

# INA819 35 $\mu$ V オフセット、8nV/ $\sqrt{\text{Hz}}$ ノイズ、低消費電力、高精度計装アンプ

## 1 特長

- 低いオフセット電圧: 10 $\mu$ V (標準値)、35 $\mu$ V (最大値)
- ゲイン・ドリフト: 5ppm/ $^{\circ}\text{C}$  ( $G = 1$ )、35ppm/ $^{\circ}\text{C}$  ( $G > 1$ ) (最大値)
- ノイズ: 8nV/ $\sqrt{\text{Hz}}$
- 帯域幅: 2 MHz ( $G = 1$ )、270 kHz ( $G = 100$ )
- 1nF の容量性負荷で安定
- $\pm 60\text{V}$  まで入力を保護
- 同相除去: 110dB、 $G = 10$  (最小値)
- 電源除去: 110dB、 $G = 1$  (最小値)
- 消費電流: 385 $\mu\text{A}$  (最大値)
- 電源電圧範囲:
  - 単一電源: 4.5V $\sim$ 36V
  - デュアル電源:  $\pm 2.25\text{V} \sim \pm 18\text{V}$
- 仕様温度範囲:  $-40^{\circ}\text{C} \sim +125^{\circ}\text{C}$
- パッケージ: 8ピン SOIC、VSSOP、WSON

## 2 アプリケーション

- アナログ入力モジュール
- 流量トランスミッタ
- バッテリ試験装置
- LCD テスト
- 心電図 (ECG)
- 外科用機器
- プロセス分析 (pH、ガス、濃度、力、湿度)

## 3 概要

INA819 は、単一電源またはデュアル電源の非常に幅広い電圧範囲で動作する、低消費電力の高精度計装アンプです。1 個の外付け抵抗により、1 $\sim$ 10,000 の範囲で任意のゲインを設定できます。このデバイスは、入力オフセット電圧、オフセット電圧ドリフト、入力バイアス電流、入力電圧ノイズ、入力電流ノイズを極めて低く抑えるスーパー  $\beta$  入力トランジスタを使用することで、高い精度を実現します。追加回路により、 $\pm 60\text{V}$  までの過電圧から入力を保護します。

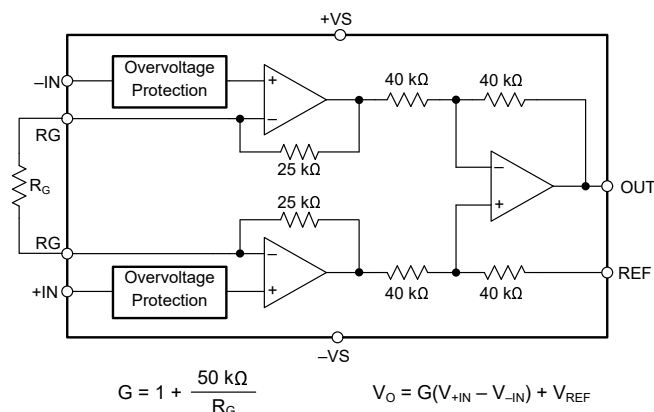

INA819 は、非常に高い同相除去比を実現するよう最適化されています。 $G = 1$  での同相除去比は、全入力同相範囲を通じて 90dB を上回ります。このデバイスは、4.5V 単一電源および最大  $\pm 18\text{V}$  のデュアル電源による低電圧動作に設計されています。

INA819 は 8 ピン SOIC、VSSOP、WSON パッケージで供給され、 $-40^{\circ}\text{C} \sim +125^{\circ}\text{C}$  の温度範囲で動作が規定されています。

### 製品情報<sup>(1)</sup>

部品番号	パッケージ	本体サイズ (公称)
INA819	SOIC (8)	4.90mm $\times$ 3.91mm
	VSSOP (8)	3.00mm $\times$ 3.00mm
	WSON (8)	3.00mm $\times$ 3.00mm

