

# DRV2605 ERMおよびLRA用ハプティクス・ドライバ、ライブラリおよびスマート・ループ・アーキテクチャ搭載

## 1 特長

- 柔軟な触覚/振動ドライバ
  - LRA (リニア共振アクチュエータ)
  - ERM (偏心回転質量)
- I<sup>2</sup>C制御のデジタル・プレイバック・エンジン
  - I<sup>2</sup>Cによるリアルタイム・プレイバック・モード
- スマート・ループ・アーキテクチャ<sup>(1)</sup>
  - 自動オーバードライブ/ブレーキ(ERM/LRA)
  - 自動共振トラッキング(LRA)
  - 自動アクチュエータ診断(ERM/LRA)
  - 自動レベル較正(ERM/LRA)
- ライセンスされた Immersion™ TouchSense® 2200の機能
  - Immersionエフェクト・ライブラリを内蔵
  - オーディオから振動への変換
- オプションのPWM入力、デューティ・サイクルの制御範囲0%~100%
- オプションのアナログ入力制御
- オプションのハードウェア・トリガ・ピン
- 効率的な出力の駆動
- 短いスタートアップ時間
- 電源電圧範囲全体で一定の加速
- 1.8V互換、VDD許容のデジタル・ピン

<sup>(1)</sup> 特許出願中の制御アルゴリズム

## 2 アプリケーション

- 携帯電話およびタブレット
- 時計およびウェアラブル・テクノロジー
- リモート制御、マウス、ペリフェラル・デバイス
- タッチ対応デバイス
- ヒューマン・マシン・インターフェイス

## 3 概要

DRV2605デバイスは、ERMおよびLRAアクチュエータの非常に柔軟な触覚制御を、共有のI<sup>2</sup>C互換バス上で行うよう設計されています。この制御によって、ホスト・プロセッサはパルス幅変調(PWM)駆動信号を一切生成する必要がなくなり、高価なタイム割り込みやハードウェア・ピンを削減できます。

DRV2605デバイスには包括的なライブラリが内蔵され、ImmersionからERMおよびLRA用にライセンスされた100を超える効果が組み込まれているため、触覚波形をデザインする必要がありません。

DRV2605デバイスにはImmersion製のTouchSense 2200ソフトウェアがライセンスされて内蔵されており、これには2200エフェクト・ライブラリおよび2200オーディオから振動への変換機能が含まれています。さらに、リアルタイム・プレイバック・モードではホスト・プロセッサがライブラリ・プレイバック・エンジンをバイパスして、I<sup>2</sup>C経由でホストから直接波形を再生できます。

また、DRV2605デバイスにはスマート・ループ・アーキテクチャが含まれており、LRAに加えて帰還最適化されたERMドライブの自動共振駆動を簡単に行えます。この帰還によりオーバードライブとブレーキを自動的に行え、単純化された入力波形パラダイムが作成されるとともに、信頼性の高いモータ制御と、一貫したモータ性能が実現されます。このオーディオから触覚への変換モードでは、オーディオ入力信号が自動的に、意味のある触覚効果に変換されます。

DRV2605デバイスには、3重変調された出力段があり、リニア・ベースの出力ドライバよりも高い効率が得られます。9ボールWCSPのフットプリント、柔軟な動作、少ない部品数から、DRV2605デバイスは携帯用およびタッチ対応の振動および触覚アプリケーションに理想的な選択肢です。

Immersionソフトウェアに関する重要な告知については、「[法的告知](#)」セクションを参照してください。

### 製品情報<sup>(1)</sup>

| 型番      | パッケージ     | 本体サイズ (最大)    |
|---------|-----------|---------------|
| DRV2605 | DSBGA (9) | 1.50mmx1.50mm |

<sup>(1)</sup> 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

## 4 改訂履歴

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

| Revision D (December 2015) から Revision E に変更  | Page |
|---|------|
| • Changed the DEFAULT value for bit 5-4 of <a href="#">Table 25</a> From: 1 To 3  | 46   |
| • Changed the DEFAULT value for bit 3-2 of <a href="#">Table 25</a> From: 2 To 1  | 46   |
| • Changed the DEFAULT value for bit 1-0 of <a href="#">Table 25</a> From: 2 To 1  | 46   |
| • Changed the typical value of $C_{(VDD)}$ in <a href="#">Table 30</a> From: 0.1 $\mu$ F To: 1 $\mu$ F                            | 49   |
| • Changed $C_{(VDD)}$ from 0.1 to 1 $\mu$ F in <a href="#">Figure 56</a>  | 50   |
| • Changed the input-voltage supply range From: 2 V to 5.2 V To: 2.5 V to 5.5 V in the <i>Power Supply Recommendations</i> section | 54   |

| Revision C (September 2014) から Revision D に変更   | Page |
|---|------|
| • Changed $t_{h(1)}$ Hold time, SCL to SDA from 10 ns to 50 ns in <a href="#">Timing Requirements</a>                     | 6    |
| • Changed the default value of NG_THRESH[1:0] from 1 to 2 in the <i>Register Map Control3 Register Field Descriptions</i> | 47   |

| Revision B (February 2014) から Revision C に変更   | Page |
|--|------|
| • 「特長」の箇条書き項目を「ロイヤリティフリーのImmersionライブラリを内蔵」から「波形イベント・シーケンサおよびトリガ」に変更   | 1    |
| • 「特長」の箇条書き項目を「オーディオから触覚モードへの変換」から「トップレベル: ライセンスされた Immersion TouchSense 2200の機能」に変更   | 1    |
| • 「オーディオから触覚モードへの変換」から「オーディオから振動への変換」に変更   | 1    |
| • 「概要」の2番目の段落を明瞭化のため 変更  | 1    |
| • Updated document to new datasheet style  | 4    |
| • Deleted <i>Operating free-air temperature range, <math>T_A</math></i> (information replaced by <i>Thermal Information</i> table) | 5    |
| • Changed EN pulldown resistance added to <i>Electrical Characteristics</i>  | 6    |
| • Changed connection terminal of input impedance from GND to $V_{(CM\_ANA)}$ in <i>Electrical Characteristics</i> section          | 6    |
| • Moved switching parameters to new Switching Characteristics table  | 6    |

|   |    |
|---|----|
| • Added TI Haptic Broadcast Mode section .....  | 23 |
| • Changed AC couple capacitor recommendation from 0.1 $\mu$ F to 1 $\mu$ F to be consistent with <a href="#">Recommended External Components</a> table..... | 31 |
| • 追加 Immersionについての法的告知 .....   | 57 |

---

|  |             |
|--|-------------|
| <b>Revision A (March 2013) から Revision B に変更</b> | <b>Page</b> |
|--|-------------|

|  |   |
|--|---|
| • プロダクト・フォルダで1ページのデータシートから完全なデータシートに変更 ..... | 1 |
|--|---|

---

|                          |             |
|--------------------------|-------------|
| <b>2012年12月発行のものから更新</b> | <b>Page</b> |
|--------------------------|-------------|

|  |    |
|--|----|
| • Changed minimum supported resonant frequency from 50 Hz to 125 Hz .....                | 5  |
| • Added digital pulldown resistance parameter to <i>Electrical Characteristics</i> ..... | 6  |
| • Changed $ I_{IH} $ MAX value from 3 to 3.5 $\mu$ A per CMS #C1303020 .....             | 6  |
| • Changed calibration diagram to include DRIVE_TIME into ERM requirements .....          | 26 |
| • Changed bitfield name from "LRA_DRIVE_MODE" to "OTP_STATUS" .....                      | 48 |
| • Changed $C_{(REG)}$ from 0.1 to 1 $\mu$ F in <a href="#">Figure 56</a> .....           | 50 |

## 5 Pin Configuration and Functions

### Pin Functions

| PIN |                 | TYPE <sup>(1)</sup> | DESCRIPTION  |
|-----|-----------------|---------------------|--|
| NO. | NAME            |                     |  |
| A1  | EN              | I                   | Device enable  |
| A2  | REG             | O                   | The REG pin is the 1.8-V regulator output. A 1- $\mu$ F capacitor is required.   |
| A3  | OUT+            | O                   | Positive haptic driver differential output   |
| B1  | IN/TRIG         | I                   | Multi-mode Input. I <sup>2</sup> C selectable as PWM, analog, or trigger. If not used, this pin should be connected to GND |
| B2  | SDA             | I/O                 | I <sup>2</sup> C data  |
| B3  | GND             | P                   | Supply ground  |
| C1  | SCL             | I                   | I <sup>2</sup> C clock   |
| C3  | OUT-            | O                   | Negative haptic-driver differential output   |
| C2  | V <sub>DD</sub> | P                   | Supply input (2.5 to 5.5 V). A 0.1- $\mu$ F capacitor is required.   |

(1) I = input, O = output, I/O = input and output, P = power

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

|                                       |          | MIN  | MAX            | UNIT             |
|---------------------------------------|----------|------|----------------|------------------|
| Input voltage                         | $V_{DD}$ | -0.3 | 6              | V                |
|                                       | EN       | -0.3 | $V_{DD} + 0.3$ | V                |
|                                       | SDA      | -0.3 | $V_{DD} + 0.3$ | V                |
|                                       | SCL      | -0.3 | $V_{DD} + 0.3$ | V                |
|                                       | IN/TRIG  | -0.3 | $V_{DD} + 0.3$ | V                |
| Operating free-air temperature, $T_A$ |          | -40  | 85             | $^\circ\text{C}$ |
| Operating junction temperature, $T_J$ |          | -40  | 150            | $^\circ\text{C}$ |
| Storage temperature, $T_{stg}$        |          | -65  | 150            | $^\circ\text{C}$ |

### 6.2 ESD Ratings

|                                     |  | VALUE      | UNIT |
|-------------------------------------|--|------------|------|
| $V_{(ESD)}$ Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>              | $\pm 2000$ | V    |
|                                     | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup> | $\pm 500$  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as  $\pm 2000$  V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as  $\pm 500$  V may actually have higher performance.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|              |                                    |                       | MIN | MAX | UNIT     |
|--------------|------------------------------------|-----------------------|-----|-----|----------|
| $V_{DD}$     | Supply voltage                     | $V_{DD}$              | 2.5 | 5.5 | V        |
| $f_{(PWM)}$  | PWM input frequency <sup>(1)</sup> | IN/TRIG Pin           | 10  | 250 | kHz      |
| $Z_L$        | Load impedance <sup>(1)</sup>      | $V_{DD} = 5.2$ V      | 8   |     | $\Omega$ |
| $V_{IL}$     | Digital low-level input voltage    | EN, IN/TRIG, SDA, SCL |     | 0.5 | V        |
| $V_{IH}$     | Digital high-level input voltage   | EN, IN/TRIG, SDA, SCL | 1.3 |     | V        |
| $V_{I(ANA)}$ | Input voltage (analog mode)        | IN/TRIG               | 0   | 1.8 | V        |
| $f_{(LRA)}$  | LRA Frequency Range <sup>(1)</sup> |                       | 125 | 300 | Hz       |

- (1) Ensured by design. Not production tested.

