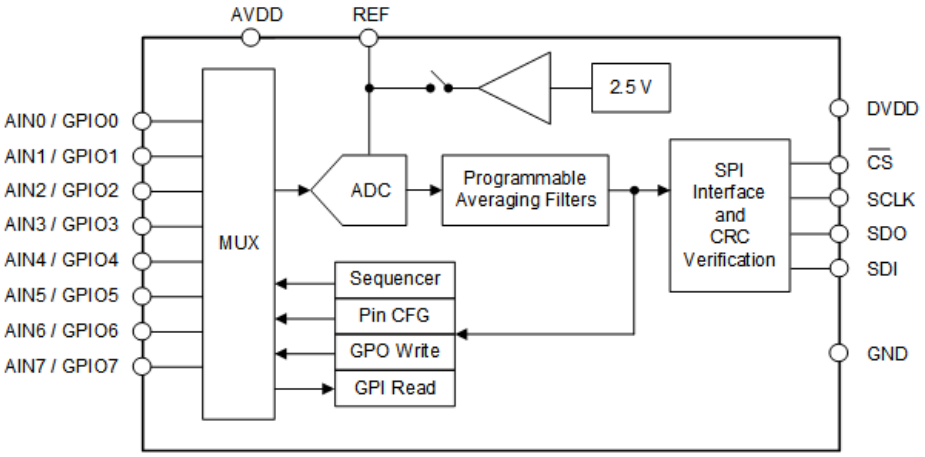
ADS7066 はオフセット較正機能を備えているため、幅広いシステム動作条件にわたって精度を高めることができます。プログラム可能な平均化フィルタにより、高分解能測定が可能です。ADS7066 の 8 つのチャネルはアナログ入力、デジタル入力、デジタル出力として個別に構成できるため、ミクスト・シグナル帰還やデジタル制御の回路設計を簡素化できます。

ADS7066 は、拡張 SPI により低いクロック速度で高いスループットを達成できるため、基板レイアウトを簡素化し、システム・コストを低減できます。ADS7066 は、データの読み書き動作と起動時の構成のための巡回冗長性検査 (CRC) 機能を備えています。

パッケージ情報

部品番号	パッケージ (1)	パッケージ・サイズ(公称) (2)
ADS7066	YBH (DSBGA、16)	1.636mm × 1.636mm
	RTE (WQFN、16)	3.00mm × 3.00mm

(1) 利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。
(2) パッケージ・サイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます。



ADS7066 のブロック図

Table of Contents

4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision B (May 2023) to Revision C (September 2023)	Page
• RTE (WQFN) パッケージのドキュメントのステータスを「事前情報」から「量産データ」に変更	1

Changes from Revision A (June 2020) to Revision B (May 2023)	Page
• ドキュメント全体にわたって表、図、相互参照の採番方法を更新	1
• 事前情報として RTE (WQFN) パッケージをドキュメントに追加	1
• 「非常に優れた AC および DC 性能」の箇条書き項目の SNR を 86dB から 91.9dB に変更	1
• 「特長」の最後の箇条書き項目を削除	1
• 「概要」セクションから WCSP および省スペース関連の説明を削除	1
• Added RTE information to *Pin Configuration and Functions* section	4
• Added *PSRR vs Frequency* figure	11
• Added first sentence to *External Reference* section	16
• Deleted last paragraph from *Internal Reference* section	16
• Added reference to *Resolution-Boosting ADS7066 Using Programmable Averaging Filter* application report and changed title of *Averaged Output Data* figure	18
• Changed the *CRC on Data Interface* section	18
• Changed discussion of when status flags are not appended in *Status Flags* section	21
• Changed discussion of CRC comparison in *Output CRC (Device to Host)* section	21
• Deleted second paragraph from *Input CRC (Host to Device)* section	21

5 Pin Configuration and Functions

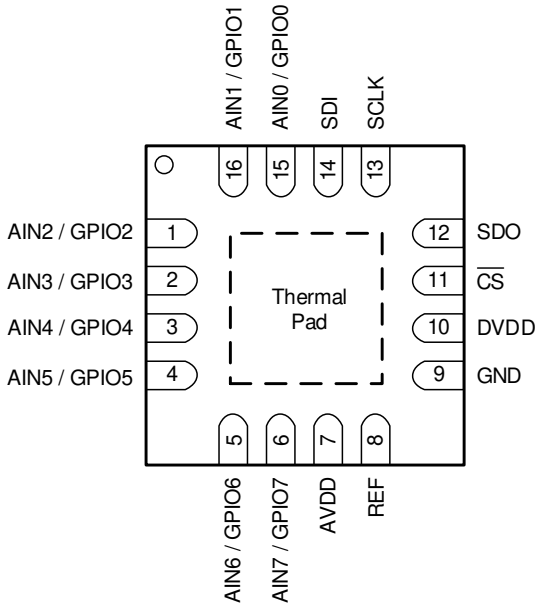


図 5-1. RTE Package, 16-Pin WQFN (Top View)

表 5-1. Pin Functions: RTE Package

PIN		TYPE(1)	DESCRIPTION
NAME	RTE		
AIN0/GPIO0	15	AI, DI, DO	Channel 0; configurable as either an analog input (default) or general-purpose input/output (GPIO).
AIN1/GPIO1	16	AI, DI, DO	Channel 1; configurable as either an analog input (default) or GPIO.
AIN2/GPIO2	1	AI, DI, DO	Channel 2; configurable as either an analog input (default) or GPIO.
AIN3/GPIO3	2	AI, DI, DO	Channel 3; configurable as either an analog input (default) or GPIO.
AIN4/GPIO4	3	AI, DI, DO	Channel 4; configurable as either an analog input (default) or GPIO.
AIN5/GPIO5	4	AI, DI, DO	Channel 5; configurable as either an analog input (default) or GPIO.
AIN6/GPIO6	5	AI, DI, DO	Channel 6; configurable as either an analog input (default) or GPIO.
AIN7/GPIO7	6	AI, DI, DO	Channel 7; configurable as either an analog input (default) or GPIO.
AVDD	7	P	Analog supply voltage. Connect a 1-µF capacitor to GND.
$\overline{CS}$	11	DI	Chip-select input pin; active low. The device takes control of the data bus when $\overline{CS}$ is low. The SDO pin goes to Hi-Z when $\overline{CS}$ is high.
DVDD	10	P	Digital I/O supply voltage. Connect a 1-µF capacitor to GND.
GND	9	P	Ground for power supply, all analog and digital signals are referred to this pin.
REF	8	P	Internal reference buffer output; external reference input. Connect a 1-µF capacitor to GND.
SCLK	13	DI	Clock input pin for the SPI interface.
SDI	14	DI	Serial data input pin for SPI interface.
SDO	12	DO	Serial data output pin for SPI interface.
Thermal Pad	Pad	P	Exposed thermal pad. Connect to ground.

(1) AI = analog input, DI = digital input, DO = digital output, P = power supply.

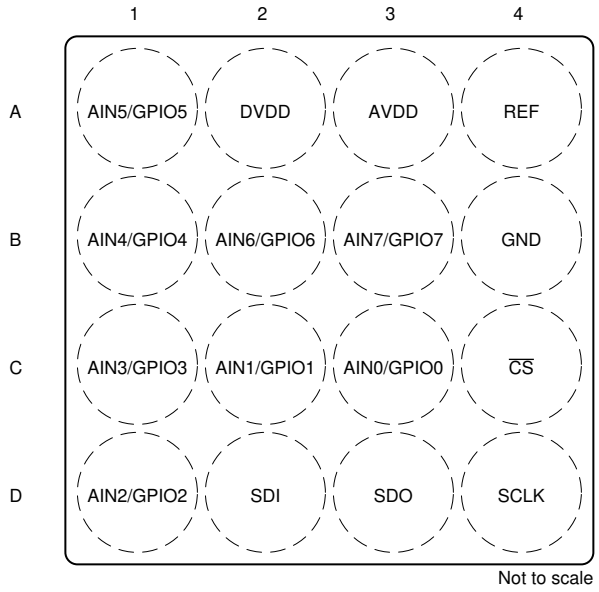

図 5-2. YBH Package, 16-Pin DSBGA (Top View)

表 5-2. Pin Functions: YBH Package

PIN		TYPE(1)	DESCRIPTION
YBH	NAME		
A1	AIN5/GPIO5	AI, DI, DO	Channel 5; configurable as either an analog input (default) or GPIO.
A2	DVDD	P	Digital I/O supply voltage. Connect a 1-µF capacitor to GND.
A3	AVDD	P	Analog supply voltage. Connect a 1-µF capacitor to GND.
A4	REF	P	Internal reference buffer output; external reference input. Connect a 1-µF capacitor to GND.
B1	AIN4/GPIO4	AI, DI, DO	Channel 4; configurable as either an analog input (default) or GPIO.
B2	AIN6/GPIO6	AI, DI, DO	Channel 6; configurable as either an analog input (default) or GPIO.
B3	AIN7/GPIO7	AI, DI, DO	Channel 7; configurable as either an analog input (default) or GPIO.
B4	GND	P	Ground for power supply, all analog and digital signals are referred to this pin.
C1	AIN3/GPIO3	AI, DI, DO	Channel 3; configurable as either an analog input (default) or GPIO.
C2	AIN1/GPIO1	AI, DI, DO	Channel 1; configurable as either an analog input (default) or GPIO.
C3	AIN0/GPIO0	AI, DI, DO	Channel 0; configurable as either an analog input (default) or general-purpose input/output (GPIO).
C4	$\overline{CS}$	DI	Chip-select input pin; active low. The device takes control of the data bus when $\overline{CS}$ is low. The SDO pin goes to Hi-Z when $\overline{CS}$ is high.
D1	AIN2/GPIO2	AI, DI, DO	Channel 2; configurable as either an analog input (default) or GPIO.
D2	SDI	DI	Serial data input pin for SPI interface.
D3	SDO	DO	Serial data output pin for SPI interface.
D4	SCLK	DI	Clock input pin for the SPI interface.

(1) AI = analog input, DI = digital input, DO = digital output, P = power supply.

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)(1)

	MIN	MAX	UNIT
DVDD to GND	–0.3	5.5	V
AVDD to GND	–0.3	5.5	V
AINx/GPIOx(2) to GND	GND – 0.3	AVDD + 0.3	V
REF to GND	GND – 0.3	AVDD + 0.3	V
Digital inputs (CS, SDI, SCLK) to GND	GND – 0.3	5.5	V
Input current to any pin except supply pins(3)	–10	10	mA
Junction temperature, T_J	–40	150	°C
Storage temperature, T_{stg}	–60	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) AINx/GPIOx refers to AIN0/GPIO0, AIN1/GPIO1, AIN2/GPIO2, AIN3/GPIO3, AIN4/GPIO4, AIN5/GPIO5, AIN6/GPIO6, and AIN7/GPIO7 pins.
(3) Pin current must be limited to 10 mA or less.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY						
AVDD	Analog power supply	AVDD to GND	3	3.3	5.5	V
DVDD	Digital power supply	DVDD to GND	1.65	3.3	5.5	V
REFERENCE VOLTAGE						
V_{REF}	Reference voltage to the ADC	Internal reference		2.5		V
		External reference	2.4		AVDD	
ANALOG INPUTS						
FSR	Full-scale input range	RANGE = 0b	0		V_{REF}	V
		RANGE = 1b	0		2 x V_{REF}	
V_{IN}	Absolute input voltage	AINx(1) to GND	–0.1		AVDD + 0.1	V
TEMPERATURE RANGE						
T_A	Ambient temperature		–40	25	125	°C

(1) AINx refers to analog inputs AIN0, AIN1, AIN2, AIN3, AIN4, AIN5, AIN6, and AIN7.

