DRV8300U：100V 対応の 3 相 BLDC ゲート・ドライバ

1 特長

- 100V 3 相ハーフブリッジ・ゲート・ドライバ
  - N チャネル MOSFET (NMOS) を駆動
  - ゲート・ドライバ電源 (GVDD)：5～20V
  - MOSFET 電源 (SHx) は最大 100V をサポート
- 内蔵ブートストラップ・ダイオード (DRV8300UD デバイス)
- 反転および非反転 INLx 入力をサポート
- ブートストラップ・ゲート駆動アーキテクチャ
  - 750mA のソース電流
  - 1.5A のシンク電流
- 最大 15S のバッテリ駆動アプリケーションをサポート
- 高いスレッショルドにより標準 MOSFET に対応：BSTUV (標準値 8V)、GVDDUV (標準値 7.6V)
- SHx ピンの低リーク電流 (55µA 未満)
- BSTx 電圧の絶対最大定格：125V
- SHx で -22V までの負過渡電圧をサポート
- クロス導通防止機能を内蔵
- DT ピンでデッドタイムを調整可能 (QFN パッケージ品)
- 200ns の固定デッドタイム挿入 (TSSOP パッケージ品)
- 3.3V および 5V ロジック入力 (絶対最大定格 20V) をサポート
- 4ns (代表値) の伝搬遅延マッチング
- 小型の QFN および TSSOP パッケージ
- パワー・ブロックによる効率的なシステム設計
- 保護機能内蔵
  - BST 低電圧誤動作防止 (BSTUV)
  - GVDD 低電圧 (GVDDUV)

2 アプリケーション

- 電動アシスト自転車、電動スクーター、E モビリティ
- ファン、ポンプ、サーボ・ドライブ
- ブラシレス DC (BLDC) モーター・モジュールおよび PMSM
- コードレス園芸用器具および電動工具、芝刈り機
- コードレス掃除機
- ドローン、ロボティクス、ラジコン玩具
- 産業用および物流用ロボット

3 概要

DRV8300U は、ハイサイドおよびローサイド N チャネル・パワー MOSFET を駆動できる 100V 3 相ハーフブリッジ・ゲート・ドライバです。DRV8300UD は、内蔵ブートストラップ・ダイオードと外付けコンデンサを使ってハイサイド MOSFET のために適切なゲート駆動電圧を生成します。GVDD は、ローサイド MOSFET のゲート駆動電圧を生成するために使います。このゲート駆動アーキテクチャは、ピークで最大 750mA のソース電流と 1.5A のシンク電流に対応します。

位相ピン SHx は大きな負電圧過渡に耐えます。一方、ハイサイド・ゲート・ドライバ電源 BSTx および GHx はさらに大きな正電圧過渡 (絶対最大定格電圧 125V) に対応できるため、システムの堅牢性を高めることができます。伝搬遅延が短く、遅延マッチング仕様によりデッドタイムの要件が最小化されるため、さらに効率が向上します。GVDD と BST の低電圧誤動作防止による低電圧保護機能がローサイドとハイサイドの両方に備わっています。

製品情報 [(1)]

部品番号	パッケージ	本体サイズ (公称)
DRV8300UDPW	TSSOP (20)	6.40mm × 4.40mm
DRV8300UDIPW	TSSOP (20)	6.40mm × 4.40mm
DRV8300UDRGE	VQFN (24)	4.00mm × 4.00mm

5 Device Comparison Table

Device Variants	Package	Integrated Bootstrap Diode	GLx polarity with respect to INLx Input	Deadtime
DRV8300UD	20-Pin TSSOP	Yes	Inverted	Fixed
DRV8300UDI		Yes	Non-Inverted	Fixed
DRV8300UD	24-Pin VQFN	Yes	Non-Inverted or Inverted	Variable

表 5-1. DRV8300 vs DRV8300U comparison

| Parameters	DRV8300	DRV8300U
GVDDUV rising	4.6-V (typ)	8.3-V (typ)
GVDDUV falling	4.35-V (typ)	8-V (typ)
BSTUV rising	4.2-V (typ)	8-V (typ)
BSTUV falling	4-V (typ)	7.6-V(typ)