### 6.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |  | DRV2605     | UNIT                      |
|-------------------------------|--|-------------|---------------------------|
|                               |  | YZF (DSBGA) |                           |
|                               |  | (9-PINS)    |                           |
| $R_{\theta JA}$               | Junction-to-ambient thermal resistance       | 145.2       | $^\circ\text{C}/\text{W}$ |
| $R_{\theta JC(top)}$          | Junction-to-case (top) thermal resistance    | 0.9         | $^\circ\text{C}/\text{W}$ |
| $R_{\theta JB}$               | Junction-to-board thermal resistance         | 105         | $^\circ\text{C}/\text{W}$ |
| $\Phi_{JT}$                   | Junction-to-top characterization parameter   | 5.1         | $^\circ\text{C}/\text{W}$ |
| $\Phi_{JB}$                   | Junction-to-board characterization parameter | 103.3       | $^\circ\text{C}/\text{W}$ |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

 $T_A = 25^\circ\text{C}$ ,  $V_{DD} = 3.6\text{ V}$  (unless otherwise noted)

| PARAMETER                 | TEST CONDITIONS                                     | MIN   | TYP  | MAX  | UNIT             |

## 7 Detailed Description

### 7.1 Overview

The DRV2605 device is a haptic driver that relies on the back-EMF produced by an actuator to provide a closed-loop system that offers extremely flexible control of LRA and ERM actuators over a shared I<sup>2</sup>C-compatible bus or PWM input signal. This schema helps improve actuator performance in terms of acceleration consistency, start time, and brake time.

The improved smart-loop architecture inside the DRV2605 device provides effortless auto-resonant drive for LRA, as well as feedback-optimized ERM drive allowing for automatic overdrive and braking. These features create a simplified input waveform paradigm as well as reliable motor control and consistent motor performance. The DRV2605 device also allows for open-loop driving by using internally-generated PWM. Additionally, the audio-to-vibe mode automatically converts an audio input signal to meaningful haptic effects.

The DRV2605 device offers a licensed version of TouchSense 2200 software from Immersion which eliminates the requirement to design haptic waveforms because the software includes over 100 licensed effects ( 5ERM libraries and 1 LRA library) and audio-to-vibe features. The waveforms can be instantly played back through an I<sup>2</sup>C or can be triggered through a hardware trigger pin. Additionally, the real-time playback mode allows the host processor to bypass the library playback engine and play waveforms directly from the host through the I<sup>2</sup>C.

The DRV2605 device features a trinary-modulated output stage that provides more efficiency than linear-based output drivers.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Support for ERM and LRA Actuators

The DRV2605 device supports both ERM and LRA actuators. The ERM\_LRA bit in register 0x1A must be configured to select the type of actuator that the device uses.

### 7.3.2 Smart-Loop Architecture

The smart-loop architecture is an advanced closed-loop system that optimizes the performance of the actuator and allows for failure detection. The architecture consists of automatic resonance tracking and reporting (for an LRA), automatic level calibration, accelerated startup and braking, diagnostics routines, and other proprietary algorithms.

#### 7.3.2.1 Auto-Resonance Engine for LRA

The DRV2605 auto-resonance engine tracks the resonant frequency of an LRA in real time, effectively locking onto the resonance frequency after half of a cycle. If the resonant frequency shifts in the middle of a waveform for any reason, the engine tracks the frequency from cycle to cycle. The auto-resonance engine accomplishes the tracking by constantly monitoring the back-EMF of the actuator. The auto-resonance engine is not affected by the auto calibration process, which is only used for level calibration. No calibration is required for the auto resonance engine. See the [Auto-Resonance Engine Programming for the LRA](#) section for auto-resonance engine programming information.

#### 7.3.2.2 Real-Time Resonance-Frequency Reporting for LRA

The smart-loop architecture makes the resonant frequency of the LRA available through I<sup>2</sup>C (see the [LRA Resonance Period \(Address: 0x22\)](#) section). Because frequency reporting occurs in real time, the frequency must be polled while the DRV2605 device synchronizes with the LRA. The data should not be polled when the actuator is idle or braking.

#### 7.3.2.3 Automatic Overdrive and Braking

A key feature of the DRV2605 is the smart-loop architecture which employs actuator feedback control for both ERMs and LRAs. The feedback control desensitizes the input waveform from the motor-response behavior by providing automatic overdrive and automatic braking.

An open-loop haptic system typically drives an overdrive voltage at startup that is higher than the steady-state rated voltage of the actuator to decrease the startup latency of the actuator. Likewise, a braking algorithm must be employed for effective braking. When using an open-loop driver, these behaviors must be contained in the input waveform data. [Figure 11](#) shows how two different ERMs with different startup behaviors (Motor A and Motor B) can both be driven optimally by the smart-loop architecture with a simple input for both motors. The smart-loop architecture works equally well for LRAs with a combination of feedback control and an auto-resonance engine.

## Feature Description (continued)

**Figure 11. Waveform Simplification With Smart Loop**

### 7.3.2.3.1 Startup Boost

To reduce the actuator start-time performance, the DRV2605 device has an overdrive boost feature that applies higher loop gain to transient response of the actuator. The `STARTUP_BOOST` bit enables the feature.

### 7.3.2.3.2 Brake Factor

To reduce the actuator brake-time performance, the DRV2605 device provides a means to increase the gain ratio between braking and driving gain. Higher feedback-gain ratios reduce the brake time, however, the gain ratios also reduce the stability of the closed-loop system. The `FB_BRAKE_FACTOR[2:0]` bits can be adjusted to set the brake factor.

### 7.3.2.3.3 Brake Stabilizer

To improve brake stability at high brake-factor gain ratios, the DRV2605 device has a brake-stabilizer mechanism that automatically reduces the loop gain when the braking is near completion. The `BRAKE_STABILIZER` bit enables the feature.

### 7.3.2.4 Automatic Level Calibration

The smart-loop architecture uses actuator feedback by monitoring the back-EMF behavior of the actuator. The level of back-EMF voltage can vary across actuator manufacturers because of the specific actuator construction. Auto calibration compensates for the variation and also performs scaling for the desired actuator according to the specified rated voltage and overdrive clamp-register settings. When auto calibration is performed, a 100% signal level at any of the DRV2605 input interfaces supplies the rated voltage to the actuator at steady-state. The feedback allows the output level to increase above the rated voltage level for automatic overdrive and braking, but without allowing the output level to exceed the programmable overdrive clamp voltage.

In the event where the automatic level-calibration routine fails, the `DIAG_RESULT` bit in register 0x00 is asserted to flag the problem. Calibration failures are typically fixed by adjusting the registers associated with the automatic level-calibration routine or, for LRA actuators, the registers associated with the automatic-resonance detection engine. See the [Automatic-Level Calibration Programming](#) section for automatic-level calibration programming.

## Feature Description (continued)

### 7.3.2.4.1 Automatic Compensation for Resistive Losses

The DRV2605 device automatically compensates for resistive losses in the driver. During the automatic level-calibration routine, the impedance of the actuator is checked and the compensation factor is determined and stored in the A\_CAL\_COMP[7:0] bit.

### 7.3.2.4.2 Automatic Back-EMF Normalization

The DRV2605 device automatically compensates for differences in back-EMF magnitude between actuators. The compensation factor is determined during the automatic level-calibration routine and the factor is stored in the A\_CAL\_BEMF[7:0] bit.

### 7.3.2.4.3 Calibration Time Adjustment

The duration of the automatic level-calibration routine has an impact on accuracy. The impact is highly dependent on the start-time characteristic of the actuator. The auto-calibration routine expects the actuator to have reached a steady acceleration before the calibration factors are calculated. Because the start-time characteristic can be different for each actuator, the AUTO\_CAL\_TIME[1:0] bit can change the duration of the automatic level-calibration routine to optimize calibration performance.

### 7.3.2.4.4 Loop-Gain Control

The DRV2605 device allows the user to control how fast the driver attempts to match the back-EMF (and thus motor velocity) and the input signal level. Higher loop-gain (or faster settling) options result in less-stable operation than lower loop gain (or slower settling). The LOOP\_GAIN[1:0] bit controls the loop gain.

### 7.3.2.4.5 Back-EMF Gain Control

The BEMF\_GAIN[1:0] bit sets the analog gain for the back-EMF amplifier. The auto-calibration routine automatically populates the bit with the most appropriate value for the actuator.

Modifying the SAMPLE\_TIME[1:0] bit also adjusts the back-EMF gain. The higher the sample time, the higher the gain.

By default, the back-EMF is sampled once during a period. In the event that a twice per-period sampling is desired, assert the LRA\_DRIVE\_MODE bit.

### 7.3.2.5 Actuator Diagnostics

The DRV2605 device is capable of determining whether the actuator is not present (open) or shorted. If a fault is detected during the diagnostic process, the DIAG\_RESULT bit is asserted.

## 7.3.3 Open-Loop Operation for LRA

When using the PWM input in open-loop mode, the DRV2605 device employs a fixed divider that observes the PWM signal and commutates the output drive signal at the PWM frequency divided by 128. To accomplish LRA drive, the host should drive the PWM frequency at 128 times the desired operating frequency.

## 7.3.4 Open-Loop Operation for ERM

The DRV2605 device offers ERM open-loop operation through the PWM input. The output voltage is based on the duty cycle of the provided PWM signal, where the OD\_CLAMP[7:0] bit in register 0x17 sets the full-scale amplitude. For details see the [Rated Voltage Programming](#) section.

## 7.3.5 Flexible Front-End Interface

The DRV2605 device offers multiple ways to launch and control haptic effects. The MODE[2:0] bit in register 0x01 is used to select the interface mode.

## Feature Description (continued)

### 7.3.5.1 PWM Interface

When the DRV2605 device is in PWM interface mode, the device accepts PWM data at the IN/TRIG pin. The DRV2605 device drives the actuator continuously in PWM interface mode until the user sets the device to standby mode or to enter another interface mode. In standby mode, the strength of vibration is determined by the duty cycle.

For the LRA, the DRV2605 device automatically tracks the resonance frequency unless the LRA\_OPEN\_LOOP bit in register 0x1D is set. If the LRA\_OPEN\_LOOP bit is set, the LRA is driven according to the frequency of the PWM input signal. Specifically, the driving frequency is the PWM frequency divided by 128.

### 7.3.5.2 Internal Memory Interface

The DRV2605 device has six internal-ROM libraries designed by Immersion called TS2200. The first five libraries are specifically tuned for five categories of ERMs operated in open-loop mode (see [Table 1](#)). Library 6 is a closed-loop library tuned for LRAs. The library selection occurs through register 0x03 (see the [\(Address: 0x03\)](#) section).

Figure 12. Library Selection

**Feature Description (continued)**
**Table 1. ERM Library Table**

| LIBRARY | RATED VOLTAGE | OVERDRIVE VOLTAGE | RISE TIME        | BRAKE TIME     |
|---------|---------------|-------------------|------------------|----------------|
| A       | 1.3 V         | 3 V               | 40 ms to 60 ms   | 20 ms to 40 ms |
| B       | 3 V           | 3 V               | 40 ms to 60 ms   | 5 ms to 15 ms  |
| C       | 3 V           | 3 V               | 60 ms to 80 ms   | 10 ms to 20 ms |
| D       | 3 V           | 3 V               | 100 ms to 140 ms | 15 ms to 25 ms |
| E       | 3 V           | 3 V               | > 140 ms         | > 30 ms        |

**7.3.5.2.1 Waveform Sequencer**

The waveform sequencer queues waveform identifiers for playback. Eight sequence registers queue up to eight waveforms for sequential playback. A waveform identifier is an integer value referring to the index position of a waveform in the ROM library. Playback begins at register address 0x04 when the user asserts the GO bit (register 0x0C). When playback of that waveform ends, the waveform sequencer plays the waveform identifier held in register 0x05 if the next waveform is non-zero. The waveform sequencer continues in this way until it reaches an identifier value of zero or until all eight identifiers are played (register addresses 0x04 through 0x0B), whichever scenario is reached first.

The waveform identifier range is 1 to 127. The MSB of each sequence register can implement a delay between sequence waveforms. When the MSB is high, bits [6:0] indicate the length of the wait time. The wait time for that step then becomes WAV\_FRM\_SEQ[6:0] × 10 ms.