6.4 Thermal Information

THERMAL METRIC(1)		ADS7066 YBH (WCSP) 16 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	80.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	0.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	18.8	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	18.8	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

6.5 Electrical Characteristics

at AVDD = 3 V to 5.5 V, DVDD = 1.65 V to 5.5 V, V_{REF} = 2.5 V (internal), and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = -40°C to +125°C; typical values at T_A = 25°C.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUTS						
C_{IN}	Input capacitance	ADC and MUX capacitance		30		pF
DC PERFORMANCE						
	Resolution	No missing codes		16		Bits
DNL	Differential nonlinearity		–0.75	±0.4	0.75	LSB
INL	Integral nonlinearity		–4	±1	4	LSB
$V_{(OS)}$	Input offset error	Post offset calibration, OSR[2:0] = 7	–7	±0.5	7	LSB
dV_{OS}/dT	Input offset thermal drift	Post offset calibration, OSR[2:0] = 7		±0.6		ppm/°C
	Offset error match	OSR[2:0] = 7	–2.75	0.5	2.75	LSB
G_E	Gain error(1)	External V_{REF} = 2.5 V, OSR[2:0] = 7	–0.05	±0.01	0.05	%FSR
dG_E/dT	Gain error thermal drift	External V_{REF} = 2.5 V, OSR[2:0] = 7		±0.5		ppm/°C
	Gain error match	OSR[2:0] = 7	–0.005	±0.001	0.005	%FSR
AC PERFORMANCE						
SINAD	Signal-to-noise + distortion ratio	f_{IN} = 2 kHz, V_{REF} = 2.5V (internal)	84.3	86.5		dB
		f_{IN} = 2 kHz, V_{REF} = 5 V, AVDD = 5 V	88.75	91		
SNR	Signal-to-noise ratio	f_{IN} = 2 kHz, V_{REF} = 2.5V (internal)	84.5	86.8		dB
		f_{IN} = 2 kHz, V_{REF} = 5 V, AVDD = 5 V	90	91.9		
THD	Total harmonic distortion	f_{IN} = 2 kHz		–100		dB
SFDR	Spurious-free dynamic range	f_{IN} = 2 kHz		101		dB
	Isolation crosstalk	f_{IN} = 10 kHz		–110		dB
REFERENCE						
V_{REF}	Internal reference output voltage(3)	at TA= 25℃	2.497	2.5	2.503	V
dV_{REF}/dT	Internal reference voltage temperature drift			6	19	ppm/°C
C_{REF}	Decoupling capacitor at REF pin		1		10	µF
DIGITAL INPUTS						
V_{IL}	Input low logic level	For $\overline{CS}$, SCLK and SDI pins	–0.3		0.3 DVDD	V
		For $GPIO_X$ (2) pins	–0.3		0.3 AVDD	
V_{IH}	Input high logic level	For $\overline{CS}$, SCLK and SDI pins	0.7 DVDD		DVDD	V
		For $GPIO_X$ pins	0.7 AVDD		AVDD	
DIGITAL OUTPUTS						
V_{OL}	Output low logic level	For SDO pin, I_{OL} = 500 µA sink	0		0.2 DVDD	V
		For $GPIO_X$ (2) pins, I_{OL} = 500 µA sink	0		0.2 AVDD	
V_{OH}	Output high logic level	For SDO pin, I_{OH} = 500 µA source	0.8 DVDD		DVDD	V
		For $GPIO_X$ (2) pins, I_{OH} = 500 µA source	0.8 AVDD		AVDD	
POWER SUPPLY						
I_{AVDD}	Analog supply current	AVDD = 3.3 V, external reference		0.7	0.91	mA
		AVDD = 3.3 V, internal reference		1.2	1.56	mA
		No conversion, external reference		250		µA
		No conversion, internal reference		800		µA

(1) These specifications include full temperature range variation but not the error contribution from internal reference.
(2) $GPIO_X$ refers to GPIO0, GPIO1, GPIO2, GPIO3, GPIO4, GPIO5, GPIO6, and GPIO7 pins.

(3) Does not include the variation in voltage resulting from solder shift effects.

6.6 Timing Requirements

at AVDD = 3 V to 5 V, DVDD = 1.65 V to 5.5 V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = –40°C to +125°C; typical values at T_A = 25°C.

			MIN	MAX	UNIT
CONVERSION CYCLE					
f_{CYCLE}	Sampling frequency			250	kSPS
t_{CYCLE}	ADC cycle-time period		$1/f_{CYCLE}$		s
t_{QUIET}	Quiet acquisition time		20		ns
t_{ACQ}	Acquisition time	Acquisition time	800		ns
t_{WH_CSZ}	Pulse duration: $\overline{CS}$ high		220		ns
t_{WL_CSZ}	Pulse duration: $\overline{CS}$ low		210		ns
SPI INTERFACE TIMINGS					
f_{CLK}	Maximum SCLK frequency			60	MHz
t_{CLK}	Minimum SCLK time period		16.67		ns
t_{PH_CK}	SCLK high time		0.45	0.55	t_{CLK}
t_{PL_CK}	SCLK low time		0.45	0.55	t_{CLK}
t_{SU_CSCK}	Setup time: $\overline{CS}$ falling to the first SCLK capture edge		15		ns
t_{SU_CKDI}	Setup time: SDI data valid to the SCLK capture edge		6.4		ns
t_{HT_CKDI}	Hold time: SCLK capture edge to data valid on SDI		4		ns
t_{D_CKCS}	Delay time: last SCLK falling to $\overline{CS}$ rising		0.8		ns

6.7 Switching Characteristics

at AVDD = 3 V to 5.5 V, DVDD = 1.65 V to 5.5 V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = –40°C to +125°C; typical values at T_A = 25°C.

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
CONVERSION CYCLE					
t_{CONV}	ADC conversion time			3200	ns
RESET					
t_{PU}	Power-up time for device	AVDD ≥ 3 V		5	ms
t_{RST}	Delay time; RST bit = 1b to device reset complete(1)			5	ms
SPI INTERFACE TIMINGS					
t_{DEN_CSDO}	Delay time: $\overline{CS}$ falling to data enable			22	ns
t_{DZ_CSDO}	Delay time: $\overline{CS}$ rising to SDO going Hi-Z			50	ns
t_{D_CKDO}	Delay time: SCLK launch edge to (next) data valid on SDO			16	ns

(1) RST bit is automatically reset to 0b after t_{RST}.

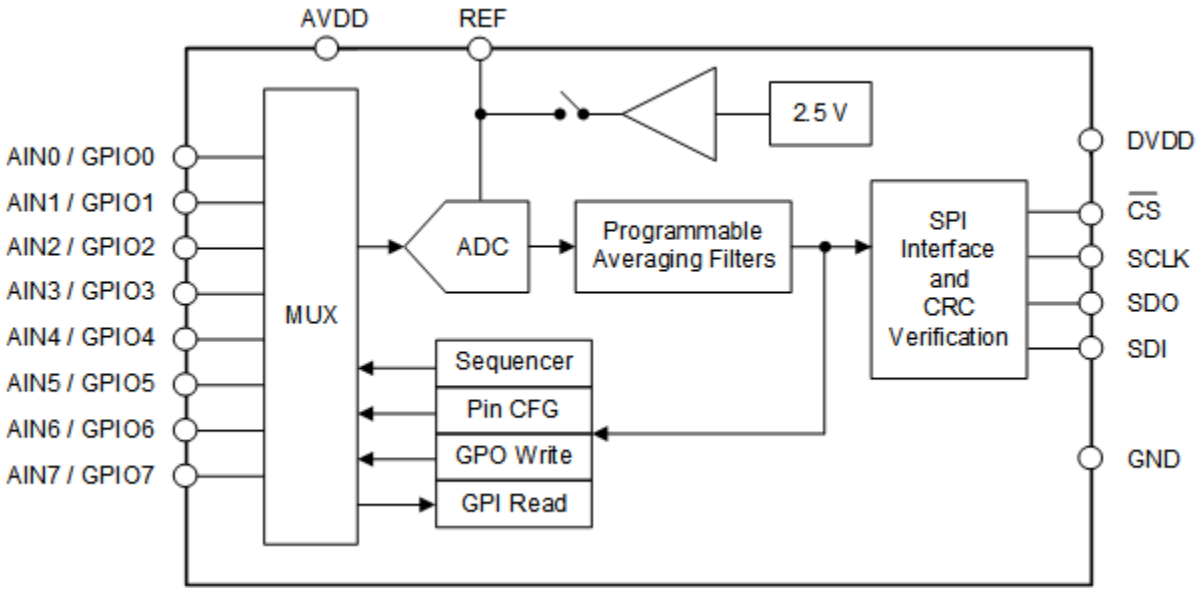
7 Detailed Description

7.1 Overview

The ADS7066 is a 16-bit, successive approximation register (SAR) analog-to-digital converter (ADC) with an analog multiplexer. This device integrates a reference, reference buffer, low-dropout regulator (LDO), and features high performance at full throughput and low-power consumption.

The ADS7066 supports unipolar, single-ended analog input signals. The internal reference generates a low-drift, buffered, 2.5-V reference output. The device uses an internal clock to perform conversions. At the end of the conversion process, the device enters an acquisition phase.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Analog Input and Multiplexer

The eight channels of the multiplexer can be independently configured as ADC inputs or general-purpose inputs/outputs (GPIOs). As shown in 図 7-1, each input pin has ESD protection diodes to AVDD and GND. On power-up or after device reset, all eight channels of the multiplexer are configured as analog inputs.

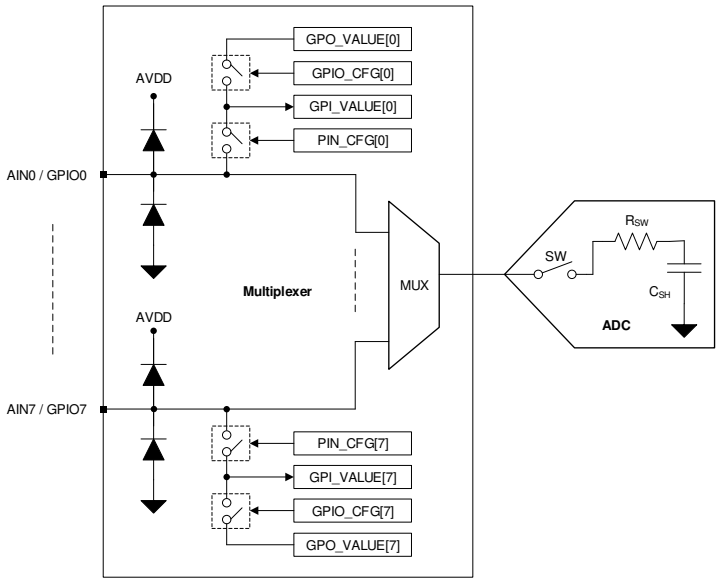


図 7-1. Analog Inputs, GPIOs, and ADC Connections

図 7-1 shows an equivalent circuit for the pins configured as analog inputs. The ADC sampling switch is represented by an ideal switch (SW) in series with a resistor (R_{SW}, typically 150 Ω) and a sampling capacitor (C_{SH}, typically 30 pF). During acquisition, the SW switch is closed to allow the signal on the selected analog input channel to charge the internal sampling capacitor. During conversion, the SW switch is opened to disconnect the analog input channel from the sampling capacitor.

