TEXAS INSTRUMENTS

LP5868T 8 × 18 LED 大電流マトリクス ドライバ、8 ビット アナログおよび 8/16 ビット PWM 調光付き

1 特長

- LED マトリクスのトポロジ:
  - 144 の LED ドットに対する 8 のスキャン スイッチを備えた 18 個の定電流シンク
  - 1～8 に構成できるスキャン スイッチ
- 動作電圧範囲:
  - V_{CC}/V_{LED} 範囲:2.7V～5.5V
  - 1.8V、3.3V、5V 互換のロジック ピン
- 18 個の高精度定電流シンク:
  - 電流シンクあたり 100mA (V_{CC} ≥ 3.3V)
  - デバイス間誤差:±5%
  - チャネル間誤差:±5%
  - 位相シフトによる過渡電力の平衡化
- 極めて低い消費電力:
  - シャットダウン モード:I_{CC} ≦ 1μA (EN = Low 時)
  - スタンバイ モード:I_{CC} ≦ 10μA (EN = High かつ CHIP_EN = 0 (データ保持) 時)
  - アクティブ モード:I_{CC} = 5mA (標準値)、チャネル電流 = 12.5mA
- 柔軟な調光オプション:
  - 各 LED ドットを個別にオン / オフ制御
  - アナログ調光法 (電流ゲイン制御)
    - すべての LED ドットに対するグローバル 7 ステップ最大電流 (MC) 設定
    - 3 グループの 7 ビット カラー電流 (CC) RGB 設定
    - 各 LED ドットに対する個別の 8 ビットドット電流 (DC) 設定
  - 可聴ノイズが発生しない周波数を使った PWM 調光
    - すべての LED ドットに対するグローバル 8 ビット PWM 調光法
    - LED ドットを任意に割り当てるための 3 つのプログラム可能な 8 ビット PWM 調光法グループ
    - 各 LED ドットに対する個別の 8 ビットまたは 16 ビット PWM 調光法
- データ通信量を最小限に抑えるための完全にアドレス指定可能な SRAM
- 個別の LED ドット開放 / 短絡検出
- ゴースト除去および低輝度補償機能
- インターフェイス オプション
  - 1MHz (最大値) の I^2C インターフェイス (IFS = Low 時)
  - 12MHz (最大値) の SPI インターフェイス (IFS = High 時)

2 アプリケーション

- LED アニメーションおよび表示:
  - 大型およびスマート家電
  - グローバル RGB キーボードのバックライト
  - 屋外キーパッドのバックライト
  - ビデオ監視および IP カメラ用 IR モジュール
  - 光学モジュール内のレーザー・ダイオード

3 概要

LP5868T は、大電流で高性能の LED マトリクス ドライバです。本デバイスは、N (N = 6/8/11) スイッチング MOSFET を備えた 18 の定電流シンクを内蔵しており、をサポートします。LP5868T は、最大 144 の LED ドットまたは 48 の RGB LED に対応する 8 個の MOSFET を内蔵しています。

LP5868T はアナログ調光法と PWM 調光法の両方をサポートしています。アナログ調光法の場合、各 LED ドットを 256 ステップで調整できます。PWM 調光法の場合、内蔵の 8 ビットまたは 16 ビット構成可能 PWM ジェネレータが、滑らかで可聴ノイズの発生しない調光制御を実現します。各 LED ドットを 8 ビット グループ PWM に任意に割り当てることで、調光制御をまとめて行うこともできます。

LP5868T デバイスは、データ通信量を最小限に抑えるために、完全にアドレス指定可能な SRAM を実装しています。上側と下側のゴーストを除去するため、ゴースト キャンセル回路を内蔵しています。LP5868T は LED 開放 / 短絡検出機能もサポートしています。LP5868T では、1MHz (最大値) の I^2C と 12MHz (最大値) の SPI が使用できます。
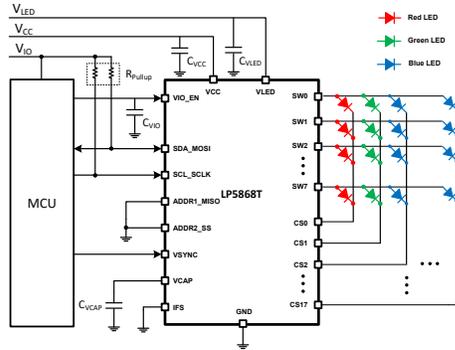

パッケージ情報

部品番号	パッケージ [(1)]	本体サイズ (公称)
LP5868T	RKP (VQFN、40)	5.00mm × 5.00mm

(1) 利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。

表 5-1. Pin Functions (続き)

PIN		I/O	DESCRIPTION
NO.	NAME		
21	NC	-	No connection.
22	CS9	O	Current sink 9. If not used, this pin must be floating.
23	CS10	O	Current sink 10. If not used, this pin must be floating.
24	CS11	O	Current sink 11. If not used, this pin must be floating.
25	CS12	O	Current sink 12. If not used, this pin must be floating.
26	CS13	O	Current sink 13. If not used, this pin must be floating.
27	CS14	O	Current sink 14. If not used, this pin must be floating.
28	CS15	O	Current sink 15. If not used, this pin must be floating.
29	CS16	O	Current sink 16. If not used, this pin must be floating.
30	CS17	O	Current sink 17. If not used, this pin must be floating.
31	AGND	Ground	Analog ground. Must be connected to exposed thermal pad and common ground plane.
32	VCAP	O	Internal LDO output. An 1µF capacitor must be connected between this pin with GND. Place the capacitor as close to the device as possible.
33	IFS	I	Interface type select. I^{2}C is selected when IFS is low. SPI is selected when IFS is high. A resistor must be connected between VIO and this pin.
34	VSYNC	I	External synchronize signal for display mode 2 and mode 3.
35	SCL_SCLK	I	I^{2}C clock input or SPI clock input. Pull up to VIO when configured as I^{2}C.
36	SDA_MOSI	I/O	I^{2}C data input or SPI leader output follower input. Pull up to VIO when configured as I^{2}C.
37	ADDR0_MISO	I/O	I^{2}C address select 0 or SPI leader input follower output.
38	ADDR1_SS	I	I^{2}C address select 1 or SPI follower select.
39	VIO_EN	Power,I	Power supply for digital circuits and chip enable. An 1nF capacitor must be connected between this pin with GND and be placed as close to the device as possible.
40	VCC	Power	Power supply for device. A 1µF capacitor must be connected between this pin with GND and be placed as close to the device as possible.
Exposed Thermal Pad	GND	Ground	Must be connected to AGND and common ground plane.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
Voltage on V_{CC} / V_{LED} / VIO / EN / CS / SW / SDA / SCL / SCLK / MOSI / MISO / SS / ADDR0 / ADDR1 / VSYNC / IFS		–0.3	6	V
Voltage on VCAP		–0.3	2	V
T_J	Junction temperature	–55	150	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[1]	±3000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins[2]	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Input voltage on V_{CC}	Supply voltage	2.7		5.5	V
Input voltage on V_{LED}	LED supply voltage	2.7		5.5	V
Input voltage on VIO_EN		1.65		5.5	V
Voltage on SDA / SCL / SCLK / MOSI / MISO / SS / ADDRx / VSYNC / IFS				VIO	V
T_A	Operating ambient temperature	–40		85	°C
T_A	Operating ambient temperature - LP5860TMRKPR, LP5866TMRKPR and LP5868TMRKPR	–55		125	°C

6.4 Thermal Information

	THERMAL METRIC	LP5860T, LP5868T, LP5866T	UNIT
		RKP (VQFN)	
		40 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	31.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	22.9	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	12.0	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	12.0	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	3.5	°C/W

6.5 Electrical Characteristics

V_{CC} = 3.3V, V_{LED} = 5V, VIO = 1.8V and T_A = –40°C to +85°C(T_A = –55°C to +125°C for LP5860TMRKPR, LP5866TMRKPR and LP5868TMRKPR); Typical values are at T_A = 25°C (unless otherwise specified)

7 Detailed Description

7.1 Overview

The LP5868T is an 8 × 18 LED matrix driver. The device integrates 8 switching FETs with 18 constant current sinks. One LP5868T device can drive up to 144 LED dots or 48 RGB pixels by using time-multiplexing matrix scheme.

