

HDC1010 低消費電力、高精度デジタル湿度センサ、温度センサ付き

1 特長

- 相対湿度の精度 $\pm 2\%$ (標準値)
- 温度精度 $\pm 0.2^\circ\text{C}$ (標準値)
- 高湿度時の優れた安定性
- 14 ビットの測定分解能
- 100nA のスリープ・モード電流
- 平均消費電流：
 - 710nA @ 1sps、11ビットのRH (相対湿度)測定時
 - 1.3 μA @ 1sps、11ビットのRHおよび温度測定時
- 電源電圧: 2.7V~5.5V
- 小型の2mm×1.6mmのデバイス専有面積
- I²Cインターフェイス

2 アプリケーション

- HVAC (暖房、通気、エアコン)
- IoTスマート・サーモスタットおよび室内監視
- 冷蔵庫
- プリンタ
- 白物家電
- 医療機器
- ワイヤレス・センサ(TIDA: 00374、00484、00524)

4 代表的なアプリケーション

3 概要

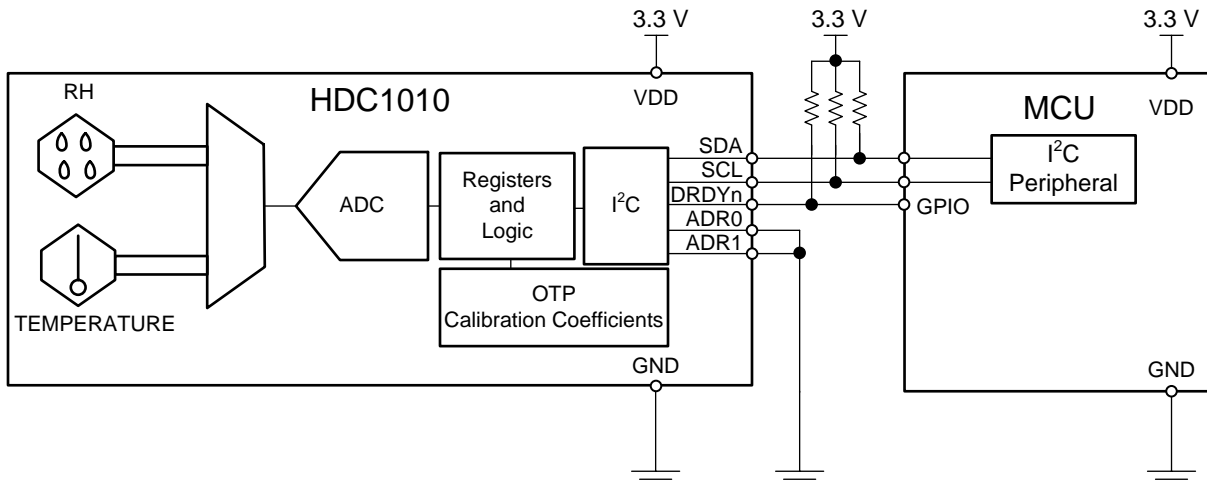

HDC1010は、超低消費電力で優れた測定精度を実現する温度センサを内蔵した、デジタル湿度センサです。

HDC1010は幅広い電源範囲で動作するため、各種の一般的なアプリケーションにおいて、競合ソリューションに代わる、低コストで低消費電力の選択肢を提供します。革新的な超小型WLCSP (ウェハー・レベル・チップ・スケール・パッケージ)を使用しており、基板設計の簡素化が可能です。HDC1010のセンシング素子はデバイス底面に配置され、HDC1010では、ちりやごみなどの環境汚染物質に対する耐性が向上しています。湿度および温度センサは工場では校正済みで、オンチップの不揮発性メモリに校正データが保存されています。

6 Pin Configuration and Functions

**WLCSP (DSBGA)
8 Pin YPA
Top View**

Pin Functions

PIN		I/O TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
SCL	A1	I	Serial clock line for I2C, open-drain; requires a pull-up resistor to VDD
VDD	B1	P	Supply Voltage
ADR0	C1	I	Address select pin – hardwired to GND or VDD
ADR1	D1	I	Address select pin – hardwired to GND or VDD
SDA	A2	I/O	Serial data line for I2C, open-drain; requires a pull-up resistor to VDD
GND	B2	G	Ground
DNC	C2	-	Do not connect, or, may be connected to GND.
DRDY _n	D2	O	Data ready, active low, open-drain. Requires a pull-up resistor to VDD. If not used tie to GND.