The multiplexer channels can be configured as GPIOs in the PIN_CFG register. On power-up, all channels of the multiplexer are configured as analog inputs. The direction of a GPIO, input or output, can be set in the GPIO_CFG register. The logic level of channels configured as digital inputs can be read from the GPI_VALUE register. The digital outputs can be accessed by writing to the GPO_VALUE register. The digital outputs can be configured as open-drain or push-pull in the GPO_DRIVE_CFG register.

7.3.2 Reference

The ADS7066 has a precision, low-drift voltage reference internal to the device.

7.3.2.1 External Reference

External reference is the default configuration on power-up or after device reset. An external reference voltage source can be connected to the REF pin with an appropriate decoupling capacitor placed between the REF and GND pins. Best SNR is achieved with a 5-V external reference because the internal reference is limited to 2.5 V. For improved thermal drift performance, a reference from the REF60xx family (REF6025, REF6030, REF6033, REF6041, REF6045, or REF6050) is recommended.

7.3.2.2 Internal Reference

The device features an internal reference source with a nominal output value of 2.5 V. On power-up, the internal reference is disabled by default. To enable the internal reference, set EN_REF = 1b in the GENERAL_CFG register. A minimum 1-µF decoupling capacitor is recommended to be placed between the REF and GND pins.

The capacitor must be placed as close to the REF pin as possible. The REF pin has ESD protection diodes connected to the AVDD and GND pins.

7.3.3 ADC Transfer Function

The ADC output is in straight binary format. The full-scale input range (FSR) of the ADC is determined by the RANGE bit. On power-up, the FSR is 0 V to V_{REF}. When using the 2 x V_{REF} mode (RANGE = 1b), the ADC can measure analog inputs up to two times the voltage reference. 式 1 can be used to compute the ADC resolution:

$$1\ LSB = FSR / 2^N \quad (1)$$

where:

- FSR = Full-scale input range of the ADC
- N = 16

図 7-2 and 表 7-1 show the ideal transfer characteristics for this device.

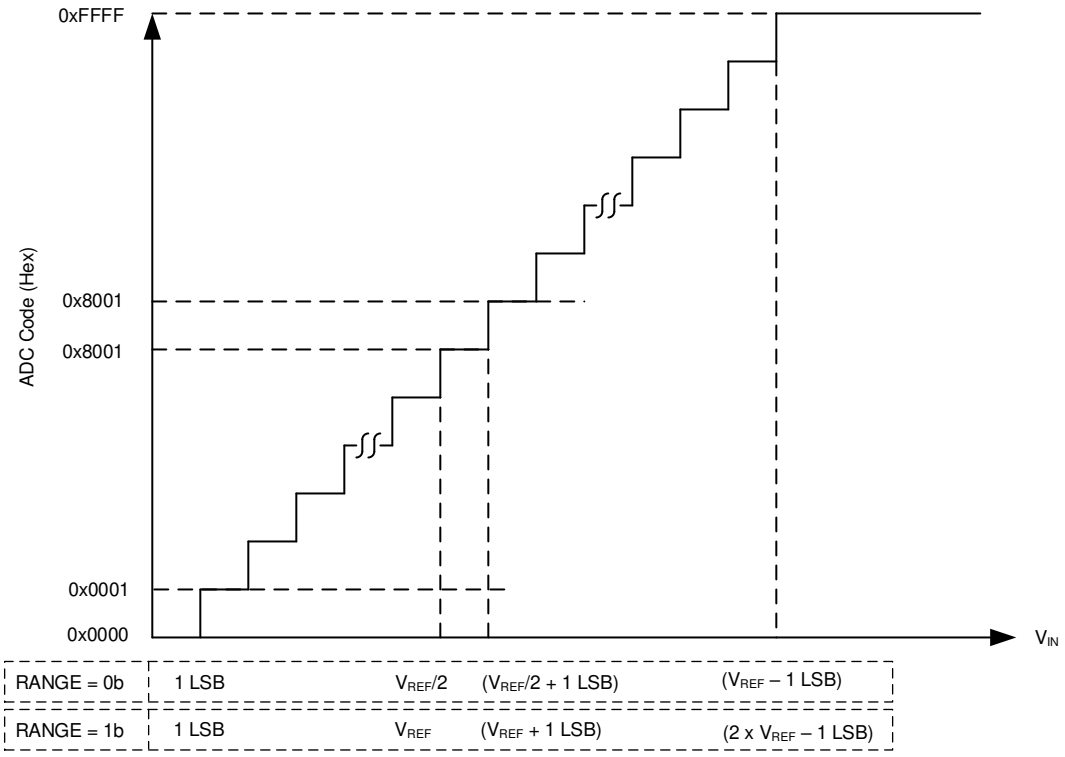

図 7-2. Ideal Transfer Characteristics

表 7-1. Transfer Characteristics

INPUT VOLTAGE		CODE	IDEAL OUTPUT CODE
RANGE = 0b	RANGE = 1b		
≤1 LSB	≤1 LSB	Zero	0000
1 LSB to 2 LSBs	1 LSB to 2 LSBs	Zero + 1	0001
(V_{REF} / 2) to (V_{REF} / 2) + 1 LSB	V_{REF} to V_{REF} + 1 LSB	Mid-scale code	8000
(V_{REF} / 2) + 1 LSB to (V_{REF} / 2) + 2 LSBs	V_{REF} + 1 LSB to V_{REF} + 2 LSBs	Mid-scale code + 1	8001
≥ V_{REF} – 1 LSB	≥ 2 x V_{REF} – 1 LSB	Full-scale code	FFFF

7.3.4 ADC Offset Calibration

The variation in ADC offset error resulting from changes in temperature or reference voltage can be calibrated by setting the CAL bit in the GENERAL_CFG register. The CAL bit is reset to 0 after calibration. The host can poll the CAL bit to check the ADC offset calibration completion status.

7.3.5 Programmable Averaging Filters

The ADS7066 features a programmable averaging filter that can be used to average analog input samples to output a higher resolution measurement. The averaging filter can be enabled by programming the OSR[2:0] bits in the OSR_CFG register to the averaging factor desired. The averaging configuration is common to all analog input channels. As shown in 図 7-3, the output of the averaging filter is 20 bits long. In manual mode and auto-sequence mode of conversion, only the first conversion for the selected analog input channel must be initiated by the host, as shown in 図 7-3; any remaining conversions are generated internally. The time (t_{AVG}) required to complete the averaging operation is determined by the sampling speed and number of samples to be averaged; see the *Oscillator and Timing Control* section for more details. After completion, the averaged 20-bit result, as shown in 図 7-3, can be read-out. For information on the programmable averaging filters and performance results see the *Resolution-Boosting ADS7066 Using Programmable Averaging Filter* application report.

In autonomous mode of operation, samples from analog input channels that are enabled in the AUTO_SEQ_CH_SEL register are averaged sequentially.

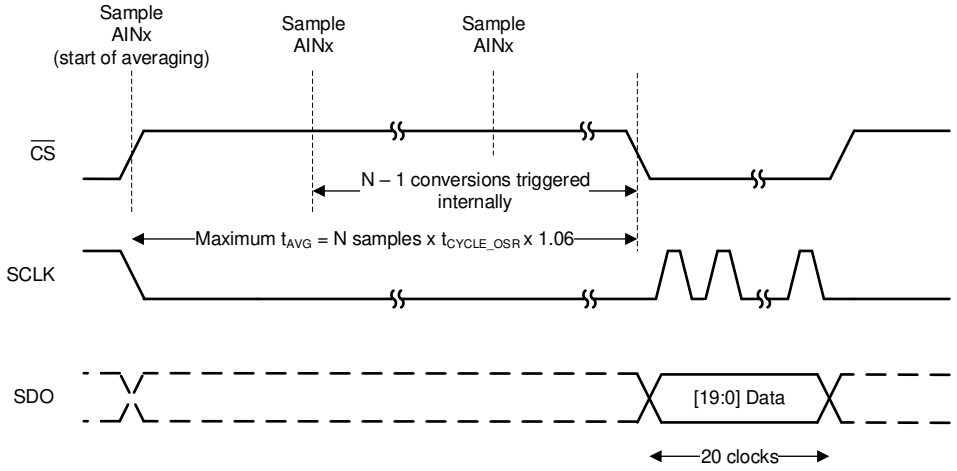

図 7-3. Averaged Output Data

7.3.6 CRC on Data Interface

The cyclic redundancy check (CRC) is an error checking code that detects communication errors to and from the host. CRC is the division remainder of the data payload bytes by a fixed polynomial. The data payload is two or three bytes, depending on the output data format; see the *Output Data Format* section for details on output data format. The CRC mode is optional and is enabled by the CRC_EN bit in the GENERAL_CFG register.

The CRC data byte is the 8-bit remainder of the bitwise exclusive-OR (XOR) operation of the argument by a CRC polynomial. The CRC polynomial is based on the CRC-8-CCITT: $X^8 + X^2 + X^1 + 1$. The nine binary polynomial coefficients are: 100000111. The CRC calculation is preset with *1* data values. For more details about the CRC implementation and for a software example, see the *Implementation of CRC for ADS7066* application report.

The host must compute and append the appropriate CRC to the command string in the same SPI frame (see the *Register Read/Write Operation* section). The ADC also computes the expected CRC corresponding to the payload received from the host and compares the calculated CRC code to the CRC received from the host. The CRC received from the host and the CRC calculated by the ADC over the received payload are compared to check for an exact match.

- If the calculated CRC and received CRC match then the data payload received from the host is valid.
- If the calculated CRC and received CRC do not match then the data payload received from the host is not valid and the command does not execute. The CRCERR_IN flag is set to 1b. ADC conversion data read and register read processes, with a valid CRC from the host, are still supported. The error condition can be detected, as listed in 表 7-2, by either status flags or by a register read. Further register writes to the device are blocked until the CRCERR_IN flag is cleared to 0b. Register write operations, with a valid CRC from the host, to the SYSTEM_STATUS (address = 0x00) and GENERAL_CFG (address = 0x01) registers are still supported.

表 7-2. Configuring Notifications When a CRC Error is Detected

CRC ERROR NOTIFICATION	CONFIGURATION	DESCRIPTION
Status flags	APPEND_STATUS = 10b	4-bit status flags, containing the CRCERR_IN bit appended to the ADC data; see the *Output Data Format* section for details.
Register read	—	Read the CRCERR_IN bit to check if a CRC error was detected.

For a conversion data read or register data read, the ADC responds with a CRC that is computed over the requested data payload bytes. The response data payload is one, two, or three bytes depending on the data operation (see the *Output CRC (Device to Host)* section).

7.3.7 Oscillator and Timing Control

The device uses an internal oscillator for conversion. When using the averaging module, the host initiates the first conversion and subsequent conversions are generated internally by the device. When the device generates the start of a conversion, the sampling rate can be controlled as described in 表 7-3 by the OSC_SEL and CLK_DIV[3:0] register fields.

The conversion time of the device, given by t_{CONV} in the *Switching Characteristics* table in the *Specifications* section, is independent of the OSC_SEL and CLK_DIV[3:0] configuration.

表 7-3. Configuring the Sampling Rate for Internal Conversion Start Control

CLK_DIV[3:0]	OSC_SEL = 0		OSC_SEL = 1	
	SAMPLING FREQUENCY, f_{CYCLE_OSR} (kSPS)	CYCLE TIME, t_{CYCLE_OSR} (µs)	SAMPLING FREQUENCY, f_{CYCLE_OSR} (kSPS)	CYCLE TIME, t_{CYCLE_OSR} (µs)

1101b	10.4	96	0.33	3072

7.3.8 Diagnostic Modes

The ADS7066 features a programmable test voltage generation circuit that can be used for ADC diagnostics.