The LP5868T supports both analog dimming and PWM dimming methods. For analog dimming, the current gain of each individual LED dot can be adjusted with 256 steps through 8-bits dot correction. For PWM dimming, the integrated 8-bits or 16-bits configurable, > 20KHz PWM generators for each LED dot enable smooth, vivid animation effects without audible noise. Each LED can also be mapped into a 8-bits group PWM to achieve the group control with minimum data traffic.

The LP5868T device implements full addressable SRAM. The device supports entire SRAM data refresh and partial SRAM data update on demand to minimize the data traffic. The LP5868T implements the ghost cancellation circuit to eliminate both upside and downside ghosting. The LP5868T also uses low brightness compensation technology to support high density LED pixels. Both 1MHz (maximum) I^{2}C and 12MHz (maximum) SPI interfaces are available in the LP5868T.

7.2 Functional Block Diagram

Product Folder Links: *LP5868T*

English Data Sheet: SNVSCE2
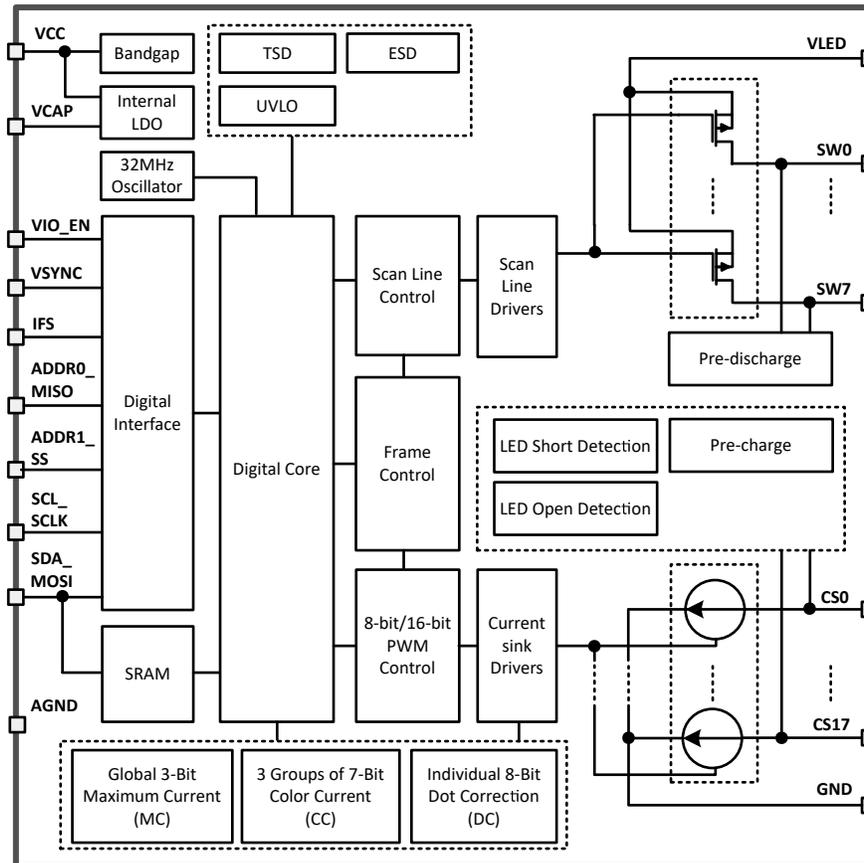

7.3 Feature Description

7.3.1 Time-Multiplexing Matrix

The LP5868T device uses a time-multiplexing matrix scheme to support up to 144 LED dots with one chip. The device integrates 18 current sinks with 8 scan lines to drive 18 × 8 = 144 LED dots or 6 × 8 = 48 RGB pixels. In matrix control scheme, the device scans from Line 0 to Line 7 sequentially as shown in 図 7-1. Current gain and PWM duty registers are programmable for each LED dot to support individual analog and PWM dimming.
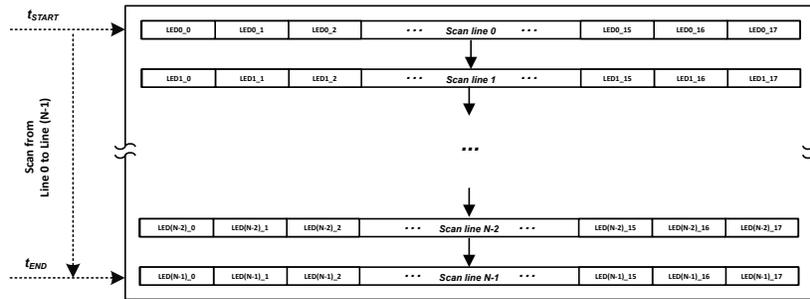

図 7-1. Scan Line Control Scheme

There are 8 high-side p-channel MOSFETs (PMOS) integrated in LP5868T device. Users can flexibly set the active scan numbers from 6 to 8 by configuring the 'Max_Line_Num' in Dev_initial register. The time-multiplexing matrix timing sequence follows the 図 7-2.
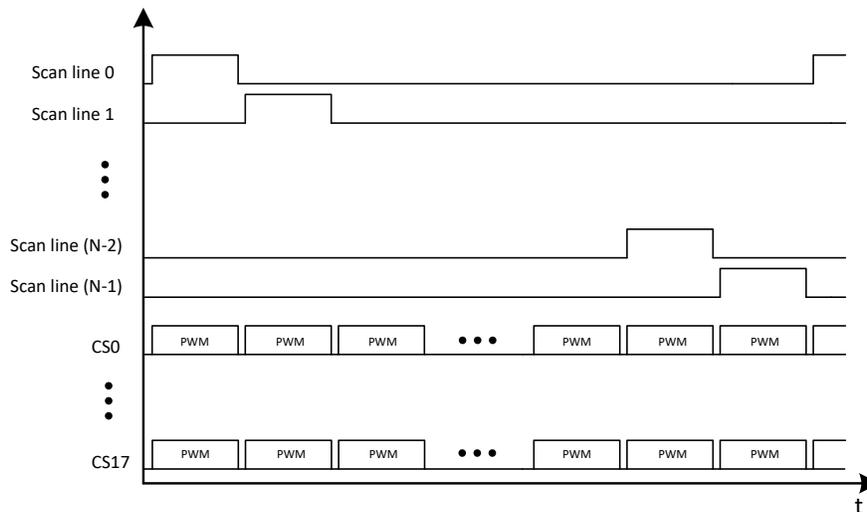

図 7-2. Time-Multiplexing Matrix Timing Sequence

One cycle time of the line switching can be calculated as below:

$$t_{line\_switch} = t_{PWM} + t_{SW\_BLK} + 2 \times t_{phase\_shift} \tag{1}$$

- t_{PWM} is the current sink active time, which equals to 8µs (PWM frequency set at 125kHz) or 16µs (PWM frequency set at 62.5kHz) by configuring 'PWM_Fre' in Dev_initial register.
- t_{SW_BLK} is the switch blank time, which equals to 1µs or 0.5µs by configuring 'SW_BLK' in Dev_config1 register.
- t_{phase_shift} is the PWM phase shift time, which equal to 0 or 125ns by configuring 'PWM_Phase_Shift' in Dev_config1 register.

Total display time for one complete sub-period is t_{sub_period} and can be calculated by the following equation:

$$t_{sub\_period} = t_{line\_switch} \times Scan\_line\# \tag{2}$$

- Scan_line# is the scan line number determined by 'Max_Line_Num' in Dev_initial register.