- (1) 利用可能なパッケージについては、データシートの末尾にあるパッケージ・オプションについての付録を参照してください。

## 6 Pin Configuration and Functions

图 6-1. D (8-Pin SOIC) and DGK (8-Pin VSSOP) Packages, Top View

图 6-2. DRG Package, 8-Pin WSON, Top View

表 6-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
-IN	1	Input	Negative (inverting) input
+IN	4	Input	Positive (noninverting) input
OUT	7	Output	Output
RG	2, 3	—	Gain setting pin. Place a gain resistor between pin 2 and pin 3.
REF	6	Input	Reference input. This pin must be driven by a low impedance source.
-VS	5	—	Negative supply
+VS	8	—	Positive supply
Thermal pad	—	—	Thermal pad internally connected to -VS. Connect externally to -VS or leave floating.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Supply voltage dual supply, $V_S = (V+) - (V-)$		±20	V
Supply voltage single supply, $V_S = (V+) - (V-)$		40	V
Signal input pins	-60	60	V
VREF pin	-20	20	V
Signal output pins maximum voltage	$(-V_S) - 0.5$	$(+V_S) + 0.5$	V
Signal output pins maximum current	-50	50	mA
Output short-circuit <sup>(2)</sup>	Continuous		
Operating Temperature, $T_A$	-50	150	°C
Junction Temperature, $T_J$		175	°C
Storage Temperature, $T_{stg}$	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Short-circuit to  $V_S / 2$ .

### 7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply voltage, $V_S$	Single-supply	4.5	36	V
	Dual-supply	±2.25	±18	
Specified temperature, $T_A$	Specified temperature	-40	125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		INA819			UNIT
		D (SOIC)	DGK (VSSOP)	DRG (WSON)	
		8 PINS	8 PINS	8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	119.6	215.4	55.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	66.3	66.3	57.9	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	61.9	97.8	28.6	°C/W
$\psi_{JT}$	Junction-to-top characterization parameter	20.5	10.5	1.8	°C/W
$\psi_{JB}$	Junction-to-board characterization parameter	61.4	96.1	28.6	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	N/A	12.1	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

at  $T_A = 25^\circ\text{C}$ ,  $V_S = \pm 15\text{ V}$ ,  $R_L = 10\text{ k}\Omega$ ,  $V_{\text{REF}} = 0\text{ V}$ , and  $G = 1$  (unless otherwise noted)

	Voltage range		$(V-)$		$(V+)$	V
	Gain to output			1		V/V
	Reference gain error			0.01%		
<b>POWER SUPPLY</b>						
$I_Q$	Quiescent current	$V_{IN} = 0\text{ V}$		350	385	$\mu\text{A}$
		vs temperature, $T_A = -40^\circ\text{C to } +125^\circ\text{C}$			520	

- (1) Total offset, referred-to-input (RTI):  $V_{OS} = (V_{OSI}) + (V_{OSO} / G)$ .
- (2) Specified by characterization.
- (3) Offset drifts are uncorrelated. Input-referred offset drift is calculated using:  $\Delta V_{OS(RTI)} = \sqrt{[\Delta V_{OSI}]^2 + (\Delta V_{OSO} / G)^2}$ .
- (4) Input voltage range of the Instrumentation Amplifier input stage. The input range depends on the common-mode voltage, differential voltage, gain, and reference voltage.
- (5) The values specified for  $G > 1$  do not include the effects of the external gain-setting resistor,  $R_G$ .
- (6) Total RTI voltage noise is equal to:  $e_{N(RTI)} = \sqrt{[e_{NI}]^2 + (e_{NO} / G)^2}$ .

## 7.6 Typical Characteristics

at  $T_A = 25^\circ\text{C}$ ,  $V_S = \pm 15\text{ V}$ ,  $R_L = 10\text{ k}\Omega$ ,  $V_{REF} = 0\text{ V}$ , and  $G = 1$  (unless otherwise noted)

## 8 Detailed Description

### 8.1 Overview

The INA819 is a monolithic precision instrumentation amplifier that incorporates a current-feedback input stage and a four-resistor difference amplifier output stage. The functional block diagram in the next section shows how the differential input voltage is buffered by  $Q_1$  and  $Q_2$  and is forced across  $R_G$ , which causes a signal current to flow through  $R_G$ ,  $R_1$ , and  $R_2$ . The output difference amplifier,  $A_3$ , removes the common-mode component of the input signal and refers the output signal to the REF pin. The  $V_{BE}$  and voltage drop across  $R_1$  and  $R_2$  produce output voltages on  $A_1$  and  $A_2$  that are approximately 0.8 V lower than the input voltages.