7.3.8.1 Bit-Walk Test Mode

To enable write access to the configuration registers for diagnostics, write 0x96 in the DIAGNOSTICS_KEY register. To enable bit-walk test mode, configure BITWALK_EN = 1b. In the bit-walk test mode (see 図 7-1), the sampling switch (SW) remains open and the test voltage is applied on the sampling capacitor (C_{SH}) during the acquisition phase of the ADC. In diagnostic mode, the conversion process of the ADC remains the same as normal device operation. The ADC starts the conversion phase on the rising edge of $\overline{CS}$ and outputs the code corresponding to the sampled test voltage. The output code of the ADC is expected to be proportional to the test voltage, as shown in 式 2, after adjusting for DC errors (such as INL, gain error, offset error, and thermal drift of offset and gain errors).

$$\text{Output code} = \left(\frac{\text{Test voltage}}{V_{REF}} \times 2^{16}\right) \pm \text{TUE} \tag{2}$$

where

- TUE = Total unadjusted error, given by the root sum square of the offset error, gain error, and INL

The test voltage is generated by a DAC configured by the BIT_SAMPLE_MSB and BIT_SAMPLE_LSB registers. Because the test voltage is derived from the ADC reference, as given by 式 3, this diagnostic mode is not sensitive to variations in reference voltage.

$$\text{Test voltage} = \frac{V_{REF}}{\text{BIT\_SAMPLE}[15:0]} \pm \text{TUE} \tag{3}$$

To resume conversion of the ADC input signal, configure BITWALK_EN = 0b.

7.3.8.2 Fixed Voltage Test Mode

For diagnostics, the ADS7066 features a fixed 1.8 V (typical) test voltage which can be internally connected to AIN6. To connect AIN6 to the internal test voltage, set VTEST_EN = 1b. When using the fixed voltage test mode, AIN6 pin must be left floating and should not be connected to any external circuit.

If bit-walk test mode is enabled (that is, BITWALK_EN = 1b), enabling the fixed voltage test mode will connect AIN6 to the test voltage but the conversion result would be according to bit-walk test mode configuration.

7.3.9 Output Data Format

図 7-4 illustrates that the output data payload consists of a combination of the conversion result, data bits from averaging filters, status flags, and channel ID. The conversion result is MSB aligned. If averaging is enabled, the output data from the ADC are 20 bits long, otherwise the data are 16 bits long. Optionally, the 4-bit channel ID or status flags can be appended at the end of the output data by configuring the APPEND_STATUS[1:0] fields.

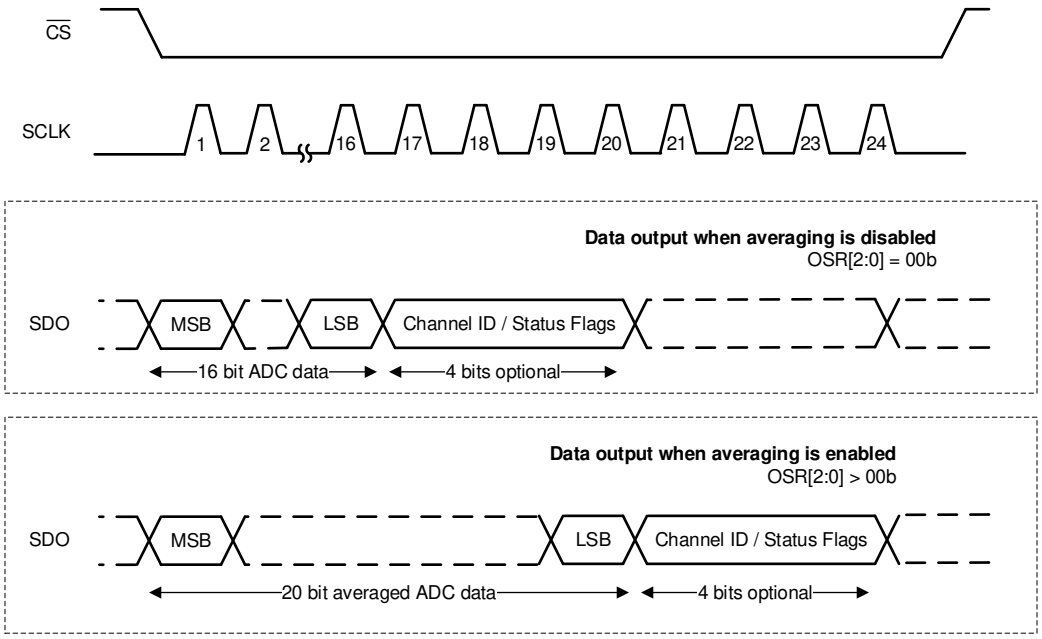

図 7-4. SPI Frames for Reading Data

7.3.9.1 Status Flags

Status flags can be appended to the ADC output by setting APPEND_STATUS = 10b. The status flag is appended only to frames where ADC data are being read. Status flags are not appended to data corresponding to a register read operation or when FIX_PAT = 1b. The 4-bit status flag field is constructed as follows:

Status flag[3:0] = { 1, VTEST_MODE, CRCERR_IN, DIAG_MODE }

where:

- VTEST_MODE: This flag is set if the current data frame corresponds to fixed voltage test mode (see the *Fixed Voltage Test Mode* section).
- CRCERR_IN: This flag indicates the status of the CRC verification of data received from the digital interface. This flag is the same as the CRCERR_IN bit in the SYSTEM_STATUS register.
- DIAG_MODE: This flag is set if the current data frame corresponds to the bit-walk test mode (see the *Bit-Walk Test Mode* section).

7.3.9.2 Output CRC (Device to Host)

A CRC byte can be appended to the output data by configuring CRC_EN to 1b. When the CRC module is enabled, the host must use 32-bit frames for SPI communication. The device outputs the data payload followed by the CRC byte computed over the data payload. Additional 0s can be appended by the ADC after the CRC byte to complete the 32-bit SPI frame (see 表 7-4). The host must compute and compare the CRC corresponding to the data payload with the CRC received from the ADC. The additional 0s appended by the device after the CRC byte must be excluded by the host for computing the CRC.

7.3.9.3 Input CRC (Host to Device)

When the CRC module is enabled, the host must always communicate with the ADC using 32-bit SPI frames comprised of a 24-bit data payload and an 8-bit CRC byte. The host must calculate the CRC byte to be appended based on a 24-bit payload. The ADC computes a CRC over the 24-bit data payload and compares the result with the CRC received from the host.表 7-4 lists the output data frames for the CRC_EN bit.

表 7-4. Output Data Frames

CRC_EN	OSR[2:0]	APPEND_STATUS[1:0]	OUTPUT DATA FRAME	DAISY-CHAIN MODE
CRC module disabled (CRC_EN = 0)	No averaging	No flags (00b or 11b)	{Conversion result [15:0], 8'b0}	Supported
		Channel ID (01b)	{Conversion result [15:0], CHID[3:0], 4'b0}	Supported
		Status flags (10b)	{Conversion result [15:0], status flags[3:0], 4'b0}	Supported
	Averaging enabled	No flags (00b or 11b)	{Conversion result [19:0], 4'b0}	Supported
		Channel ID (01b)	{Conversion result [19:0], CHID[3:0]}	Supported
		Status flags (10b)	{Conversion result [19:0], status flags[3:0]}	Supported
CRC module enabled (CRC_EN = 1)	No averaging	No flags (00b or 11b)	{Conversion result [15:0], CRC[7:0], 8'b0}	Supported
		Channel ID (01b)	{Conversion result [15:0], CHID[3:0], 4'b0, CRC[7:0]}	Not supported
		Status flags (10b)	{Conversion result [15:0], status flags[3:0], 4'b0, CRC[7:0]}	Not supported
	Averaging enabled	No flags (00b or 11b)	{Conversion result [19:0], 4'b0, CRC[7:0]}	Not supported
		Channel ID (01b)	{Conversion result [19:0], CHID[3:0], CRC[7:0]}	Not supported
		Status flags (10b)	{Conversion result [19:0], status flags[3:0], CRC[7:0]}	Not supported

7.3.10 Device Programming

7.3.10.1 Enhanced-SPI Interface

The device features an enhanced-SPI interface that allows the host controller to operate at slower SCLK speeds and still achieve full throughput. As described in 表 7-5, the host controller can use any of the four SPI-compatible protocols (SPI-00, SPI-01, SPI-10, or SPI-11) to access the device.

表 7-5. SPI Protocols for Configuring the Device

PROTOCOL	SCLK POLARITY (At the $\overline{CS}$ Falling Edge)	SCLK PHASE (Capture Edge)	CPOL_CPHA[1:0]	DIAGRAM
SPI-00	Low	Rising	00b	図 7-5
SPI-01	Low	Falling	01b	図 7-6
SPI-10	High	Falling	10b	図 7-5
SPI-11	High	Rising	11b	図 7-6

On power-up, the device defaults to the SPI-00 protocol for data read and data write operations. To select a different SPI-compatible protocol, program the CPOL_CPHA[1:0] field. This first write operation must adhere to the SPI-00 protocol. Any subsequent data transfer frames must adhere to the newly-selected protocol.

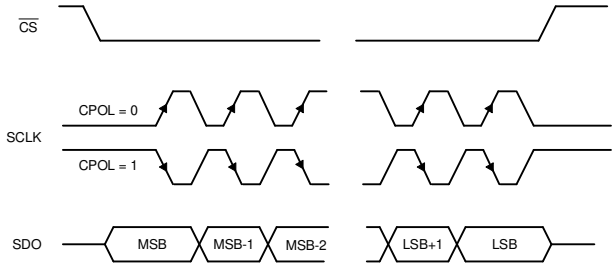

図 7-5. Standard SPI Timing Protocol (CPHA = 0)

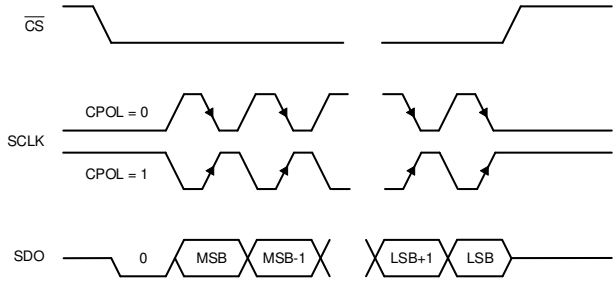

図 7-6. Standard SPI Timing Protocol (CPHA = 1)

7.3.10.2 Daisy-Chain Mode

The ADS7066 can operate as a single converter or in a system with multiple converters. System designers can take advantage of the simple, high-speed, enhanced-SPI serial interface by cascading converters in a daisy-chain configuration when multiple converters are used. No register configuration is required to enable daisy-chain mode. 図 7-7 shows a typical connection of three converters in daisy-chain mode.