6 Pin Configuration and Functions

図 6-1. DRV8300UD RGE Package 24-Pin VQFN With Exposed Thermal Pad Top View

表 6-1. Pin Functions—24-Pin DRV8300U Devices

PIN		TYPE[1]	DESCRIPTION
NAME	NO.		
BSTA	20	O	Bootstrap output pin. Connect capacitor between BSTA and SHA
BSTB	17	O	Bootstrap output pin. Connect capacitor between BSTB and SHB
BSTC	14	O	Bootstrap output pin. Connect capacitor between BSTC and SHC
DT	21	I	Deadtime input pin. Connect resistor to ground for variable deadtime, fixed deadtime when left it floating
GHA	19	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GHB	16	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GHC	13	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GLA	11	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
GLB	10	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
GLC	9	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
INHA	22	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INHB	23	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INHC	24	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INLA	1	I	Low-side gate driver control input. This pin controls the output of the low-side gate driver.
INLB	2	I	Low-side gate driver control input. This pin controls the output of the low-side gate driver.
INLC	3	I	Low-side gate driver control input. This pin controls the output of the low-side gate driver.
MODE	5	I	Mode Input controls polarity of GLx compared to INLx inputs. Mode pin floating: GLx output polarity same(Non-Inverted) as INLx input Mode pin to GVDD: GLx output polarity inverted compared to INLx input
NC	7, 8	NC	No internal connection. This pin can be left floating or connected to system ground.
GND	6	PWR	Device ground.
SHA	18	I	High-side source sense input. Connect to the high-side power MOSFET source.
SHB	15	I	High-side source sense input. Connect to the high-side power MOSFET source.
SHC	12	I	High-side source sense input. Connect to the high-side power MOSFET source.
GVDD	4	PWR	Gate driver power supply input. Connect a X5R or X7R, GVDD-rated ceramic and greater then or equal to 10-uF local capacitance between the GVDD and GND pins.

(1)   PWR = power, I = input, O = output, NC = no connection

7 Specifications

7.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
Gate driver regulator pin voltage	GVDD	-0.3	21.5	V
Bootstrap pin voltage	BSTx	-0.3	125	V
Bootstrap pin voltage	BSTx with respect to SHx	-0.3	21.5	V
Logic pin voltage	INHx, INLx, MODE, DT	-0.3	V_{GVDD}+0.3	V
High-side gate drive pin voltage	GHx	-22	125	V
High-side gate drive pin voltage	GHx with respect to SHx	-0.3	22	V
Transient 500-ns high-side gate drive pin voltage	GHx with respect to SHx	-5	22	V
Low-side gate drive pin voltage	GLx	-0.3	V_{GVDD}+0.3	V
Transient 500-ns low-side gate drive pin voltage	GLx	-5	V_{GVDD}+0.3	V
High-side source pin voltage	SHx	-22	110	V
Ambient temperature, T_A		–40	125	°C
Junction temperature, T_J		–40	150	°C
Storage temperature, T_{stg}		–65	150	°C

(1)   Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime

7.2 ESD Ratings Comm

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±1000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101[2]	±250	

(1)   JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2)   JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{GVDD}	Power supply voltage	GVDD	8.7		20	V
V_{SHx}	High-side source pin voltage	SHx	-2		85	V
V_{SHx}	Transient 2µs high-side source pin voltage	SHx	-22		85	V
V_{BST}	Bootstrap pin voltage	BSTx	5		105	V
V_{BST}	Bootstrap pin voltage	BSTx with respect to SHx	5		20	V
V_{IN}	Logic input voltage	INHx, INLx, MODE, DT	0		GVDD	V
f_{PWM}	PWM frequency	INHx, INLx	0		200	kHz
V_{SHSL}	Slew rate on SHx pin (DRV8300UD and DRV8300UDI)				2	V/ns
C_{BOOT} [1]	Capacitor between BSTx and SHx (DRV8300UD and DRV8300UDI)				1	µF
T_A	Operating ambient temperature		–40		125	°C
T_J	Operating junction temperature		–40		150	°C

(1)   Current flowing through boot diode (D_{BOOT}) needs to be limited for C_{BOOT} > 1µF

8 Detailed Description

8.1 Overview

The DRV8300U family of devices is a gate driver for three-phase motor drive applications. These devices decrease system component count, saves PCB space and cost by integrating three independent half-bridge gate drivers and optional bootstrap diodes.

DRV8300U supports external N-channel high-side and low-side power MOSFETs and can drive 750-mA source, 1.5-A sink peak currents with total combined 30-mA average output current. The DRV8300U family of devices are available in 0.5-mm pitch QFN and 0.65-mm pitch TSSOP surface-mount packages. The QFN size is 4 × 4 mm (0.5-mm pin pitch) for the 24-pin package, and TSSOP body size is 6.5 × 4.4 mm (0.65-mm pin pitch) for the 20-pin package.