**7.3.5.2.2 Library Parameterization**

The ROM waveforms are augmented by the time offset registers (registers 0x0D to 0x10). The augmentation occurs only for the ROM waveforms and not for the other interfaces (such as PWM and RTP). The purpose of the functionality is to add *time stretching* (or time shrinking) to the waveform. This functionality is useful for customizing the entire library of waveforms for a specific actuator rise time and fall time.

The time parameters that can be stretched or shrunk include:

|            |                       |
|------------|-----------------------|
| <b>ODT</b> | Overdrive time        |
| <b>SPT</b> | Sustain positive time |
| <b>SNT</b> | Sustain Negative Time |
| <b>BRT</b> | Brake Time            |

The time values are additive offsets and are 8-bit signed values. The default offset of the time values is 0. Positive values add and negative values subtract from the time value of the effect that is currently played. The most positive value in the waveform is automatically interpreted as the overdrive time, and the most negative value in the waveform is automatically interpreted as the brake time. The time-offset parameters are applied to both voltage-time pairs and linear ramps. For linear ramps, linear interpolation is stretched (or shrunk) over the two operative points for the period (see [Equation 1](#)).

$$t + t_{(ofs)}$$

where

- $t_{(ofs)}$  is the time offset (1)

**7.3.5.3 Real-Time Playback (RTP) Interface**

The real-time playback mode is a simple, single 8-bit register interface that holds an amplitude value. When real-time playback is enabled, the real-time playback register is sent directly to the playback engine. The amplitude value is played until the user sends the device to standby mode or removes the device from RTP mode. The RTP mode operates exactly like the PWM mode except that the user enters a register value over the I<sup>2</sup>C rather than a duty cycle through the input pin. Therefore, any API (application-programming interface) designed for use with a PWM generator in the host processor can write the data values over the I<sup>2</sup>C rather than writing the data values to the host timer. This ability frees a timer in the host while retaining compatibility with the original software.

For the LRA, the DRV2605 device automatically tracks the resonance frequency.

#### 7.3.5.4 Analog Input Interface

When the DRV2605 device is in analog-input interface mode, the device accepts an analog voltage at the IN/TRIG pin. The DRV2605 device drives the actuator continuously in analog-input interface mode until the user sets the device to standby mode or to enter another interface mode. The reference voltage in standby mode is 1.8 V. Therefore, the 1.8-V reference voltage is interpreted as a 100% input value. A reference voltage of 0.9 V is interpreted as a 50% input value and a reference voltage of 0 V is interpreted as a 0% input value. The input value in standby mode is analogous to the duty-cycle percentage in PWM mode.

For the LRA, the DRV2605 automatically tracks the resonance frequency.

#### 7.3.5.5 Audio-to-Vibe Interface

The DRV2605 device features an audio-to-vibe mode that converts an audio input signal into meaningful haptic effects using the Immersion audio-to-vibe technology. Audio-to-Vibe mode adds a vibratory *bass extension* to portable devices which allows users to feel the audio and visual content. Audio-to-Vibe mode is a key feature because it allows for existing applications to include haptic sensations without requiring additional software drivers. Additionally, event-driven audio effects generated within an operating system can be used to automatically provide a product with haptic sensations. See the [Waveform Playback Using Audio-to-Vibe Mode](#) section for details.

#### 7.3.5.6 Input Trigger Option

The DRV2605 device includes continuous haptic modes (such as PWM and RTP mode) as well as triggered modes (such as the internal memory interface). The haptic effects in the continuous haptic modes begin as soon as the device enters the mode and stop when the device goes into standby mode or exits the continuous haptic mode. For the triggered mode, the DRV2605 device has a variety of trigger options that are explained in this section.

In the continuous haptic modes, the IN/TRIG pin provides external trigger control of the GO bit, which allows GPIO control to fire ROM waveforms. The external trigger control can provide improved latencies in systems where a significant delay exists between the desired effect time and the time a GO command can be sent over the I<sup>2</sup>C interface.

---

#### NOTE

The triggered effect must already be selected to take advantage of the lower latency. This option works best for accelerating a pre-queued high-priority effect (such as a button press) or for the repeated firing of the same effect (such as scrolling).

---

##### 7.3.5.6.1 I<sup>2</sup>C Trigger

Setting the GO bit (in register 0x0C) launches the waveform. The user can cancel the launching of the waveform by clearing the GO bit.

##### 7.3.5.6.2 Edge Trigger

A low-to-high transition on the IN/TRIG pin sets the GO bit. The playback sequence indicated in the waveform sequencer plays as normal. The user can cancel the transaction by clearing the GO bit. An additional low-to-high transition while the GO bit is high also cancels the transaction which clears and resets the GO bit. Clearing the trigger pin (high-to-low transition) does nothing, therefore the user can send a short pulse without knowing how long the waveform is. The pulse width should be at least 1  $\mu$ s to ensure detection.

Figure 13. Edge Trigger Mode

### 7.3.5.6.3 Level Trigger

The actions of the GO bit directly follow the IN/TRIG pin. When the IN/TRIG pin is high, the GO bit is high. When the IN/TRIG pin goes low, the GO bit clears. Therefore, a falling edge cancels the transaction. The level trigger can implement a GPIO-controlled buzz on-off controller if an appropriately long waveform is selected. The user must hold the IN/TRIG high for the entire duration of the waveform to complete the effect.

Figure 14. Level Trigger Mode

### 7.3.6 Edge Rate Control

The DRV2605 output driver implements edge rate control (ERC). The ERC ensures that the rise and fall characteristics of the output drivers do not emit levels of radiation that could interfere with other circuitry common in mobile and portable platforms. Because of ERC most system do not require external output filters, capacitors, or ferrite beads.

### 7.3.7 Constant Vibration Strength

The DRV2605 PWM input uses a digital level-shifter. Therefore, as long as the input voltage meets the  $V_{IH}$  and  $V_{IL}$  levels, the vibration strength remains the same even if the digital levels vary. The DRV2605 device also features power-supply feedback. If the supply voltage drifts over time (because of battery discharge, for example), the vibration strength remains the same as long as enough supply voltage is available to sustain the required output voltage.

### 7.3.8 Battery Voltage Reporting

During playback, the DRV2605 device provides real-time voltage measurement of the  $V_{DD}$  pin. The VBAT[7:0] bit located in register 0x21 provides this information.

### 7.3.9 One-Time Programmable (OTP) Memory for Configuration

The DRV2605 device contains nonvolatile, on-chip, OTP memory for specific configuration parameters. When written, the DRV2605 device retains the device settings in registers 0x16 through 0x1A including after power cycling. This retention allows the user to account for small variations in actuator manufacturing from unit to unit as well as to shorten the device-initialization process for device-specific parameters such as actuator type, actuator-rated voltage, and other parameters. An additional benefit of OTP is that the DRV2605 memory can be customized at the device-test level without driving changes in the device software.

### 7.3.10 Low-Power Standby

Setting the device to standby reduces the idle power consumption without resetting the registers. In Low-Power Standby mode, the DRV2605 device features a fast turnon time when it is requested to play a waveform.

### 7.3.11 Device Protection

#### 7.3.11.1 Thermal Protection

The DRV2605 device has thermal protection that causes the device to shut down if it becomes too hot. In the event where the thermal protection kicks in, the DRV2605 device asserts a flag (bit OVER\_TEMP in register 0x00) to notify the host processor.

#### 7.3.11.2 Overcurrent Protection of the Actuator

If the impedance at the output pin of the DRV2605 device is too low, the device latches the over-current flag (OC\_DETECT bit in register 0x00) and shuts down. The device periodically monitors the status of the short and remains in this condition until the short is removed. When the short is removed, the DRV2605 device restarts in the default state.

## 7.4 Device Functional Modes

### 7.4.1 Power States

The DRV2605 device has three different power states which allow for different power-consumption levels and functions. Figure 15 shows the transition in to and out of each state.

Figure 15. Power-State Transition Diagram

#### 7.4.1.1 Operation With $V_{DD} < 2.5\text{ V}$ (Minimum $V_{DD}$ )

Operating the device with a  $V_{DD}$  value below 2 V is not recommended.

#### 7.4.1.2 Operation With $V_{DD} > 6\text{ V}$ (Absolute Maximum $V_{DD}$ )

The DRV2605 device is designed to operate at up to 5.5 V, with an absolute maximum voltage of 6 V. If exposed to voltages above 6 V, the device can suffer permanent damage.

## Device Functional Modes (continued)

### 7.4.1.3 Operation With EN Control

The EN pin of the DRV2605 device gates the active operation. When the EN pin is logic high, the DRV2605 device is active. When the EN pin is logic low, the device enters the shutdown state, which is the lowest power state of the device. The device registers are not reset. The EN pin operation is particularly useful for constant-source PWM and analog input modes to maintain compatibility with non-I<sup>2</sup>C device signaling. The EN pin must be high to write I<sup>2</sup>C device registers. However, if the EN pin is low the DRV2605 device can still acknowledge (ACK) during an I<sup>2</sup>C transaction, however, no read or write is possible. To completely reset the device to the powerup state, set the DEV\_RESET bit in register 0x01.

### 7.4.1.4 Operation With STANDBY Control

The STANDBY bit in register 0x01 forces the device in an out of the standby state. The STANDBY bit is asserted by default. When the STANDBY bit is asserted, the DRV2605 device goes into a low-power state. In the standby state the device retains register values and the ability to have I<sup>2</sup>C communication. The properties of the standby state also feature a fast turn, wake up, and play, on-time. Asserting the STANDBY bit has an immediate effect. For example, if a waveform is played, it immediately stops when the STANDBY bit is asserted.

Clear the STANDBY bit to exit the standby state (and go to the ready state).

### 7.4.1.5 Operation With DEV\_RESET Control

The DEV\_RESET bit in register 0x01 performs the equivalent of power cycling the device. Any playback operations are immediately interrupted, and all registers are reset to the default values. The Dev\_Reset bit automatically-clears after the reset operation is complete.

### 7.4.1.6 Operation in the Active State

In the active state, the DRV2605 device has I<sup>2</sup>C communication and is capable of playing waveforms, running calibration, and running diagnostics. These operations are referred to as *processes*. Figure 16 shows the flow of starting, or *firing*, a process. Notice that the GO signal fires the processes. Note that the GO signal is not the same as the GO bit. Figure 17 shows a diagram of the GO-signal behavior.

Note: If an output short is present before a waveform is played, changing modes (with the MODE[2:0] bit in register 0x01) is required to resume normal playback.

Figure 16. Diagram of Active States

## 7.4.2 Changing Modes of Operation

The DRV2605 has multiple modes for playing waveforms, as well as a calibration mode and a diagnostic mode. Table 2 lists the available modes.

Table 2. Mode Selection Table

| MODE                         | MODE[2:0] | N_PWM_ANALOG |
|------------------------------|-----------|--------------|
| Internal trigger mode        | 0         | X            |
| External Trigger mode (edge) | 1         | X            |

**Table 2. Mode Selection Table (continued)**

| MODE                          | MODE[2:0] | N_PWM_ANALOG |
|-------------------------------|-----------|--------------|
| External trigger mode (level) | 2         | X            |
| Analog input mode             | 3         | 0            |
| PWM mode                      | 3         | 1            |
| Audio-to-vibe mode            | 4         | X            |
| RTP mode                      | 5         | X            |
| Diagnostics mode              | 6         | X            |
| Calibration mode              | 7         | X            |

### 7.4.3 Operation of the GO Bit

The GO bit is the primary way to assert the GO signal, which fires processes in the DRV2605 device. The primary purpose of the GO bit is to fire the playback of the waveform identifiers in the waveform sequencer (registers 0x04 to 0x0B). However, The GO bit can also fire the calibration or diagnostics processes.