The time-multiplexing matrix scheme time diagram is shown in 図 7-3. The $t_{CS\_ON\_Shift}$ is the current sink turning on shift by configuring 'CS_ON_Shift' bit in Dev_config1 register.
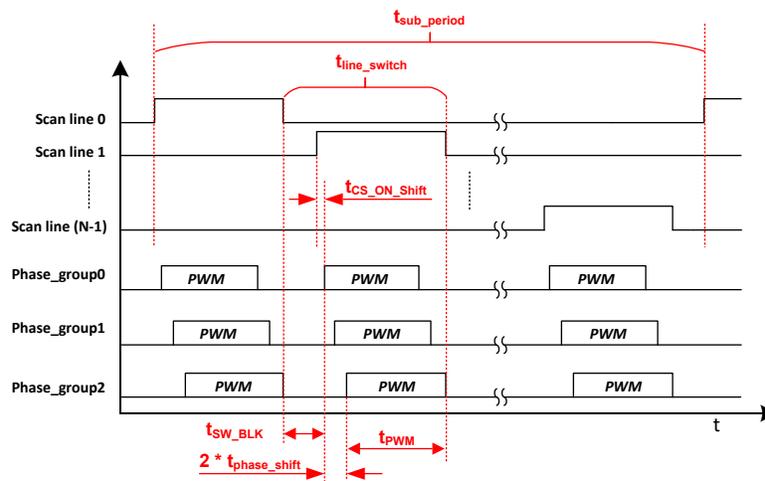

図 7-3. Time-Multiplexing Matrix Timing Diagram

The LP5868T device implements de-ghosting and low brightness compensation to remove the side effects of matrix topology:

- **De-ghosting**: Both upside de-ghosting and downside de-ghosting are implemented to eliminate the LED's unexpected weak turn-on.
  - Upside_de-ghosting: discharge each scan line during blank state. By configuring the 'Up_Deghost' in Dev_config3 register, the LP5868T discharges and clamps the scan line switch to a certain voltage.
  - Downside_deghosting: pre-charge each current sink voltage during blank state. The de-ghosting capability can be adjusted through the 'Down_Deghost' in Dev_config3 register.

- **Low Brightness Compensation**: three groups compensation are implemented to overcome the color-shift and non-uniformity in low brightness conditions. The compensation capability can be through 'Comp_Group1', 'Comp_Group2', and 'Comp_Group3' in Dev_config2 register.
  - Compensation_group 1: CS0, CS3, CS6, CS9, CS12, CS15.
  - Compensation_group 2: CS1, CS4, CS7, CS10, CS13, CS16.
  - Compensation_group 3: CS2, CS5, CS8, CS11, CS14, CS17.

English Data Sheet: SNVSCE2

7.3.2 Analog Dimming (Current Gain Control)

Analog dimming of LP5868T is achieved by configuring the current gain control. There are several methods to control the current gain of each LED.

- Global 3-bits Maximum Current (MC) setting without external resistor
- 3 Groups of 7-bits Color Current (CC) setting
- Individual 8-bit Dot Current (DC) setting

注

When setting to small output current in low brightness situation, adjusting MC to a small value firstly can get smaller output saturation voltage.

7.3.2.1 Global 3-Bits Maximum Current (MC) Setting

The MC is used to set the maximum current I_{OUT_MAX} for each current sink, and this current is the maximum peak current for each LED dot. The MC can be set with 7 steps from 7.5 mA to 100 mA. When the device is powered on, the MC data is set to default value, which is 37.5 mA.

For data refresh Mode 1, MC data is effective immediately after new data is updated. For Mode 2 and Mode 3, to avoid unexpected MC data change during high speed data refreshing, MC data must be changed when all channels are off and new MC data is only updated when the 'Chip_EN' bit in Chip_en register is set to 0, and after the 'Chip_EN' returns to 1, the new MC data is effective. 'Down_Deghost' and 'Up_Deghost' in Dev_config3 work in the similar way with MC.

表 7-1. Maximum Current (MC) Register Setting

3-BITS MAXIMUM_CURRENT REGISTER		I_{OUT_MAX}
Binary	Decimal	mA
000	0	7.5
001	1	12.5
010	2	25
011 (Default)	3 (Default)	37.5 (Default)
100	4	50
101	5	75
110	6	100

7.3.2.2 3 Groups of 7-Bits Color Current (CC) Setting

The LP5868T device is able to adjust the output current of three color groups separately. For each color, the device has 7-bits data in 'CC_Group1', 'CC_Group2', and 'CC_Group3'. Thus, all color group currents can be adjusted in 128 steps from 0% to 100% of the maximum output current, I_{OUT_MAX}.

The 18 current sinks have fixed mapping to the three color groups:
- CC-Group 1: CS0, CS3, CS6, CS9, CS12, CS15.
- CC-Group 2: CS1, CS4, CS7, CS10, CS13, CS16.
- CC-Group 3: CS2, CS5, CS8, CS11, CS14, CS17.

表 7-2. 3 Groups of 7-bits Color Current (CC) Setting

7-BITS CC_GROUP1/CC_GROUP2/CC_GROUP3 REGISTER		RATIO OF OUTPUT CURRENT TO I_{OUT_MAX}
Binary	Decimal	%
000 0000	0	0
000 0001	1	0.79
000 0010	2	1.57
- - -	- - -	- - -
100 0000 (default)	64 (default)	50.4 (default)
- - -	- - -	- - -
111 1101	125	98.4
111 1110	126	99.2
111 1111	127	100

7.3.2.3 Individual 8-bit Dot Current (DC) Setting

The LP5868T can individually adjust the output current of each LED by using dot current function through DC setting. The device allows the brightness deviations of the LEDs to adjusted be individually. Each output DC is programmed with an 8-bit depth, so the value can be adjusted with 256 steps within the range from 0% to 100% of (I_{OUT_MAX} × CC/127).

表 7-3. Individual 8-bit Dot Current (DC) Setting

8-BIT DC REGISTER		RATIO OF OUTPUT CURRENT TO I_{OUT_MAX} × CC/127
Binary	**Decimal**	**%**
0000 0000	0	0
0000 0001	1	0.39
0000 0010	2	0.78
- - -	- - -	- - -
1000 0000 (Default)	128 (Default)	50.2 (Default)
- - -	- - -	- - -
1111 1101	253	99.2
1111 1110	254	99.6
1111 1111	255	100

In summary, the current gain of each current sink can be calculated as below:

$$I_{OUT} \text{ (mA)} = I_{OUT\_MAX} \times (CC/127) \times (DC/255) \tag{3}$$

For time-multiplexing scan scheme, if the scan number is N, each LED dot's average current I_{AVG} is shown as below:

$$I_{AVG} \text{ (mA)} = I_{OUT}/N = I_{OUT\_MAX} \times (CC/127) \times (DC/255)/N \tag{4}$$

7.3.3 PWM Dimming

There are several methods to control the PWM duty cycle of each LED dot.

7.3.3.1 Individual 8-Bit / 16-Bit PWM for Each LED Dot

Every LED has an individual 8-bit or 16-bit PWM register that is used to change the LED brightness by PWM duty. The LP5868T uses an enhanced spectrum PWM (ES-PWM) algoithm to achieve 16-bit depth with high refresh rate and this can avoid flicker under high speed camera. Comparing with conventional 8-bit PWM, 16-bit PWM can help to achieve ultimate high dimming resolution in LED animation applications.

7.3.3.2 Programmable Groups of 8-Bit PWM Dimming

The group PWM Control is used to select LEDs into 1 to 3 groups while each group has a separate register for PWM control. Every LED has 2-bit selection in LED_DOT_GROUP Registers (x = 0, 1, … , 39) to select whether the LED dot belongs to one of the three groups or not:

- 00: not a member of any group
- 01: member of group 1
- 10: member of group 2
- 11: member of group 3

7.3.3.3 8-Bit PWM for Global Dimming

The Global PWM Control function affects all LEDs simultaneously.

The final PWM duty cycle can be calculated as below:

$$PWM\_Final(8\text{-bit}) = PWM\_Individual(8\text{-bit}) \times PWM\_Group(8\text{-bit}) \times PWM\_Global(8\text{-bit}) \quad (5)$$

$$PWM\_Final(16\text{-bit}) = PWM\_Individual(16\text{-bit}) \times PWM\_Group(8\text{-bit}) \times PWM\_Global(8\text{-bit}) \quad (6)$$

The LP5868T supports 125kHz or 62.5kHz PWM output frequency. The PWM frequency is selected by configuring the 'PWM_Fre' in Dev_initial register. An internal 31.2MHz oscillator is used for generating PWM outputs. The oscillator's high accuracy design ($f_{OSC\_ERR} \leq \pm 3\%$) enables a better synchronization if multiple LP5868T devices are connected together.