(1) P=Power, G=Ground, I=Input, O=Output

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

		MIN	MAX	UNIT
Input Voltage	VDD	-0.3	6	V
	SCL	-0.3	6	
	SDA	-0.3	6	
	DRDYn	-0.3	6	
	ADR0	-0.3	VDD+0.3	
	ADR1	-0.3	VDD+0.3	
Storage Temperature	T _{STG}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±1000	V
		Charged device model (CDM), per JEDEC specification –500 500 JESD22-C101, all pins ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{DD}	Supply Voltage	2.7	3	5.5	V
T _A , Temperature Sensor	Ambient Operating Temperature	-40		125	°C
T _A , Humidity Sensor ⁽¹⁾	Ambient Operating Temperature	-20		70	°C
T _A , Humidity sensor ⁽¹⁾	Functional Operating Temperature	-20		85	°C

- (1) See [Figure 2](#)

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		HDC1010	UNIT
		DSBGA -YPA	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	98.0	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	0.8	°C/W
R _{θJB}	Junction-to-board thermal resistance	17.8	°C/W
ψ _{JT}	Junction-to-top characterization parameter	3.7	°C/W
ψ _{JB}	Junction-to-board characterization parameter	17.8	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics⁽¹⁾

The electrical ratings specified in this section apply to all specifications in this document, unless otherwise noted. $T_A = 30^\circ\text{C}$, $V_{DD} = 3\text{V}$, and $\text{RH} = 40\%$.

PARAMETER	TEST CONDITION ⁽²⁾	MIN ⁽³⁾	TYP ⁽⁴⁾	MAX ⁽³⁾	UNIT
POWER CONSUMPTION					
I_{DD} Supply Current	RH measurement, bit 12 of 0x02 register = 0 ⁽⁵⁾		190	220	μA
	Temperature measurement, bit 12 of 0x02 register = 0 ⁽⁵⁾		160	185	μA
	Sleep Mode		100	200	nA
	Average @ 1 measurement/second, RH (11 bit), bit 12 of 0x02 register = 0 ⁽⁵⁾⁽⁶⁾		710		nA
	Average @ 1 measurement/second, Temp (11 bit), bit 12 of 0x02 register = 0 ⁽⁵⁾⁽⁶⁾		590		nA
	Average @ 1 measurement/second, RH (11bit) +temperature (11 bit), bit 12 of 0x02 register = 1 ⁽⁵⁾⁽⁶⁾		1.3		μA
	Startup (average on Start-up time)		300		μA
I_{HEAT} Heater Current ⁽⁷⁾	Peak current		7.2		mA
	Average @ 1 measurement/second, RH (11bit) +temperature (11 bit), bit 12 of 0x02 register = 1 ⁽⁵⁾⁽⁶⁾		50		μA
RELATIVE HUMIDITY SENSOR					
RH_{ACC} Accuracy	Refer to Figure 2 in Typical Characteristics section.		± 2		%RH
RH_{REP} Repeatability ⁽⁷⁾	14 bit resolution.		± 0.1		%RH
RH_{HYS} Hysteresis ⁽⁸⁾	$10\% \leq \text{RH} \leq 70\%$		± 1		%RH
RH_{RT} Response Time ⁽⁹⁾	$t_{63\%}$ ⁽¹⁰⁾		15		s
RH_{CT} Conversion Time ⁽⁷⁾	8 bit resolution		2.50		ms
	11 bit resolution		3.85		ms
	14 bit resolution		6.50		ms
RH_{HOR} Operating Range ⁽¹¹⁾	Non-condensing	0		100	%RH
RH_{LTD} Long Term Drift ⁽¹²⁾			± 0.25		%RH/yr
TEMPERATURE SENSOR					
TEMP_{ACC} Accuracy ⁽⁷⁾	$5^\circ\text{C} < T_A < 60^\circ\text{C}$		± 0.2	± 0.4	$^\circ\text{C}$
TEMP_{REP} Repeatability ⁽⁷⁾	14 bit accuracy		± 0.1		$^\circ\text{C}$
TEMP_{CT} Conversion Time ⁽⁷⁾	11 bit accuracy		3.65		ms
	14 bit accuracy		6.35		ms