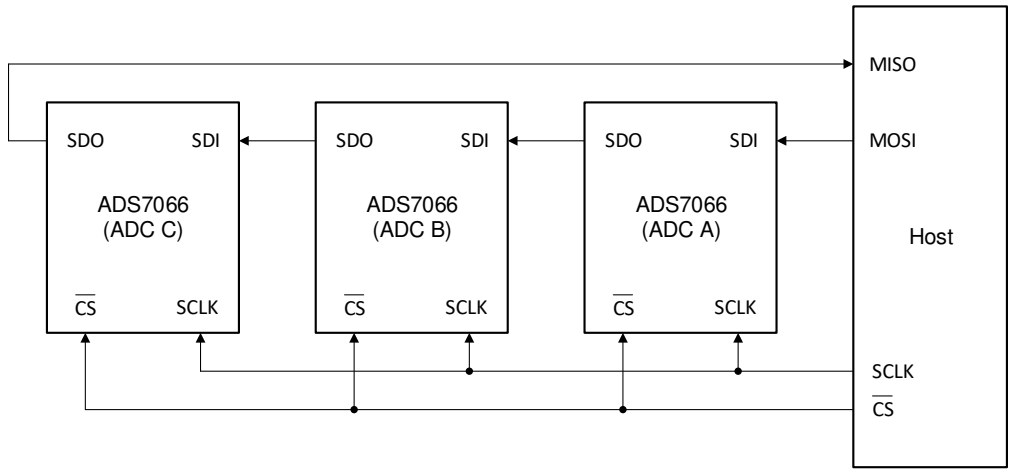

図 7-7. Multiple Converters Connected Using Daisy-Chain Mode

When the ADS7066 is connected in daisy-chain mode, the serial input data passes through the ADS7066 with a 24-SCLK delay, as long as $\overline{CS}$ is active. 図 7-8 shows a detailed timing diagram of this mode. In 図 7-8, the conversion in each converter is performed simultaneously.

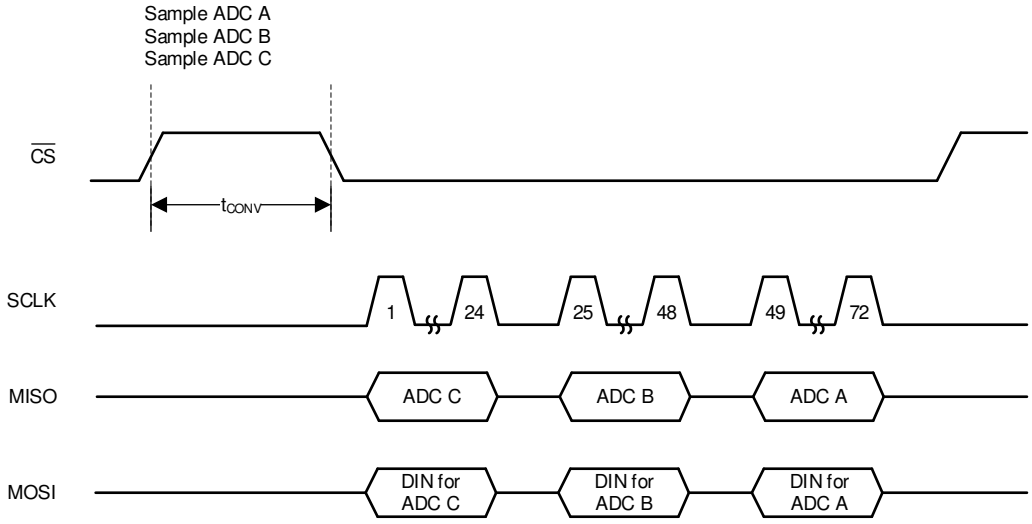

図 7-8. Simplified Daisy-Chain Mode Timing

The ADS7066 supports daisy-chain mode for output data payloads up to 24 bits long; see the *Output Data Format* section for more details. If either the status flags or channel ID are appended (APPEND_STATUS ≠ 00b) and the CRC module is enabled (CRC_EN = 1b), then the serial input data does not pass through the ADS7066 and daisy-chain mode is disabled.

7.3.10.3 Register Read/Write Operation

The device supports the commands listed in 表 7-6 to access the internal configuration registers

表 7-6. Opcodes for Commands

OPCODE	COMMAND DESCRIPTION
0000 0000b	No operation
0001 0000b	Single register read
0000 1000b	Single register write
0001 1000b	Set bit
0010 0000b	Clear bit

The clear bit command clears the specified bits (identified by 1) at the 8-bit address (without affecting the other bits), and the set bit command sets the specified bits (identified by 1) at the 8-bit address (without affecting the other bits).

7.3.10.3.1 Register Write

A 24-bit SPI frame is required to write data to configuration registers. The 24-bit data on SDI, as shown in 図 7-9, consists of an 8-bit write command (0000 1000b), an 8-bit register address, and 8-bit data. The write command is decoded on the $\overline{CS}$ rising edge and the specified register is updated with the 8-bit data specified in the register write operation.

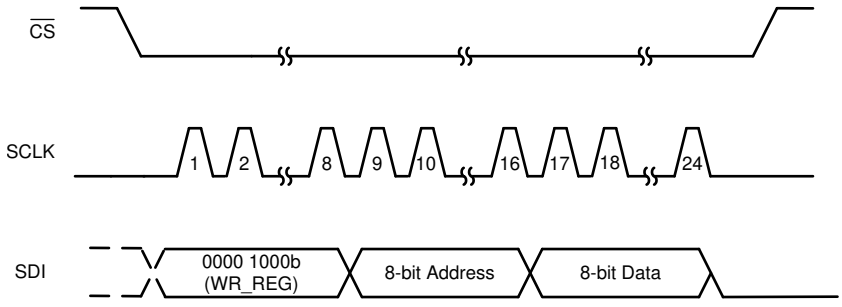

図 7-9. Register Write Operation

7.3.10.3.2 Register Read

A register read operation consists of two SPI frames: the first SPI frame initiates a register read and the second SPI frame reads data from the register address provided in the first frame. As shown in 図 7-10, the read command (0001 0000b), the 8-bit register address, and the 8-bit dummy data are sent over the SDI pin during the first 24-bit frame. On the rising edge of $\overline{CS}$, the read command is decoded and the requested register data are available for reading during the next frame. During the second frame, the first eight bits on SDO correspond to the requested register read. During the second frame, SDI can be used to initiate another operation or can be set to 0.

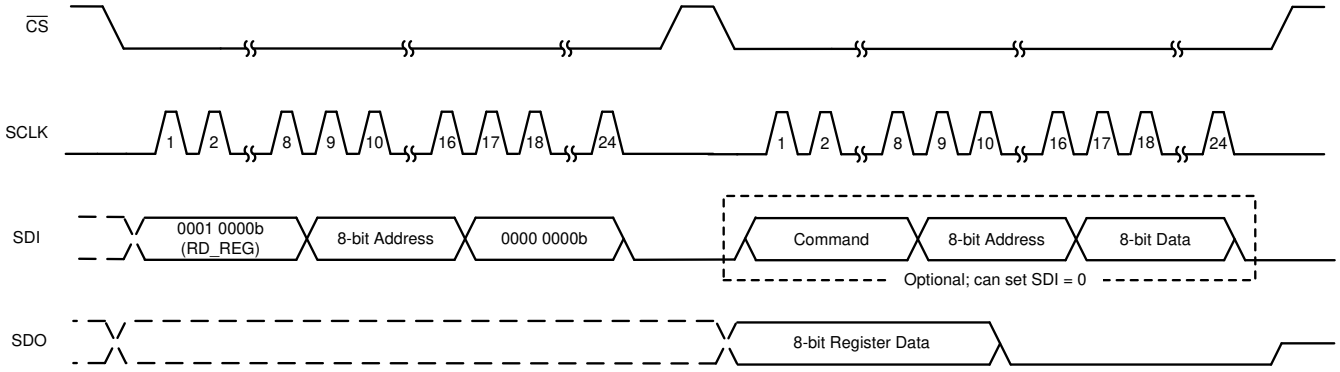

図 7-10. Register Read Operation

7.3.10.3.2.1 Register Read With CRC

A register read consists of two SPI frames, as described in the *Register Read* section. When the CRC module is enabled during a register read, as shown in 図 7-11, the device appends an 8-bit output CRC byte along with 8-bit register data. The output CRC is computed by the device on the 8-bit register data.

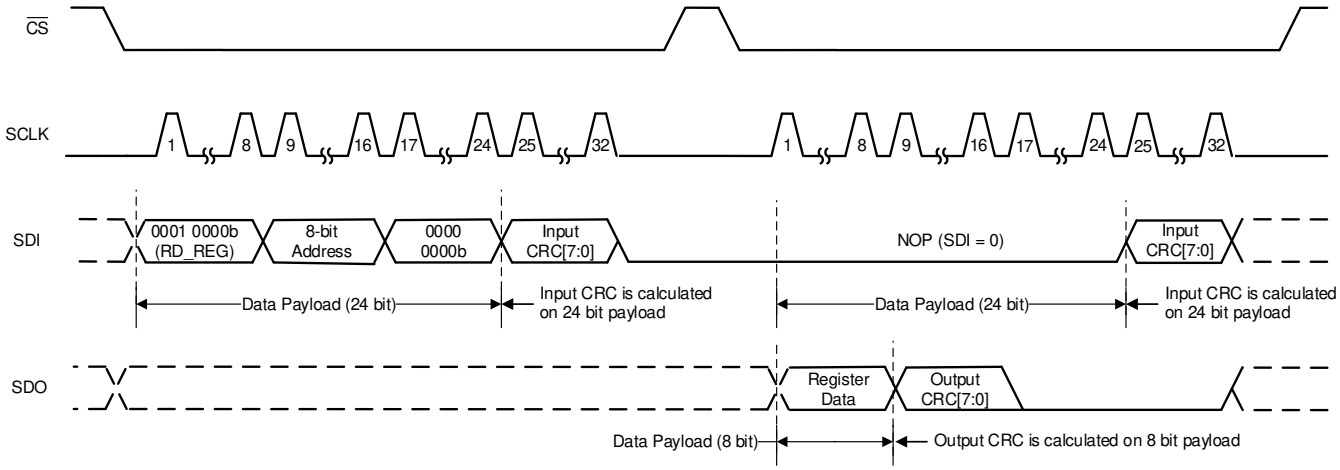

図 7-11. Register Read With CRC

7.4 Device Functional Modes

表 7-7 lists the functional modes supported by the ADS7066.

表 7-7. Functional Modes

FUNCTIONAL MODE	CONVERSION CONTROL	MUX CONTROL	SEQ_MODE[1:0]
Manual	$\overline{CS}$ rising edge	Register write to MANUAL_CHID	00b
On-the-fly	$\overline{CS}$ rising edge	First 5 bits after $\overline{CS}$ falling edge	10b
Auto-sequence	$\overline{CS}$ rising edge	Channel sequencer	01b
Autonomous	Internal to the device	Channel sequencer	01b

The device powers up in manual mode and can be configured into either of these modes by writing the configuration registers for the desired mode.

7.4.1 Device Power-Up and Reset

On power up, the BOR bit is set indicating a power-cycle or reset event. The device can be reset by setting the RST bit or by recycling the power on the AVDD pin.

7.4.2 Manual Mode

Manual mode allows the external host processor to directly select the analog input channel. 図 7-12 shows steps for operating the device in manual mode.