8.3 Feature Description

8.3.1 Three BLDC Gate Drivers

The DRV8300U integrates three half-bridge gate drivers, each capable of driving high-side and low-side N-channel power MOSFETs. Input on GVDD provides the gate bias voltage for the low-side MOSFETs. The high voltage is generated using bootstrap capacitor and GVDD supply. The half-bridge gate drivers can be used in combination to drive a three-phase motor or separately to drive other types of loads.

8.3.1.1 Gate Drive Timings

8.3.1.1.1 Propagation Delay

The propagation delay time (t_{pd}) is measured as the time between an input logic edge to a detected output change. This time has two parts consisting of the input deglitcher delay and the delay through the analog gate drivers.

The input deglitcher prevents high-frequency noise on the input pins from affecting the output state of the gate drivers. The analog gate drivers have a small delay that contributes to the overall propagation delay of the device.
8.3.1.1.2 Deadtime and Cross-Conduction Prevention

In the DRV8300U, high-side and low-side inputs operate independently, with an exception to prevent cross conduction when high and low side are turned ON at same time. The DRV8300U turns OFF high-side and low-side output to prevent shoot through when the both high-side and low-side inputs are at logic HIGH at same time.

The DRV8300U also provides option to insert additional deadtime to prevent the external high-side and low-side MOSFET from switching on at the same time. In the devices with DT pin (QFN package), deadtime can be linearly adjusted between 200 ns to 2000 ns by configuring resistor value between DT and GND. When the DT pin is left floating, fixed deadtime of 200 nS (typical value) is inserted. The value of resistor can be calculated using 式 1.

$$R_{DT}(k\Omega) = \frac{Deadtime\ (nS)}{5}$$

(1)

In the devices without DT pin (TSSOP package), fixed deadtime of 200 ns (typical value) is inserted to prevent high and low side gate output turning ON at same time.

図 8-2. Cross Conduction Prevention and Deadtime Insertion

8.3.1.2 Mode (Inverting and non inverting INLx)

The DRV8300U has flexibility of accepting different kind of inputs on INLx. In the devices with MODE pin (QFN package), the DRV8300U provides option of configuring the GLx outputs to be inverted or non-inverted compared to polarity of signal on INLx pins. When the MODE pin is left floating, the INLx is configured to be in non-inverting mode and GLx output is in phase with respect to INLx (see 図 8-3), whereas when the MODE pin is connected to GVDD, GLx output is out of phase with respect to INLx (see 図 8-4). In devices without MODE pin (TSSOP package device), there are different device option available for inverting and non inverting inputs (see セクション 5).
図 8-3. Non-Inverted INLx inputs

図 8-4. Inverted INLx inputs

Product Folder Links: *DRV8300U*

8.3.2 Pin Diagrams

図 8-5 shows the input structure for the logic level pins INHx, INLx. INHx and non-inverted INLx has passive pull down, so when inputs are floating the output the gate driver will be pulled low. 図 8-6 shows the input structure for the inverted INLx pins. The inverted INLx has passive pull up, so when inputs are floating the output of the low-side gate driver will be pulled low.

図 8-5. INHx and non-inverted INLx Logic-Level Input Pin Structure

図 8-6. Inverted INLx Logic-Level Input Pin Structure
8.3.3 Gate Driver Protective Circuits

The DRV8300U is protected against BSTx undervoltage and GVDD undervoltage events.

表 8-1. Fault Action and Response

FAULT	CONDITION	GATE DRIVER	RECOVERY
V_{BSTx} undervoltage (BSTUV)	$V_{BSTx} < V_{BSTUV}$	GHx - Hi-Z	Automatic: $V_{BSTx} > V_{BSTUV}$ and low to high PWM edge detected on INHx pin
GVDD undervoltage (GVDDUV)	$V_{GVDD} < V_{GVDDUV}$	Hi-Z	Automatic: $V_{GVDD} > V_{GVDDUV}$

8.3.3.1 V_{BSTx} Undervoltage Lockout (BSTUV)

The DRV8300U has separate voltage comparator to detect undervoltage condition for each phases. If at any time the voltage on the BSTx pin falls lower than the V_{BSTUV} threshold, high side external MOSFETs of that particular phase is disabled by disabling (Hi-Z) GHx pin. Normal operation starts again when the BSTUV condition clears and low to high PWM edge is detected on INHx input of the same phase that BSTUV condition was detected. BSTUV protection ensures that high-side MOSFETs are not driven when the BSTx pins has lower value.