When using the GO bit to play waveforms in internal trigger mode, the GO bit is asserted by writing 0x01 to register 0x0C. In this case, the GO bit can be thought of as a *software trigger* for haptic waveforms. The GO bit remains high until the playback of the haptic waveform sequence is complete. Clearing the GO bit during waveform playback cancels the waveform sequence. The GO bit can also be asserted by the external trigger when in external trigger mode. The GO bit in register 0x0C mirrors the state of the external trigger.

Setting RTP mode, PWM mode, or audio-to-vibe mode also sets the GO bit. However, setting the GO bit in this way has no impact on the GO bit located in register 0x0C.

**Figure 17. GO-Signal Logic**

### 7.4.4 Operation During Exceptional Conditions

This section lists different exceptional conditions and the ways that the DRV2605 device operates during these conditions. This section also describes how the device goes into and out of these states.

#### 7.4.4.1 Operation With No Actuator Attached

In LRA closed-loop mode, if a waveform is played without an actuator connected to the OUT+ and OUT– pins, the output pins toggle. However, the toggling frequency is not predictable. In LRA open-loop mode, the output pins toggle at the specified open-loop frequency.

#### 7.4.4.2 Operation With a Short at REG Pin

If the REG pin is shorted to GND, the device automatically shuts down. When the short is removed, the device starts in the default condition.

#### 7.4.4.3 Operation With a Short at OUT+, OUT–, or Both

If any of the output pins (OUT+ or OUT–) is shorted to  $V_{DD}$ , GND, or to each other while the device is playing a waveform, the OC\_DETECT bit is asserted and remains asserted until the short is removed. A current-protection circuit automatically enables to shutdown the current through the short.

If the driver is playing a waveform the DRV2605 device checks for shorts in the output through either a haptic-playback, auto-calibration, or diagnostics process. If the short occurs when the device is idle, the short is not detected until the device attempts to run a waveform.

## 7.5 Programming

### 7.5.1 Auto-Resonance Engine Programming for the LRA

#### 7.5.1.1 Drive-Time Programming

The resonance frequency of each LRA actuator varies based on many factors and is generally dominated by mechanical properties. The auto-resonance engine-tracking system is optimized by providing information about the resonance frequency of the actuator. The DRIVE\_TIME[4:0] bit is used as an initial guess for the half-period of the LRA. The drive time is automatically and quickly adjusted for optimum drive. For example, if the LRA has a resonance frequency of 200 Hz, then the drive time should be set to 2.5 ms.

For ERM actuators, the DRIVE\_TIME[4:0] bit controls the rate for back-EMF sampling. Lower drive times imply higher back-EMF sampling frequencies which cause higher peak-to-average ratios in the output signal, and requires more supply headroom. Higher drive times imply lower back-EMF sampling frequencies which cause the feedback to react at a slower rate.

#### 7.5.1.2 Current-Dissipation Time Programming

To sense the back-EMF of the actuator, the DRV2605 device goes into high impedance mode. However, before the device enters high impedance mode, the device must dissipate the current in the actuator. The DRV2605 device controls the time allocated for dissipation-current through the IDISS\_TIME[1:0] bit.

#### 7.5.1.3 Blanking Time Programming

After the current in the actuator dissipates, the DRV2605 device waits for a blanking time of the signal to settle before the back-EMF analog-to-digital (AD) conversion converts. The BLANKING\_TIME[1:0] bit controls this time.

### 7.5.2 Automatic-Level Calibration Programming

#### 7.5.2.1 Rated Voltage Programming

The rated voltage is the driving voltage that the driver will output during steady state. However, in closed-loop drive mode, temporarily having an output voltage that is higher than the rated voltage is possible. See the [Overdrive Voltage-Clamp Programming](#) section for details.

The RATED\_VOLTAGE[7:0] bit in register 0x16 sets the rated voltage for the closed-loop drive modes. For the ERM, [Equation 2](#) calculates the average steady-state voltage when a full-scale input signal is provided. For the LRA, [Equation 3](#) calculates the root-mean-square (RMS) voltage when driven to steady state with a full-scale input signal.

$$V_{(\text{ERM-CL\_AV})} = 21.33 \times 10^{-3} \text{ RATED\_VOLTAGE}[7:0] \quad (2)$$

$$V_{(\text{LRA-CL\_RMS})} = \frac{20.71 \times 10^{-3} \times \text{RATED\_VOLTAGE}[7:0]}{\sqrt{1 - (4 \times t_{(\text{SAMPLE\_TIME})} + 300 \times 10^{-6}) \times f_{(\text{LRA})}}} \quad (3)$$

In open-loop mode, the RATED\_VOLTAGE[7:0] bit is ignored. Instead, the OD\_CLAMP[7:0] bit (in register 0x17) is used to set the rated voltage for the open-loop drive modes. For the ERM, [Equation 4](#) calculates the rated voltage with a full-scale input signal. For the LRA, [Equation 5](#) calculates the RMS voltage with a full-scale input signal.

$$V_{(\text{ERM-OL\_AV})} = 21.96 \times 10^{-3} \text{ OD\_CLAMP}[7:0] \quad (4)$$

$$V_{(\text{LRA-OL\_RMS})} = 21.33 \times 10^{-3} \times \text{OD\_CLAMP}[7:0] \times \sqrt{1 - f_{(\text{LRA})} \times 800 \times 10^{-6}} \quad (5)$$

The auto-calibration routine uses the RATED\_VOLTAGE[7:0] and OD\_CLAMP[7:0] bits as inputs and therefore these registers must be written before calibration is performed. Any modification of this register value should be followed by calibration to appropriately set A\_CAL\_BEMF[7:0].

## Programming (continued)

### 7.5.2.2 Overdrive Voltage-Clamp Programming

During closed-loop operation, the actuator feedback allows the output voltage go above the rated voltage during the automatic overdrive and automatic braking periods. The OD\_CLAMP[7:0] bit (in Register 0x17) sets a clamp so that the automatic overdrive is bounded. The OD\_CLAMP[7:0] bit also serves as the full-scale reference voltage for open-loop operation. The OD\_CLAMP[7:0] bit always represents the maximum *peak voltage* that is allowed, regardless of the mode.

---

#### NOTE

If the supply voltage ( $V_{DD}$ ) is less than the overdrive clamp voltage, the output driver is unable to reach the clamp voltage value because the output voltage cannot exceed the supply voltage. If the rated voltage exceeds the overdrive clamp voltage, the overdrive clamp voltage has priority over the rated voltage.

---

In ERM mode, use [Equation 6](#) to calculate the allowed maximum voltage. In LRA mode, use [Equation 7](#) to calculate the maximum peak voltage.

$$V_{(ERM\_clamp)} = \frac{21.33 \times 10^{-3} \times OD\_CLAMP[7:0] \times (t_{(DRIVE\_TIME)} - 300 \times 10^{-6})}{t_{(DRIVE\_TIME)} + t_{(DISS\_TIME)} + t_{(BLANKING\_TIME)}} \quad (6)$$

$$V_{(LRA\_clamp)} = 21.96 \times 10^{-3} \times OD\_CLAMP[7:0] \quad (7)$$

## 7.5.3 I<sup>2</sup>C Interface

### 7.5.3.1 TI Haptic Broadcast Mode

The DRV2605 device features the TI haptic broadcast mode where the DRV2605 responds to the slave address 0x58 (7-bit) or 1011000. Haptic broadcast mode is useful in the event that multiple drivers implementing the TI haptic broadcast mode are installed in the system. In such a scenario, writing the GO bit to the TI haptic broadcast slave address will cause all haptic drivers to trigger the process at the same time.

### 7.5.3.2 General I<sup>2</sup>C Operation

The I<sup>2</sup>C bus employs two signals, SDA (data) and SCL (clock), to communicate between integrated circuits in a system. The bus transfers data serially, one bit at a time. The 8-bit address and data bytes are transferred with the most-significant bit (MSB) first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an acknowledge bit. Each transfer operation begins with the master device driving a start condition on the bus and ends with the master device driving a stop condition on the bus. The bus uses transitions on the data pin (SDA) while the clock is at logic high to indicate start and stop conditions. A high-to-low transition on the SDA signal indicates a start, and a low-to-high transition indicates a stop. Normal data-bit transitions must occur within the low time of the clock period. [Figure 18](#) shows a typical sequence. The master device generates the 7-bit slave address and the read-write (R/W) bit to start communication with a slave device. The master device then waits for an acknowledge condition. The slave device holds the SDA signal low during the acknowledge clock period to indicate acknowledgment. When this acknowledgment occurs, the master transmits the next byte of the sequence. Each device is addressed by a unique 7-bit slave address plus a R/W bit (1 byte). All compatible devices share the same signals through a bidirectional bus using a wired-AND connection.

The number of bytes that can be transmitted between start and stop conditions is not limited. When the last word transfers, the master generates a stop condition to release the bus. [Figure 18](#) shows a generic data-transfer sequence.

Use external pullup resistors for the SDA and SCL signals to set the logic-high level for the bus. Pullup resistors with values between 660  $\Omega$  and 4.7 k $\Omega$  are recommended. Do not allow the SDA and SCL voltages to exceed the DRV2605 supply voltage,  $V_{DD}$ .

---

#### NOTE

The DRV2605 slave address is 0x5A (7-bit), or 1011010 in binary.

---

**Programming (continued)**

**Figure 18. Typical I<sup>2</sup>C Sequence**

The DRV2605 device operates as an I<sup>2</sup>C-slave 1.8-V logic thresholds, but can operate up to the V<sub>DD</sub> voltage. The device address is 0x5A (7-bit), or 1011010 in binary which is equivalent to 0xB4 (8-bit) for writing and 0xB5 (8-bit) for reading.

**7.5.3.3 Single-Byte and Multiple-Byte Transfers**

The serial control interface supports both single-byte and multiple-byte R/W operations for all registers.

During multiple-byte read operations, the DRV2605 device responds with data one byte at a time and beginning at the signed register. The device responds as long as the master device continues to respond with acknowledges.

The DRV2605 supports sequential I<sup>2</sup>C addressing. For write transactions, a sequential I<sup>2</sup>C write transaction has taken place if a register is issued followed by data for that register as well as the remaining registers that follow. For I<sup>2</sup>C sequential-write transactions, the register issued then serves as the starting point and the amount of data transmitted subsequently before a stop or start is transmitted determines how many registers are written.

**7.5.3.4 Single-Byte Write**

As shown in Figure 19, a single-byte data-write transfer begins with the master device transmitting a start condition followed by the I<sup>2</sup>C device address and the read-write bit. The read-write bit determines the direction of the data transfer. For a write-data transfer, the read-write bit must be set to 0. After receiving the correct I<sup>2</sup>C device address and the read-write bit, the DRV2605 responds with an acknowledge bit. Next, the master transmits the register byte corresponding to the DRV2605 internal-memory address that is accessed. After receiving the register byte, the device responds again with an acknowledge bit. Finally, the master device transmits a stop condition to complete the single-byte data-write transfer.

**Figure 19. Single-Byte Write Transfer**

## Programming (continued)

### 7.5.3.5 Multiple-Byte Write and Incremental Multiple-Byte Write

A multiple-byte data write transfer is identical to a single-byte data write transfer except that multiple data bytes are transmitted by the master device to the DRV2605 device as shown in Figure 20. After receiving each data byte, the DRV2605 device responds with an acknowledge bit.