A PWM phase-shifting scheme is implemented in each current sink to avoid the current overshot when turning on simultaneously. As the LED drivers are not activated simultaneously, the peak load current from the pre-stage power supply is significantly decreased. This scheme also reduces input-current ripple and ceramic-capacitor audible ringing. LED drivers are grouped into three different phases. By configuring the 'PWM_Phase_Shift' in Dev_config1 register, which is default off, the LP5868T supports t_{phase_shift} = 125ns shifting time shown in 図 7-4.

- Phase 1: CS0, CS3, CS6, CS9, CS12, CS15.
- Phase 2: CS1, CS4, CS7, CS10, CS13, CS16.
- Phase 3: CS2, CS5, CS8, CS11, CS14, CS17.

図 7-4. Phase Shift

Product Folder Links: LP5868T

English Data Sheet: SNVSCE2
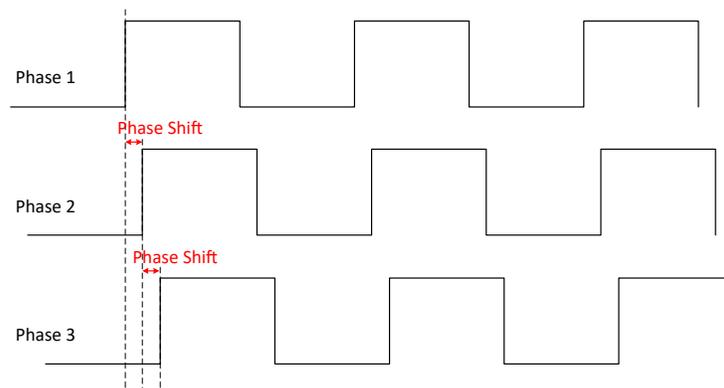

To avoid high current sinks output ripple during line switching, current sinks can be configured to turn on with 1 clock delay (62.5ns or 31.25ns according to the PWM frequency) after lines turn on, as shown in 図 7-3. This function can be configured by 'CS_ON_Shift' in Dev_config1 register.

The LP5868T allows users to configure the dimming scale either exponentially (Gamma Correction) or linearly through the 'PWM_Scale_Mode' in Dev_config1 register. If a human-eye-friendly dimming curve is desired, using the internal fixed exponential scale is an easy approach. If a special dimming curve is desired, using the linear scale with software correction is recommended. The LP5868T supports both linear and exponential dimming curves under 8-bit and 16-bit PWM depth. 図 7-5 is an example of 8-bit PWM depth.
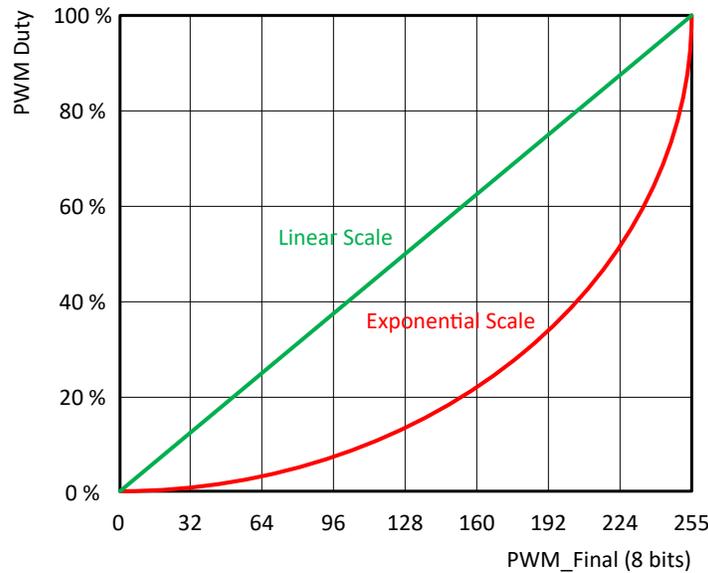

図 7-5. Linear and Exponential Dimming Curves

In summary, the PWM control method is illustrated as 図 7-6:
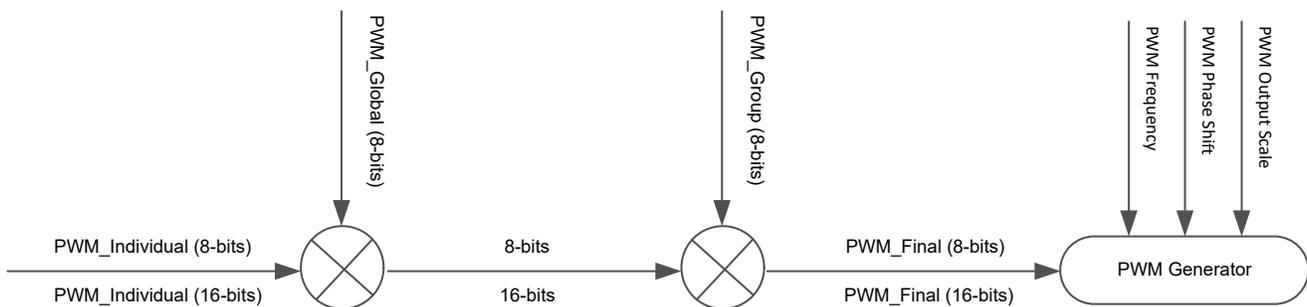

図 7-6. PWM Control Scheme

7.3.4 ON and OFF Control

The LP5868T device supports the individual ON and OFF control of each LED. For indication purpose, users can turn on and off the LED directly by writing 1-bit ON and OFF data to the corresponding Dot_onoffx (x = 0, 1, … , 23) register.

7.3.5 Data Refresh Mode

The LP5868T supports three data refresh modes: Mode 1, Mode 2, and Mode 3, by configuring 'Data_Ref_Mode' in Dev_initial register.

Mode 1: 8-bit PWM data without VSYNC command. Data is sent out for display instantly after received. With Mode1, users can refresh the corresponding dots' data only instead of updating the whole SRAM. It is called 'on demand data refresh', which can save the total data volume effectively. As shown in 図 7-7, the red LED dots can be refreshed after sending the corresponding data while the others kept the same with last frame.

Frame N-1   Frame N
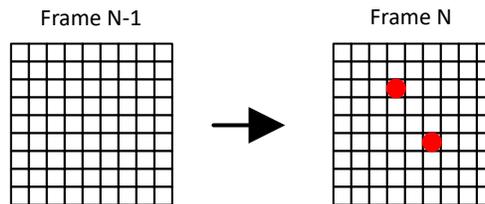

図 7-7. On Demand Data Refresh - Mode 1

Mode 2: 8-bit PWM data with VSYNC command. Data is held and sent out simultaneously by frame after receiving the VSYNC command.

Mode 3: 16-bit PWM data with VSYNC command. Data is held and sent out simultaneously by frame after receiving the VSYNC command.

Frame control is implemented in Mode 2 and Mode 3. Instead of refreshing the output instantly after data is received (Mode 1), the device holds the data and refreshes the whole frame data by a fixed frame rate, f_{VSYNC}. Usually, 24Hz, 50Hz, 60Hz, 120Hz or even higher frame rate is selected to achieve vivid animation effects. Whole SRAM Data Refresh is shown in 図 7-8, a new frame is updated after receiving the VSYNC command.

Frame N-1   Frame N

図 7-8. Whole SRAM Data Refresh

Product Folder Links: *LP5868T*

English Data Sheet: SNVSCE2
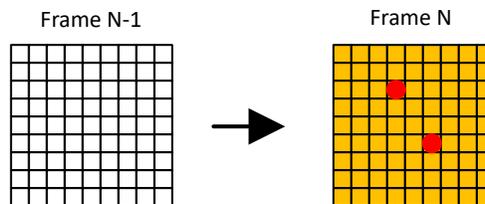

Comparing with Mode 1, Mode 2 and Mode 3 provide a better synchronization when multiple LP5868T devices used together. A high-level pulse width longer than t_{SYNC_H} is required at the beginning of each VSYNC frame. 図 7-9 shows the VSYNC connections and 図 7-10 shows the timing requirements.
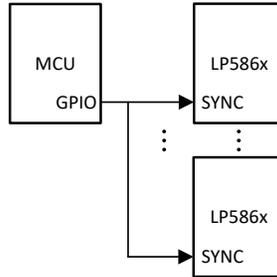

図 7-9. Multiple Devices Sync
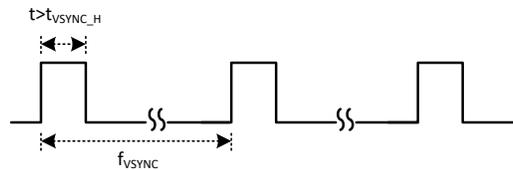

図 7-10. VSYNC Timing

Table 8-4 is the summary of the 3 data refresh modes.