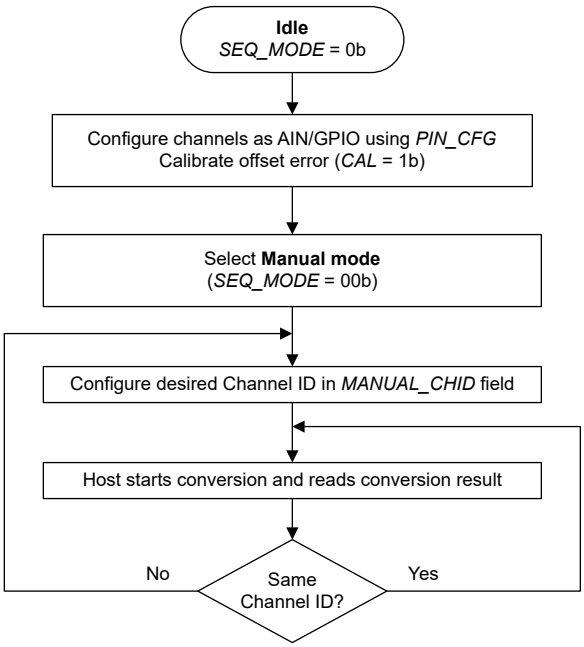

図 7-12. Device Operation in Manual Mode

In manual mode, the command to switch to a new channel, cycle N in 図 7-13, is decoded by the device on the $\overline{CS}$ rising edge. The $\overline{CS}$ rising edge is also the start of the conversion cycle, and thus the device samples the previously selected MUX channel in cycle N+1. The newly selected analog input channel data are available in cycle N+2. For switching the analog input channel, a register write to the MANUAL_CHID field requires 24 clocks; see the *Register Write* section for more details. After a channel is selected, the number of clocks required for reading the output data depends on the device output data frame size; see the *Output Data Format* section for more details.

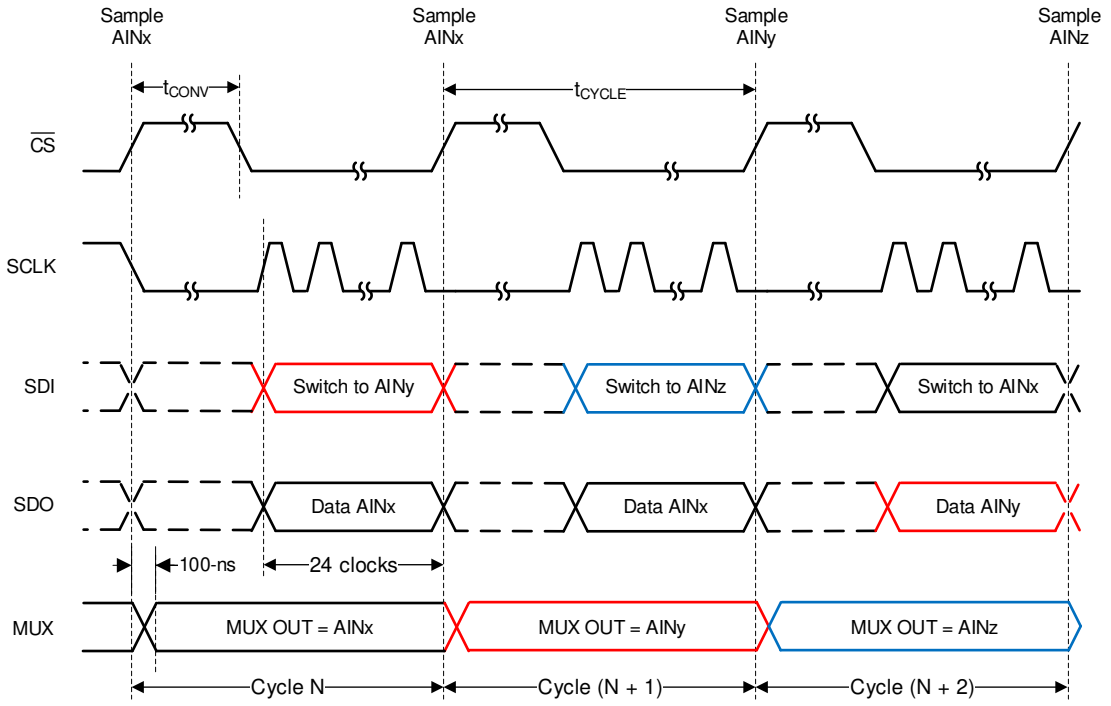

図 7-13. Starting a Conversion and Reading Data in Manual Mode

7.4.3 On-the-Fly Mode

In the on-the-fly mode of operation, as shown in 図 7-14, the analog input channel is selected using the first five bits on SDI without waiting for the $\overline{CS}$ rising edge. Thus, the ADC samples the newly selected channel on the $\overline{CS}$ rising edge and there is no latency between the channel selection and the ADC output data. 表 7-8 lists the channel selection commands for this mode.

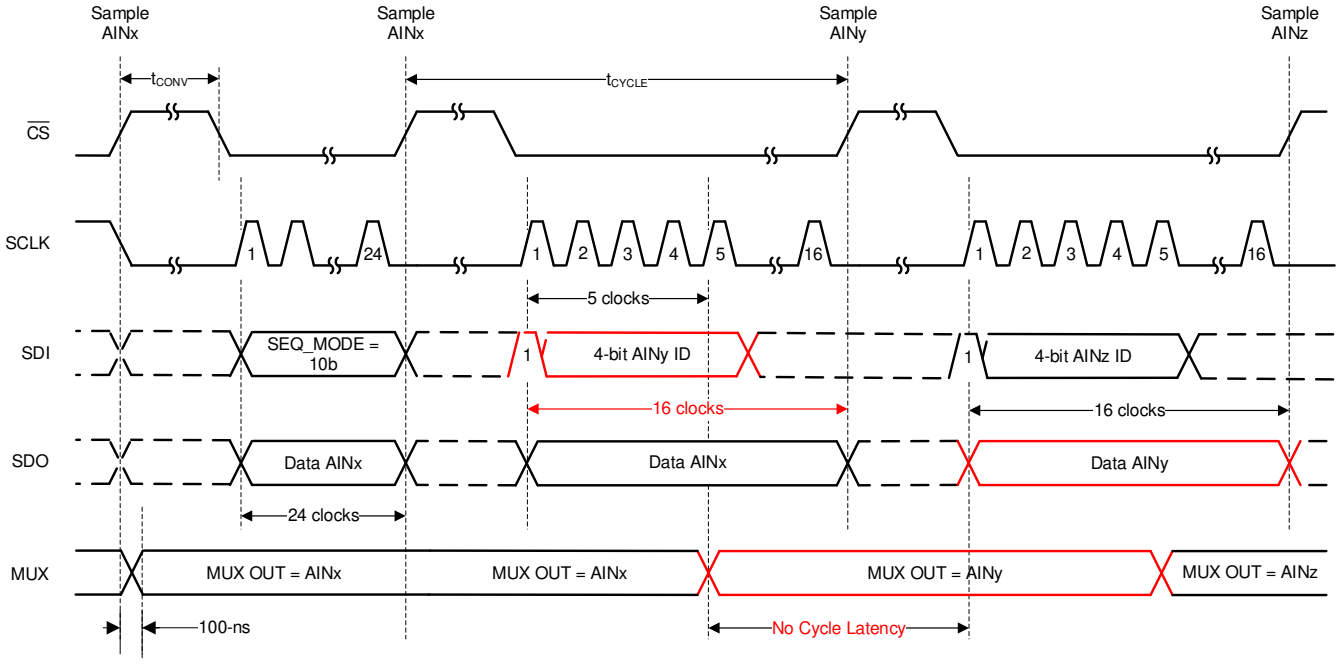

図 7-14. Starting a Conversion and Reading data in On-the-Fly Mode

表 7-8. On-the-Fly Mode Channel Selection Commands

SDI BITS[15:11]	SDI BITS [10:0]	DESCRIPTION
1 0000	Don't care	Select analog input 0
1 0001	Don't care	Select analog input 1
1 0010	Don't care	Select analog input 2
1 0011	Don't care	Select analog input 3
1 0100	Don't care	Select analog input 4
1 0101	Don't care	Select analog input 5
1 0110	Don't care	Select analog input 6
1 0111	Don't care	Select analog input 7
1 1000 to 1 1111	Don't care	Reserved

The number of clocks required for reading the output data depends on the device output data frame size; see the *Output Data Format* section for more details.

7.4.4 Auto-Sequence Mode

In auto-sequence mode, the internal channel sequencer switches the multiplexer to the next analog input channel after every conversion. The desired analog input channels can be configured for sequencing in the AUTO_SEQ_CHSEL register. To enable the channel sequencer, set SEQ_START = 1b. After every conversion, the channel sequencer switches the multiplexer to the next analog input in ascending order. To stop the channel sequencer from selecting channels, set SEQ_START = 0b.

In the example shown in 図 7-15, AIN2 and AIN6 are enabled for sequencing in the AUTO_SEQ_CHSEL register. The channel sequencer loops through AIN2 and AIN6 and repeats until SEQ_START is set to 0b. The number of clocks required for reading the output data depends on the device output data frame size; see the *Output Data Format* section for more details.

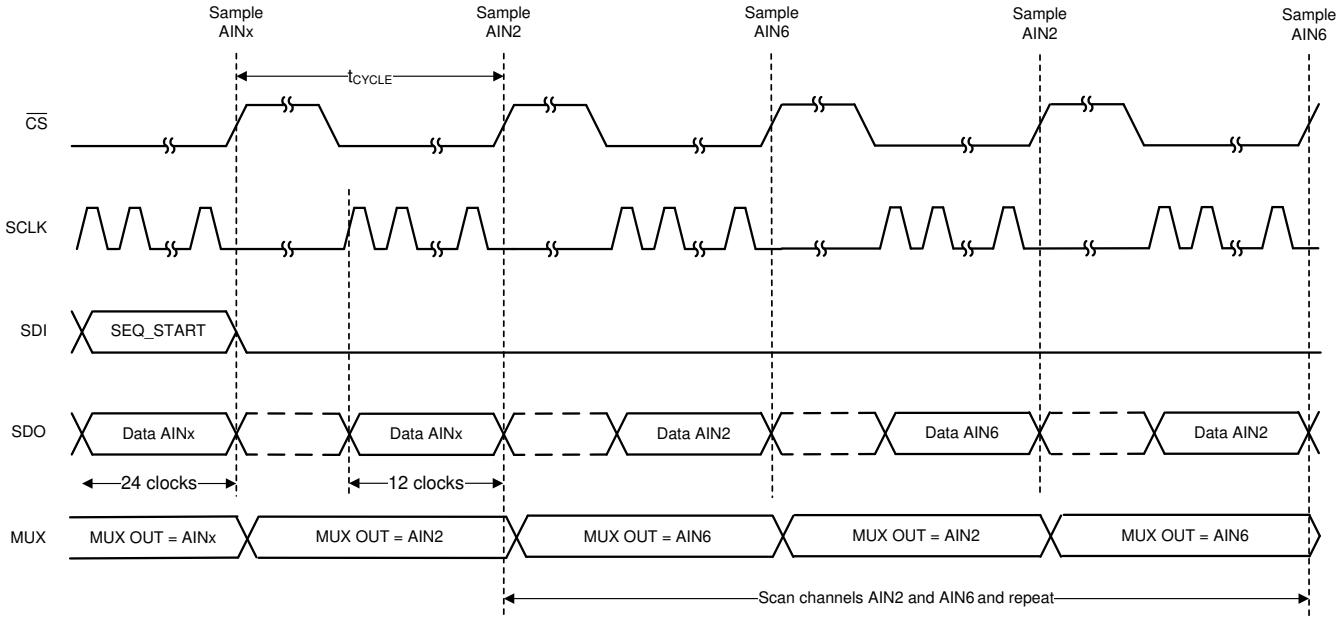

図 7-15. Starting Conversion and Reading Data in Auto-Sequence Mode

7.5 ADS7066 Registers

ADS7066 Registers lists the memory-mapped registers for the ADS7066 registers. All register offset addresses not listed in ADS7066 Registers should be considered as reserved locations and the register contents should not be modified.