Figure 20. Multiple-Byte Write Transfer

### 7.5.3.6 Single-Byte Read

Figure 21 shows that a single-byte data-read transfer begins with the master device transmitting a start condition followed by the I<sup>2</sup>C device address and the read-write bit. For the data-read transfer, both a write followed by a read actually occur. Initially, a write occurs to transfer the address byte of the internal memory address to be read. As a result, the read-write bit is set to 0.

After receiving the DRV2605 address and the read-write bit, the DRV2605 device responds with an acknowledge bit. The master then sends the internal memory address byte, after which the device issues an acknowledge bit. The master device transmits another start condition followed by the DRV2605 address and the read-write bit again. This time, the read-write bit is set to 1, indicating a read transfer. Next, the DRV2605 device transmits the data byte from the memory address that is read. After receiving the data byte, the master device transmits a not-acknowledge followed by a stop condition to complete the single-byte data read transfer. See the note in the [General I<sup>2</sup>C Operation](#) section.

Figure 21. Single-Byte Read Transfer

### 7.5.3.7 Multiple-Byte Read

A multiple-byte data-read transfer is identical to a single-byte data-read transfer except that multiple data bytes are transmitted by the DRV2605 device to the master device as shown in Figure 22. With the exception of the last data byte, the master device responds with an acknowledge bit after receiving each data byte.

Figure 22. Multiple-Byte Read Transfer

## Programming (continued)

### 7.5.4 Programming for Open-Loop Operation

The DRV2605 device can be used in open-loop mode and closed-loop mode. If open-loop operation is desired, the first step is to determine which actuator type is to use, either ERM or LRA.

#### 7.5.4.1 Programming for ERM Open-Loop Operation

To configure the DRV2605 device in ERM open-loop operation, the ERM must be selected by writing the N\_ERM\_LRA bit to 0 (in register 0x1A), and the ERM\_OPEN\_LOOP bit to 1 in register 0x1D.

#### 7.5.4.2 Programming for LRA Open-Loop Operation

To configure the DRV2605 device in LRA open-loop operation, the LRA must be selected by writing the N\_ERM\_LRA bit to 1 in register 0x1A, and the LRA\_OPEN\_LOOP bit to 1 in register 0x1D.

### 7.5.5 Programming for Closed-Loop Operation

For closed-loop operation, the device must be calibrated according to the actuator selection. When calibrated accordingly, the user is only required to provide the desired waveform. The DRV2605 device automatically adjusts the level and, for the LRA, automatically adjusts the driving frequency.

### 7.5.6 Auto Calibration Procedure

The calibration engine requires a number of bits as inputs before the engine can be executed (see [Figure 23](#)). When the inputs are configured, the calibration routine can be executed. After calibration execution occurs, the output parameters are written over the specified register locations. [Figure 23](#) shows all of the required inputs and generated outputs. To ensure proper auto-resonance operation, the LRA actuator type requires more input parameters than the ERM. The LRA parameters are ignored when the device is in ERM mode.

**Figure 23. Calibration-Engine Functional Diagram**

Variation occurs between different actuators even if the actuators are of the same model. To ensure optimal results, TI recommends that the calibration routine be run at least once for each actuator. The OTP feature of the DRV2605 device can store the calibration values. Because of the stored values, the calibration procedure does not have to run every time. Having a single set of calibration register values that can be loaded during the system initialization is possible.

## Programming (continued)

The following instructions list the step-by-step register configuration for auto-calibration. For additional details see the [Register Map](#) section.

1. Apply the supply voltage to the DRV2605 device, and pull the EN pin high. The supply voltage should allow for adequate drive voltage of the selected actuator.
2. Write a value of 0x07 to register 0x01. This value moves the DRV2605 device out of STANDBY and places the MODE[2:0] bits in auto-calibration mode.
3. Populate the input parameters required by the auto-calibration engine:
  - a. ERM\_LRA — selection will depend on desired actuator.
  - b. FB\_BRAKE\_FACTOR[2:0] — A value of 2 is valid for most actuators.
  - c. LOOP\_GAIN[1:0] — A value of 2 is valid for most actuators.
  - d. RATED\_VOLTAGE[7:0] — See the [Rated Voltage Programming](#) section for calculating the correct register value.
  - e. OD\_CLAMP[7:0] — See the [Overdrive Voltage-Clamp Programming](#) section for calculating the correct register value.
  - f. AUTO\_CAL\_TIME[1:0] — A value of 3 is valid for most actuators.
  - g. DRIVE\_TIME[3:0] — See the [Drive-Time Programming](#) for calculating the correct register value.
  - h. SAMPLE\_TIME[1:0] — A value of 3 is valid for most actuators.
  - i. BLANKING\_TIME[1:0] — A value of 1 is valid for most actuators.
  - j. IDISS\_TIME[1:0] — A value of 1 is valid for most actuators.
4. Set the GO bit (write 0x01 to register 0x0C) to start the auto-calibration process. When auto calibration is complete, the GO bit automatically clears. The auto-calibration results are written in the respective registers as shown in [Figure 23](#).
5. Check the status of the DIAG\_RESULT bit (in register 0x00) to ensure that the auto-calibration routine is complete without faults.
6. Evaluate system performance with the auto-calibrated settings. Note that the evaluation should occur during the final assembly of the device because the auto-calibration process can affect actuator performance and behavior. If any adjustment is required, the inputs can be modified and this sequence can be repeated. If the performance is satisfactory, the user can do any of the following:
  - a. Repeat the calibration process upon subsequent power ups.
  - b. Store the auto-calibration results in host processor memory and rewrite them to the DRV2605 device upon subsequent power ups. The device retains these settings when in STANDBY mode or when the EN pin is low.
  - c. Program the results permanently in nonvolatile, on-chip OTP memory. Even when a device power cycle occurs, the device retains the auto-calibration settings. See the [Programming On-Chip OTP Memory](#) section for additional information.

### 7.5.7 Programming On-Chip OTP Memory

The OTP memory can only be written once. To permanently program the OTP memory in registers 0x16 through 0x1A, use the following steps:

1. Write registers 0x16 through 0x1A with the desired configuration and calibration values which provide satisfactory performance.
2. Ensure that the supply voltage ( $V_{DD}$ ) is between 4 V and 4.4 V. This voltage is required for the nonvolatile memory to program properly.
3. Set the OTP\_PROGRAM bit by writing a value of 0x01 to register 0x1E. When the OTP memory is written which can only occur once in the device, the OTP\_STATUS bit (in register 0x1E) only reads 1.
4. Reset the device by power cycling the device or setting the DEV\_RESET bit in register 0x01, and then read registers 0x16 to 0x1A to ensure that the programmed values were retained.

## Programming (continued)

### 7.5.8 Waveform Playback Programming

#### 7.5.8.1 Data Formats for Waveform Playback

The DRV2605 smart-loop architecture has three modes of operation. Each of the modes can drive either ERM or LRA devices.

1. Open-loop mode
2. Closed-loop mode (unidirectional)
3. Closed-loop mode (bidirectional)

Each mode has different advantages and disadvantages. The DRV2605 device brings new cutting-edge actuator control with closed-loop operation around the back-EMF for automatic overdrive and braking. However, some existing haptic implementations already include overdrive and braking that are embedded in the waveform data. Open-loop mode is used to preserve compatibility with such systems.

The following sections show how the input data for each DRV2605 interface is translated to the output drive signal.

##### 7.5.8.1.1 Open-Loop Mode

In open-loop mode, the reference level for full-scale drive is set by the OD\_CLAMP[7:0] bit in Register 0x17. A mid-scale input value gives no drive signal, and a less-than mid-scale gives a negative drive value. For an ERM, a negative drive value results in counter-rotation, or braking. For an LRA, a negative drive value results in a 180-degree phase shift in commutation.

The RTP mode has 8 bits of resolution over the I<sup>2</sup>C bus. The RTP data can either be in a signed (2s complement) or unsigned format as defined by the DATA\_FORMAT\_RTP bit.

**Figure 24.**

## Programming (continued)

### 7.5.8.1.2 Closed-Loop Mode, Unidirectional

In closed-loop unidirectional mode, the DRV2605 device provides automatic overdrive and braking for both ERM and LRA actuators. Closed-loop unidirectional mode is the easiest mode to use and understand. Closed-loop unidirectional mode uses the full 8-bit resolution of the driver. Closed-loop unidirectional mode offers the best performance; however, the data format is not physically compatible with the open-loop mode data that can be used in some existing systems.

The reference level for steady-state full-scale drive is set by the `RATED_VOLTAGE[7:0]` bit (when auto-calibration is performed). The output voltage can momentarily exceed the rated voltage for automatic overdrive and braking, but does not exceed the `OD_CLAMP[7:0]` voltage. Braking occurs automatically based on the input signal when the back-EMF feedback determines that braking is necessary.

Because the system is unidirectional in closed-loop unidirectional mode, only unsigned data should be used. The RTP mode has 8 bits of resolution over the I<sup>2</sup>C bus. Setting the `DATA_FORMAT_RTP` bit to 0 (signed) is not recommended for closed-loop unidirectional mode.

Figure 25.

#### NOTE

The TS2200 library data is stored in bidirectional format and cannot be used in unidirectional mode.

For the RTP interface, set the `DATA_FORMAT_RTP` bit to 1 (unsigned).

**Programming (continued)**

**7.5.8.1.3 Closed-Loop Mode, Bidirectional**

In closed-loop bidirectional mode, the DRV2605 device provides automatic overdrive and braking for both ERM and LRA devices. Closed-loop bidirectional mode preserves compatibility with data created in open-loop signaling by maintaining zero drive-strength at the mid-scale value. When input values less than the mid-scale value are given, the DRV2605 device interprets them as the same as the mid-scale with zero drive.

The reference level for steady-state full-scale drive is set by the RATED\_VOLTAGE[7:0] bit (when auto calibration is performed). The output voltage can momentarily exceed the rated voltage for automatic overdrive and braking, but does not exceed the OD\_CLAMP[7:0] voltage. Braking occurs automatically based on the input signal when the back-EMF feedback determines that braking is necessary. Although the Closed-Loop mode preserves compatibility with existing device data formats, it provides closed loop benefits and is the default configuration at power up.

The RTP mode has 8 bits of resolution over the I<sup>2</sup>C bus. The RTP data can either be in signed (2s complement) or unsigned format as defined by the DATA\_FORMAT\_RTP bit.

**Figure 26.**

**NOTE**

Closed-loop bidirectional mode is compatible with all DRV2605 interfaces except for TS2200 Library A (with fixed overdrive programming). Library A should only be used in open-loop mode. Libraries B through F (no overdrive) can take advantage of the automatic overdrive and braking of closed-loop bidirectional mode.

## Programming (continued)

### 7.5.8.2 Waveform Setup and Playback

Playback of a haptic effect can occur in multiple ways. Using the PWM mode, RTP mode, audio-to-vibe mode, and analog-input mode can provide the waveform in real time. The waveforms can also be played from the ROM in which case the waveform playback engine is used and the waveform is either played by an internal GO bit (register 0x0C), or by an external trigger.

#### 7.5.8.2.1 Waveform Playback Using RTP Mode

The user can enter the RTP mode by writing the MODE[2:0] bit to 5 in register 0x01. When in RTP mode, the DRV2605 device drives the actuator continuously with the amplitude specified in the RTP\_INPUT[7:0] bit (in register 0x02). Because the amplitude tracks the value specified in the RTP\_INPUT[7:0] bit, the I<sup>2</sup>C bus can stream waveforms.