Each input is protected by two field-effect transistors (FETs) that provide a low series resistance under normal signal conditions, and preserve excellent noise performance. When excessive voltage is applied, these transistors limit input current to approximately 8 mA.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Setting the Gain

Figure 8-1 shows that the gain of the INA819 is set by a single external resistor ( $R_G$ ) connected between the  $R_G$  pins (pins 1 and 8).

**Figure 8-1. Simplified Diagram of the INA819 With Gain and Output Equations**

The value of  $R_G$  is selected according to Equation 1:

$$G = 1 + \frac{50 \text{ k}\Omega}{R_G} \tag{1}$$

Table 8-1 lists several commonly used gains and resistor values. The 50-k $\Omega$  term in Equation 1 is a result of the sum of the two internal 25-k $\Omega$  feedback resistors. These on-chip resistors are laser-trimmed to accurate absolute values. The accuracy and temperature coefficients of these resistors are included in the gain accuracy and drift specifications of the INA819. As shown in Figure 8-1 and explained in more details in Section 11, make sure to connect low-ESR, 0.1- $\mu$ F ceramic bypass capacitors between each supply pin and ground that are placed as close to the device as possible.

**Table 8-1. Commonly Used Gains and Resistor Values**

DESIRED GAIN	$R_G$ ( $\Omega$ )	NEAREST 1% $R_G$ ( $\Omega$ )
1	NC	NC
2	50 k	49.9 k
5	12.5 k	12.4 k
10	5.556 k	5.49 k
20	2.632 k	2.61 k
50	1.02 k	1.02 k
100	505.1	511
200	251.3	249
500	100.2	100
1000	50.05	49.9

### 8.3.1.1 Gain Drift

The stability and temperature drift of the external gain setting resistor ( $R_G$ ) also affects gain. The contribution of  $R_G$  to gain accuracy and drift is determined from 式 1.

The best gain drift of 5 ppm/°C (maximum) is achieved when the INA819 uses  $G = 1$  without  $R_G$  connected. In this case, gain drift is limited by the mismatch of the temperature coefficient of the integrated 40-kΩ resistors in the differential amplifier ( $A_3$ ). At gains greater than 1, gain drift increases as a result of the individual drift of the 25-kΩ resistors in the feedback of  $A_1$  and  $A_2$ , relative to the drift of the external gain resistor ( $R_G$ .) The low temperature coefficient of the internal feedback resistors improves the overall temperature stability of applications using gains greater than 1 V/V over alternate solutions.

Low resistor values required for high gain make wiring resistance an important consideration. Sockets add to the wiring resistance and contribute additional gain error (such as a possible unstable gain error) at gains of approximately 100 or greater. To maintain stability, avoid parasitic capacitance of more than a few picofarads at  $R_G$  connections. Careful matching of any parasitics on the  $R_G$  pins maintains optimal CMRR over frequency; see 图 7-17.

### 8.3.2 EMI Rejection

Texas Instruments developed a method to accurately measure the immunity of an amplifier over a broad frequency spectrum extending from 10 MHz to 6 GHz. This method uses an EMI rejection ratio (EMIRR) to quantify the ability of the INA819 to reject EMI. The offset resulting from an input EMI signal is calculated using Equation 2:

$$\Delta V_{OS} = \left( \frac{V_{RF\_PEAK}^2}{100 \text{ mV}_P} \right) \cdot 10^{-\left( \frac{EMIRR \text{ (dB)}}{20} \right)} \quad (2)$$

where

- $V_{RF\_PEAK}$  is the peak amplitude of the input EMI signal.

图 8-2 and 图 8-3 show the INA819 EMIRR graph for differential and common-mode EMI rejection across this frequency range. 表 8-2 lists the EMIRR values for the INA819 at frequencies commonly encountered in real-world applications. Applications listed in 表 8-2 are centered on or operated near the frequency shown. Depending on the end-system requirements, additional EMI filters may be required near the signal inputs of the system. Incorporating known good practices such as using short traces, low-pass filters, and damping resistors combined with parallel and shielded signal routing may be required.