表 7-9. ADS7066 Registers

Address	Acronym	Register Name	Section
0x0	SYSTEM_STATUS		SYSTEM_STATUS Register (Address = 0x0) [Reset = 0x81]
0x1	GENERAL_CFG		GENERAL_CFG Register (Address = 0x1) [Reset = 0x00]
0x2	DATA_CFG		DATA_CFG Register (Address = 0x2) [Reset = 0x00]
0x3	OSR_CFG		OSR_CFG Register (Address = 0x3) [Reset = 0x00]
0x4	OPMODE_CFG		OPMODE_CFG Register (Address = 0x4) [Reset = 0x04]
0x5	PIN_CFG		PIN_CFG Register (Address = 0x5) [Reset = 0x00]
0x7	GPIO_CFG		GPIO_CFG Register (Address = 0x7) [Reset = 0x00]
0x9	GPO_DRIVE_CFG		GPO_DRIVE_CFG Register (Address = 0x9) [Reset = 0x00]
0xB	GPO_OUTPUT_VALUE		GPO_OUTPUT_VALUE Register (Address = 0xB) [Reset = 0x00]
0xD	GPI_VALUE		GPI_VALUE Register (Address = 0xD) [Reset = 0x00]
0x10	SEQUENCE_CFG		SEQUENCE_CFG Register (Address = 0x10) [Reset = 0x00]
0x11	CHANNEL_SEL		CHANNEL_SEL Register (Address = 0x11) [Reset = 0x00]
0x12	AUTO_SEQ_CH_SEL		AUTO_SEQ_CH_SEL Register (Address = 0x12) [Reset = 0x00]
0xBF	DIAGNOSTICS_KEY		DIAGNOSTICS_KEY Register (Address = 0xBF) [Reset = 0x00]
0xC0	DIAGNOSTICS_EN		DIAGNOSTICS_EN Register (Address = 0xC0) [Reset = 0x00]
0xC1	BIT_SAMPLE_LSB		BIT_SAMPLE_LSB Register (Address = 0xC1) [Reset = 0x00]
0xC2	BIT_SAMPLE_MSB		BIT_SAMPLE_MSB Register (Address = 0xC2) [Reset = 0x00]

Complex bit access types are encoded to fit into small table cells. ADS7066 Access Type Codes shows the codes that are used for access types in this section.

表 7-10. ADS7066 Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.

表 7-10. ADS7066 Access Type Codes (続き)

Access Type	Code	Description
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

7.5.1 SYSTEM_STATUS Register (Address = 0x0) [Reset = 0x81]

SYSTEM_STATUS is shown in SYSTEM_STATUS Register Field Descriptions.

Return to the Summary Table.

表 7-11. SYSTEM_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RSVD	R	1b	Reads return 1b.
6	SEQ_STATUS	R	0b	Status of the channel sequencer. 0b = Sequence stopped 1b = Sequence in progress
5-3	RESERVED	R	000b	Reserved Bit
2	CRCERR_FUSE	R	0b	Device power-up configuration CRC check status. To re-evaluate this bit, software reset the device or power cycle AVDD. 0b = No problems detected in power-up configuration. 1b = Device configuration not loaded correctly.
1	CRCERR_IN	R/W	0b	Status of CRC check on incoming data. Write 1b to clear this error flag. 0b = No CRC error. 1b = CRC error detected. All register writes, except to addresses 0x00 and 0x01, are blocked.
0	BOR	R/W	1b	Brown out reset indicator. This bit is set if brown out condition occurs or device is power cycled. Write 1b to this bit to clear the flag. 0b = No brown out since last time this bit was cleared. 1b = Brown out condition detected or device power cycled.

7.5.2 GENERAL_CFG Register (Address = 0x1) [Reset = 0x00]

GENERAL_CFG is shown in GENERAL_CFG Register Field Descriptions.

Return to the Summary Table.

表 7-12. GENERAL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	REF_EN	R/W	0b	Enable or disable the internal reference. 0b = Internal reference is powered down. 1b = Internal reference is enabled.
6	CRC_EN	R/W	0b	Enable or disable the CRC on device interface. 0b = CRC module disabled. 1b = CRC appended to data output. CRC check is enabled on incoming data.
5-4	RESERVED	R	00b	Reserved Bit
3	RANGE	R/W	0b	Select the input range of the ADC. 0b = Input range of the ADC is 1x VREF 1b = Input range of the ADC is 2x VREF

表 7-12. GENERAL_CFG Register Field Descriptions (続き)

Bit	Field	Type	Reset	Description
2	CH_RST	R/W	0b	Force all channels to be analog inputs. 0b = Normal operation 1b = All channels will be set as analog inputs irrespective of configuration in other registers
1	CAL	R/W	0b	Calibrate ADC offset. 0b = Normal operation. 1b = ADC offset is calibrated. After calibration is complete, this bit is set to 0b.
0	RST	W	0b	Software reset all registers to default values. 0b = Normal operation. 1b = Device is reset. After reset is complete, this bit is set to 0b and BOR bit is set to 1b.

7.5.3 DATA_CFG Register (Address = 0x2) [Reset = 0x00]

DATA_CFG is shown in DATA_CFG Register Field Descriptions.

Return to the Summary Table.

表 7-13. DATA_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	FIX_PAT	R/W	0b	Device outputs fixed data bits which can be helpful for debugging communication with the device. 0b = Normal operation. 1b = Device outputs fixed code 0xA5A5 repeatitively when reading ADC data.
6	RESERVED	R	0b	Reserved Bit
5-4	APPEND_STATUS[1:0]	R/W	00b	Append 4-bit channel ID or status flags to output data. 00b = Channel ID and status flags are not appended to ADC data. 01b = 4-bit channel ID is appended to ADC data. 10b = 4-bit status flags are appended to ADC data. 11b = Reserved.
3-2	RESERVED	R	00b	Reserved Bit
1-0	CPOL_CPHA[1:0]	R/W	00b	This field sets the polarity and phase of SPI communication. 00b = CPOL = 0, CPHA = 0. 01b = CPOL = 0, CPHA = 1. 10b = CPOL = 1, CPHA = 0. 11b = CPOL = 1, CPHA = 1.

7.5.4 OSR_CFG Register (Address = 0x3) [Reset = 0x00]

OSR_CFG is shown in OSR_CFG Register Field Descriptions.

Return to the Summary Table.

表 7-14. OSR_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-3	RESERVED	R	00000b	Reserved Bit

表 7-14. OSR_CFG Register Field Descriptions (続き)

Bit	Field	Type	Reset	Description
2-0	OSR[2:0]	R/W	000b	Selects the oversampling ratio for ADC conversion result. 000b = No averaging 001b = 2 samples 010b = 4 samples 011b = 8 samples 100b = 16 samples 101b = 32 samples 110b = 64 samples 111b = 128 samples

7.5.5 OPMODE_CFG Register (Address = 0x4) [Reset = 0x04]

OPMODE_CFG is shown in OPMODE_CFG Register Field Descriptions.

Return to the Summary Table.

表 7-15. OPMODE_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-5	RESERVED	R	000b	Reserved Bit
4	OSC_SEL	R/W	0b	Selects the oscillator for internal timing generation. 0b = High-speed oscillator. 1b = Low-power oscillator.
3-0	CLK_DIV[3:0]	R/W	0100b	Sampling speed control when using averaging filters. Refer to section on oscillator and timing control for details.

7.5.6 PIN_CFG Register (Address = 0x5) [Reset = 0x00]

PIN_CFG is shown in PIN_CFG Register Field Descriptions.

Return to the Summary Table.

表 7-16. PIN_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	PIN_CFG[7:0]	R/W	00000000b	Configure device channels AIN/GPIO [7:0] as analog inputs or GPIOs. 00000000b = Channel is configured as analog input. 00000001b = Channel is configured as GPIO.

7.5.7 GPIO_CFG Register (Address = 0x7) [Reset = 0x00]

GPIO_CFG is shown in GPIO_CFG Register Field Descriptions.

Return to the Summary Table.

表 7-17. GPIO_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	GPIO_CFG[7:0]	R/W	00000000b	Configure GPIO[7:0] as either digital inputs or digital outputs. 00000000b = GPIO is configured as digital input. 00000001b = GPIO is configured as digital output.

7.5.8 GPO_DRIVE_CFG Register (Address = 0x9) [Reset = 0x00]

GPO_DRIVE_CFG is shown in GPO_DRIVE_CFG Register Field Descriptions.

Return to the Summary Table.

表 7-18. GPO_DRIVE_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	GPO_DRIVE_CFG[7:0]	R/W	00000000b	Configure digital outputs GPO[7:0] as open-drain or push-pull outputs. 00000000b = Digital output is open-drain; connect external pullup resistor. 00000001b = Push-pull driver is used for digital output.

7.5.9 GPO_OUTPUT_VALUE Register (Address = 0xB) [Reset = 0x00]

GPO_OUTPUT_VALUE is shown in GPO_OUTPUT_VALUE Register Field Descriptions.

Return to the Summary Table.

表 7-19. GPO_OUTPUT_VALUE Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	GPO_OUTPUT_VALUE[7:0]	R/W	00000000b	Logic level to be set on digital outputs GPO[7:0]. 00000000b = Digital output set to logic 0. 00000001b = Digital output set to logic 1.

7.5.10 GPI_VALUE Register (Address = 0xD) [Reset = 0x00]

GPI_VALUE is shown in GPI_VALUE Register Field Descriptions.

Return to the Summary Table.

表 7-20. GPI_VALUE Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	GPI_VALUE[7:0]	R	00000000b	Readback the logic level on GPIO[7:0]. 00000000b = GPIO is at logic 0. 00000001b = GPIO is at logic 1.

7.5.11 SEQUENCE_CFG Register (Address = 0x10) [Reset = 0x00]

SEQUENCE_CFG is shown in SEQUENCE_CFG Register Field Descriptions.

Return to the Summary Table.

表 7-21. SEQUENCE_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
7-5	RESERVED	R	000b	Reserved Bit
4	SEQ_START	R/W	0b	Control for start of channel sequence when using auto sequence mode (SEQ_MODE = 01b). 0b = Stop channel sequencing. 1b = Start channel sequencing in ascending order for channels enabled in AUTO_SEQ_CH_SEL register.
3-2	RESERVED	R	00b	Reserved Bit

表 7-21. SEQUENCE_CFG Register Field Descriptions (続き)

Bit	Field	Type	Reset	Description
1-0	SEQ_MODE[1:0]	R/W	00b	Selects the mode of scanning of analog input channels. 00b = Manual sequence mode; channel selected by MANUAL_CHID field. 01b = Auto sequence mode; channel selected by AUTO_SEQ_CHSEL. 10b = On-the-fly sequence mode. 11b = Reserved.

7.5.12 CHANNEL_SEL Register (Address = 0x11) [Reset = 0x00]

CHANNEL_SEL is shown in CHANNEL_SEL Register Field Descriptions.

Return to the Summary Table.

表 7-22. CHANNEL_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
7-4	RESERVED	R	0000b	Reserved Bit
3-0	MANUAL_CHID[3:0]	R/W	0000b	In manual mode (SEQ_MODE = 00b), this field contains the 4-bit channel ID of the analog input channel for next ADC conversion. For valid ADC data, the selected channel must not be configured as GPIO in PIN_CFG register. 1xxx = Reserved. 0000b = AIN0 0001b = AIN1 0010b = AIN2 0011b = AIN3 0100b = AIN4 0101b = AIN5 0110b = AIN6 0111b = AIN7 1000b = Reserved.

7.5.13 AUTO_SEQ_CH_SEL Register (Address = 0x12) [Reset = 0x00]

AUTO_SEQ_CH_SEL is shown in AUTO_SEQ_CH_SEL Register Field Descriptions.