#### 7.5.8.2.2 Waveform Playback Using the Analog-Input Mode

The user can enter the analog-input mode by setting the MODE[2:0] bit to 3 in register 0x01 and by setting the N\_PWM\_ANALOG bit to 1 in register 0x1D. When in analog-input mode, the DRV2605 device accepts an analog voltage at the IN/TRIG pin. The DRV2605 device drives the actuator continuously in analog-input mode until the user sets the device into STANDBY mode or enters another interface mode. The reference voltage in analog-input mode is 1.8 V. Therefore a 1.8-V reference voltage is interpreted as a 100% input value, a 0.9-V reference voltage is interpreted as 50%, and a 0-V reference voltage is interpreted as 0%. The input value is analogous to the duty-cycle percentage in PWM mode. The interpretation of these percentages varies according to the selected mode of operation. See the [Data Formats for Waveform Playback](#) section for details.

#### 7.5.8.2.3 Waveform Playback Using PWM Mode

The user can enter the PWM mode by setting the MODE[2:0] bit to 3 in register 0x01 and by setting the N\_PWM\_ANALOG bit to 0 in register 0x1D. When in PWM mode, the DRV2605 device accepts PWM data at the IN/TRIG pin. The DRV2605 device drives the actuator continuously in PWM mode until the user sets the device to STANDBY mode or to enter another interface mode. The interpretation of the duty-cycle information varies according to the selected mode of operation. See the [Data Formats for Waveform Playback](#) section for details.

#### 7.5.8.2.4 Waveform Playback Using Audio-to-Vibe Mode

To take advantage of the audio-to-vibe feature, connect the DRV2605 device to a line-out source as shown in [Figure 55](#). The full-scale range of the IN/TRIG pin in the audio-to-vibe mode is 1.8 V<sub>PP</sub>. A 1-μF capacitor is recommended to AC couple the audio source and the IN/TRIG pin. For sources smaller than 1.8 V<sub>PP</sub>, the ATH\_MAX\_INPUT bit in register 0x13 can scale down the input range.

The device enters audio-to-vibe mode when the MODE[2:0] bit is set to 4 in register 0x01 and when the AC\_COUPLE bit in register 0x1B and the N\_PWM\_ANALOG bit in register 0x1D are set to 1. See the [Register Map](#) section for details.

#### 7.5.8.2.5 Waveform Sequencer

If the user uses library effects, the effects must first be loaded into the waveform sequencer, and then the effects can be launched by using any of the trigger options (see the [Waveform Triggers](#) section for details).

The waveform sequencer (see the [Waveform Sequencer \(Address: 0x04 to 0x0B\)](#) section) queues waveform-library identifiers for playback. Eight sequence registers queue up to eight library waveforms for sequential playback. A waveform identifier is an integer value referring to the index position of a waveform in the ROM library. Playback begins at register address 0x04 when the user asserts the GO bit (register 0x0C). When playback of that waveform ends, the waveform sequencer plays the next waveform identifier held in register 0x05, if the next waveform is non-zero. The waveform sequencer continues in this way until the sequencer reaches an identifier value of zero or until all eight identifiers are played (register addresses 0x04 through 0x0B), whichever comes first.

The waveform identifier range is 1 to 123. The MSB of each sequence register can be used to implement a delay between sequence waveforms. When the MSB is high, bits 6-0 indicate the length of the wait time. The wait time for that step then becomes WAV\_FRM\_SEQ[6:0] × 10 ms.

**Programming (continued)**

**Figure 27. Waveform Sequencer Programming**
**7.5.8.2.6 Waveform Triggers**

When the waveform sequencer has the effect (or effects) loaded, the waveform sequencer can be triggered by an internal trigger, external trigger (edge), or external trigger (level). To trigger using the internal trigger set the MODE[2:0] bit to 0 in register 0x01. To trigger using the external trigger (edge), set the MODE[2:0] bit to 1 and then follow the trigger instructions listed in the [Edge Trigger](#) section. To trigger using the external trigger (level), set the MODE[2:0] bit to 2 and then follow the trigger instructions listed in the [Level Trigger](#) section.

## 7.6 Register Map

**Table 3. Register Map Overview**

| REG NO. | DEFAULT | BIT 7              | BIT 6                | BIT 5              | BIT 4           | BIT 3              | BIT 2          | BIT 1           | BIT 0          |

| BIT | FIELD          | TYPE | DEFAULT | DESCRIPTION  |
|-----|----------------|------|---------|--|
| 7-5 | DEVICE_ID[2:0] | RO   | 3       | Device identifier. The DEVICE_ID bit indicates the part number to the user. The user software can ascertain the device capabilities by reading this register. <ul style="list-style-type: none"> <li>3: DRV2605 (contains licensed ROM library, does not contain RAM)</li> <li>4: DRV2604 (contains RAM, does not contain licensed ROM library)</li> <li>6: DRV2604L (low-voltage version of the DRV2604 device)</li> <li>7: DRV2605L (low-voltage version of the DRV2605 device)</li> </ul>   |
| 4   | Reserved       |      |         |  |
| 3   | DIAG_RESULT    | RO   | 0       | This flag stores the result of the auto-calibration routine and the diagnostic routine. The flag contains the result for whichever routine was executed last. The flag clears upon read. Test result is not valid until the GO bit self-clears at the end of the routine. <p>Auto-calibration mode:</p> <ul style="list-style-type: none"> <li>0: Auto-calibration passed (optimum result converged)</li> <li>1: Auto-calibration failed (result did not converge)</li> </ul> <p>Diagnostic mode:</p> <ul style="list-style-type: none"> <li>0: Actuator is functioning normally</li> <li>1: Actuator is not present or is shorted, timing out, or giving out-of-range back-EMF</li> </ul> |
| 2   | FB_STS         | RO   | 0       | Contains status for the feedback controller. This indicates when the ERM back-EMF has been zero for more than ~10 ms in ERM mode, and indicates when the LRA frequency tracking has lost frequency lock in LRA mode. This bit is for debug purposes only, and can sometimes be set under normal operation when extensive braking periods are used. This bit will clear upon read. <ul style="list-style-type: none"> <li>0: Feedback controller has not timed out</li> <li>1: Feedback controller has timed out</li> </ul>   |
| 1   | OVER_TEMP      | RO   | 0       | Latching overtemperature detection flag. If the device becomes too hot, it shuts down. This bit clears upon read. <ul style="list-style-type: none"> <li>0: Device is functioning normally</li> <li>1: Device has exceeded the temperature threshold</li> </ul>  |
| 0   | OC_DETECT      | RO   | 0       | Latching overcurrent detection flag. If the load impedance is below the load-impedance threshold, the device shuts down and periodically attempts to restart until the impedance is above the threshold. <ul style="list-style-type: none"> <li>0: No overcurrent event is detected</li> <li>1: Overcurrent event is detected</li> </ul>   |

**7.6.2 Mode (Address: 0x01)**

| R/W-0     | R/W-1   |          |   |   | R/W-0     |   |   |

**Table 5. Mode Register Field Descriptions**

| BIT | FIELD     | TYPE | DEFAULT | DESCRIPTION  |
|-----|-----------|------|---------|--|
| 7   | DEV_RESET | R/W  | 0       | Device reset. Setting this bit performs the equivalent operation of power cycling the device. Any playback operations are immediately interrupted, and all registers are reset to the default values. The DEV_RESET bit self-clears after the reset operation is complete.   |
| 6   | STANDBY   | R/W  | 1       | Software standby mode<br>0: Device ready<br>1: Device in software standby  |
| 5-3 | Reserved  |      |         |  |
| 2-0 | MODE      | R/W  | 0       | <p>0: Internal trigger<br/>Waveforms are fired by setting the GO bit in register 0x0C.</p> <p>1: External trigger (edge mode)<br/>A rising edge on the IN/TRIG pin sets the GO Bit. A second rising edge on the IN/TRIG pin cancels the waveform if the second rising edge occurs before the GO bit has cleared.</p> <p>2: External trigger (level mode)<br/>The GO bit follows the state of the external trigger. A rising edge on the IN/TRIG pin sets the GO bit, and a falling edge sends a cancel. If the GO bit is already in the appropriate state, no change occurs.</p> <p>3: PWM input and analog input<br/>A PWM or analog signal is accepted at the IN/TRIG pin and used as the driving source. The device actively drives the actuator while in this mode. The PWM or analog input selection occurs by using the N_PWM_ANALOG bit.</p> <p>4: Audio-to-vibe<br/>An AC-coupled audio signal is accepted at the IN/TRIG pin. The device converts the audio signal into meaningful haptic vibration. The AC_COUPLE and N_PWM_ANALOG bits should also be set.</p> <p>5: Real-time playback (RTP mode)<br/>The device actively drives the actuator with the contents of the RTP_INPUT[7:0] bit in register 0x02.</p> <p>6: Diagnostics<br/>Set the device in this mode to perform a diagnostic test on the actuator. The user must set the GO bit to start the test. The test is complete when the GO bit self-clears. Results are stored in the DIAG_RESULT bit in register 0x00.</p> <p>7: Auto calibration<br/>Set the device in this mode to auto calibrate the device for the actuator. Before starting the calibration, the user must set the all required input parameters. The user must set the GO bit to start the calibration. Calibration is complete when the GO bit self-clears. For more information see the <a href="#">Auto Calibration Procedure</a> section.</p> |

**7.6.3 Real-Time Playback Input (Address: 0x02)**

**Table 6. Real-Time Playback Input Register Field Descriptions**

| BIT | FIELD          | TYPE | DEFAULT | DESCRIPTION   |
|-----|----------------|------|---------|---|
| 7-0 | RTP_INPUT[7:0] | R/W  | 0       | This field is the entry point for real-time playback (RTP) data. The DRV2605 playback engine drives the RTP_INPUT[7:0] value to the load when MODE[2:0] = 5 (RTP mode). The RTP_INPUT[7:0] value can be updated in real-time by the host controller to create haptic waveforms. The RTP_INPUT[7:0] value is interpreted as signed by default, but can be set to unsigned by the DATA_FORMAT_RTP bit in register 0x1D. When the haptic waveform is complete, the user can idle the device by setting MODE[2:0] = 0, or alternatively by setting STANDBY = 1. |

**7.6.4 (Address: 0x03)**
**Figure 31. Register**

|          |   |   |       |          |                  |       |   |

**Table 7. Register Field Descriptions**

| BIT | FIELD       | TYPE | DEFAULT | DESCRIPTION   |
|-----|-------------|------|---------|---|
| 7-5 | Reserved    |      |         |   |
| 4   | HI_Z        | R/W  | 0       | This bit sets the output driver into a true high-impedance state. The device must be enabled to go into the high-impedance state. When in hardware shutdown or standby mode, the output drivers have 15 kΩ to ground. When the HI_Z bit is asserted, the hi-Z functionality takes effect immediately, even if a transaction is taking place.  |
| 3   | Reserved    |      |         |   |
| 2-0 | LIBRARY_SEL | R/W  | 1       | Waveform library selection value. This bit determines which library the playback engine selects when the GO bit is set. For additional details on the ERM libraries see the <a href="#">Table 1</a> section. <ul style="list-style-type: none"> <li>0: Empty</li> <li>1: TS2200 Library A</li> <li>2: TS2200 Library B</li> <li>3: TS2200 Library C</li> <li>4: TS2200 Library D</li> <li>5: TS2200 Library E</li> <li>6: LRA Library</li> <li>7: Reserved</li> </ul> |