**表 8-2. INA819 EMIRR for Frequencies of Interest**

FREQUENCY	APPLICATION OR ALLOCATION	DIFFERENTIAL EMIRR	COMMON-MODE EMIRR
400 MHz	Mobile radio, mobile satellite, space operation, weather, radar, ultrahigh-frequency (UHF) applications	52 dB	80 dB
900 MHz	Global system for mobile communications (GSM) applications, radio communication, navigation, GPS (up to 1.6 GHz), GSM, aeronautical mobile, UHF applications	55 dB	71 dB
1.8 GHz	GSM applications, mobile personal communications, broadband, satellite, L-band (1 GHz to 2 GHz)	58 dB	73 dB
2.4 GHz	802.11b, 802.11g, 802.11n, Bluetooth®, mobile personal communications, industrial, scientific and medical (ISM) radio band, amateur radio and satellite, S-band (2 GHz to 4 GHz)	59 dB	95 dB
3.6 GHz	Radiolocation, aero communication and navigation, satellite, mobile, S-band	78 dB	96 dB
5 GHz	802.11a, 802.11n, aero communication and navigation, mobile communication, space and satellite operation, C-band (4 GHz to 8 GHz)	70 dB	100 dB

**8.3.3 Input Common-Mode Range**

The linear input voltage range of the INA819 input circuitry extends within 1.5 volts (typical) of both power supplies and maintains excellent common-mode rejection throughout this range. The common-mode range for the most common operating conditions are shown in 8-4 to 8-7. The common-mode range for other operating conditions is best calculated using the *Analog Engineers Calculator*.

$G = 100$

**8-5. Input Common-Mode Voltage vs Output Voltage**

$V_S = \pm 5\text{ V}$

$V_{REF} = 0\text{ V}$

**8-6. Input Common-Mode Voltage vs Output Voltage**

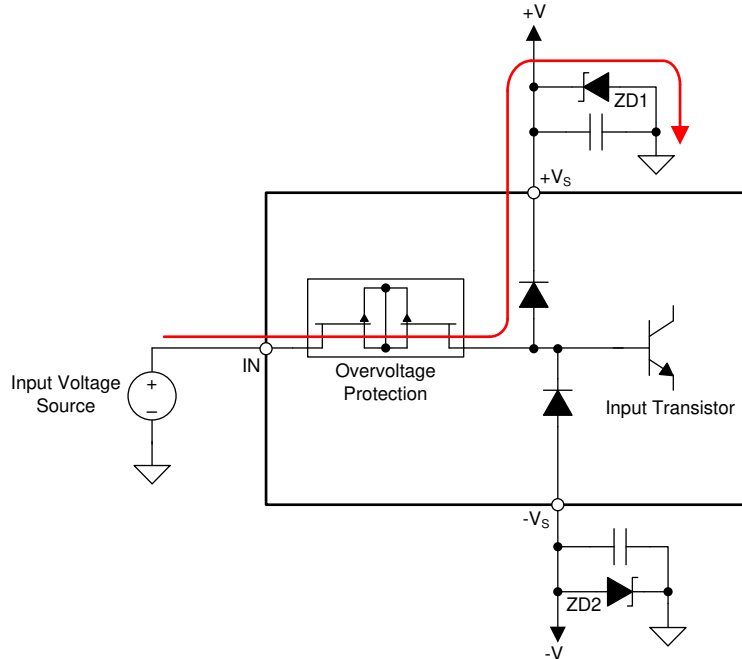

$V_S = \pm 15\text{ V}$

$V_{REF} = 0\text{ V}$

**8-7. Input Common-Mode Voltage vs Output Voltage**

### 8.3.4 Input Protection

The inputs of the INA819 device are individually protected for voltages up to  $\pm 60$  V. For example, a condition of  $-60$  V on one input and  $+60$  V on the other input does not cause damage. Internal circuitry on each input provides low series impedance under normal signal conditions. If the input is overloaded, the protection circuitry limits the input current to a value of approximately 8 mA.

8-8. Input Current Path During an Overvoltage Condition

During an input overvoltage condition, current flows through the input protection diodes into the power supplies; see 8-8. If the power supplies are unable to sink current, then Zener diode clamps (ZD1 and ZD2 in 8-8) must be placed on the power supplies to provide a current pathway to ground. 8-9 shows the input current for input voltages from  $-50$  V to  $50$  V when the INA819 is powered by  $\pm 15$ -V supplies.