- (1) Electrical Characteristics Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_J > T_A$. Absolute Maximum Ratings indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
- (2) Register values are represented as either binary (b is the prefix to the digits), or hexadecimal (0x is the prefix to the digits). Decimal values have no prefix.
- (3) Limits are ensured by testing, design, or statistical analysis at 30°C . Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.
- (4) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not guaranteed on shipped production material.
- (5) I²C read/write communication and pull-up resistors current through SCL and SDA not included.
- (6) Average current consumption while conversion is in progress.
- (7) This parameter is specified by design and/or characterization and it is not tested in production.
- (8) The hysteresis value is the difference between an RH measurement in a rising and falling RH environment, at a specific RH point.
- (9) Actual response times will vary dependent on system thermal mass and air-flow.
- (10) Time for the RH output to change by 63% of the total RH change after a step change in environmental humidity.
- (11) Recommended humidity operating range is 10% to 70% RH. Prolonged operation outside this range may result in a measurement offset. The measurement offset will decrease after operating the sensor in this recommended operating range.
- (12) Drift due to aging effects at typical conditions (30°C and 20% to 50% RH). This value may be impacted by dust, vaporized solvents, out-gassing tapes, adhesives, packaging materials, etc.

Electrical Characteristics⁽¹⁾ (continued)

The electrical ratings specified in this section apply to all specifications in this document, unless otherwise noted. $T_A = 30^\circ\text{C}$, $V_{DD} = 3\text{V}$, and $RH = 40\%$.

PARAMETER	TEST CONDITION ⁽²⁾	MIN ⁽³⁾	TYP ⁽⁴⁾	MAX ⁽³⁾	UNIT
TEMP _{OR} Operating Range		-40		125	°C

7.6 I2C Interface Electrical Characteristics

At $T_A = 30^\circ\text{C}$, $V_{DD} = 3\text{V}$ (unless otherwise noted)

PARAMETER	TEST CONDITION	MIN	TYP	MAX	UNIT
I2C INTERFACE VOLTAGE LEVEL					
V _{IH}	Input High Voltage	0.7xV _{DD}			V
V _{IL}	Input Low Voltage			0.3xV _{DD}	V
V _{OL}	Output Low Voltage	Sink current 3mA		0.4	V
HYS	Hysteresis ⁽¹⁾	0.1xV _{DD}			V
CIN	Input Capacitance on all digital pins		0.5		pF

(1) This parameter is specified by design and/or characterization and it is not tested in production.

7.7 I2C Interface Timing Requirements

PARAMETER	TEST CONDITION	MIN	TYP	MAX	UNIT
I2C INTERFACE VOLTAGE LEVEL					
f _{SCL}	Clock Frequency	10		400	kHz
t _{LOW}	Clock Low Time	1.3			μs
t _{HIGH}	Clock High Time	0.6			μs
t _{SP}	Pulse width of spikes that must be suppressed by the input filter ⁽¹⁾			50	ns
t _{START}	Device Start-up time	From V _{DD} ≥ 2.7 V to ready for a conversion ⁽¹⁾⁽²⁾	10	15	ms

(1) This parameter is specified by design and/or characterization and it is not tested in production.

(2) Within this interval it is not possible to communicate to the device.

8 Detailed Description

8.1 Overview

The HDC1010 is a digital humidity sensor with integrated temperature sensor that provides excellent measurement accuracy at very low power. The sensing element of the HDC1010 is placed on the bottom part of the device, which makes the HDC1010 more robust against dirt, dust, and other environmental contaminants. Measurement results can be read out through the I2C compatible interface. Resolution is based on the measurement time and can be 8, 11, or 14 bits for humidity; 11 or 14 bits for temperature.

8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 Power Consumption

One of the key features of the HDC1010 is its low power consumption, which makes the device suitable in battery or power harvesting applications. In these applications the HDC1010 spends most of the time in sleep mode: with a typical 100nA of current consumption in sleep mode, the averaged current consumption is minimal. Its low consumption in measurement mode minimizes any self-heating.

8.3.2 Voltage Supply Monitoring

The HDC1010 monitors the supply voltage level and indicates when the voltage supply of the HDC1010 is less than 2.8V. This information is useful in battery-powered systems in order to inform the user to replace the battery. This is reported in the BTST field (register address 0x02:bit[11]) which is updated after power-on reset (POR) and after each measurement request.

8.3.3 Heater

The heater is an integrated resistive element that can be used to test the sensor or to drive condensation off the sensor. The heater can be activated using HEAT, bit 13 in Configuration Register. The heater helps in reducing the accumulated offset after long exposure at high humidity conditions.

Once enabled the heater is turned on only in the measurement mode. To have a reasonable increase of the temperature it is suggested to increase the measurement data rate.