表 7-4. Data Refresh Mode

MODE TYPE	PWM RESOLUTION	PWM OUTPUT	EXTERNAL VSYNC
Mode 1	8 Bits	Data update instantly	No
Mode 2	8 Bits	Data update by frame	Yes
Mode 3	16 Bits		

7.3.6 Full Addressable SRAM

SRAM is implemented inside the LP5868T device to support data writing and reading at the same time.

Although data refresh mechanisms are not the same for Mode 1 and Mode 2/3, the data writing and reading follow the same method. Uses can update partial of the SRAM data only or the whole SRAM page simultaneously. The LP5868T supports auto-increment function to minimize data traffic and increase data transfer efficiency.

Please be noted that 16-bit PWM (Mode 3) and 8-bit PWM (Mode 1 and Mode 2) are assigned with different SRAM addresses.

7.3.7 Protections and Diagnostics

7.3.7.1 LED Open Detection

The LP5868T includes LED open detection (LOD) for the fault caused by any opened LED dot. The threshold for LED open is 0.25V typical. LED open detection is only performed when PWM ≥ 25 (Mode 1 and Mode 2) or PWM ≥ 6400 (Mode 3) and voltage on CSn is detected lower than open threshold for continuously 4 sub-periods.

図 7-11 shows the detection circuit of LOD function. When open fault is detected, 'Global_LOD' bit in Fault_state register is set to 1 and detailed fault state for each LED is also monitored in register Dot_lodx (x = 0, 1, … , 23). All open fault indicator bits can be cleared by setting LOD_clear = 0Fh after the open condition is removed.

LOD removal function can be enabled by setting 'LOD_removal' bit in Dev_config2 register to 1. This function turns off the current sink of the open channel when scanning to the line where the opened LED is included.

図 7-11. LOD Circuits

Product Folder Links: *LP5868T*

English Data Sheet: SNVSCE2
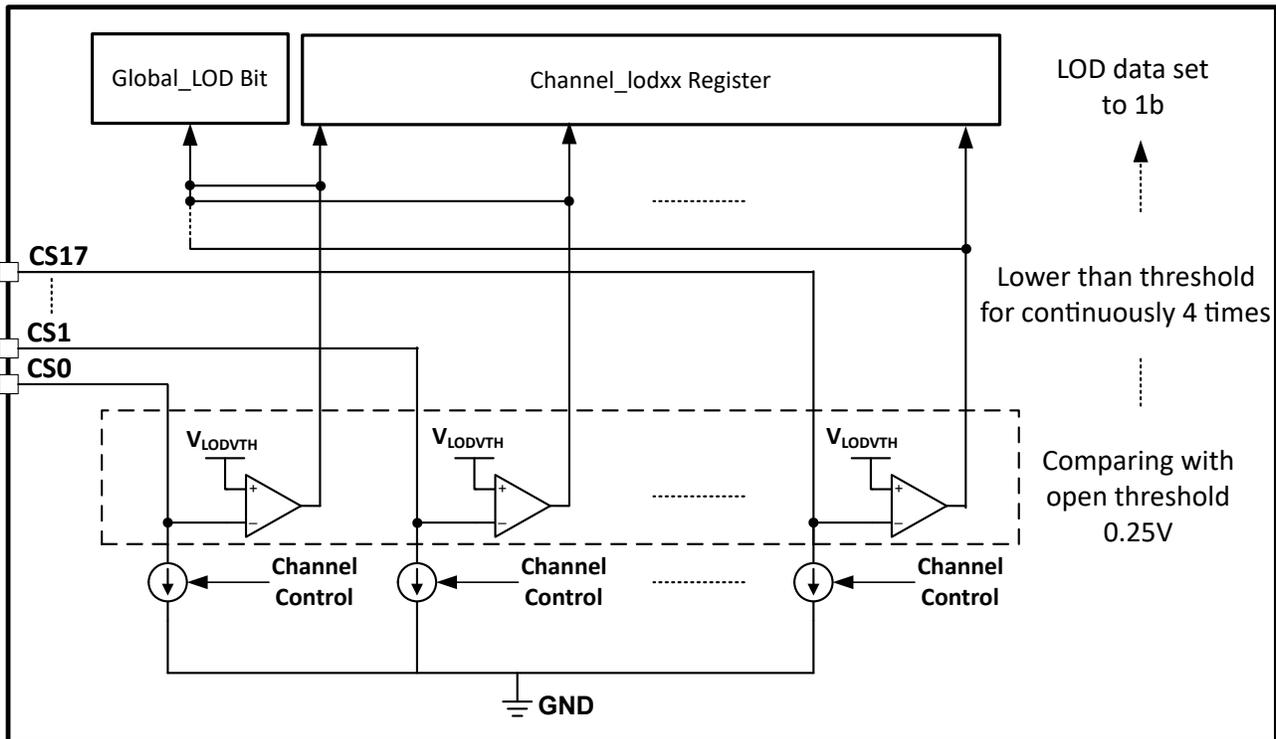

7.3.7.2 LED Short Detection

The LP5868T includes LED short detection (LSD) for the fault caused by any shorted LED. Threshold for channel short is (VLED – 1) V typical. LED short detection only performed when PWM ≥ 25 (Mode 1 and Mode 2) or PWM ≥ 6400 (Mode 3) and voltage on CSn is detected higher than short threshold for continuously 4 sub-periods. As there is parasitic capacitance for the current sink, to make sure the LSD result is correct, setting the LED current higher than 0.5mA is recommended.

The image below shows the detection circuit of LSD function. When short fault is detected, 'Global_LSD bit' in Fault_state register is set to 1 and detailed fault state for every channel are also monitored in register Dot_lsdx (x = 0, 1, … , 23). All short fault indicator bits can be cleared by setting LSD_clear = 0Fh after the short condition is removed.

LSD removal function can be enabled by setting 'LSD_removal' bit in Dev_config2 register to 1. This function turns off the upside deghosting function of the scan line where short LED is included.
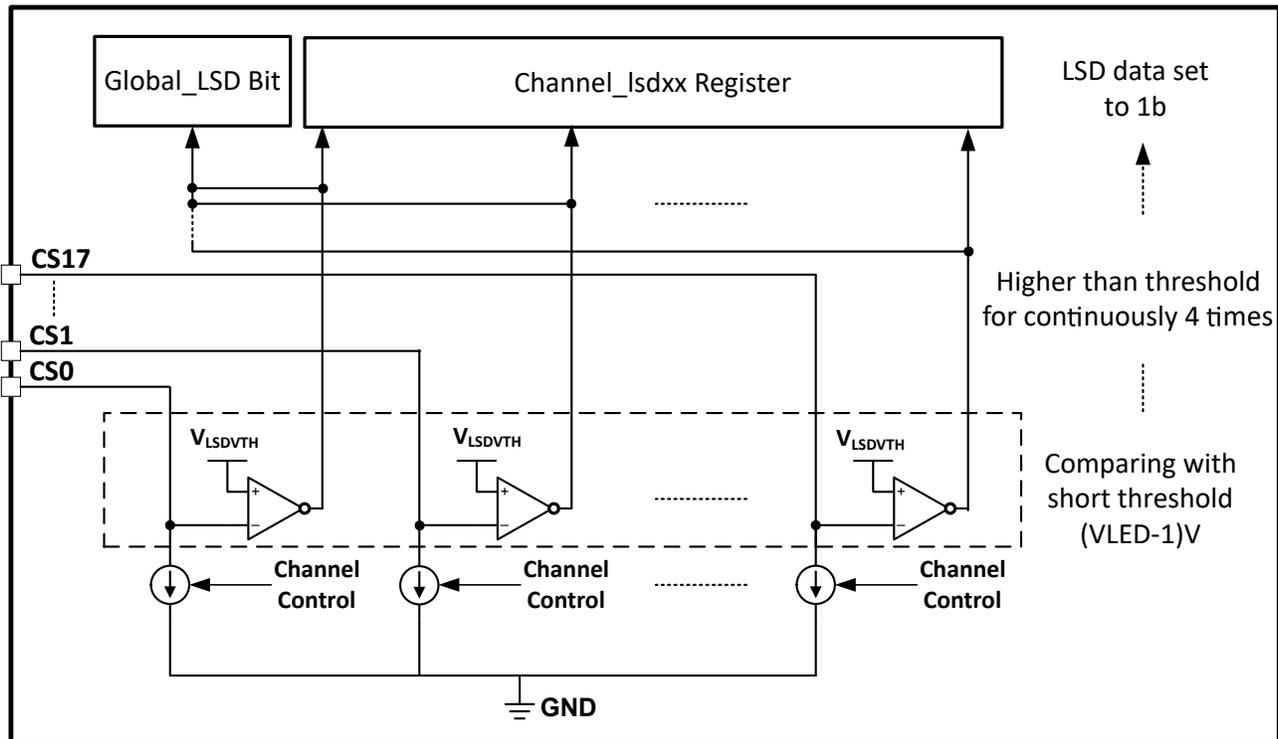