8-9. Input Current vs Input Overvoltage

### 8.3.5 Operating Voltage

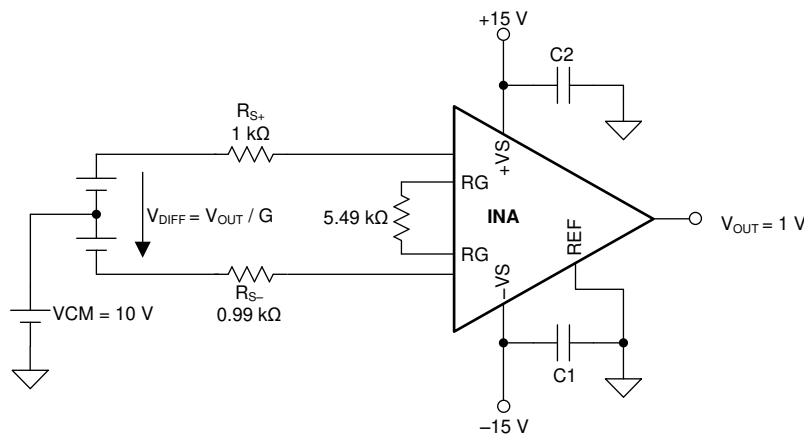

The INA819 operates over a power-supply range of 4.5 V to 36 V ( $\pm 2.25$  V to  $\pm 18$  V).

#### CAUTION

Supply voltages higher than 40 V ( $\pm 20$  V) can permanently damage the device. Parameters that vary over supply voltage or temperature are shown in [セクション 7.6](#).

### 8.3.6 Error Sources

Most modern signal-conditioning systems calibrate errors at room temperature. However, calibration of errors that result from a change in temperature is normally difficult and costly. Therefore, minimize these errors by choosing high-precision components, such as the INA819, that have improved specifications in critical areas that impact the precision of the overall system. [図 8-10](#) shows an example application.

**図 8-10. Example Application with  $G = 10$  V/V and 1-V Output Voltage**

Resistor-adjustable devices (such as the INA819) show the lowest gain error in  $G = 1$  because of the inherently well-matched drift of the internal resistors of the differential amplifier. At gains greater than 1 (for instance,  $G = 10$  V/V or  $G = 100$  V/V), the gain error becomes a significant error source because of the contribution of the resistor drift of the 25-k $\Omega$  feedback resistors in conjunction with the external gain resistor. Except for very high gain applications, the gain drift is by far the largest error contributor compared to other drift errors, such as offset drift.

The INA819 offers excellent gain error over temperature for both  $G > 1$  and  $G = 1$  (no external gain resistor). [表 8-4](#) summarizes the major error sources in common INA applications and compares the three cases of  $G = 1$  (no external resistor) and  $G = 10$  (5.49-k $\Omega$  external resistor) and  $G = 100$  (511- $\Omega$  external resistor). All calculations are assuming an output voltage of  $V_{OUT} = 1$  V. Thus, the input signal  $V_{DIFF}$  (given by  $V_{DIFF} = V_{OUT}/G$ ) exhibits smaller and smaller amplitudes with increasing gain  $G$ . In this example,  $V_{DIFF} = 1$  mV at  $G = 1000$ . All calculations refer the error to the input for easy comparison and system evaluation. As [表 8-4](#) shows, errors generated by the input stage (such as input offset voltage) are more dominant at higher gain, while the effects of output stage are suppressed because they are divided by the gain when referring them back to the input. The gain error and gain drift error are much more significant for gains greater than 1 because of the contribution of the resistor drift of the 25-k $\Omega$  feedback resistors in conjunction with the external gain resistor. In most applications, static errors (absolute accuracy errors) can readily be removed during calibration in production, while the drift errors are the key factors limiting overall system performance.

## 8.4 Device Functional Modes

The INA819 has a single functional mode and operates when the power-supply voltage is greater than 4.5 V ( $\pm 2.25$  V). The maximum power-supply voltage for the INA819 is 36 V ( $\pm 18$  V).

## 9 Application and Implementation

### Note

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 9.1 Application Information

#### 9.1.1 Reference Pin

The output voltage of the INA819 is developed with respect to the voltage on the reference pin (REF.) Often, in dual-supply operation, REF (pin 6) is connected to the low-impedance system ground. In single-supply operation, offsetting the output signal to a precise midsupply level is useful (for example, 2.5 V in a 5-V supply environment). To accomplish this level shift, a voltage source must be connected to the REF pin to level-shift the output so that the INA819 drives a single-supply analog-to-digital converter (ADC).