8.4 Device Functional Modes

The HDC1010 has two modes of operation: sleep mode and measurement mode. After power up, the HDC1010 is in sleep mode. In this mode, the HDC1010 waits for I2C input including commands to configure the conversion times, read the status of the battery, trigger a measurement, and read measurements. Once it receives a command to trigger a measurement, the HDC1010 moves from sleep mode to measurement mode. In measurement mode, the HDC1010 acquires the configured measurements and sets the DRDYn line low when the measurement is complete. After completing the measurement and setting DRDYn low, the HDC1010 returns to sleep mode.

8.5 Programming

8.5.1 I2C Serial Bus Address Configuration

To communicate with the HDC1010, the master must first address slave devices via a slave address byte. The slave address byte consists of seven address bits and a direction bit that indicates the intent to execute a read or write operation. The HDC1010 features two address pins to allow up to 4 devices to be addressed on a single bus. [Table 1](#) describes the pin logic levels used to properly connect up to 4 devices. The state of the ADR0 and ADR1 pins is sampled on every bus communication and should be set before any activity on the interface occurs. The address pin is read at the start of each communication event.

Table 1. HDC1010 ADDRESS

ADR1	ADR0	ADDRESS (7-bit address)
0	0	1000000
0	1	1000001
1	0	1000010
1	1	1000011

8.5.2 I2C Interface

The HDC1010 operates only as a slave device on the I2C bus interface. It is not allowed to have on the I2C bus multiple devices with the same address. Connection to the bus is made via the open-drain I/O lines, SDA, and SCL. The SDA and SCL pins feature integrated spike-suppression filters and Schmitt triggers to minimize the effects of input spikes and bus noise. After power-up, the sensor needs at most 15 ms, to be ready to start RH and temperature measurement. During this power-up time the HDC1010 is only able to provide the content of the serial number registers (0xFB to 0xFF) if requested. After the power-up the sensor is in the sleep mode until a communication or measurement is performed. All data bytes are transmitted MSB first.

8.5.2.1 Serial Bus Address

To communicate with the HDC1010, the master must first address slave devices via a slave address byte. The slave address byte consists of seven address bits, and a direction bit that indicates the intent to execute a read or write operation.

8.5.2.2 Read and Write Operations

To access a particular register on the HDC1010, write the desired register address value to the Pointer Register. The pointer value is the first byte transferred after the slave address byte with the R/W bit low. Every write operation to the HDC1010 requires a value for the pointer register (refer to [Figure 10](#)).

When reading from the HDC1010, the last value stored in the pointer by a write operation is used to determine which register is read by a read operation. To change the pointer register for a read operation, a new value must be written to the pointer. This transaction is accomplished by issuing the slave address byte with the R/W bit low, followed by the pointer byte. No additional data is required (refer to [Figure 11](#)).

The master can then generate a START condition and send the slave address byte with the R/W bit high to initiate the read command. Note that register bytes are sent MSB first, followed by the LSB. A write operation in a read-only register such as (DEVICE ID, MANUFACTURER ID, SERIAL ID) returns a NACK after each data byte; read/write operation to unused address returns a NACK after the pointer; a read/write operation with incorrect I2C address returns a NACK after the I2C address.

Figure 10. Writing Frame (Configuration Register)

Figure 11. Reading Frame (Configuration Register)

8.5.2.3 Device Measurement Configuration

By default the HDC1010 will first perform a temperature measurement followed by a humidity measurement. On power-up, the HDC1010 enters a low power sleep mode and is not actively measuring. Use the following steps to perform a measurement of both temperature and humidity and then retrieve the results:

1. Configure the acquisition parameters in register address 0x02:
 - (a) Set the acquisition mode to measure both temperature and humidity by setting Bit[12] to 1.
 - (b) Set the desired temperature measurement resolution:
 - Set Bit[10] to 0 for 14 bit resolution.
 - Set Bit[10] to 1 for 11 bit resolution.
 - (c) Set the desired humidity measurement resolution:
 - Set Bit[9:8] to 00 for 14 bit resolution.
 - Set Bit[9:8] to 01 for 11 bit resolution.
 - Set Bit[9:8] to 10 for 8 bit resolution.
2. Trigger the measurements by executing a pointer write transaction with the address pointer set to 0x00. Refer to [Figure 12](#).

3. Wait for the measurements to complete, based on the conversion time (refer to [Electrical Characteristics^{\(1\)}](#) for the conversion time). Alternatively, wait for the assertion of DRDYn.
4. Read the output data:

Read the temperature data from register address 0x00, followed by the humidity data from register address 0x01 in a single transaction as shown in [Figure 14](#). A read operation will return a NACK if the contents of the registers have not been updated as shown in [Figure 13](#).