8.3.3.2 GVDD Undervoltage Lockout (GVDDUV)

If at any time the voltage on the GVDD pin falls lower than the V_{GVDDUV} threshold voltage, all of the external MOSFETs are disabled. Normal operation starts again when the GVDDUV condition clears. GVDDUV protection ensures that external MOSFETs are not driven when the GVDD input is at lower value.

8.4 Device Functional Modes

The DRV8300U is in operating (active) mode, whenever the GVDD and BST pins are higher than the UV threshold (GVDD > V_{GVDDUV} and $V_{BSTX} > V_{BSTUV}$). In active mode, the gate driver output GHx and GLX will follow respective inputs INHx and INLx.

# 9 Application and Implementation

---

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DRV8300U family of devices is primarily used in applications for three-phase brushless DC motor control. The design procedures in the *セクション 9.2* section highlight how to use and configure the DRV8300U.

9.2 Typical Application
図 9-1. Application Schematic

9.2.1 Design Requirements

表 9-1 lists the example design input parameters for system design.

表 9-1. Design Parameters

EXAMPLE DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
MOSFET	-	CSD19532Q5B
Gate Supply Voltage	V_{GVDD}	12 V
Gate Charge	Q_G	48 nC

9.2.2 Bootstrap Capacitor and GVDD Capacitor Selection

The bootstrap capacitor must be sized to maintain the bootstrap voltage above the undervoltage lockout for normal operation. 式 2 calculates the maximum allowable voltage drop across the bootstrap capacitor:

$$\Delta V_{BSTX} = V_{GVDD} - V_{BOOTD} - V_{BSTUV}$$

(2)

=12 V – 0.85 V – 4.5 V = 6.65 V

where

- V_{GVDD} is the supply voltage of the gate drive
- V_{BOOTD} is the forward voltage drop of the bootstrap diode
- V_{BSTUV} is the threshold of the bootstrap undervoltage lockout

In this example the allowed voltage drop across bootstrap capacitor is 6.65 V. It is generally recommended that ripple voltage on both the bootstrap capacitor and GVDD capacitor should be minimized as much as possible. Many of commercial, industrial, and automotive applications use ripple value between 0.5 V to 1 V.

The total charge needed per switching cycle can be estimated with 式 3:

$$Q_{TOT} = Q_G + \frac{IL_{BS\_TRANS}}{f_{SW}}$$

(3)

=48 nC + 220 µA/20 kHz = 50 nC + 11 nC = 59 nC

where

- Q_G is the total MOSFET gate charge
- I_{LBS_TRAN} is the bootstrap pin leakage current
- f_{SW} is the is the PWM frequency

The minimum bootstrap capacitor an then be estimated as below assuming 1V ΔV_{BSTx}:

$$C_{BST\_MIN} = {Q_{TOT}}/{\Delta V_{BSTX}}$$
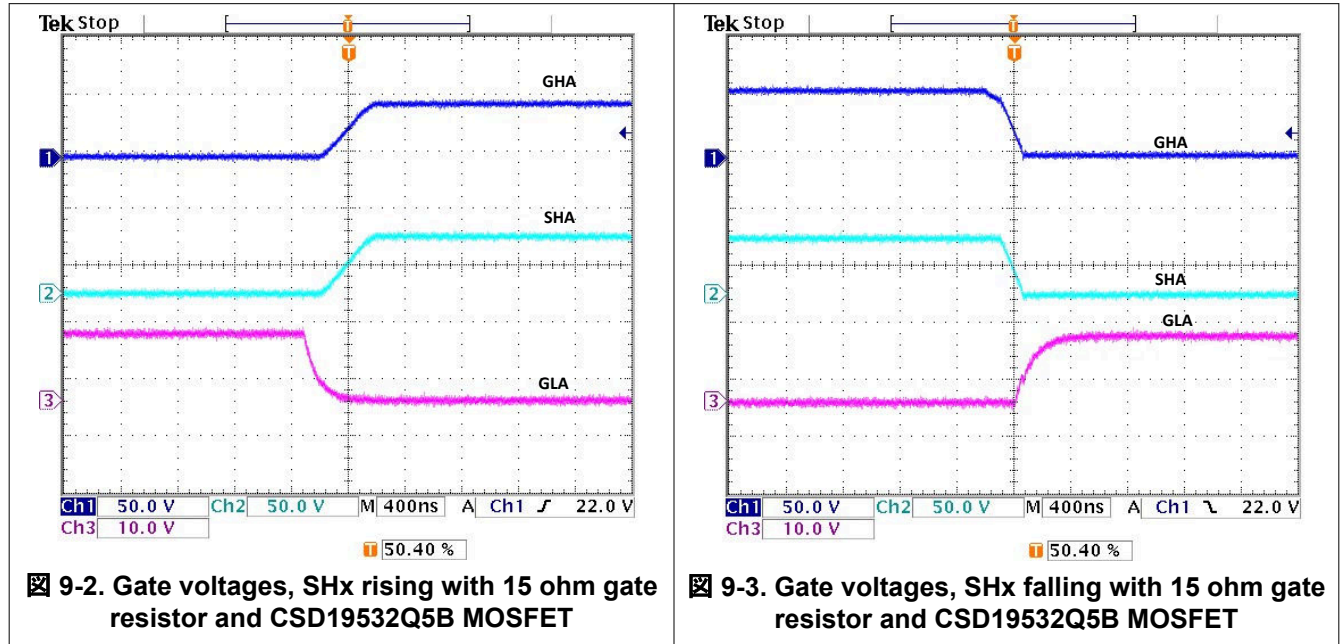