図 7-12. LSD Circuit

7.3.7.3 Thermal Shutdown

The LP5868T device implements thermal shutdown mechanism to protect the device from damage due to overheating. When the junction temperature rises to 160°C (typical) and above, the device switches into shutdown mode. The LP5868T exits thermal shutdown when the junction temperature of the device drops to 145°C (typical) and below.

7.3.7.4 UVLO (Under Voltage Lock Out)

The LP5868T has an internal comparator that monitors the voltage at VCC. When VCC is below V_{UVF}, reset is active and the LP5868T enters INITIALIZATION state.

7.4 Device Functional Modes
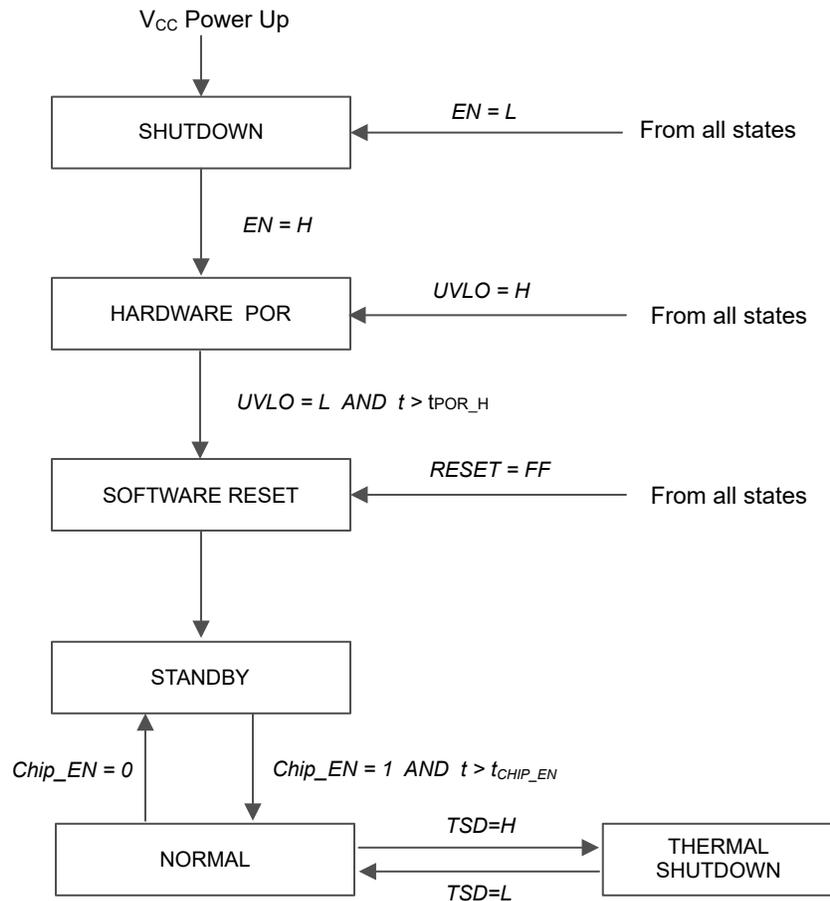

図 7-13. Device Functional Modes

- SHUTDOWN: The device enters into SHUTDOWN mode from all states on VCC power up or EN pin is low.
- HARDWARE POR: The device enters into HARDWARE POR when Enable pin is high or VCC fall under V_{UVF} causing UVLO=H from all states.
- SOFTWARE RESET: The device enters into SOFTWARE RESET mode when VCC rise higher than V_{UVR} with the time $t > t_{POR\_H}$. In this mode, all the registers are reset. Entry can also be from any state when the RESET (register) = FFh or UVLO is low.
- STANDBY: The device enters the STANDBY mode when Chip_EN (register) = 0. In this mode, device enters into low power mode, but the I²C/SPI are still available for Chip_EN only and the registers' data are retained.
- NORMAL: The device enters the NORMAL mode when 'Chip_EN' = 1 with the time $t > t_{CHIP\_EN}$.
- THERMAL SHUTDOWN: The device automatically enters the THERMAL SHUTDOWN mode when the junction temperature exceeds 160°C (typical). If the junction temperature decreases below 145°C (typical), the device returns to the NORMAL mode.

English Data Sheet: SNVSCE2

7.5 Programming

7.5.1 Interface Selection

The LP5868T supports two communication interfaces: I^{2}C and SPI. If IFS is high, ithe device enters into SPI mode. If IFS is low, the device enters into I^{2}C mode.

表 7-5. Interface Selection

INTERFACE TYPE	ENTRY CONDITION
I^{2}C	IFS = Low
SPI	IFS = High

7.5.2 I^{2}C Interface

The LP5868T is compatible with I^{2}C standard specification. The device supports both fast mode (400KHz maximum) and fast plus mode (1MHz maximum).

7.5.2.1 I^{2}C Data Transactions

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, state of the data line can only be changed when clock signal is LOW. START and STOP conditions classify the beginning and the end of the data transfer session. A START condition is defined as the SDA signal transitioning from HIGH to LOW while SCL line is HIGH. A STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The bus leader always generates START and STOP conditions. The bus is considered to be busy after a START condition and free after a STOP condition. During data transmission, the bus leader can generate repeated START conditions. First START and repeated START conditions are functionally equivalent.

Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the leader. The leader releases the SDA line (HIGH) during the acknowledge clock pulse. The device pulls down the SDA line during the 9th clock pulse, signifying an acknowledge. The device generates an acknowledge after each byte has been received.

There is one exception to the acknowledge after every byte rule. When the leader is the receiver, it must indicate to the transmitter an end of data by not acknowledging (*negative acknowledge*) the last byte clocked out of the follower. This negative acknowledge still includes the acknowledge clock pulse (generated by the leader), but the SDA line is not pulled down.

Product Folder Links: *LP5868T*

English Data Sheet: SNVSCE2

7.5.2.2 I²C Data Format

The address and data bits are transmitted MSB first with 8-bits length format in each cycle. Each transmission is started with Address Byte 1, which are divided into 5-bits of the chip address, 2 higher bits of the register address, and 1 read/write bit. The other 8 lower bits of register address are put in Address Byte 2.The device supports both independent mode and broadcast mode. The auto-increment feature allows writing / reading several consecutive registers within one transmission. If not consecutive, a new transmission must be started.