To perform another acquisition with the same measurement configuration simply repeat steps 2 through 4.

If only a humidity or temperature measurement is desired, the following steps will perform a measurement and retrieve the result:

1. Configure the acquisition parameters in register address 0x02:
 - (a) Set the acquisition mode to independently measure temperature or humidity by setting Bit[12] to 0.
 - (b) For a temperature measurement, set the desired temperature measurement resolution:
 - Set Bit[10] to 0 for 14 bit resolution.
 - Set Bit[10] to 1 for 11 bit resolution.
 - (c) For a humidity measurement, set the desired humidity measurement resolution:
 - Set Bit[9:8] to 00 for 14 bit resolution.
 - Set Bit[9:8] to 01 for 11 bit resolution.
 - Set Bit[9:8] to 10 for 8 bit resolution.
2. Trigger the measurement by executing a pointer write transaction. Refer to [Figure 12](#)
 - Set the address pointer to 0x00 for a temperature measurement.
 - Set the address pointer to 0x01 for a humidity measurement.
3. Wait for the measurement to complete, based on the conversion time (refer to [Electrical Characteristics^{\(1\)}](#) for the conversion time). Alternatively, wait for the assertion of DRDYn.
4. Read the output data:

Retrieve the completed measurement result from register address 0x00 or 0x01, as appropriate, as shown in [Figure 10](#). A read operation will return a NACK if the measurement result is not yet available, as shown in [Figure 13](#).

To perform another acquisition with the same measurement configuration repeat steps 2 through 4.

It is possible to read the output registers (addresses 0x00 and 0x01) during an Temperature or Relative Humidity measurement without affecting any ongoing measurement. Note that a write to address 0x00 or 0x01 while a measurement is ongoing will abort the ongoing measurement. If the newest acquired measurement is not read, DRDYn stays low until the next measurement is triggered.

Figure 12. Trigger Humidity/Temperature Measurement

(1) Electrical Characteristics Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_J > T_A$. Absolute Maximum Ratings indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.

Figure 13. Read Humidity/Temperature Measurement (Data Not Ready)

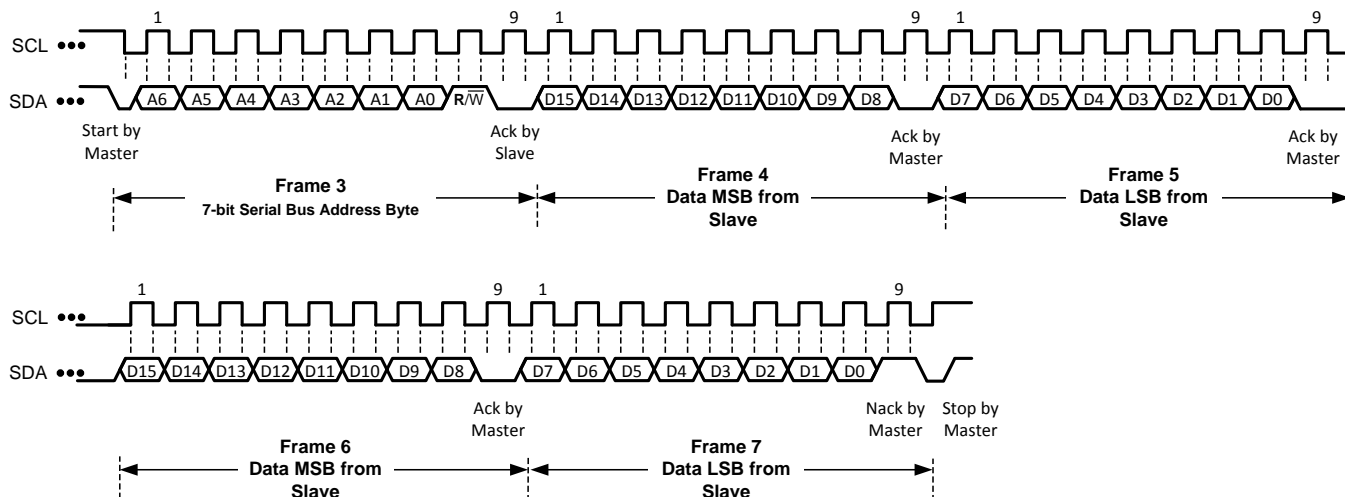

Figure 14. Read Humidity and Temperature Measurement (Data Ready)

8.6 Register Map

The HDC1010 contains data registers that hold configuration information, temperature and humidity measurement results, and status information.

