

DRV8837C 1A低電圧、Hブリッジ・ドライバ

1 特長

- Hブリッジ・モータ・ドライバ
 - DCモータまたは他の負荷を駆動
 - 低いMOSFETオン抵抗: HS + LS 1Ω
- 最大1Aの駆動電流
- 動作電源電圧範囲: 0~11V
- 標準PWMインターフェイス(IN1/IN2)
- 低消費電力のスリープ・モード、スリープ時の最大電流120nA
 - nSLEEPピン
- 小さなパッケージと占有面積
 - 8 WSON (サーマル・パッド付き)
 - 2.0×2.0mm
- 保護機能
 - VCC低電圧誤動作防止(UVLO)
 - 過電流保護(OCP)
 - サーマル・シャットダウン(TSD)

2 アプリケーション

- カメラ
- DSLRレンズ
- コンシューマ製品
- 玩具
- ロボティクス
- 医療機器

3 概要

DRV8837Cデバイスは、カメラ、コンシューマ製品、玩具、その他低電圧またはバッテリー駆動のモーション制御用途に使用される内蔵用モータ・ドライバ・ソリューションです。このデバイスは、1つのDCモータ、またはソレノイドなど他のデバイスを駆動できます。出力ドライバ・ブロックには、モータ巻線を駆動するHブリッジとして構成されたNチャネルのパワーMOSFETが搭載されています。内部のチャージ・ポンプにより、必要なゲート・ドライブ電圧が生成されます。

DRV8837Cデバイスは、最大1Aの出力電流を供給できます。このデバイスは、モータの電源電圧0~11Vで動作し、制御ロジックは1.8V~5Vレールで動作できます。

DRV8837Cデバイスには、PWM (IN/IN)入力インターフェイスが搭載されています。

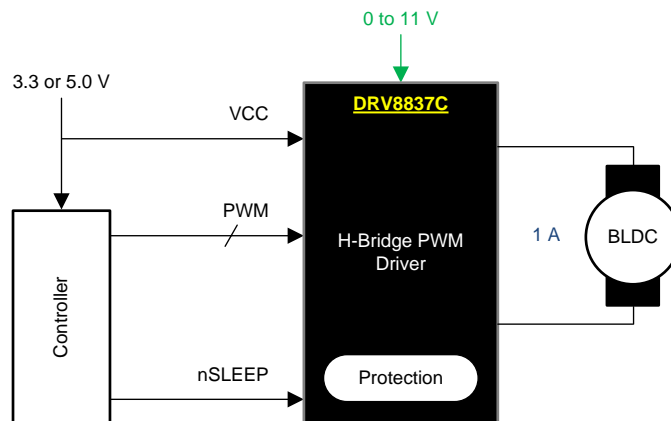

過電流保護、短絡保護、低電圧誤動作防止、および過熱保護のために、内部シャットダウン機能が用意されています。

5 Pin Configuration and Functions

DSG Package
8-Pin WSON With Exposed Thermal Pad
Top View

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
POWER AND GROUND			
GND	4	PWR	Device ground This pin must be connected to the PCB ground.
VCC	8	PWR	Logic power supply Bypass this pin to the GND pin with a 0.1- μ F ceramic capacitor rated for VCC.
VM	1	PWR	Motor power supply Bypass this pin to the GND pin with a 0.1- μ F ceramic capacitor rated for VM.
CONTROL			
IN1	6	I	IN1 input
IN2	5	I	IN2 input
nSLEEP	7	I	Sleep mode input When this pin is in logic low, the device enters low-power sleep mode. The device operates normally when this pin is logic high. The pin has an internal pulldown resistor to GND.
OUTPUT			
OUT1	2	O	Motor output
OUT2	3	O	Connect this pin to the motor winding.

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
Motor power-supply voltage	V _M	-0.3	12	V
Logic power-supply voltage	V _{CC}	-0.3	7	V
Control pin voltage	IN1, IN2, nSLEEP	-0.5	7	V
Peak drive current	OUT1, OUT2	Internally limited		A
Operating virtual junction temperature, T _J		-40	150	°C
Storage temperature, T _{stg}		-60	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground pin.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _{VM}	Motor power-supply voltage	0	11	V
V _{CC}	Logic power-supply voltage	1.8	7	V
I _{OUT}	Motor peak current	0	1	A
f _{PWM}	Externally applied PWM frequency	0	250	kHz
V _{LOGIC}	Logic level input voltage	0	5.5	V
T _A	Operating ambient temperature	-40	85	°C