表 7-6. I²C Data Format

Address Byte1	Chip Address					Register Address		R/W
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Independent	1	0	0	ADDR1	ADDR0	9th bit	8th bit	R: 1 W: 0
Broadcast	1	0	1	0	1			
Address Byte2	Register Address							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
	7th bit	6th bit	5th bit	4th bit	3th bit	2th bit	1th bit	0th bit
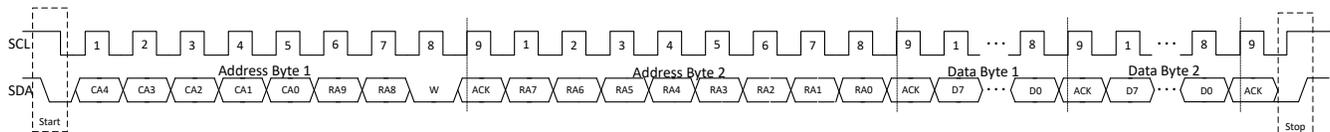

図 7-14. I²C Write Timming

図 7-15. I²C Read Timing

Product Folder Links: LP5868T
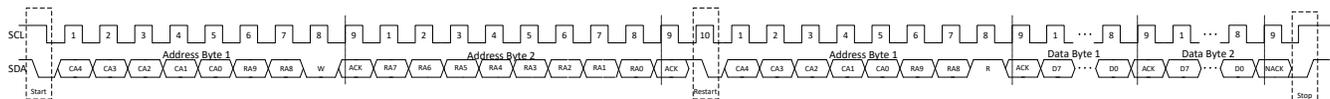

7.5.2.3 Multiple Devices Connection

The LP5868T enters into I^{2}C mode if IFS is connected to GND. The ADDR0/1 pin is used to select the unique I^{2}C follower address for each device. The SCL and SDA lines must each have a pullup resistor (4.7KΩ for 400KHz, 2KΩ for 1MHz) placed somewhere on the line and remain HIGH even when the bus is idle. VIO_EN can either be connected with VIO power supply or GPIO. It's suggested to put one 1nF cap as closer to VIO_EN pin as possible. Up to four LP5868T follower devices can share the same I^{2}C bus by the different ADDR configurations.
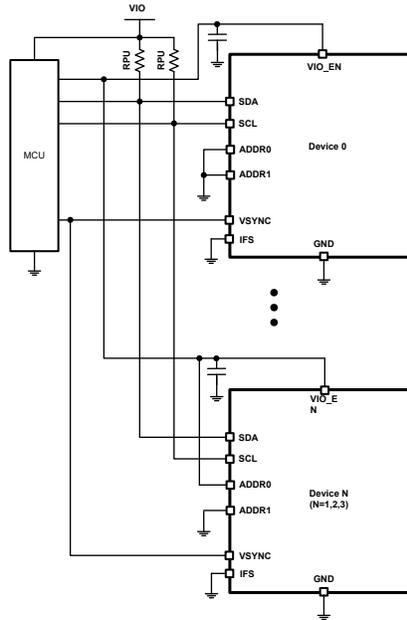

図 7-16. I^{2}C Multiple Devices Connection

7.5.3 Programming

7.5.3.1 SPI Data Transactions

MISO output is normally in a high impedance state. When the follower-select pin SS for the device is active (low) the MISO output is pulled low for read only. During write cycle MISO stays in high-impedance state. The follower-select signal SS must be low during the cycle transmission. SS resets the interface when high. Data is clocked in on the rising edge of the SCLK clock signal, while data is clocked out on the falling edge of SCLK.

7.5.3.2 SPI Data Format

The address and data bits are transmitted MSB first with 8-bits length format in each cycle. Each transmission is started with Address Byte 1, which contains 8 higher bits of the register address. The Address Byte 2 is started with 2 lower bits of the register address and 1 read/write bit. The auto-increment feature allows writing / reading several consecutive registers within one transmission. If not consecutive, a new transmission must be started.

表 7-7. SPI Data Format

Address Byte1	Register Address							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
	9th bit	8th bit	7th bit	6th bit	5th bit	4th bit	3th bit	2th bit

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The LP5868T integrates 18 constant current sinks with 8 switching FETs and one LP5868T can drive up to 144 LED dots or 48 RGB pixels and achieve great dimming effect. In smart home, gaming keyboards, and other human-machine interaction applications, the device can greatly improve user experience with small amount of components.

8.2 Typical Application

8.2.1 Application

図 8-1 shows an example of typical application, which uses one LP5868T to drive 66 common-anode RGB LEDs through I^{2}C communication.
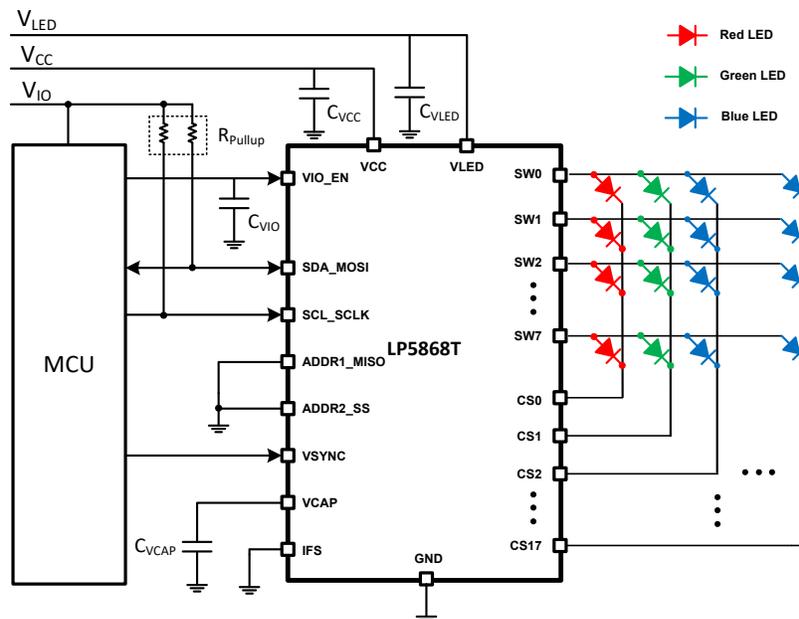

図 8-1. Typical Application - LP5868T Driving 48 RGB LEDs (144 LED Dots)

8.2.2 Design Requirements

表 8-1. Design Parameters

PARAMETER	VALUE
VCC / VIO	3.3V
VLED	5V
RGB LED count	48
Scan number	8
Interface	I²C
LED maximum average current (red, green, blue)	12.5mA, 11.25mA, 10mA
LED maximum peak current (red, green, blue)	100mA, 90mA, 80mA

8.2.3 Detailed Design Procedure

LP5868T requires an external capacitor C_{VCAP}, whose value is 1µF connected from V_{CAP} to GND for proper operation of internal LDO. The device must be placed as close to the device as possible.

TI recommends that 1-µF capacitors be placed between VCC / VLED with GND, and a 1nF capacitor placed between VIO with GND. Place the capacitors as close to the device as possible.

Pull-up resistors $R_{pull-up}$ are requirement for SCL and SDA when using I²C as communication method. In typical applications, TI recommends 1.8kΩ to 4.7kΩ resistors.

To decrease thermal dissipation from device to ambient, resistors R_{CS} can optionally be placed in serial with the LED. Voltage drop on these resistors must left enough margins for VSAT to ensure the device works normally.

8.2.3.1 Program Procedure

When selecting data refresh Mode 1, outputs are refreshed instantly after data is received.