Table 2. Register Map

Pointer	Name	Reset value	Description
0x00	Temperature	0x0000	Temperature measurement output
0x01	Humidity	0x0000	Relative Humidity measurement output
0x02	Configuration	0x1000	HDC1010 configuration and status
0xFB	Serial ID	device dependent	First 2 bytes of the serial ID of the part
0xFC	Serial ID	device dependent	Mid 2 bytes of the serial ID of the part
0xFD	Serial ID	device dependent	Last byte bit of the serial ID of the part
0xFE	Manufacturer ID	0x5449	ID of Texas Instruments
0xFF	Device ID	0x1000	ID of HDC1010 device

Registers from 0x03 to 0xFA are reserved and should not be written.

The HDC1010 has an 8-bit pointer used to address a given data register. The pointer identifies which of the data registers should respond to a read or write command on the two-wire bus. This register is set with every write command. A write command must be issued to set the proper value in the pointer before executing a read command. The power-on reset (POR) value of the pointer is 0x00, which selects a temperature measurement.

8.6.1 Temperature Register

The temperature register is a 16-bit result register in binary format (the 2 LSBs D1 and D0 are always 0). The result of the acquisition is always a 14 bit value. The accuracy of the result is related to the selected conversion time (refer to [Electrical Characteristics^{\(1\)}](#)). The temperature can be calculated from the output data with:

$$\text{Temperature}(^{\circ}\text{C}) = \left(\frac{\text{TEMPERATURE}[15:00]}{2^{16}} \right) * 165^{\circ}\text{C} - 40^{\circ}\text{C}$$

Table 3. Temperature Register Description (0x00)

Name	Registers	Description
TEMPERATURE	[15:02] Temperature	Temperature measurement (read only)
	[01:00] Reserved	Reserved, always 0 (read only)

- (1) Electrical Characteristics Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_J > T_A$. Absolute Maximum Ratings indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.

8.6.2 Humidity Register

The humidity register is a 16-bit result register in binary format (the 2 LSBs D1 and D0 are always 0). The result of the acquisition is always a 14 bit value, while the accuracy is related to the selected conversion time (refer to [Electrical Characteristics^{\(1\)}](#)). The humidity can be calculated from the output data with:

$$\text{Relative Humidity}(\% \text{ RH}) = \left(\frac{\text{HUMIDITY}[15:00]}{2^{16}} \right) * 100\% \text{ RH}$$

Table 4. Humidity Register Description (0x01)

Name	Registers	Description
HUMIDITY	[15:02] Relative Humidity	Relative Humidity measurement (read only)
	[01:00] Reserved	Reserved, always 0 (read only)

- (1) Electrical Characteristics Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_J > T_A$. Absolute Maximum Ratings indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.

8.6.3 Configuration Register

This register configures device functionality and returns status.

Table 5. Configuration Register Description (0x02)

NAME	REGISTERS		DESCRIPTION	
RST	[15]	Software reset bit	0	Normal Operation, this bit self clears
			1	Software Reset
Reserved	[14]	Reserved	0	Reserved, must be 0
HEAT	[13]	Heater	0	Heater Disabled
			1	Heater Enabled
MODE	[12]	Mode of acquisition	0	Temperature or Humidity is acquired.
			1	Temperature and Humidity are acquired in sequence, Temperature first.
BTST	[11]	Battery Status	0	Battery voltage > 2.8V (read only)
			1	Battery voltage < 2.8V (read only)
TRES	[10]	Temperature Measurement Resolution	0	14 bit
			1	11 bit
HRES	[9:8]	Humidity Measurement Resolution	00	14 bit
			01	11 bit
			10	8 bit
Reserved	[7:0]	Reserved	0	Reserved, must be 0

8.6.4 Serial Number Registers

These registers contain a 40bit unique serial number for each individual HDC1010.

Table 6. Serial Number Register Description (0xFB)

Name	Registers	Description
SERIAL ID[40:25]	[15:0]	Serial Id bits Device Serial Number bits from 40 to 25 (read only)

Table 7. Serial Number Register Description (0xFC)

Name	Registers	Description
SERIAL ID[24:9]	[15:0]	Serial Id bits Device Serial Number bits from 24 to 9 (read only)

Table 8. Serial Number Register Description (0xFD)

Name	Registers	Description
SERIAL ID[8:0]	[15:7]	Serial Id bits Device Serial Number bits from 8 to 0 (read only)

8.6.5 Manufacturer ID Register

This register contains a factory-programmable identification value that identifies this device as being manufactured by Texas Instruments. This register distinguishes this device from other devices that are on the same I2C bus. The manufacturer ID reads 0x5449.