### 7.6.5 Waveform Sequencer (Address: 0x04 to 0x0B)

**Figure 32. Waveform Sequencer Register**

|       |                  |   |   |   |   |   |   |
|-------|------------------|---|---|---|---|---|---|

| WAIT  | WAV_FRM_SEQ[6:0] |   |   |   |   |   |   |
| R/W-0 | R/W-0            |   |   |   |   |   |   |

**Table 8. Waveform Sequencer Register Field Descriptions**

| BIT | FIELD       | TYPE | DEFAULT | DESCRIPTION   |
|-----|-------------|------|---------|---|
| 7   | WAIT        | R/W  | 0       | <p>When this bit is set, the WAV_FRM_SEQ[6:0] bit is interpreted as a <i>wait time</i> in which the playback engine idles. This bit is used to insert timed delays between sequentially played waveforms.</p> <p style="text-align: center;">Delay time = 10 ms × WAV_FRM_SEQ[6:0]</p> <p>If WAIT = 0, then WAV_FRM_SEQ[6:0] is interpreted as a waveform identifier for sequence playback.</p>   |
| 6-0 | WAV_FRM_SEQ | R/W  | 0       | <p>Waveform sequence value. This bit holds the waveform identifier of the waveform to be played. A waveform identifier is an integer value referring to the index position of a waveform in a ROM library. Playback begins at register address 0x04 when the user asserts the GO bit (register 0x0C). When playback of that waveform ends, the waveform sequencer plays the next waveform identifier held in register 0x05, if the next waveform identifier is non-zero. The waveform sequencer continues in this way until the sequencer reaches an identifier value of zero, or all eight identifiers are played (register addresses 0x04 through 0x0B), whichever comes first.</p> |

### 7.6.6 GO (Address: 0x0C)

**Figure 33. GO Register**

|          |   |   |   |   |   |   |       |

|          |   |   |   |   |   |   | R/W-0 |

**Table 9. GO Register Field Descriptions**

| BIT | FIELD    | TYPE | DEFAULT | DESCRIPTION  |
|-----|----------|------|---------|--|
| 7-1 | Reserved |      |         |  |
| 0   | GO       | R/W  | 0       | <p>This bit is used to fire processes in the DRV2605 device. The process fired by the GO bit is selected by the MODE[2:0] bit (register 0x01). The primary function of this bit is to fire playback of the waveform identifiers in the waveform sequencer (registers 0x04 to 0x0B), in which case, this bit can be thought of a <i>software trigger</i> for haptic waveforms. The GO bit remains high until the playback of the haptic waveform sequence is complete. Clearing the GO bit during waveform playback cancels the waveform sequence. Using one of the external trigger modes can cause the GO bit to be set or cleared by the external trigger pin. This bit can also be used to fire the auto-calibration process or the diagnostic process.</p> |

**7.6.7 Overdrive Time Offset (Address: 0x0D)**
**Figure 34. Overdrive Time Offset Register**

|          |   |   |   |   |   |   |   |
|----------|---|---|---|---|---|---|---|
| 7        | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 19. Rated Voltage Register Field Descriptions**

| BIT | FIELD              | TYPE | DEFAULT | DESCRIPTION  |
|-----|--------------------|------|---------|--|
| 7-0 | RATED_VOLTAGE[7:0] | R/W  | 0x3F    | This bit sets the reference voltage for full-scale output during closed-loop operation. The auto-calibration routine uses this register as an input, therefore this register must be written with the rated voltage value of the motor before calibration is performed. This register is ignored for open-loop operation because the overdrive voltage sets the reference for that case. Any modification of this register value should be followed by calibration to set A_CAL_BEMF appropriately.<br>See the <a href="#">Rated Voltage Programming</a> section for calculating the correct register value. |

**7.6.17 Overdrive Clamp Voltage (Address: 0x17)**
**Figure 44. Overdrive Clamp Voltage Register**

|               |       |       |       |       |       |       |       |
|---------------|-------|-------|-------|-------|-------|-------|-------|

**Table 26. Control3 Register Field Descriptions**

| BIT | FIELD           | TYPE | DEFAULT | DESCRIPTION  |
|-----|-----------------|------|---------|--|
| 7-6 | NG_THRESH[1:0]  | R/W  | 2       | This bit is the noise-gate threshold for PWM and analog inputs.<br>0: Disabled<br>1: 2%<br>2: 4% (Default)<br>3: 8%  |
| 5   | ERM_OPEN_LOOP   | R/W  | 1       | This bit selects mode of operation while in ERM mode. Closed-loop operation is usually desired for because of automatic overdrive and braking properties. However, many existing waveform libraries were designed for open-loop operation, therefore open-loop operation can be required for compatibility.<br>0: Closed Loop<br>1: Open Loop  |
| 4   | SUPPLY_COMP_DIS | R/W  | 0       | This bit disables supply compensation. The DRV2605 device generally provides constant drive output over variation in the power supply input ( $V_{DD}$ ). In some systems, supply compensation can have already been implemented upstream, therefore disabling the DRV2605 supply compensation can be useful.<br>0: Supply compensation enabled<br>1: Supply compensation disabled   |
| 3   | DATA_FORMAT RTP | R/W  | 0       | This bit selects the input data interpretation for RTP (Real-Time Playback) mode.<br>0: Signed<br>1: Unsigned  |
| 2   | LRA_DRIVE_MODE  | R/W  | 0       | This bit selects the drive mode for the LRA algorithm. This bit determines how often the drive amplitude is updated. Updating once per cycle provides a symmetrical output signal, while updating twice per cycle provides more precise control.<br>0: Once per cycle<br>1: Twice per cycle  |
| 1   | N_PWM_ANALOG    | R/W  | 0       | This bit selects the input mode for the IN/TRIG pin when MODE[2:0] = 3. In PWM input mode, the duty cycle of the input signal determines the amplitude of the waveform. In analog input mode, the amplitude of the input determines the amplitude of the waveform.<br>0: PWM Input<br>1: Analog Input  |
| 0   | LRA_OPEN_LOOP   | R/W  | 0       | This bit selects an open-loop drive option for LRA Mode. When asserted, the playback engine drives the LRA at the selected frequency independently of the resonance frequency. In PWM input mode, the playback engine recovers the LRA commutation frequency from the PWM input, dividing the frequency by 128. Therefore the PWM input frequency must be equal to 128 times the resonant frequency of the LRA.<br>0: Auto-resonance mode<br>1: LRA open-loop mode |

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The typical application for a haptic driver is in a touch-enabled system that already has an application processor which makes the decision on when to execute haptic effects.

The DRV2605 device can be used fully with I<sup>2</sup>C communications (either using RTP or the memory interface). A system designer can choose to use external triggers to play low-latency effects (such as from a physical button) or can decide to use the PWM interface. Figure 54 shows a typical haptic system implementation. The system designer should not use the internal regulator (REG) to power any external load.

A system designer can also implement audio-to-vibe. Figure 55 shows a typical haptic system implementation supporting audio-to-vibe.

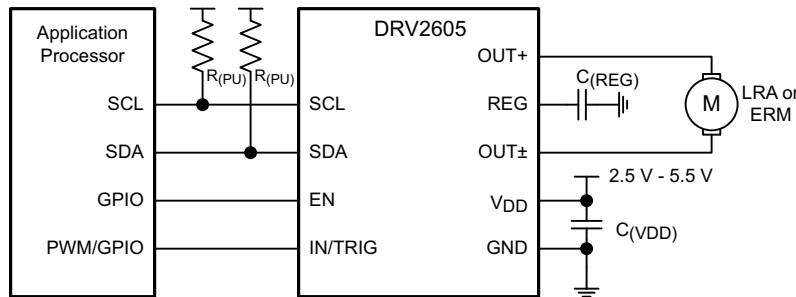

Figure 54. I<sup>2</sup>C Control with Optional PWM Input or External Trigger

Figure 55. I<sup>2</sup>C Control With Audio-to-Vibe Input and Optional AC Coupling

Table 30. Recommended External Components

| COMPONENT | DESCRIPTION                      | SPECIFICATION | TYPICAL VALUE  |
|-----------|----------------------------------|---------------|----------------|
| C(VDD)    | Input capacitor                  | Capacitance   | 1 $\mu$ F      |
| C(REG)    | Regulator capacitor              | Capacitance   | 1 $\mu$ F      |
| C(IN)     | AC coupling capacitor (optional) | Capacitance   | 1 $\mu$ F      |
| R(PU)     | Pullup resistor                  | Resistance    | 2.2 k $\Omega$ |

## 8.2 Typical Application

A typical application of the DRV2605 device is in a system that has external buttons which fire different haptic effects when pressed. Figure 56 shows a typical schematic of such a system. The buttons can be physical buttons, capacitive-touch buttons, or GPIO signals coming from the touch-screen system.

Effects in this type of system are programmable.

Figure 56. Typical Application Schematic

### 8.2.1 Design Requirements

For this design example, use the values listed in Table 31 as the input parameters.

Table 31. Design Parameters

| DESIGN PARAMETER   | EXAMPLE VALUE                      |
|--------------------|------------------------------------|
| Interface          | I <sup>2</sup> C, external trigger |
| Actuator type      | LRA, ERM                           |
| Input power source | Li-ion/Li-polymer, 5-V boost       |

### 8.2.2 Detailed Design Procedure

#### 8.2.2.1 Actuator Selection

The actuator decision is based on many factors including cost, form factor, vibration strength, power-consumption requirements, haptic sharpness requirements, reliability, and audible noise performance. The actuator selection is one of the most important design considerations of a haptic system and therefore the actuator should be the first component to consider when designing the system. The following sections list the basics of ERM and LRA actuators.

##### 8.2.2.1.1 Eccentric Rotating-Mass Motors (ERM)

Eccentric rotating-mass motors (ERMs) are typically DC-controlled motors of the bar or coin type. ERMs can be driven in the clockwise direction or counter-clockwise direction depending on the polarity of voltage across the two pins. Bidirectional drive is made possible in a single-supply system by differential outputs that are capable of sourcing and sinking current. The bidirectional drive feature helps eliminate long vibration tails which are undesirable in haptic feedback systems.

Figure 57. Motor Spin Direction in ERM Motors

Another common approach to driving DC motors is the concept of overdrive voltage. To overcome the inertia of the mass of the motor, the DC motors are often *overdriven* for a short amount of time before returning to the rated voltage of the motor to sustain the rotation of the motor. Overdrive is also used to stop (or brake) a motor quickly. Refer to the data sheet of the particular motor used with the DRV2605 device for safe and reliable overdrive voltage and duration.

8.2.2.1.2 Linear Resonance Actuators (LRA)

Linear resonant actuators (LRAs) vibrate optimally at the resonant frequency. LRAs have a high-Q frequency response because of a rapid drop in vibration performance at the offsets of 3 to 5 Hz from the resonant frequency. Many factors also cause a shift or drift in the resonant frequency of the actuator such as temperature, aging, the mass of the product to which the LRA is mounted, and in the case of a portable product, the manner in which the product is held. Furthermore, as the actuator is driven to the maximum allowed voltage, many LRAs will shift several hertz in frequency because of mechanical compression. All of these factors make a real-time tracking auto-resonant algorithm critical when driving LRA to achieve consistent, optimized performance.

Figure 58. Typical LRA Response

8.2.2.1.2.1 Auto-Resonance Engine for LRA

The DRV2605 auto-resonance engine tracks the resonant frequency of an LRA in real time effectively locking into the resonance frequency after half a cycle. If the resonant frequency shifts in the middle of a waveform for any reason, the engine tracks the frequency from cycle to cycle. The auto resonance engine accomplishes this tracking by constantly monitoring the back-EMF of the actuator. Note that the auto resonance engine is not affected by the auto-calibration process which is only used for level calibration. No calibration is required for the auto resonance engine.