When selecting data refresh Mode 2/3, VSYNC signal is required for synchronized display. Programming flow is showed as 図 8-2. To display full pixel of last frame, VSYNC pulse must be sent to the device after the end of last PWM. Time between two pulses t_{SYNC} must be larger than the whole PWM time of all Dots t_{frame}. Common selection like 60Hz, 90Hz, 120Hz or even higher refresh frequency can be supported. High pulse width longer than t_{SYNC_H} is required at the beginning of each VSYNC frame, and data must not be write to PWM registers during high pulse width.
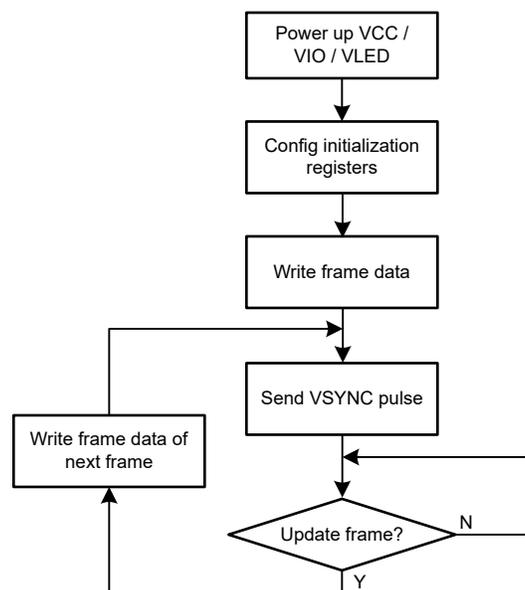

図 8-2. Program Procedure

8.2.4 Application Performance Plots

The following figures show the application performance plots.
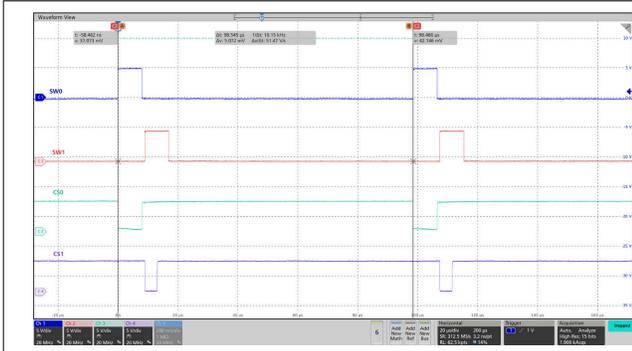

図 8-3. Scan Lines and Current Sinks Waveforms of SW0, SW1, CS0, CS1
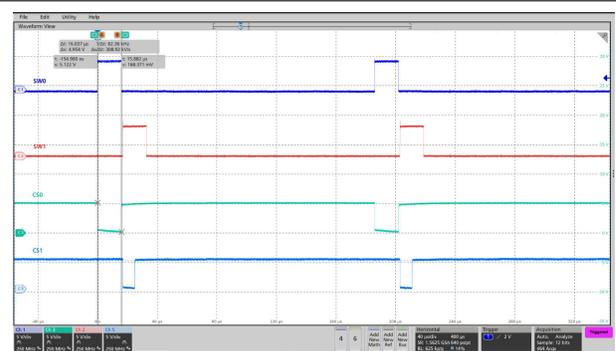

PWM frequency = 62.5kHz

図 8-4. Scan Lines and Current Sinks Waveforms of SW0, SW1, CS0, CS1

図 8-8. PWM Phase Shift Disabled
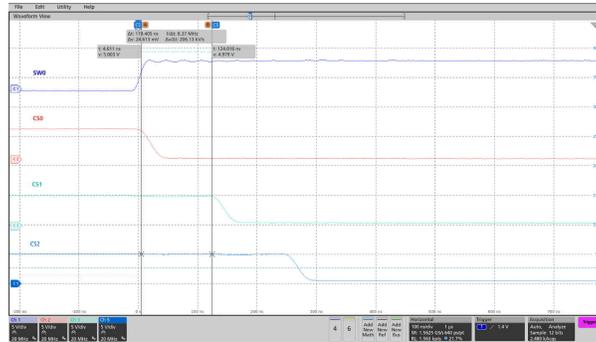

PWM_Phase_Shift = 1h

図 8-9. PWM Phase Shift Enabled

8.3 Power Supply Recommendations

8.3.1 VDD Input Supply Recommendations

LP5868T is designed to operate from a 2.7V to 5.5V VDD voltage supply. This input supply must be well regulated and be able to provide the peak current required by the LED matrix. The resistance of the VDD supply rail must be low enough such that the input current transient does not cause the LP5868T VDD supply voltage to drop below the maximum POR voltage.

8.3.2 VLED Input Supply Recommendations

LP5868T is designed to operate with a 2.7V to 5.5V VLED voltage supply. The VLED supply must be well regulated and able to provide the peak current required by the LED configuration without voltage drop, under load transients like start-up or rapid brightness change. The resistance of the input supply rail must be low enough so that the input current transient does not cause the VLED supply voltage to drop below LED V_f + VSAT voltage.

8.3.3 VIO Input Supply Recommendations

LP5868T is designed to operate with a 1.65V to 5.5V VIO_EN voltage supply. The VIO_EN supply must be well regulated and able to provide the peak current required by the LED configuration without voltage drop under load transients like startup or rapid brightness change.

8.4 Layout

8.4.1 Layout Guidelines

Below guidelines for layout design can help to get a better on-board performance.

*   The decoupling capacitors C_{VCC} and C_{VLED} for power supply must be close to the chip to have minimized the impact of high-frequency noise and ripple from power. C_{VCAP} for internal LDO must be put as close to chip as possible. GND plane connections to C_{VLED} and GND pins must be on TOP layer copper with multiple vias connecting to system ground plane. C_{VIO} for internal enable block also must be put as close to chip as possible.
*   The exposed thermal pad must be well soldered to the board, which can have better mechanical reliability. This action can optimize heat transfer so that increasing thermal performance. The AGND pin must be connected to thermal pad and system ground.
*   The major heat flow path from the package to the ambient is through copper on the PCB. Several methods can help thermal performance. Below exposed thermal pad of the device, putting much vias through the PCB to other ground layer can dissipate more heat. Maximizing the copper coverage on the PCB can increase the thermal conductivity of the board.
*   Low inductive and resistive path of switch load loop can help to provide a high slew rate. Therefore, path of VLED – SWx must be short and wide and avoid parallel wiring and narrow trace. Transient current in SWx pins is much larger than CSy pins, so that trace for SWx must be wider than CSy.

9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

9.1 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、www.tij.co.jp のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

9.2 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計で必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの使用条件を参照してください。

9.3 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

9.4 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

9.5 用語集

テキサス・インスツルメンツ用語集　　この用語集には、用語や略語の一覧および定義が記載されています。

10 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
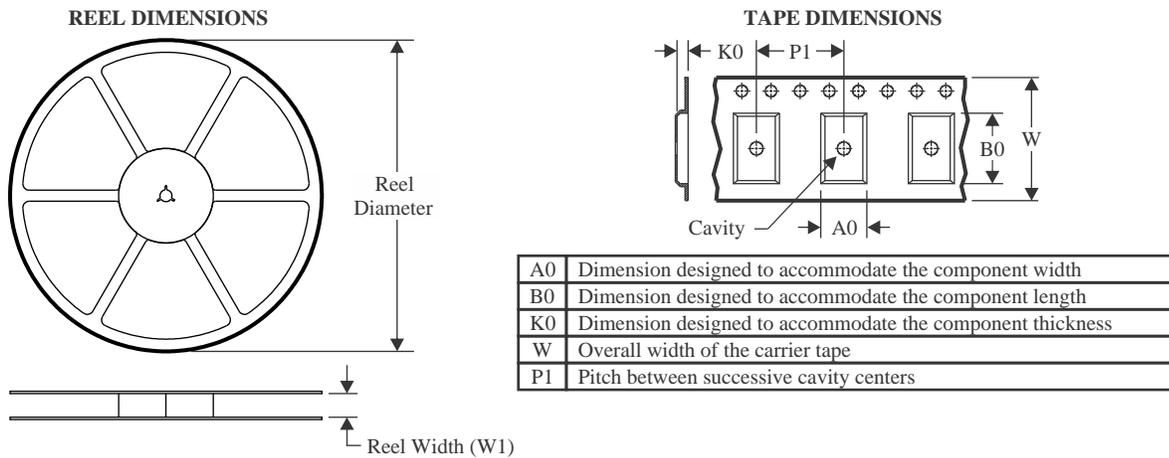

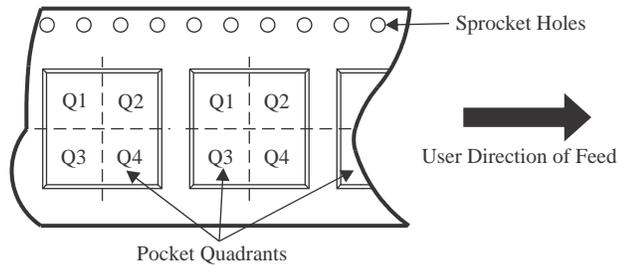

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