Table 9. Manufacturer ID Register Description (0xFE)

9 Application and Implementation

NOTE

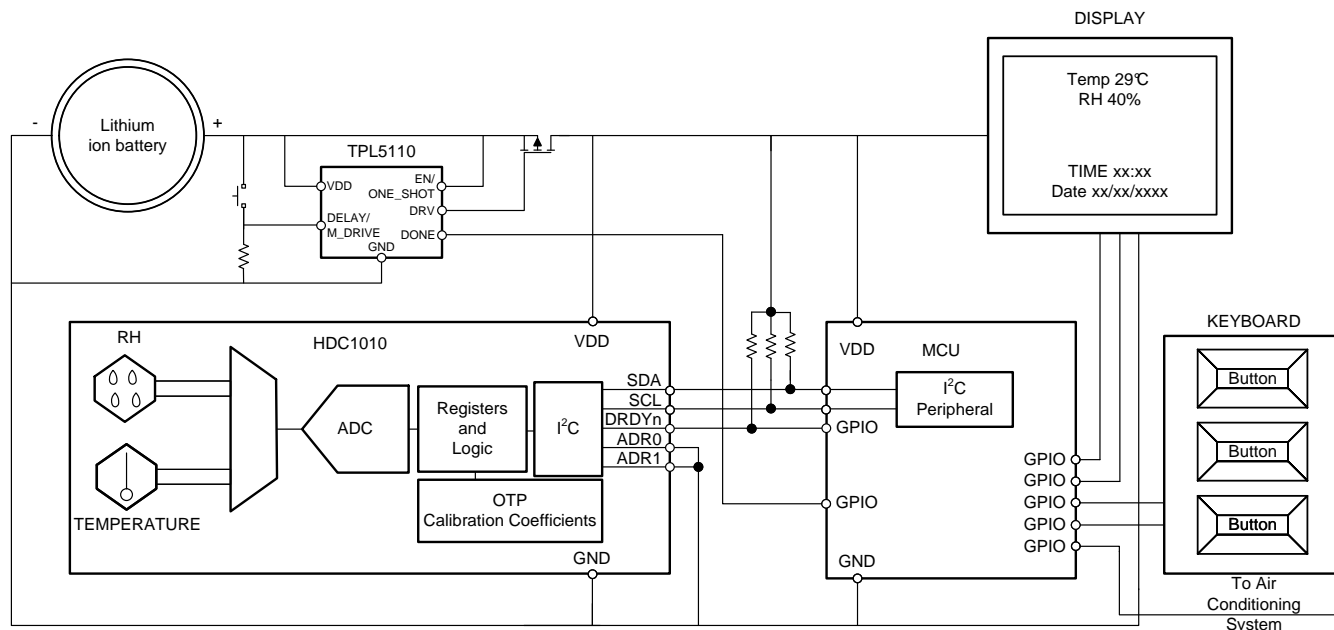

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

An HVAC system thermostat control is based on environmental sensors and a micro-controller. The micro-controller acquires data from humidity sensors and temperature sensors and controls the heating/cooling system. The collected data are then showed on a display that can be easily controlled by the micro controller. Based on data from the humidity and temperature sensor, the heating/cooling system then maintains the environment at customer-defined preferred conditions.

9.2 Typical Application

In a battery-powered HVAC system thermostat, one of the key parameters in the selection of components is the power consumption. The HDC1010, with its 1.3 μ A of current consumption (average consumption over 1s for RH and Temperature measurements) in conjunction with an MSP430 represents an excellent choice for the low power consumption, which extends the battery life. A system block diagram of a battery powered HVAC or Thermostat is shown in Figure 15.

Figure 15. Typical Application Schematic HVAC

9.2.1 Design Requirements

In order to correctly sense the ambient temperature and humidity, the HDC1010 should be positioned away from heat sources on the PCB. Generally, it should not be close to the LCD and battery. Moreover, to minimize any self-heating of the HDC1010 it is recommended to acquire at a maximum sample rate of 1sps (RH + Temp). In home systems, humidity and the temperature monitoring rates of less than 1sps (even 0.5sps or 0.2sps) can be still effective.