6.4 Thermal Information

over operating free-air temperature range (unless otherwise noted)

THERMAL METRIC ⁽¹⁾		DRV8837C	UNIT
		DSG (WSON)	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	60.9	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	71.4	°C/W
R _{θJB}	Junction-to-board thermal resistance	32.2	°C/W
ψ _{JT}	Junction-to-top characterization parameter	1.6	°C/W
ψ _{JB}	Junction-to-board characterization parameter	32.8	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	9.8	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

 $T_A = 25^\circ\text{C}$, over recommended operating conditions unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLIES (VM, VCC)						
V_{VM}	VM operating voltage		0		11	V
I_{VM}	VM operating supply current	$V_{VM} = 5\text{ V}; V_{CC} = 3\text{ V};$ No PWM		40	100	μA
		$V_{VM} = 5\text{ V}; V_{CC} = 3\text{ V};$ 50 kHz PWM		0.8	1.5	mA
I_{VMQ}	VM sleep mode supply current	$V_{VM} = 5\text{ V}; V_{CC} = 3\text{ V};$ $n\text{SLEEP} = 0$		30	95	nA
V_{CC}	V_{CC} operating voltage		1.8		7	V
I_{VCC}	V_{CC} operating supply current	$V_{VM} = 5\text{ V}; V_{CC} = 3\text{ V};$ No PWM		300	500	μA
		$V_{VM} = 5\text{ V}; V_{CC} = 3\text{ V};$ 50 kHz PWM		0.7	1.5	mA
I_{VCCQ}	V_{CC} sleep mode supply current	$V_{VM} = 5\text{ V}; V_{CC} = 3\text{ V};$ $n\text{SLEEP} = 0$		5	25	nA
CONTROL INPUTS (IN1/PH, IN2/EN, nSLEEP)						
V_{IL}	Input logic-low voltage				$0.25 \times V_{CC}$	V
V_{IH}	Input logic-high voltage		$0.5 \times V_{CC}$			V
V_{HYS}	Input logic hysteresis			$0.08 \times V_{CC}$		V
I_{IL}	Input logic-low current	$V_{INx} = 0\text{ V}$	-5		5	μA
I_{IH}	Input logic-high current	$V_{INx} = 3.3\text{ V}$			50	μA
R_{PD}	Pulldown resistance			100		k Ω
MOTOR DRIVER OUTPUTS (OUT1, OUT2)						
$R_{DS(ON)}$	HS + LS FET on-resistance	$V_{VM} = 5\text{ V}; V_{CC} = 3.3\text{ V};$ $I_O = 200\text{ mA}; T_J = 25^\circ\text{C}$		1000		m Ω
I_{OFF}	Off-state leakage current	$V_{OUTx} = 0\text{ V}$	-200		200	nA
PROTECTION CIRCUITS						
V_{UVLO}	V_{CC} undervoltage lockout	V_{CC} falling			1.7	V
		V_{CC} rising			1.8	V
I_{OCP}	Overcurrent protection trip level		1.2			A
t_{DEG}	Overcurrent deglitch time			1		μs
t_{RETRY}	Overcurrent retry time			1		ms
$T_{TSD}^{(1)}$	Thermal shutdown temperature	Die temperature T_J	150	160	180	$^\circ\text{C}$

(1) Not tested in production; limits are based on characterization data

6.6 Timing Requirements

$T_A = 25^\circ\text{C}$, $V_{VM} = 5\text{ V}$, $V_{CC} = 3\text{ V}$, $R_L = 20\ \Omega$

NO.			MIN	MAX	UNIT
1	t_7	Output enable time		300	ns
2	t_8	Output disable time		300	ns
3	t_9	Delay time, INx high to OUTx high		160	ns
4	t_{10}	Delay time, INx low to OUTx low		160	ns
5	t_{11}	Output rise time	20	188	ns
6	t_{12}	Output fall time	20	188	ns
—	t_{wake}	Wake time, nSLEEP rising edge to part active		30	μs

DRV8837C

6.7 Typical Characteristics

Plots generated using characterization data.

7 Detailed Description

7.1 Overview

The DRV8837C device is an H-bridge driver that can drive one DC motor or other devices like solenoids. The outputs are controlled using a PWM interface (IN1/IN2).

A low-power sleep mode is included, which can be enabled using the nSLEEP pin.

This device greatly reduces the component count of motor driver systems by integrating the necessary driver FETs and FET control circuitry into a single device. In addition, the DRV8837C device adds protection features beyond traditional discrete implementations: undervoltage lockout, overcurrent protection, and thermal shutdown.