The voltage source applied to the reference pin must have a low output impedance. As shown in [Figure 9-1](#), any resistance at the reference pin (shown as  $R_{REF}$  in [Figure 9-1](#)) is in series with an internal 40-k $\Omega$  resistor.

**Figure 9-1. Parasitic Resistance Shown at the Reference Pin**

The parasitic resistance at the reference pin ( $R_{REF}$ ) creates an imbalance in the four resistors of the internal difference amplifier that results in a degraded common-mode rejection ratio (CMRR). [Figure 9-2](#) shows the degradation in CMRR of the INA819 as a result of increased resistance at the reference pin. For the best performance, keep the source impedance to the REF pin ( $R_{REF}$ ) less than  $5\ \Omega$ .

**Figure 9-2. The Effect of Increasing Resistance at the Reference Pin**

Voltage reference devices are an excellent option for providing a low-impedance voltage source for the reference pin. However, if a resistor voltage divider generates a reference voltage, the divider must be buffered by an op amp, as [Figure 9-3](#) shows, to avoid CMRR degradation.

Copyright © 2017, Texas Instruments Incorporated

**Figure 9-3. Using an Op Amp to Buffer Reference Voltages**

### 9.1.2 Input Bias Current Return Path

The input impedance of the INA819 is extremely high—approximately 100 GΩ. However, a path must be provided for the input bias current of both inputs. This input bias current is typically 150 pA. High input impedance means that this input bias current changes very little with varying input voltage.

For proper operation, input circuitry must provide a path for input bias current. [Figure 9-4](#) shows various provisions for an input bias current path. Without a bias current path, the inputs float to a potential that exceeds the common-mode range of the INA819, and the input amplifiers saturate. If the differential source resistance is low, the bias current return path can connect to one input (as shown in the thermocouple example in [Figure 9-4](#)). With a higher source impedance, using two equal resistors provides a balanced input with possible advantages of a lower input offset voltage as a result of bias current and better high-frequency common-mode rejection.

**Figure 9-4. Providing an Input Common-Mode Current Path**

## 9.2 Typical Applications

### 9.2.1 Three-Pin Programmable Logic Controller (PLC)

Figure 9-5 shows a three-pin programmable-logic controller (PLC) design for the INA819. This PLC reference design accepts inputs of  $\pm 10$  V or  $\pm 20$  mA. The output is a single-ended voltage of  $2.5$  V  $\pm 2.3$  V (or 200 mV to 4.8 V). Many PLCs typically have these input and output ranges.

Copyright © 2018, Texas Instruments Incorporated

**Figure 9-5. PLC Input ( $\pm 10$  V, 4 mA to 20 mA)**

#### 9.2.1.1 Design Requirements

For this application, the design requirements are as follows:

- 4-mA to 20-mA input with less than 20- $\Omega$  burden
- $\pm 20$ -mA input with less than 20- $\Omega$  burden
- $\pm 10$ -V input with impedance of approximately 100 k $\Omega$
- Maximum 4-mA to 20-mA or  $\pm 20$ -mA burden voltage equal to  $\pm 0.4$  V
- Output range within 0 V to 5 V

#### 9.2.1.2 Detailed Design Procedure

There are two modes of operation for the circuit shown in Figure 9-5: current input and voltage input. This design requires  $R_1 \gg R_2 \gg R_3$ . Given this relationship, Equation 3 calculates the current input mode transfer function.

$$V_{OUT-I} = V_D \times G + V_{REF} = -(I_{IN} \times R_3) \times G + V_{REF} \quad (3)$$

where

- G represents the gain of the instrumentation amplifier.
- $V_D$  represents the differential voltage at the INA819 inputs.
- $V_{REF}$  is the voltage at the INA819 REF pin.
- $I_{IN}$  is the input current.

Equation 4 shows the transfer function for the voltage input mode.

$$V_{OUT-V} = V_D \times G + V_{REF} = -\left[V_{IN} \times \frac{R_2}{R_1 + R_2}\right] \times G + V_{REF} \quad (4)$$

where

- $V_{IN}$  is the input voltage.