Typical Application (continued)

9.2.2 Detailed Design Procedure

When a circuit board layout is created from the schematic shown in [Figure 15](#) a small circuit board is possible. The accuracy of a RH and temperature measurement depends on the sensor accuracy and the setup of the sensing system. The HDC1010 samples relative humidity and temperature in its immediate environment, it is therefore important that the local conditions at the sensor match the monitored environment. Use one or more openings in the physical cover of the thermostat to obtain a good airflow even in static conditions. Refer to the layout below ([Figure 20](#)) for a PCB layout which minimizes the thermal mass of the PCB in the region of the HDC1010, which can improve measurement response time and accuracy.

9.2.3 Application Curve

The data showed below have been acquired with the HDC1010EVM. A humidity chamber was used to control the environment.

Figure 16. RH vs. Time

9.3 Do's and Don'ts

9.3.1 Soldering

For soldering HDC1010 use the standard soldering profile IPC/JEDEC J-STD-020 with peak temperatures at 260 °C. Refer to the document [SNVA009](#) for more details on the DSBGA package. In the document refer to DSBGA package with bump size 0.5mm pitch and 0.32mm diameter.

When soldering the HDC1010 it is mandatory to use no-clean solder paste and no board wash shall be applied. The HDC1010 should be limited to a single IR reflow and no rework is recommended.

9.3.2 Chemical Exposure and Sensor Protection

The humidity sensor is not a standard IC and therefore should not be exposed to particulates or volatile chemicals such as solvents or other organic compounds. If any type of protective coating must be applied to the circuit board, the sensor must be protected during the coating process.

9.3.3 High Temperature and Humidity Exposure

Long exposure outside the recommended operating conditions may temporarily offset the RH output. [Table 11](#) shows the RH offset values that can be expected for exposure to 85°C and 85% RH for duration between 12 and 500 hours (continuos).

Table 11. Induced RH Offset Due to Extended Exposure to High Humidity and High Temperature (85°C/85% RH)

85°C/85% RH Duration (hours)	12	24	168	500
RH Offset (%)	3	6	12	15

When the sensor is exposed to less severe conditions, [Figure 17](#) shows the typical RH offset at other combinations of temperature and RH.

Figure 17. Relative Humidity Accuracy vs Temperature

10 Power Supply Recommendations

The HDC1010 requires a voltage supply within 2.7V and 5.5V. A multilayer ceramic bypass X7R capacitor of 0.1µF between VDD and GND pin is recommended.

11 Layout

11.1 Layout Guidelines

The Relative Humidity sensor element is located on the bottom side of the package. It is positioned between the two rows of bumps.

It is recommended to not route any traces below the sensor element. Moreover, the external components, such as pull-up resistors and bypass capacitors, need to be placed next to the 2 rows of bumps or on the bottom side of the PCB in order to guarantee a good air flow.

It is recommended to isolate the sensor from the rest of the PCB by eliminating copper layers below the device (GND, V_{DD}) and creating a slot into the PCB around the sensor to enhance thermal isolation.

11.1.1 Surface Mount

Two types of PCB land patterns are used for surface mount packages:

1. Non-solder mask defined (NSMD)
2. Solder mask defined (SMD)

Pros and cons of NSMD and SMD:

1. The NSMD configuration is preferred due to its tighter control of the copper etch process and a reduction in the stress concentration points on the PCB side compared to SMD configuration.
2. A copper layer thickness of less than 1 oz. is recommended to achieve higher solder joint stand-off. A 1 oz. (30 micron) or greater copper thickness causes a lower effective solder joint stand-off, which may

Layout Guidelines (continued)

compromise solder joint reliability.

- For the NSMD pad geometry, the trace width at the connection to the land pad should not exceed $\frac{2}{3}$ of the pad diameter.

Figure 18. Solder Mask

11.1.2 Stencil Printing Process

- Use laser cutting followed by electro-polishing for stencil fabrication
- If possible, offset apertures from land pads to maximize separation and minimize possibility of bridging for DSBGA packages
- Use Type 3 (25 to 45 micron particle size range) or finer solder paste for printing

Figure 19. Solder Paste

11.2 Layout Example

The only component next to the device is the supply bypass capacitor. Since the relative humidity is dependent on the temperature, the HDC1010 should be positioned away from hot points present on the board such as battery, display or micro-controller. Slots around the device can be used to reduce the thermal mass, for a quicker response to environmental changes.

13 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。これらの情報は、指定のデバイスに対して提供されている最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
HDC1010YPAR	ACTIVE	DSBGA	YPA	8	3000	RoHS & Green	SAC405 SNAGCU	Level-1-260C-UNLIM	-40 to 85	3N	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