7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 Bridge Control

The DRV8837C device is controlled using a PWM input interface, also called an IN/IN interface. Each output is controlled by a corresponding input pin.

表 1 shows the logic for the DRV8837C device.

表 1. DRV8837C Device Logic

nSLEEP	IN1	IN2	OUT1	OUT2	FUNCTION (DC MOTOR)
0	X	X	Z	Z	Coast
1	0	0	Z	Z	Coast
1	0	1	L	H	Reverse
1	1	0	H	L	Forward
1	1	1	L	L	Brake

7.3.2 Sleep Mode

If the nSLEEP pin is brought to a logic-low state, the DRV8837C device enters a low-power sleep mode. In this state, all unnecessary internal circuitry is powered down.

7.3.3 Power Supplies and Input Pins

The input pins can be driven within the recommended operating conditions with or without the VCC, VM, or both power supplies present. No leakage current path exists to the supply. Each input pin has a weak pulldown resistor (approximately 100 k Ω) to ground.

The VCC and VM supplies can be applied and removed in any order. When the VCC supply is removed, the device enters a low-power state and draws very little current from the VM supply. The VCC and VM pins can be connected together if the supply voltage is between 1.8 and 7 V.

The VM voltage supply does not have any undervoltage-lockout protection (UVLO). As long as $V_{CC} > 1.8$ V, the internal device logic remains active which means that the VM pin voltage can drop to 0 V, however, the load may not be sufficiently driven at low VM voltages.

7.3.4 Protection Circuits

The DRV8837C is fully protected against VCC undervoltage, overcurrent, and overtemperature events.

VCC undervoltage lockout If at any time the voltage on the VCC pin falls below the undervoltage lockout threshold voltage, all FETs in the H-bridge are disabled. Operation resumes when the VCC pin voltage rises above the UVLO threshold.

Overcurrent protection (OCP) An analog current-limit circuit on each FET limits the current through the FET by removing the gate drive. If this analog current limit persists for longer than t_{DEG} , all FETs in the H-bridge are disabled. Operation resumes automatically after t_{RETRY} has elapsed. Overcurrent conditions are detected on both the high-side and low-side devices. A short to the VM pin, GND, or from the OUT1 pin to the OUT2 pin results in an overcurrent condition.

Thermal shutdown (TSD) If the die temperature exceeds safe limits, all FETs in the H-bridge are disabled. After the die temperature falls to a safe level, operation automatically resumes.

表 2. Fault Behavior

FAULT	CONDITION	H-BRIDGE	RECOVERY
VCC undervoltage (UVLO)	$V_{CC} < 1.7$ V	Disabled	$V_{CC} > 1.8$ V
Overcurrent (OCP)	$I_{OUT} > 1.2$ A (MIN)	Disabled (retries automatically)	t_{RETRY} elapses
Thermal Shutdown (TSD)	$T_J > 150^\circ\text{C}$ (MIN)	Disabled (retries automatically)	$T_J < 150^\circ\text{C}$

7.4 Device Functional Modes

The DRV8837C device is active unless the nSLEEP pin is brought logic low. In sleep mode the H-bridge FETs are disabled Hi-Z. The DRV8837C device is brought out of sleep mode automatically if nSLEEP is brought logic high.

The H-bridge outputs are disabled during undervoltage lockout, overcurrent, and overtemperature fault conditions.

表 3. Operation Modes

MODE	CONDITION	H-BRIDGE
Operating	nSLEEP pin = 1	Operating
Sleep mode	nSLEEP pin = 0	Disabled
Fault encountered	Any fault condition met	Disabled (retries automatically)

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DRV8837C device is used to drive one DC motor or other devices like solenoids. The following design procedure can be used to configure the DRV8837C device.

8.2 Typical Application

Copyright © 2016, Texas Instruments Incorporated

图 7. Schematic of DRV8837C Application

8.2.1 Design Requirements

表 4 lists the required parameters for a typical usage case.

表 4. System Design Requirements

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Motor supply voltage	VM	9 V
Logic supply voltage	VCC	3.3 V
Target RMS current	I _{OUT}	0.8 A

8.2.2 Detailed Design Procedure

8.2.2.1 Motor Voltage

The appropriate motor voltage depends on the ratings of the motor selected and the desired RPM. A higher voltage spins a brushed dc motor faster with the same PWM duty cycle applied to the power FETs. A higher voltage also increases the rate of current change through the inductive motor windings.