8.2.2.2 Capacitor Selection

The DRV2605 device has a switching output stage which pulls transient currents through the  $V_{DD}$  pin. TI recommends placing a 0.1- $\mu$ F low equivalent-series-resistance (ESR) supply-bypass capacitor of the X5R or X7R type near the  $V_{DD}$  supply pin for proper operation of the output driver and the digital portion of the device. Place a 1- $\mu$ F X5R or X7R-type capacitor from the REG pin to ground.

### 8.2.2.3 Interface Selection

The I<sup>2</sup>C interface is required to configure the device. The device can be used fully with the I<sup>2</sup>C interface and with either RTP or internal memory. The advantage of using the I<sup>2</sup>C interface is that no additional GPIO (for the IN/TRIG pin) is required for firing effects, and no PWM signal is required to be generated. Therefore the IN/TRIG pin can be connected to GND. Using the external trigger pin has the advantage that no I<sup>2</sup>C transaction is required to fire the pre-loaded effect, which is a good choice for interfacing with a button. The PWM interface is available for backward compatibility. If audio-to-vibe is desired, then use C<sub>(IN)</sub> as shown in Figure 55.

### 8.2.2.4 Power Supply Selection

The DRV2605 device supports a wide range of voltages in the input. Ensuring that the battery voltage is high enough to support the desired vibration strength with the selected actuator is an important design consideration. The typical application uses Li-ion or Li-polymer batteries which provide enough voltage headroom to drive most common actuators.

If very strong vibrations are desired, a boost converter can be placed between the power supply and the V<sub>DD</sub> pin to provide a constant voltage with a healthy headroom (5-V rails are common in some systems) which is particularly true if two AA batteries in series are being used to power the system.

### 8.2.3 Application Curves

V<sub>DD</sub> = 3.6 V    ERM open loop

V<sub>DD</sub> = 3.6 V    LRA closed loop  
 Strong click -    External level  
                   100%            trigger

Figure 60. LRA Click With and Without Braking

## 8.3 Initialization Setup

### 8.3.1 Initialization Procedure

1. After powerup, wait at least 250  $\mu$ s before the DRV2605 device accepts I<sup>2</sup>C commands.
2. Assert the EN pin (logic high). The EN pin can be asserted any time during or after the 250- $\mu$ s wait period.
3. Write the MODE register (address 0x01) to value 0x00 to remove the device from standby mode.
4. If the nonvolatile auto-calibration memory has been programmed as described in the [Auto Calibration Procedure](#) section, skip Step 5 and proceed to Step 6.
5. Perform the steps as described in the [Auto Calibration Procedure](#) section. Alternatively, rewrite the results from a previous calibration.
6. If using the embedded ROM library, write the library selection register (address 0x03) to select a library.
7. The default setup is closed-loop bidirectional mode. To use other modes and features, write Control1 (0x1B), Control2 (0x1C), and Control3 (0x1D) as required. Open-loop operation is recommended for ERM mode when using the ROM libraries.
8. Put the device in standby mode or deassert the EN pin, whichever is the most convenient. Both settings are low-power modes. The user can select the desired MODE (address 0x01) at the same time the STANDBY bit is set.

### 8.3.2 Typical Usage Examples

#### 8.3.2.1 Play a Waveform or Waveform Sequence from the ROM Waveform Memory

1. Initialize the device as listed in the [Initialization Procedure](#) section.
2. Assert the EN pin (active high) if it was previously deasserted.
3. If register 0x01 already holds the desired value and the STANDBY bit is low, the user can skip this step. Select the desired MODE[2:0] value of 0 (internal trigger), 1 (external edge trigger), or 2 (external level trigger) in the MODE register (address 0x01). If the STANDBY bit was previously asserted, this bit should be deasserted (logic low) at this time.
4. Select the waveform index to be played and write it to address 0x04. Alternatively, a sequence of waveform indices can be written to register 0x04 through 0x0B. See the [Waveform Sequencer](#) section for details.
5. If using the internal trigger mode, set the GO bit (in register 0x0C) to fire the effect or sequence of effects. If using an external trigger mode, send an appropriate trigger pulse to the IN/TRIG pin. See the [Waveform Triggers](#) section for details.
6. If desired, the user can repeat Step 5 to fire the effect or sequence again.
7. Put the device in low-power mode by deasserting the EN pin or setting the STANDBY bit.

#### 8.3.2.2 Play a Real-Time Playback (RTP) Waveform

1. Initialize the device as shown in the [Initialization Procedure](#) section.
2. Assert the EN pin (active high) if it was previously deasserted.
3. Set the MODE[2:0] value to 5 (RTP Mode) at address 0x01. If the STANDBY bit was previously asserted, this bit should be deasserted (logic low) at this time. If register 0x01 already holds the desired value and the STANDBY bit is low, the user can skip this step.
4. Write the desired drive amplitude to the real-time playback input register (address 0x02).
5. When the desired sequence of drive amplitudes is complete, put the device in low-power mode by deasserting the EN pin or setting the STANDBY bit.

## Initialization Setup (continued)

### 8.3.2.3 Play a PWM or Analog Input Waveform

1. Initialize the device as shown in the [Initialization Procedure](#) section.
2. Assert the EN pin (active high) if it was previously deasserted.
3. If register 0x01 already holds the desired value and the STANDBY bit is low, the user can skip this step. Set the MODE value to 3 (PWM/Analog Mode) at address 0x01. If the STANDBY bit was previously asserted, this bit should be deasserted (logic low) at this time.
4. Select the input mode (PWM or analog) in the Control3 register (address 0x1D). If this mode was selected during the initialization procedure, the user can skip this step.
5. Send the desired PWM or analog input waveform sequence from the external source. See the [Data Formats for Waveform Playback](#) section for drive amplitude scaling.
6. When the desired drive sequence is complete, put the device in low-power mode by deasserting the EN pin or setting the STANDBY bit.

## 9 Power Supply Recommendations

The DRV2605 device is designed to operate from an input-voltage supply range between 2.5 V to 5.5 V. The decoupling capacitor for the power supply should be placed closed to the device pin.

## 10 Layout

### 10.1 Layout Guidelines

Use the following guidelines for the DRV2605 layout:

- The decoupling capacitor for the power supply ( $V_{DD}$ ) should be placed closed to the device pin.
- The filtering capacitor for the regulator (REG) should be placed close to the device REG pin.
- When creating the pad size for the WCSP pins, TI recommends that the PCB layout use nonsolder mask-defined (NSMD) land. With this method, the solder mask opening is made larger than the desired land area and the opening size is defined by the copper pad width. Figure 61 shows and Table 32 lists appropriate diameters for a wafer-chip scale package (WCSP) layout.

Figure 61. Land Pattern Dimensions

Table 32. Land Pattern Dimensions

| SOLDER PAD DEFINITIONS        | COPPER PAD                                   | SOLDER MASK OPENING                          | COPPER THICKNESS                 | STENCIL OPENING   | STENCIL THICKNESS        |
|-------------------------------|--|--|----------------------------------|---|--------------------------|
| Nonsolder mask defined (NSMD) | 275 $\mu\text{m}$<br>(0, -25 $\mu\text{m}$ ) | 375 $\mu\text{m}$<br>(0, -25 $\mu\text{m}$ ) | 1-oz maximum (32 $\mu\text{m}$ ) | 275 $\mu\text{m} \times 275 \mu\text{m}^2$<br>(rounded corners) | 125- $\mu\text{m}$ thick |

1. Circuit traces from NSMD defined PWB lands should be 75- $\mu\text{m}$  to 100- $\mu\text{m}$  wide in the exposed area inside the solder mask opening. Wider trace widths reduce device stand-off and impact reliability.
2. The recommended solder paste is Type 3 or Type 4.
3. The best reliability results are achieved when the PWB laminate glass transition temperature is above the operating the range of the intended application.
4. For a PWB using a Ni/Au surface finish, the gold thickness should be less than 0.5  $\mu\text{m}$  to avoid a reduction in thermal fatigue performance.
5. Solder mask thickness should be less than 20  $\mu\text{m}$  on top of the copper circuit pattern.
6. The best solder stencil performance is achieved using laser-cut stencils with electro polishing. Use of chemically-etched stencils results in inferior solder paste volume control.
7. Trace routing away from the WCSP device should be balanced in X and Y directions to avoid unintentional component movement because of solder-wetting forces.

### 10.1.1 Trace Width

The recommended trace width at the solder pins is 75  $\mu\text{m}$  to 100  $\mu\text{m}$  to prevent solder wicking onto wider PCB traces. Maintain this trace width until the pin pattern has escaped, then the trace width can be increased for improved current flow. The width and length of the 75- $\mu\text{m}$  to 100- $\mu\text{m}$  traces should be as symmetrical as possible around the device to provide even solder reflow on each of the pins.

### 10.2 Layout Example

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

| Device      | Package Type | Package Drawing | Pins | SPQ  | Reel Diameter (mm) | Reel Width W1 (mm) | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) | Pin1 Quadrant |
|-------------|--------------|-----------------|------|------|--------------------|--------------------|---------|---------|---------|---------|--------|---------------|
| DRV2605YZFR | DSBGA        | YZF             | 9    | 3000 | 180.0              | 8.4                | 1.65    | 1.65    | 0.81    | 4.0     | 8.0    | Q1            |
| DRV2605YZFR | DSBGA        | YZF             | 9    | 3000 | 180.0              | 8.4                | 1.65    | 1.65    | 0.81    | 4.0     | 8.0    | Q1            |
| DRV2605YZFT | DSBGA        | YZF             | 9    | 250  | 180.0              | 8.4                | 1.65    | 1.65    | 0.81    | 4.0     | 8.0    | Q1            |

**TAPE AND REEL BOX DIMENSIONS**

\*All dimensions are nominal

| Device      | Package Type | Package Drawing | Pins | SPQ  | Length (mm) | Width (mm) | Height (mm) |
|-------------|--------------|-----------------|------|------|-------------|------------|-------------|
| DRV2605YZFR | DSBGA        | YZF             | 9    | 3000 | 182.0       | 182.0      | 20.0        |
| DRV2605YZFR | DSBGA        | YZF             | 9    | 3000 | 182.0       | 182.0      | 20.0        |
| DRV2605YZFT | DSBGA        | YZF             | 9    | 250  | 182.0       | 182.0      | 20.0        |

YZF0009

# PACKAGE OUTLINE

DSBGA - 0.625 mm max height

DIE SIZE BALL GRID ARRAY

4219558/A 10/2018

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

# EXAMPLE BOARD LAYOUT

YZF0009

DSBGA - 0.625 mm max height

DIE SIZE BALL GRID ARRAY

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 40X

SOLDER MASK DETAILS  
NOT TO SCALE

4219558/A 10/2018

NOTES: (continued)

- 3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. See Texas Instruments Literature No. SNVA009 ([www.ti.com/lit/snva009](http://www.ti.com/lit/snva009)).

# EXAMPLE STENCIL DESIGN

YZF0009

DSBGA - 0.625 mm max height

DIE SIZE BALL GRID ARRAY

SOLDER PASTE EXAMPLE  
BASED ON 0.1 mm THICK STENCIL  
SCALE: 40X

4219558/A 10/2018

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

## 重要なお知らせと免責事項

TI は、技術データと信頼性データ（データシートを含みます）、設計リソース（リファレンス デザインを含みます）、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、[TI の総合的な品質ガイドライン](#)、[ti.com](#) または TI 製品などに関連して提供される他の適用条件に従い提供されます。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。TI がカスタム、またはカスタマー仕様として明示的に指定していない限り、TI の製品は標準的なカタログに掲載される汎用機器です。

お客様がいかなる追加条項または代替条項を提案する場合も、TI はそれらに異議を唱え、拒否します。