Return to the Summary Table.

表 7-23. AUTO_SEQ_CH_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	AUTO_SEQ_CH_SEL[7:0]	R/W	00000000b	Select analog input channels AIN[7:0] in for auto sequencing mode. 00000000b = Analog input channel is not enabled in scanning sequence. 00000001b = Analog input channel is enabled in scanning sequence.

7.5.14 DIAGNOSTICS_KEY Register (Address = 0xBF) [Reset = 0x00]

DIAGNOSTICS_KEY is shown in DIAGNOSTICS_KEY Register Field Descriptions.

Return to the Summary Table.

表 7-24. DIAGNOSTICS_KEY Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	DIAG_KEY[7:0]	R/W	00000000b	Enable write access to diagnostics registers in address locations 0xC0, 0xC1, and 0xC2. Write 0x96 to this register to enable write access to diagnostics registers.

7.5.15 DIAGNOSTICS_EN Register (Address = 0xC0) [Reset = 0x00]

DIAGNOSTICS_EN is shown in DIAGNOSTICS_EN Register Field Descriptions.

Return to the Summary Table.

表 7-25. DIAGNOSTICS_EN Register Field Descriptions

Bit	Field	Type	Reset	Description
7-5	RESERVED	R	000b	Reserved Bit
4	VTEST_EN	R/W	0b	Enable measurement of internal 1.8 V (typical) test voltage using AIN6. When using this mode, AIN6 pin should not be left floating and should not be connected to any external circuit. If BITWALK_EN = 1b, this bit has no effect. 0b = Normal operation. 1b = AIN6 is internally connected to 1.8V (typical) test voltage. AIN6 pin should be floating and should not be connected to any external circuit.
3-1	RESERVED	R	000b	Reserved Bit
0	BITWALK_EN	R/W	0b	Enable bit-walk mode of the ADC bit decisions. 0b = Normal operation. 1b = Bit walk mode enabled.

7.5.16 BIT_SAMPLE_LSB Register (Address = 0xC1) [Reset = 0x00]

BIT_SAMPLE_LSB is shown in BIT_SAMPLE_LSB Register Field Descriptions.

Return to the Summary Table.

表 7-26. BIT_SAMPLE_LSB Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	BIT_SAMPLE_LSB[7:0]	R/W	00000000b	Define the [7:0] bit positions during sampling phase of the ADC. This field has no effet when DIAG_EN = 0.

7.5.17 BIT_SAMPLE_MSB Register (Address = 0xC2) [Reset = 0x00]

BIT_SAMPLE_MSB is shown in BIT_SAMPLE_MSB Register Field Descriptions.

Return to the Summary Table.

表 7-27. BIT_SAMPLE_MSB Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	BIT_SAMPLE_MSB[7:0]	R/W	00000000b	Define the [15:8] bit positions during sampling phase of the ADC. This field has no effet when DIAG_EN = 0.

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The primary circuit required to maximize the performance of a high-precision, successive approximation register (SAR), analog-to-digital converter (ADC) is the input driver circuits. This section details some general principles for designing the input driver circuit for the ADS7066.

8.2 Typical Application

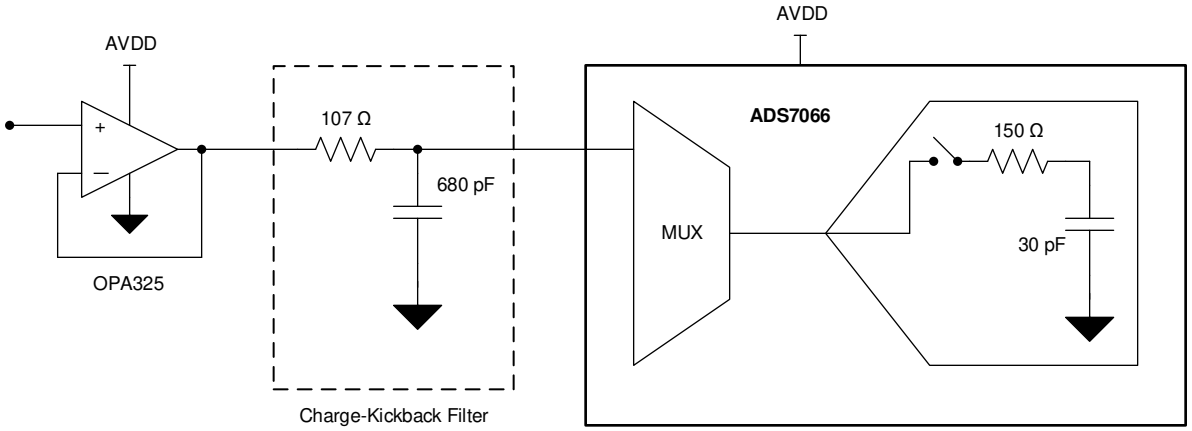

図 8-1. DAQ Circuit: Single-Supply DAQ

8.2.1 Design Requirements

The goal of this application is to design a single-supply digital acquisition (DAQ) circuit based on the ADS7066 with SNR greater than 80 dB and THD less than –80 dB for input frequencies of 2 kHz at full throughput.

8.2.2 Detailed Design Procedure

The optimal input driver circuit for a high-precision SAR ADC consists of a driving amplifier and a charge-kickback filter (RC filter). The amplifier driving the ADC must have low output impedance and be able to charge the internal sampling capacitor to a 16-bit settling level within the minimum acquisition time. The charge-kickback filter helps attenuate the sampling charge injection from the switched-capacitor input stage of the ADC and helps reduce the wide-band noise contributed by the front-end circuit.

8.2.2.1 Charge-Kickback Filter and ADC Amplifier

As illustrated in 図 8-1, a filter capacitor (C_{FLT}) is connected from each input pin of the ADC to ground. This capacitor helps reduce the sampling charge injection and provides a charge bucket to quickly charge the internal sample-and-hold capacitors during the acquisition process. This capacitor must be a COG- or NPO-type. One method for determining the required amplifier bandwidth and the values of the RC charge-kickback filter is provided in this section. This optimization and more details on the math behind the component selection are covered in ADC Precision Labs.

The minimum bandwidth of the amplifier for driving the ADC can be computed using the settling accuracy (0.5 LSB) and settling time (acquisition time) information. 式 4, 式 5, 式 6, and 式 7 compute the unity-gain bandwidth (UGBW) of the amplifier.

$$LSB = \frac{V_{REF}}{2^N} = \frac{2.5\ V}{2^{16}} = 38.2\ \mu V \tag{4}$$

$$\tau_c = \frac{-t_{ACQ}}{\ln\left(\frac{0.5 \cdot LSB}{100\ mV}\right)} = \frac{-800\ ns}{\ln\left(\frac{0.5 \cdot (38.2\ \mu V)}{100\ mV}\right)} = 93.4\ ns \tag{5}$$

$$\tau_{oa} = \frac{\tau_c}{\sqrt{17}} = \frac{93.4\ ns}{\sqrt{17}} = 22.7\ ns \tag{6}$$

$$UGBW = \frac{1}{2 \cdot \pi \cdot \tau_{oa}} = \frac{1}{2 \cdot \pi \cdot (22.7\ ns)} = 7\ MHz \tag{7}$$

Based on the result of 式 7, select an amplifier that has more than 7-MHz UGBW. For this example, OPA325 is used.

The value of C_{filt} is computed in 式 8 by taking 20 times the internal sample-and-hold capacitance. The factor of 20 is a rule of thumb that is intended to minimize the droop in voltage on the charge-bucket capacitor, C_{filt}, after the start of the acquisition period. The filter resistor, R_{filt}, is computed in 式 9 using the op-amp time constant and C_{filt}. 式 10 and 式 11 compute the minimum and maximum R_{filt} values, respectively.

$$C_{filt} = 20 \cdot C_{SH} = 20 \cdot (30pF) = 600\ pF \tag{8}$$

The value of C_{filt} can be approximated to the nearest standard value 680 pF.

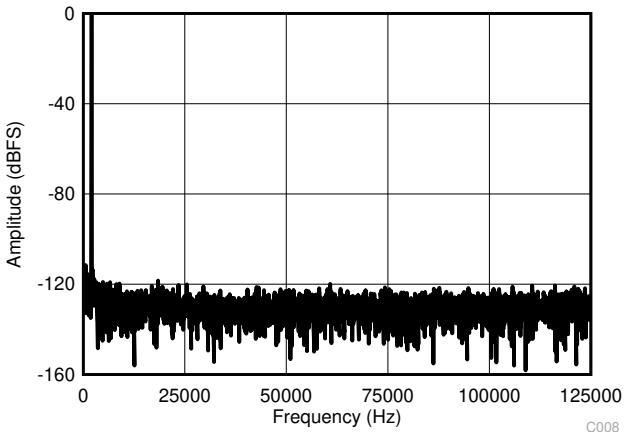
$$R_{filt} = \frac{4 \times \tau_{oa}}{C_{filt}} = \frac{4 \times (22.7\ ns)}{680\ pF} = 133.5\ \Omega \tag{9}$$

$$R_{filt\,Min} = 0.25 \times R_{filt} = 0.25 \times (133.5\ \Omega) = 33.4\ \Omega \tag{10}$$

$$R_{filt\,Max} = 2 \times R_{filt} = 2 \times (133.5\ \Omega) = 267\ \Omega \tag{11}$$

8.2.3 Application Curve

図 8-2 shows the FFT plot for the ADS7066 with a 2-kHz input frequency used for the circuit in 図 8-1.



f_{IN} = 2 kHz, SNR = 86.6 dBFS, THD = –97 dB

図 8-2. Test Results for the Single-Supply DAQ Circuit

8.3 Power Supply Recommendations

8.3.1 AVDD and DVDD Supply Recommendations

The ADS7066 has two separate power supplies: AVDD and DVDD. The device operates on AVDD; DVDD is used for the interface circuits. AVDD and DVDD can be independently set to any value within the permissible ranges. As shown in 図 8-3, decouple the AVDD and DVDD pins individually with 1-µF ceramic decoupling capacitors.

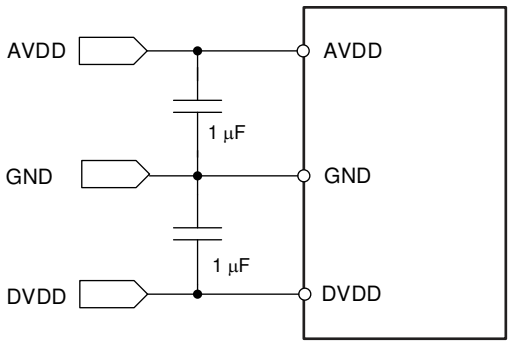


図 8-3. Power-Supply Decoupling

8.4 Layout

8.4.1 Layout Guidelines

図 8-4 shows a board layout example for the ADS7066. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the reference input signals away from noise sources.

Use 1-µF ceramic bypass capacitors in close proximity to the analog (AVDD) and digital (DVDD) power-supply pins. Avoid placing vias between the AVDD and DVDD pins and the bypass capacitors. Connect all ground pins to the ground plane using short, low-impedance paths.

Place the reference decoupling capacitor (C_{REF}) close to the device REF and GND pins. Avoid placing vias between the REF pin and the bypass capacitors.

The charge-kickback RC filters are placed close to the device. Among ceramic surface-mount capacitors, COG- or NPO-type ceramic capacitors provide the best capacitance precision. The type of dielectric used in COG- or NPO-type ceramic capacitors provides the most stable electrical properties over voltage, frequency, and temperature changes.

9.6 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

9.7 用語集

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