(4)

= 59 nC / 1 V = 59 nF

The calculated value of minimum bootstrap capacitor is 59 nF. It should be noted that, this value of capacitance is needed at full bias voltage. In practice, the value of the bootstrap capacitor must be greater than calculated value to allow for situations where the power stage may skip pulse due to various transient conditions. It is recommended to use a 100 nF bootstrap capacitor in this example. It is also recommenced to include enough margin and place the bootstrap capacitor as close to the BSTx and SHx pins as possible.

$$C_{GVDD} \geq 10 \times C_{BSTX}$$

(5)

= 10*100 nF= 1 µF

For this example application choose 1 µF C_{GVDD} capacitor. Choose a capacitor with a voltage rating at least twice the maximum voltage that it will be exposed to because most ceramic capacitors lose significant capacitance when biased. This value also improves the long term reliability of the system.

9.2.3 Application Curves

図 9-2. Gate voltages, SHx rising with 15 ohm gate resistor and CSD19532Q5B MOSFET

図 9-3. Gate voltages, SHx falling with 15 ohm gate resistor and CSD19532Q5B MOSFET

10 Power Supply Recommendations

The DRV8300U is designed to operate from an input voltage supply (GVDD) range from 4.8 V to 20 V. A local bypass capacitor should be placed between the GVDD and GND pins. This capacitor should be located as close to the device as possible. A low ESR, ceramic surface mount capacitor is recommended. It is recommended to use two capacitors across GVDD and GND: a low capacitance ceramic surface-mount capacitor for high frequency filtering placed very close to GVDD and GND pin, and another high capacitance value surfacemount capacitor for device bias requirements. In a similar manner, the current pulses delivered by the GHx pins are sourced from the BSTx pins. Therefore, capacitor across the BSTx to SHx is recommended, it should be high enough capacitance value capacitor to deliver GHx pulses

Product Folder Links: *DRV8300U*

11 Layout

11.1 Layout Guidelines

- Low ESR/ESL capacitors must be connected close to the device between GVDD and GND and between BSTx and SHx pins to support high peak currents drawn from GVDD and BSTx pins during the turn-on of the external MOSFETs.
- To prevent large voltage transients at the drain of the top MOSFET, a low ESR electrolytic capacitor and a good quality ceramic capacitor must be connected between the high side MOSFET drain and ground.
- In order to avoid large negative transients on the switch node (SHx) pin, the parasitic inductances between the source of the high-side MOSFET and the source of the low-side MOSFET must be minimized.
- In order to avoid unexpected transients, the parasitic inductance of the GHx, SHx, and GLx connections must be minimized. Minimize the trace length and number of vias wherever possible. Minimum 10 mil and typical 15 mil trace width is recommended.
- Resistance between DT and GND must be place as close as possible to device
- Place the gate driver as close to the MOSFETs as possible. Confine the high peak currents that charge and discharge the MOSFET gates to a minimal physical area by reducing trace length. This confinement decreases the loop inductance and minimize noise issues on the gate terminals of the MOSFETs.
- In QFN package device variants, NC pins can be connected to GND to increase ground conenction between thermal pad and external ground plane.
- Refer to sections *General Routing Techniques and MOSFET Placement and Power Stage Routing* in Application Report

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

TI Glossary   This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided.