$R_1$  sets the input impedance of the voltage input mode. The minimum typical input impedance is 100 k $\Omega$ . The  $R_1$  value is 100 k $\Omega$  because increasing the  $R_1$  value also increases noise. The value of  $R_3$  must be extremely small compared to  $R_1$  and  $R_2$ . 20  $\Omega$  for  $R_3$  is selected because that resistance value is much smaller than  $R_1$  and yields an input voltage of  $\pm 400$  mV when operated in current mode ( $\pm 20$  mA).

Use Equation 5 to calculate  $R_2$  given  $V_D = \pm 400$  mV,  $V_{IN} = \pm 10$  V, and  $R_1 = 100$  k $\Omega$ .

$$V_D = V_{IN} \times \frac{R_2}{R_1 + R_2} \rightarrow R_2 = \frac{R_1 \times V_D}{V_{IN} - V_D} = 4.167 \text{ k}\Omega \quad (5)$$

The value obtained from Equation 5 is not a standard 0.1% value, so 4.17 k $\Omega$  is selected.  $R_1$  and  $R_2$  also use 0.1% tolerance resistors to minimize error.

Use Equation 6 to calculate the ideal gain of the instrumentation amplifier.

$$G = \frac{V_{OUT} - V_{REF}}{V_D} = \frac{4.8 \text{ V} - 2.5 \text{ V}}{400 \text{ mV}} = 5.75 \frac{\text{V}}{\text{V}} \quad (6)$$

Equation 7 calculates the gain-setting resistor value using the INA819 gain equation (式 1).

$$R_G = \frac{50 \text{ k}\Omega}{G - 1} = \frac{50 \text{ k}\Omega}{5.75 - 1} = 10.5 \text{ k}\Omega \quad (7)$$

Use a standard 0.1% resistor value of 10.5 k $\Omega$  for this design.

### 9.2.1.3 Application Curves

Figure 9-6 and Figure 9-7 show typical characteristic curves for the circuit in Figure 9-5.

Figure 9-6. PLC Output Voltage vs Input Voltage

Figure 9-7. PLC Output Voltage vs Input Current

### 9.2.2 Resistance Temperature Detector Interface

Figure 9-8 illustrates a 3-wire interface circuit for resistance temperature detectors (RTDs). The circuit incorporates analog linearization and has an output voltage range from 0 V to 5 V. The linearization technique employed is described in *Analog linearization of resistance temperature detectors analog application journal*. Series and parallel combinations of standard 1% resistor values are used to achieve less than 0.02°C of error over a 200°C temperature span.

## 10 Power Supply Recommendations

The nominal performance of the INA819 is specified with a supply voltage of  $\pm 15$  V and midsupply reference voltage. The device also operates using power supplies from  $\pm 2.25$  V (4.5 V) to  $\pm 18$  V (36 V) and non-midsupply reference voltages with excellent performance. Parameters that can vary significantly with operating voltage and reference voltage are shown in the [セクション 7.6](#) section.