8.2.2.2 Low-Power Operation

When entering sleep mode, TI recommends setting all inputs as a logic low to minimize system power.

8.2.3 Application Curves

8. 50% Duty Cycle, Forward Direction

9. 50% Duty Cycle, Reverse Direction

10. 20% Duty Cycle, Forward Direction

11. 20% Duty Cycle, Reverse Direction

9 Power Supply Recommendations

9.1 Bulk Capacitance

Having appropriate local bulk capacitance is an important factor in motor-drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

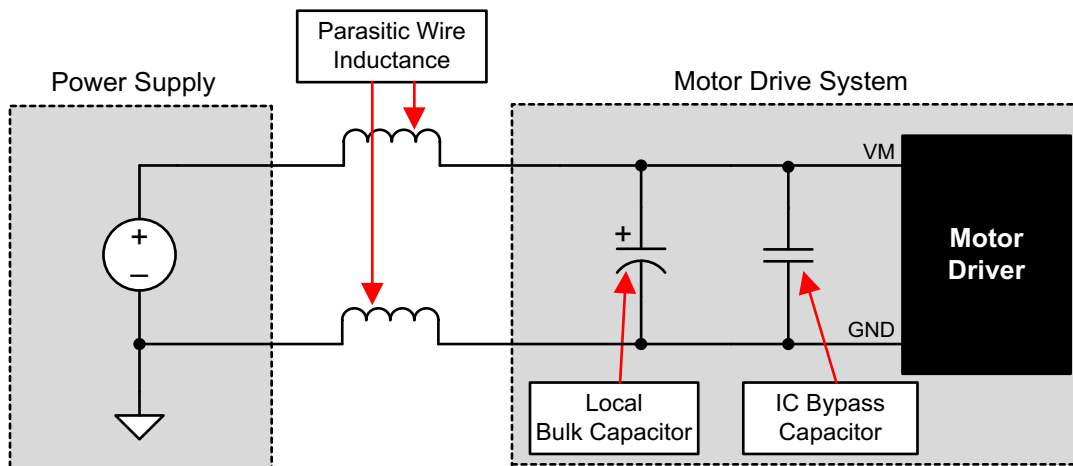

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The power-supply capacitance and ability to source current
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed dc, brushless dc, stepper)
- The motor braking method

The inductance between the power supply and motor drive system limits the rate at which current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate size of bulk capacitor.

Bulk Capacitance (continued)

☒ 12. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply

10 Layout

10.1 Layout Guidelines

The VM and VCC pins should be bypassed to GND using low-ESR ceramic bypass capacitors with a recommended value of 0.1 μF rated for the VM and VCC supplies. These capacitors should be placed as close to the VM and VCC pins as possible with a thick trace or ground plane connection to the device GND pin. In addition bulk capacitance is required on the VM pin.

10.2 Layout Example

图 13. Simplified Layout Example

10.3 Power Dissipation

Power dissipation in the DRV8837C device is dominated by the power dissipated in the output FET resistance, or $R_{\text{DS(ON)}}$. Use 式 1 to estimate the average power dissipation when running a brushed-DC motor.

$$P_{\text{TOT}} = R_{\text{DS(ON)}} \times (I_{\text{OUT(RMS)}})^2$$

where

- P_{TOT} is the total power dissipation
- $R_{\text{DS(ON)}}$ is the resistance of the HS plus LS FETs
- $I_{\text{OUT(RMS)}}$ is the RMS or DC output current being supplied to the load (1)

The maximum amount of power that can be dissipated in the device is dependent on ambient temperature and heatsinking.

注

The value of $R_{\text{DS(ON)}}$ increases with temperature, so as the device heats, the power dissipation increases.

The DRV8837C device has thermal shutdown protection. If the die temperature exceeds approximately 150°C, the device is disabled until the temperature drops to a safe level.

Any tendency of the device to enter thermal shutdown is an indication of either excessive power dissipation, insufficient heatsinking, or too high an ambient temperature.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

重要なお知らせと免責事項

TI は、技術データと信頼性データ（データシートを含みます）、設計リソース（リファレンス デザインを含みます）、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、[TI の総合的な品質ガイドライン](#)、[ti.com](#) または TI 製品などに関連して提供される他の適用条件に従い提供されます。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。TI がカスタム、またはカスタマー仕様として明示的に指定していない限り、TI の製品は標準的なカタログに掲載される汎用機器です。

お客様がいかなる追加条項または代替条項を提案する場合も、TI はそれらに異議を唱え、拒否します。