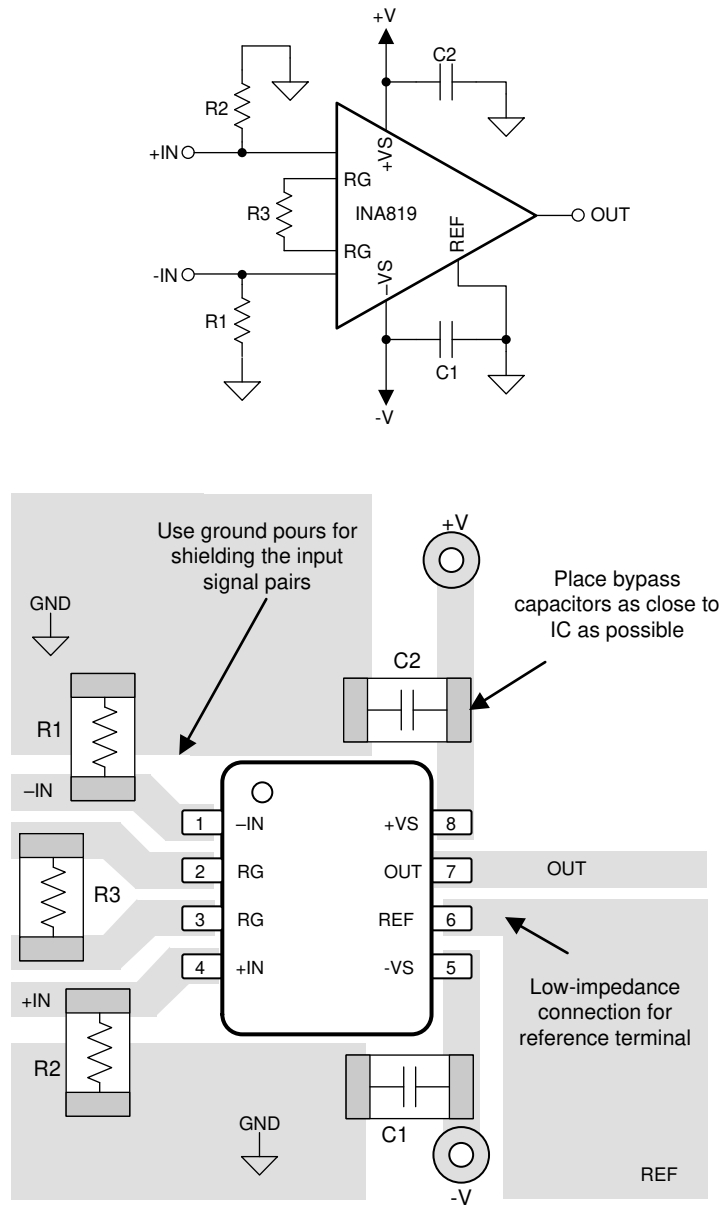

## 11 Layout

### 11.1 Layout Guidelines

Attention to good layout practices is always recommended. For best operational performance of the device, use good PCB layout practices, including:

- Take care to make sure that both input paths are well-matched for source impedance and capacitance to avoid converting common-mode signals into differential signals. Even slight mismatch in parasitic capacitance at the gain setting pins can degrade CMRR over frequency. For example, in applications that implement gain switching using switches or PhotoMOS<sup>®</sup> relays to change the value of  $R_G$ , select the component so that the switch capacitance is as small as possible and most importantly so that capacitance mismatch between the  $R_G$  pins is minimized.
- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and of the device. Bypass capacitors reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1- $\mu$ F ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from  $V+$  to ground is applicable for single-supply applications.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace perpendicular is much better than in parallel with the noisy trace.
- Place the external components as close to the device as possible. As shown in [図 11-1](#), keep  $R_G$  close to the pins to minimize parasitic capacitance.
- Keep the traces as short as possible.
- Connect exposed thermal pad to negative supply  $-V$ .

## 12 Device and Documentation Support

### 12.1 Device Support

#### 12.1.1 Development Support

##### 12.1.1.1 PSpice® for TI

PSpice® for TI is a design and simulation environment that helps evaluate performance of analog circuits. Create subsystem designs and prototype solutions before committing to layout and fabrication, reducing development cost and time to market.

##### 12.1.1.2 TINA-TI™ Simulation Software (Free Download)

TINA-TI™ simulation software is a simple, powerful, and easy-to-use circuit simulation program based on a SPICE engine. TINA-TI simulation software is a free, fully-functional version of the TINA™ software, preloaded with a library of macromodels, in addition to a range of both passive and active models. TINA-TI simulation software provides all the conventional dc, transient, and frequency domain analysis of SPICE, as well as additional design capabilities.

Available as a [free download](#) from the Analog eLab Design Center, TINA-TI simulation software offers extensive post-processing capability that allows users to format results in a variety of ways. Virtual instruments offer the ability to select input waveforms and probe circuit nodes, voltages, and waveforms, creating a dynamic quick-start tool.

---

#### Note

These files require that either the TINA software or TINA-TI software be installed. Download the free TINA-TI simulation software from the [TINA-TI™ software folder](#).

---

### 12.2 Documentation Support

#### 12.2.1 Related Documentation

For related documentation see the following:

Texas Instruments, [Comprehensive Error Calculation for Instrumentation Amplifiers application note](#)

#### 12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.4 サポート・リソース

TI E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の[使用条件](#)を参照してください。

### 12.5 Trademarks

TINA-TI™ and TI E2E™ are trademarks of Texas Instruments.

TINA™ is a trademark of DesignSoft, Inc.

Bluetooth® is a registered trademark of Bluetooth SIG, Inc.

PhotoMOS® is a registered trademark of Panasonic Electric Works Europe AG.

PSpice® is a registered trademark of Cadence Design Systems, Inc.

すべての商標は、それぞれの所有者に帰属します。

## 12.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 12.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

**(6) Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
